

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

+ *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.

+ *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.

+ *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.

+ *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at `http://books.google.com/`

The Economy of Gargoyle Mobiloils

LUBRICATING oils "break-up" and thin out in use. In plain terms, they wear out. The better the oil the longer it wears.

In sheer wearing-qualities, Gargoyle Mobiloils stand alone.

Further:

Different types of motor demand different grades of oil. In Gargoyle Mobiloils we give you the one grade of oil best suited to your motor.

This increases power and further reduces the consumption of oil. It minimizes wear on the moving parts.

The life of your car depends on the reduction of friction. Is it not worth your while to insist on the oil that will reduce friction most effectively and most economically?

In price, Gargoyle Mobiloils are somewhat higher than ordinary automobile lubricants. But—

The cost per mile is low.

Gargoyle Mobiloils are the product of our experience as the world-wide leaders in lubrication.

In them we have set a new standard for automobile lubricants.

They are put up in barrels, half-barrels, in 5 and 1 gallon sealed white cans.

All are branded with the Gargoyle, which is our mark of manufacture. They are handled by the higher class garages, auto-supply stores and others who supply lubricants.

Our complete list of recommendations showing the correct grade of oil for every American car, and many foreign makes, will be sent you on request.

Mobiloil

A grade for each type of motor.

1912 Annual Catalog No. 22

Our 1912 Catalog, the Largest and Most Complete Catalog of the kind, containing 256 Pages, is Now Ready for Distribution. The Circulation is Limited to ONE HUNDRED THOUSAND Copies. It will be mailed to any one on request.

CUT PRICES

Concerns that offer Large Discounts make it their practice to INFLATE LIST PRICES and then offer Large Discounts, which are somewhat misleading. We have seen a catalog in which a certain spark plug is illustrated, "PRICE $2.50, OUR PRICE $1.00," while THE STANDARD LIST or RETAIL PRICE for the same spark plug as illustrated in Our Catalog and advertised by the manufacturer is $1.00 each. Their CUT PRICE Th refore Is Not Lower Than OUR LIST PRICE.

DON'T BE DECEIVED BY LARGE DISCOUNTS QUOTED FROM INFLATED LIST PRICES . . . .

The Michigan "40"

Wants More Dealers

This year the Michigan "40" will take its place in the very front rank among advertised cars.

It has taken four years to get ready. During that time we have gathered around us some of the ablest men in this line.

We have put out 5000 cars, and carefully watched their performance. We have made in four years some 300 improvements.

We have equipped an up-to-date factory, with 1200 employees, and 600,000 square feet of space. So we have an easy capacity of 150 cars weekly.

And we now have a car, at a modest price, with which the right dealer can easily outsell any other car in its class.

We now seek that right dealer in every section not closed.

Designed by Cameron

Our designer-in-chief is W. H. Cameron, for years the chief engineer of the Overland. There is not a more competent engineer in America.

Under him are experts of the highest order, in charge of every detail.

The Michigan "40"—the 1913 model—is the very last word in modern designing. Its equipment is complete and attractive, including electric lights and dynamo. Its tires are oversize—35x4½ inches. It is built with four forward-speed transmission, the most perfect ever designed. Its lines are impressive. Its finish and upholstering have never been excelled. Its price is far below any other car in its class.

We can't publish the details until our big announcements are made, but we will go into complete details with every dealer, and better yet, show him the car.

Bodies by Campbell

The bodies for this new model are designed by John A. Campbell, famous in this line the world over.

Mr. Campbell is one of the few recognized masters in the designing of vehicle bodies. The finest equipages of the late King of England were of his designing. So with the Sultan of Turkey.

Many of the most distinguished families of Europe and America have long given preference to Mr. Campbell's designs.

Mr. Campbell is now in our exclusive employ.

All of his exquisite skill has been brought to bear on the Michigan "40." You never have seen a car which surpassed it in simple elegance, distinction and grace.

Advertised by Hopkins

Our advertising appropriation for the coming season is $350,000. This will place the Michigan among the three biggest advertised cars in America.

This advertising will be handled by Lord & Thomas, who have handled nearly all of the greatest successes made in advertising automobiles.

George H. Daugherty, formerly head of the copy department of Lord & Thomas, will direct this campaign from our office.

C. C. Hopkins, vice-president of Lord & Thomas, will personally write the copy. Mr. Hopkins is the highest-paid man in this field. And his remarkable campaigns on automobiles include five of the greatest successes ever made in this line.

Our Organization

The Michigan "40" has behind it a very rare organization. Its owners have spent over 30 years in successful vehicle building. Our reputation in this line is nation-wide.

The Michigan Motor Car Company is a separate organization, but it is backed by all of the capital and all the experience of the 30-year-old concern.

The Michigan "40" is four years old. It is the product of some of the best brains in this industry. No concern in the line ever took greater pains to gather able men around it. The names we have mentioned indicate that.

Dealers are thus assured that every detail of this business will be handled capably.

The Record to Date

We have sent out in test territories 5000 Michigan cars, to be sure of our ground before we undertook this expansion.

Last year in these test territories the Michigan probably outsold every car in its class.

550 were sold in the Pittsburgh district alone. Our home city took 70. Portland, Ore., took 162.

On that same basis, the country over, the Michigan would have been the dominant medium-priced car.

The new-model Michigan is immensely better. We are bringing out this season some seventy improvements. This, with our present capacity, organization and advertising, puts the Michigan in the front rank at once.

A Great Opportunity

This means for one dealer in every locality a very rare opportunity.

It means a car which, on simple comparison, will easily outsell any other car in its class.

It means a coming car, backed by money and ability—by efficiency and experience—by a 30-year record for making good.

It means an advertised car, where nine-tenths of the selling is done for the dealer, and done with the highest ability.

It means a car which every possible prospect is bound to come and see. And the price—under $1600 with complete equipment—will make competition difficult indeed.

Our advertising begins September 1, with double-page spreads in all leading mediums. By that time we want nation-wide distribution. So immediate action is necessary.

We invite immediate correspondence from capable dealers. Or better still, come to our factory at once. Write or wire for an appointment.

The Michigan agency has a money value. And it is the only great agency that isn't sewed up in nearly every center.

If these facts appeal to you, act—now.

Michigan Motor Car Company, 254 Lay Blvd., Kalamazoo, Michigan

Hook up with COLE.

How can you ever make money in the automobile business if you don't hook up with a big live organization which can give you a full line of the right cars at the right price—the cars your trade demands ?

YOU have said to yourself time and again: "If I could only get a line that would meet the demands of all my prospects, whether the customer asks for a small, a medium, or a large size car—if I could get a thoroughly *good* car which I could sell at a profit and at a reasonable price—if this car came in a full line of models so that there would never be any danger of a prospect getting away from me *because I could not supply him with what he wanted* —if I could "hook up" with a factory which would give me what I want when I want it—if these cars that I speak of were really self-starting, equipped with the Delco electric lighting, starting and ignition system—and constructed out of nothing but the most *standard* parts, so that my profits would not be frittered away in free repair service to my users, and if the people who make these cars were absolutely gilt edge and already a success—*then I would not hesitate to stay in the automobile business*, for it is a fascinating business, and if I had a line of cars such as I describe, it would be a decidedly *profitable* business."

If your manufacturer does not give you *real* co-operation he is blocking your success. Part of the co-operation he *should* give you is *a full line of cars.* The Cole will come in three sizes this next season—a Standard Four, a Junior Cole and a 132-inch wheel base Six. This is *real* co-operation. You know what it will mean in sales cinched which last year got away from you. Take no chances. Fish with the Cole Triple Hook—not a bent pin. Go after every prospect and GET him. "Hook up" with Cole.

Here is what we are going to do for our dealers this season.

First, we are going to give you what you will consider the greatest selling line of automobiles in the history of the industry. You are going to be supported by the most extensive and most educational newspaper advertising campaign that the best experts obtainable can produce for you.

You are going to be able to put into the hands of every prospect the Cole Blue Book, which is in itself the most complete printed salesman ever sent out "on the road." It brings your prospect to you more than half sold. And we are not going to stop here. We are going to keep special trained, experienced men from our organization ready at any time to come into your territory, and co-operate with you on newspaper publicity and salesmanship.

Furthermore, we are not going to ask you to depend on your sales ability alone, no matter how good a salesman or how experienced a salesman you may be. We are going to place in your hands every thirty days a confidential Bulletin showing how every Cole representative in the field is turning his cars. This gives you approximately 1,000 salesmen on your floor—1,000 of the best salesmen on earth pulling for your bank account. This is characteristic Cole co-operation.

Hook up with COLE.

Hook up with COLE.

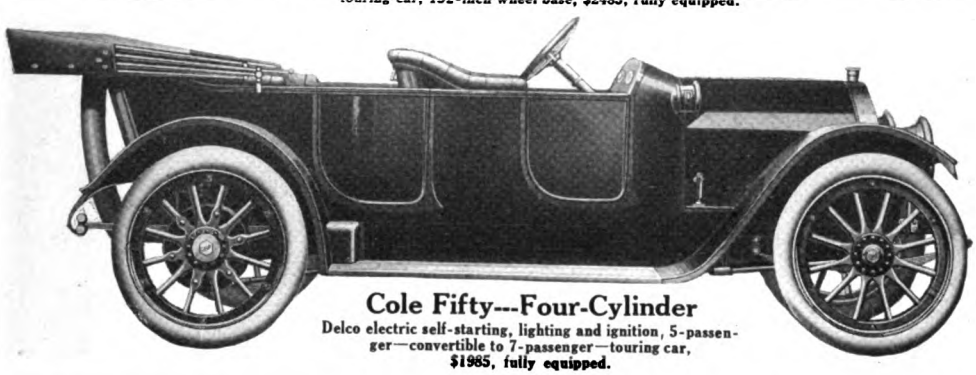
Hook up with COLE

Here they are---the new series Cole models---the most complete selling line in America

Nothing like this combination ever offered the dealer; a Standard Four, 122-inch wheel base; the Cole Six, 132-inch wheel base, and the Junior Cole, 116-inch wheel base. The new series will all be Delco electric self-starting, lighting and igniting.



The design throughout has been slightly refined, but the old tried Cole principles of construction still hold—unit power plant, three point suspension, working parts enclosed, including valves, no grease cups on motor, Timken full floating rear axle, Timken front axle and bearings, demountable rims part of regular equipment, long wheel base, over size tires and springs guaranteed highest quality.

The following improvements have been adopted: Delco starting, lighting and ignition system, sight oil feed and speedometer on dash, slightly more sprawl room in the tonneau, running boards cleared and lengthened, gasoline automatic pressure feed tank, and tire rack in rear.

Cole Sixty---Six-Cylinder

Delco electric starting, 5-passenger—convertible to 7—six-cylinder touring car, 132-inch wheel base, $2485, fully equipped.

Cole Fifty---Four-Cylinder

Delco electric self-starting, lighting and ignition, 5-passenger—convertible to 7-passenger—touring car, $1985, fully equipped.

Cole Forty---Four-Cylinder $1685

This car is identical with the Standard Four shown above, except in dimensions. Its size throughout is proportionate to its wheel base—116 inches. Delco electric starting, lighting and ignition as regular equipment—complete, $1685.

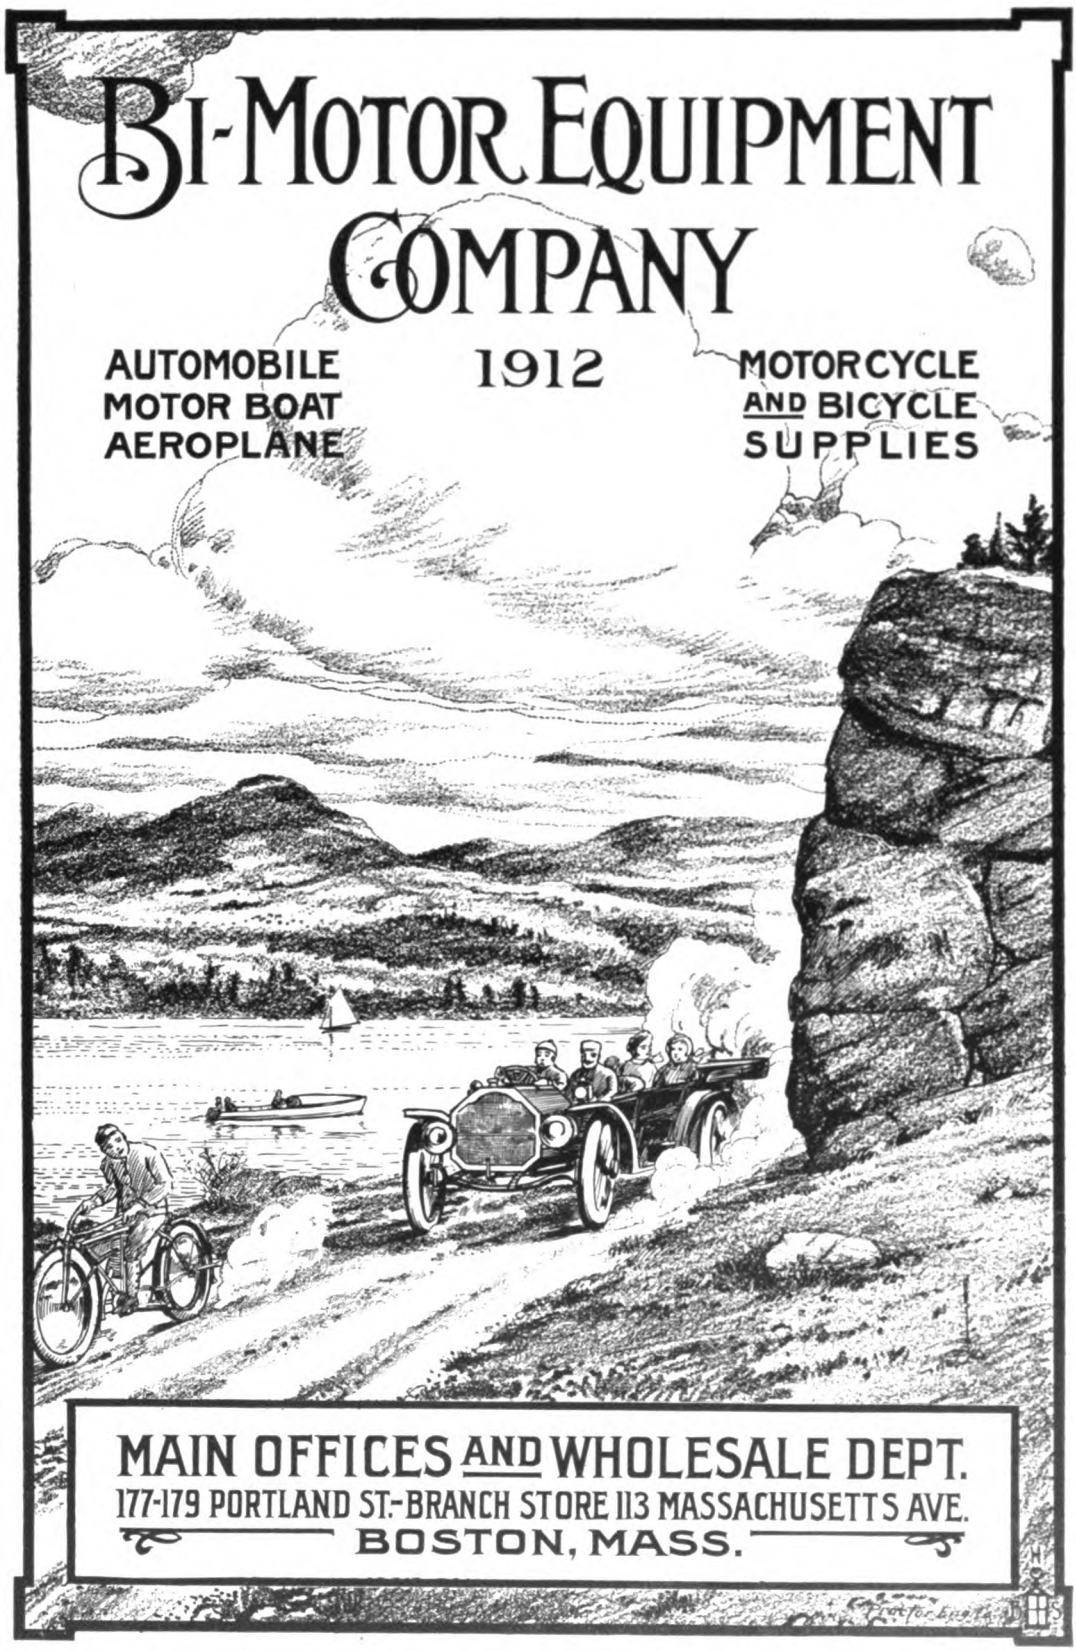
USE THIS COUPON

Cole Motor Car Co., Indianapolis, Ind. I

I am an automobile dealer. If you have anything better than I am now handling it's up to you to show me. Without obligation on my part, send me immediately the Cole Blue Book and your special proposition.

Name and Address _____

Write today for our 64-page automobile education. Put the best brains in the automobile business pulling for your bank account—you will never hook up with a mechanical "lemon" after you have read the Cole Blue Book. This book is not confined to information about the Cole. It handles the subject of automobile construction in a broad, truthful way. Get this book---read it---and then if you are in open territory hook up with Cole. Quit fishing with a bent pin—**use the Cole Triple Hook.** The first step toward a bigger and more profitable year is to fill out the coupon and "fire it" in at once to the



Cole Motor Car Company, Indianapolis, Ind.

There will be a General Sales Convention of automobile dealers at Indianapolis, October 8 and 9. Mr. J. J. Cole personally invites you. Such noted sales authorities as A. F. Sheldon, Elbert Hubbard, W. D. Nesbitt and John Lee Mahin will talk to you on "Selling More Motor Cars."

Price $75

Warner AUTO-METER

FOR 1913 the world's largest automobile manufacturers will equip their cars with Warner Auto-Meters. Over 100,000 new cars will carry Warners as regular equipment.

Having decided to carry a speed indicator as "regular equipment," it naturally followed that the highest grade cars would select the highest grade speed indicator made. The Warner was selected. When it came to a final and thorough test the Warner proved its superiority under every possible condition.

Examine the speed indicator on the car you buy, for a manufacturer's equipment is a good guide to the whole character of his product.

Priced from $50 to $145. For sale at our own branches and by leading dealers all over the world.

¶ That is what more than half of the motorists in this country wish they could. They know too well that most of their auto troubles are traceable to faulty carburetion which means loss of power, waste of power and waste of gasoline.

¶ Let us suggest a remedy.

¶ When every part of the motor car is working in harmony, performing its various tasks as a single co-ordinated unit of splendid machinery, the motor hums along the highway with agility, with speed, with a reserve power that barks snappily when you suddenly open the cut-out. You ride along unconscious of any transmission gears, pistons, differential or clutch. There is no trouble; you know you will get there and come back.

¶ You forget there is a carburetor; the motor steps up with a leap when you touch the accelerator. You get over the steepest hills with no difficulty. You pull through shifty sand with rugged powerful engine strokes.

¶ *That kind of a carburetor is a MAYER.* The Mayer seldom needs adjustment. It is built right, installed right at the factories; there is nothing to get out of order. Just forget you have a carburetor when your motor is *Mayer-fed* and you will learn motoring joys you never thought possible.

¶ The Mayer is the right carburetor for your engine. We sell you that Mayer model which is especially adapted for your make of motor with its bore and stroke. The principles incorporated in the construction of the Mayer are the result of years of experimental work and other years of splendid success.

¶ A Mayer furnished fuel to the engine that took the Thomas Flyer around the world in the New York to Paris race. A Mayer carburetor fed the motor in the Abbott-Detroit Bull Dog during 45,000 miles of cross country plugging.

¶ And these two Mayer carburetors never failed for a minute.

¶ The Mayer gives the motor the right mixture at varying speeds. The Mayer is the most economical of carburetors. It will reduce your gasoline expense a full 25 per cent. And with the *Mayer* you can get from 15 to 30 per cent. more power from your motor than with 90 per cent. of the other carburetors in the market.

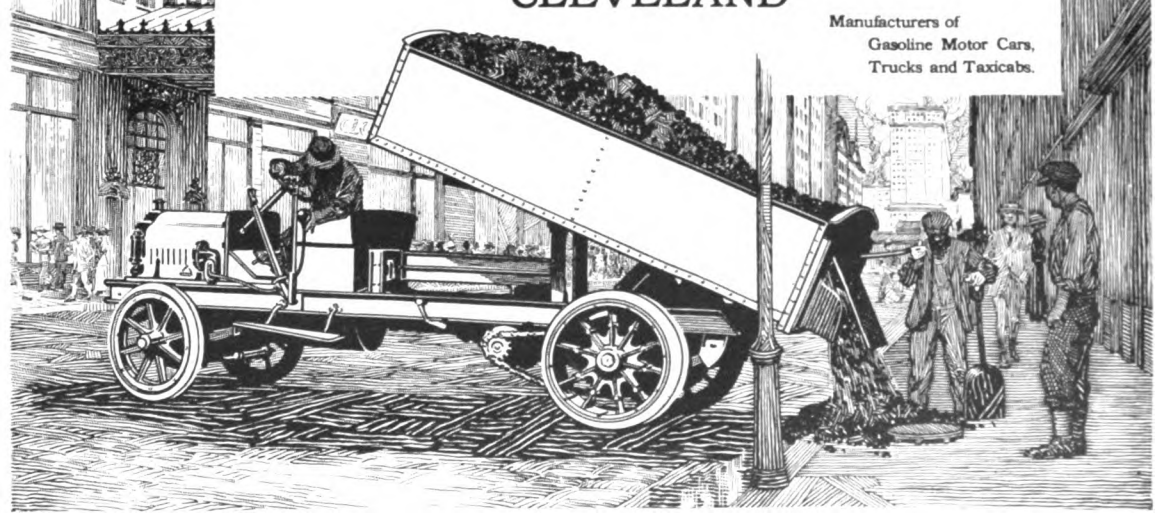
WHITE MOTOR TRUCKS

Have More Than a Guarantee Behind Them

THE purchaser of a motor truck, to be secure in his investment, must consider not only the construction of the truck and its adaptability to his business conditions, but also the financial responsibility and the integrity of the truck manufacturer behind it.



The guarantees and service inducements under which so many trucks are offered for sale, are no better than the reputation and responsibility of the manufacturers who make them.

White Trucks are manufactured by a company which has had the confidence and respect of the industrial world for over fifty years. The name of the White Company is the best guarantee in the world of the sterling quality of White Trucks.

PROTECTING THE CAR AGAINST THEFT.

Conditions Warrant the Assumption That Organized Bands Are Operating in Many Sections---Means Should Be Provided for Safeguarding the Machine When Left Unattended---Some Devices Now on the Market.

TWO hundred and eleven motor cars stolen within seven months is the substance of the report recently made public by the police department in Detroit. This means an average of one automobile theft a day in that city, and the situation may be regarded as an example of what is taking place in practically every city of consequence in the United States. Of the 211 machines stolen in Detroit 209 were recovered, but in each instance the owner was called upon to face losses, which were it possible to secure authentic figures, must aggregate a decidedly substantial sum. Even if insurance companies were called upon to make good this sum, the owners were still losers, through inability to use their machines for a given period.

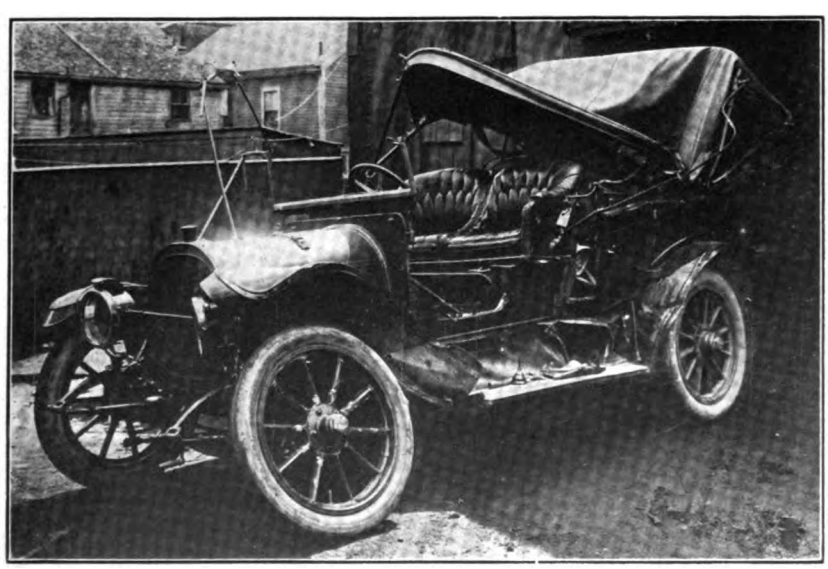

Fig. 1—A Striking Example of What May Be Expected as the Result of the So-Called "Joy Ride."

Automobile theft may be divided into at least two classes. First, there is the organized gang which either drives the machine to some secluded spot and strips it of such parts and accessories as can readily be turned into money, or completely renovates and sells the car. Then there is the party which starts upon what has come to be termed a "joy ride."

Fig. 1 presents a striking example of the manner in which cars suffer at the hands of the "joy rider." This situation may arise because the chauffeur utilizes the machine for his own enjoyment without the owner's knowledge or

Digitized by Google

consent, and the possibility of such results has occasioned no little worry on the part of both the owner and the garage proprietor. However, that is a subject which can best be considered in another manner.

While this condition exists, that which more nearly comes within the scope of this discussion is the growing tendency of certain persons to watch their opportunity for securing temporary possession of a car when it is left unattended outside the garage, in front of the owner's home or place of business, or elsewhere. Within the past few months, comparatively speaking, almost every city, and even many of the smaller towns, has developed thievery of this character. That the owner needs to be protected from his own folly in this respect semes to be borne out by the clause in the motoring law of Massachusetts,

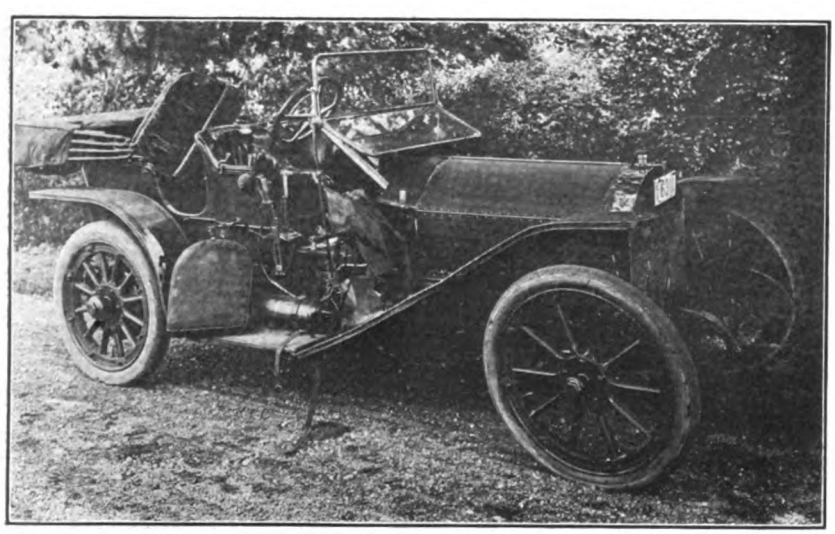

Fig. 2—Car Abandoned by Automobile Thieves After Being Stripped of Articles That Can Be Turned Into Ready Money.

and in the laws of several other states, providing that "no person having control or charge of a motor vehicle shall allow such vehicle to stand in any public street or way and remain unattended without first locking or making it fast."

Fig. 2 depicts a car which has been stolen for the purpose of stripping it of the accessories. So prevalent has this form of theft become, both in this country and abroad, that organized bands of automobile thieves have come into being, with a splendid system of obtaining plunder and disposing of it by means of "fences." Judging from the fact that 209 of the 211 cars stolen in Detroit were recovered by the police, it seems probable that a large proportion of the thefts were committed by some such band.

Within two years, the practise of stealing cars outright, the vehicles being completely overhauled and sold to unsuspecting purchasers as second hand machines, seems to have been gaining rapidly. This situation becomes the hardest of all with which the police have to deal, and the owner naturally is subjected to the greatest loss. Whenever the cars have been recovered, which has been seldom indeed, it has been found that they have been stolen in New York City, for instance, and disposed of in some middle western city. This would indicate that those engaged in this form of theft operate upon a large scale, and many times the condition of the recovered machine has been such as to suggest that they had access to a well equipped plant for the renovation of automobiles, including painting, replacement of parts and other extensive alterations.

A fruitful field for the activity of either band of thieves mentioned above may be found at Fig. 3, which represents an open air stand for automobiles utilized by the business men of a large city in the East. Here the machines have been permitted to remain throughout the day, and often long into the night, absolutely unprotected, except in such manner as can be afforded by the occasional visit of the patrolman in making his rounds of duty. It may be argued that as this open air garage is within full view of office buildings, and the public is passing to and fro at all times, there is little possibility that anyone other than the rightful owner or chauffeur would attempt to drive away a car, but this condition has not obtained in practise. Thieves so well organized as has been indicated herein do not hesitate to take chances of being discovered, and it will be admitted that the public generally is too busy with its own affairs to make a mental note as to whether or not the man seen entering an automobile in an open square is entitled to do so.

It is well enough to provide insurance against theft, which aims to reimburse the owner for all losses of this character above $25, whether the loss is occasioned by the so-called joy ride, in which the machine may be as thoroughly damaged as indicated in Fig. 1, or it is the result of dismantling as presented in Fig. 2. It will be admitted, however, that this protection by no means satisfies the owner, when his machine is missing,

Digitized by Google

and he is in need of a car to carry on his business or to prevent rearrangement of his plans in other ways.

These conditions have resulted in the production of numerous devices, designed for the absolute protection of the car at all times, when left unattended. The object of this discussion is to present the merits of these various offerings, as outlined by the manufacturers, and it is assumed that the motoring public will be interested in comparing their particular features.

Those familiar with the components of the motor car realize that gasoline must be fed to the carburetor where it is vaporized and that the mixture in the cylinder must be exploded by a spark. If the main supply be cut off it is obvious that the machine can be operated but a short distance, a few blocks or so, as the fuel soon falls below the vaporizing level in the float chamber or becomes utilized. Similarly, if the ignition circuit be broken on one side by means of a locked switch, it will be impossible to start the motor until the connection is re-established.

Two other factors are essential for the operation of the automobile, namely the clutch and transmission. With the former held out of engagement and locked, even with the motor in operation, it would be impossible to move the machine under its own power. With the sliding gearset, the retention of the gear shift lever in neutral would prevent theft of the vehicle, as a set of gears would have to be brought into engagement before the energy of the motor could be utilized. The design of the planetary transmission does not lend itself readily to locking, but with this type use may be prevented by locking the steering wheel, fuel or ignition systems. The various applications of the above methods are described and illustrated herein.

The Gasolock, shown in Fig. 4, is marketed by the International Sales Company, 412 Scherer building, Detroit. It comprises a Yale cylinder lock enclosed in a brass head or ball connected by a tube to a valve inserted in the line between the gasoline tank and carburetor. The cylinder lock is gear meshed with the stem of the valve in such manner that the operation of the key locks and unlocks the fuel supply.

The device is securely bolted to the dash and in locking the gasoline every portion of the Gasolock is locked. It is maintained that it cannot be shakened off or removed in any way without first working the lock. Inasmuch as this portion of the device is made by the Yale & Towne Manufacturing Company, each key is distinctive. The valve, stem and head are produced by the Detroit Lubricator Company.

Fig. 3—Cars Parked in Public Square Without Attendant—A Fruitful Source of Trouble from Automobile Thieves of Every Class.

The Troy Carriage Sunshade Company, Troy, O., manufactures the Troy automatic auto-lock shown at Fig. 5. This is one of the combination, keyless devices, in which the combination may be changed at the will of the owner. This latter operation is performed by simply removing the face of the lock, utilizing a special key provided for that purpose, and manipulating the little levers seen in the illustration, as is desired. However, it is impossible to employ this special key before the original combination has been worked and the bolt drawn up to a given point, so that a person ignorant of the combination would be helpless even if he secured temporary possession of the special key.

Digitized by Google

Fig. 4—Gasolock for Securing Fuel Supply.

The cut presents the location of the lock on the speed lever, and in applying it it is necessary to make a slot through the lever so that the locking dog or flattened bolt can slide up and down in the slot. This dog projects on each side beyond the faces of the speed lever to such an extent that when the lever is in neutral and the bolt is forced downward it slides snugly between the inner sides of the quadrant, preventing the movement of the lever from its neutral position. It is maintained that if attempt be made to wrench the lock from the lever, the lock itself takes none of the strain and the lever would be broken off before the lock would yield.

The Campbell locking control lever at Fig. 6 A is particularly unique, in that it is impossible to suggest how the device is operated, unless previous knowledge has been obtained. There is held to be no manner in which the lock may be picked as a four pin tumbler Yale lock is employed, and of course, the entire apparatus is worked from the seat. It is the product of the Auto Specialty Company, Toledo, O.

It will be noted that the locking mechanism apparently is located in the top of the lever, which is substituted for that furnished with the car. In reality, however, the locking shaft extends down through a hollow steel lever to engage in the neutral point of the sector. The key is inserted in the top of the handle, as indicated, and when removed the thief is puzzled to understand why he cannot manipulate the lever in any manner.

The Globe Auto Lock is presented at Fig. 6 B. This is manufactured by the Globe Auto Lock Company, Canisteo, N. Y., and is a simple, compact valve attachment with provision for inserting in the fuel line. It may be fitted to the outside of the car body, under the seat or any other convenient place. When the lever is moved it shuts off the supply of fuel positively and locks the device. The entire arrangement is outlined in the drawing.

Another device which locks the gear shifting lever is the Crown, made by the Wiener-Barnet Company, 312 Adams street, Newark, N. J., and illustrated at Fig. 6 C. This differs materially from those previously described in that there is no drilling, filing or changing of any of the mechanism of the car.

In the drawing the padlock can be seen underneath the quadrant. About the lever which has been locked in neutral may be noted a notched bar, which is slipped into place, when it is desired to lock the car. The padlock is fastened into a hole at the lower end of this bar and renders it impossible to release it, and consequently the lever, until this lock has been unlocked in the customary manner.

The Fetterlock at Fig. 6 D is somewhat similar, in that a small bent plate slips over the quadrant, this having an opening for receiving a lip with a hole in it. Through this hole the padlock, fitted with either Corbin or Yale tumbler lock, is slipped. In practise the lever is thrown into neutral and the plate, lip and lock applied. It is claimed that it will fit any make of car having selective or progressive transmission. It is made by the Autolock Company, 2828 Smallman street, Pittsburg, Penn.

The principle involved in the Rochester safety lock at Fig. 6 E is entirely different. The lock itself is a three tumbler combination, keyless device, capable of a large number of different combinations, and in this respect it affords the same possibilities as the Troy device described above.

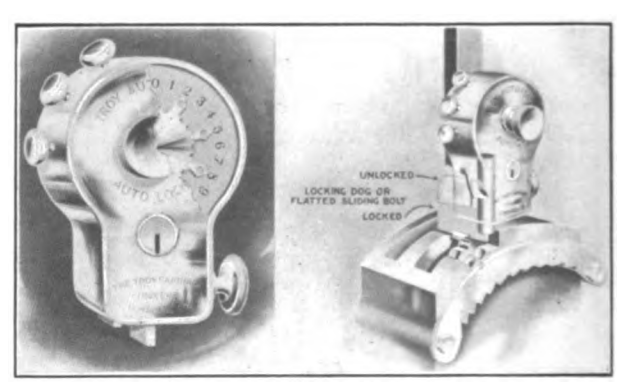

Fig. 5—Troy Automatic Auto-Lock: At Left, the Lock Itself; at Right, Applied to Gear Shifting Lever.

Digitized by Google

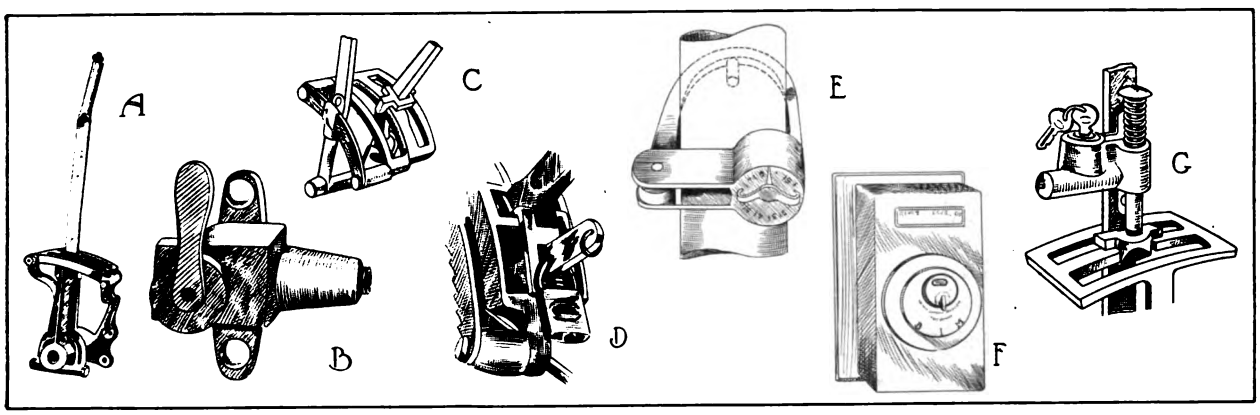

Fig. 6—Some Interesting Types of Automobile Locking Devices: A, Campbell Lever; B, Globe Fuel Lock; C, Crown; D, Fetterlock; E, Rochester Safety Lock; F, Blackburn Lock Switch; G, Saunders Automatic Lever Lock.

It is made by the Rochester Safety Lock Company, 530 Main street, Rochester, Ind.

This apparatus is applied to the steering post. It will be noted that there is a .25-inch lug or pin projecting inwardly from the hasp of the lock. This is supposed to enter a .25-inch hole drilled in the steering column, about eight or 10 inches below the steering wheel, and in the front side of the bar as the driver sits in the seat. This will put the lock at the right hand of the driver and make it possible to operate it from the seat. The idea of application is that, in most cases, one part of the steering column is stationary, while the other rotates with the steering wheel. The lug in place holds the bar rigid and makes the car useless.

The Blackburn lock switch at Fig. 6 F offers a means for locking the ignition circuit. The plan is that of substituting for the usual ignition key and socket, supplied by the maker of the unit, a Yale lock of the pin and tumbler type, the key to this acting as the ignition plug. Obviously, when this key is removed the switch cannot be turned except with a duplicate. It is maintained that the switch cover cannot be removed even if unscrewed, until after the key has been inserted and turned to the releasing point, and that when the switch is mounted on the coil it is impossible to short circuit the wiring. The maker is the Blackburn Specialty Company, 1120 Prospect avenue, S. E., Cleveland, O.

Still another means of locking the gear shifting lever is presented in the Saunders automatic lever lock at Fig. 6 G. This is the product of F. H. Kelsey & Co., 408 Frankfort avenue, N. W., Cleveland, O. It will be noted an attachment fitted with a spring is permanently fixed to the side of the lever, its bottom portion engaging with the quadrant when the lever is in neutral and the top of the spring device is pushed downward. Pushing this down, either with the hand or foot, automatically operates the Corbin tumbler lock, which cannot be unlocked except with the individual key. Unlocking the lock automatically throws the bottom portion of the device out of engagement with the quadrant and permits the

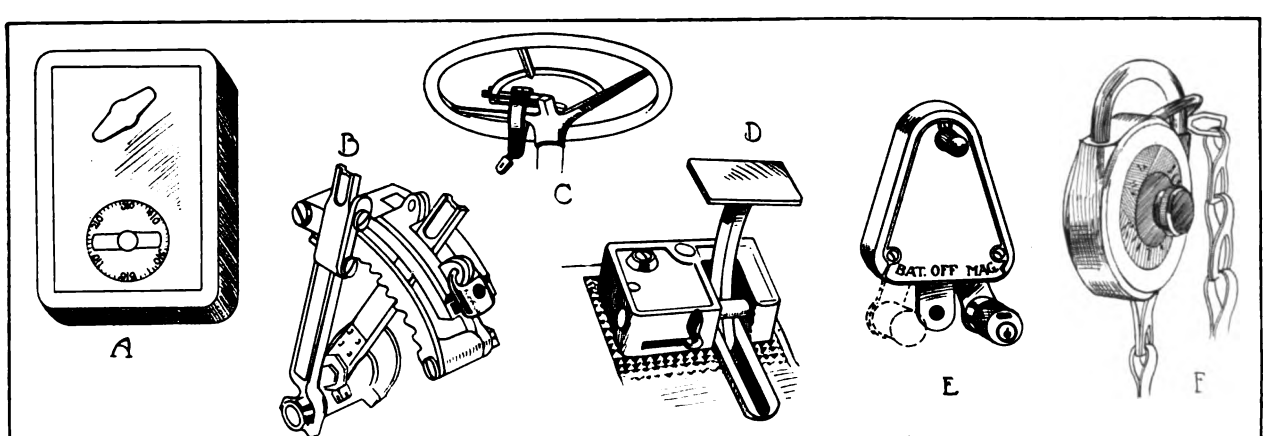

Fig. 7—Other Devices for Securing Cars Against Theft: A, Johnstone Ignition Lock; B, Parker; C, Watch Dog; D, Auto Safety Lock for Clutch Pedal; E, Yale Ignition Lock; F, Miller's Keyless Padlock.

Digitized by Google

use of the lever in any position desired.

The Johnstone ignition lock at Fig. 7 A differs from the Blackburn in that it is worked by a combination lock instead of a key. It is made by the Johnstone Auto Lock Company, Cleveland, O., and is composed of a pressed steel box, fastened over the coil box and attached to the dash by screws inside. When in position, it is maintained that the engine cannot be started unless the combination is known, and that the latter can be changed at the will of the car owner.

Fig. 8—No-Key, a Combination Padlock.

The Parker lock at Fig. 7 B is another supplemental device for insertion at the quadrant in order to secure the gear shifting lever. It is the product of the General Utility Company, 1326-1330 Ogden street, Philadelphia, Penn. The attachment is hinged, so as to slip around the lever when in neutral, and locks by means of a Yale lock. The maker calls attention to the fact that no filing or drilling is required.

The Watch Dog, made by S. Breakstone, 1712 Michigan avenue, Chicago, and shown at Fig. 7 C, consists of a pair of hinged arms which slip around the steering wheel spider, and the throttle and spark levers. It may be had either with or without padlock, that furnished with the device being of the Corbin make. It is claimed by the maker that it is possible to leave the car with the engine running, as when the lock is applied under such conditions the machine can be operated in a circle only.

A device for locking the clutch pedal is depicted at Fig. 7 D, this being the Auto safety lock made by Daniels & Woods, Los Angeles, Cal., and marketed by Smalley Daniels, 23 Motor Mart, Boston. The apparatus is neat in appearance and is always ready for service. The locking arrangement comprises a short bar, which slips across back of the clutch pedal, and holds it out of engagement. This is thrown into action by a small lever operated by the foot, while a key is needed in order to release it when it is desired to operate the car.

As has been stated most makers of ignition equipment supply some form of lock with the coil switch, and the Yale & Towne Manufacturing Company, 9 Murray street, New York City, has developed the special lock shown at Fig. 7 E for this purpose. When locked in the neutral position the switch lever cannot be moved until released by the individual key.

The J. B. Miller Keyless Lock Company, Kent, O., manufactures the padlock presented at Fig. 7 F, this being a combination device. That in the drawing is more commonly used on motorcycles, although the padlock can be utilized either with or without the chain. The concern is engaged upon the production of a special device for locking the steering gears and levers of an automobile, but this is not yet ready for announcement.

Still another combination lock is the No-Key, produced by the American Keyless Lock Company, 619 West Jackson boulevard, Chicago, and depicted at Fig. 8. This is made entirely of brass, and is utilized in the same manner as any padlock, with the exception that it is opened by working the combination. Any of the numbers from 1 to 8 on either side of the lock may be employed in the combination and it is claimed that more than 40,000 different combinations are possible on each lock.

Besides making locking devices for its ignition equipment, the Connecticut Telephone & Electric Company, Meriden, Conn., produces the Autolock presented at Fig. 9. This is a simple form of padlock, so small as to be carried in the vest pocket with ease, and is designed to be applied to the ratchet brake lever as depicted. The construction is from a solid block of brass, machined out to receive the mechanism which is of the ball bearing pin tumbler design. The shackle and steel inserts are hardened so they cannot be filed.

Tarvia

Preserves Roads
Prevents Dust

Hunnewell Avenue, Newton, Mass. Roads treated with Tarvia-B.

Newton's Experience with Tarvia

IN Newton, Mass., the Hunnewell Hill District, one of the finest residential sections, was treated consistently for three sucessive seasons of 1908, 1909 and 1910 with "Tarvia-B," as a road binder and a dust layer, to enable the macadam streets of this beautiful section to withstand automobile traffic.

In the spring of 1911 the roads were still in such good condition that it was not deemed necessary to re-treat them and they successfully passed the season without further attention.

On Washington Street and Waverly Avenue, for example, "Tarvia-B" was used year after year, but each year the amount of Tarvia required to put the road in first class condition has diminished; and during last season the treatment was omitted entirely.

The expense for each application has been low, and the cost has decreased each year. In 1910 it fell below three cents per square yard and the omission of the 1911 treatment made the annual cost extremely low. Residents are enthusiastic over the appearance of the streets, which are smooth and hard enough to be cleaned with brooms, yet sufficiently absorbent to remain dustless.

In 1906 the automobile had practically ruined the Newton Boulevard, which has long been reserved for automobiles. "Tarvia-A" has been used since 1906 and has brought about great economies.

In the spring of 1910 and again in 1911, after the "Tarvia-A" treatment had been down from three to five years, a foreman and three men did in a week all the repairing necessary on five miles of roadway. The thoroughfare was then in an admirable condition for the summer traffic. No water has been used on the Boulevard since the Tarvia work began, yet it remains dustless and clean at all seasons.

There is nothing unusual about Newton's experience. Scores of localities are reducing their maintenance cost on their macadam streets in the same way. The use of Tarvia has become standard wherever there has been thorough experimentation.

No attempt is made to include all of the devices upon the market, but rather to present the varying features of those which have been brought to the attention of the motoring public. That there is need for some kind of protection against theft is being borne home to the automobile owner almost daily. The market affords ample opportunity for securing this protection, it would appear. There are other features of the situation which might be considered, but space does not permit of their presentation here.

TESTING IN SAND BANK.

There is no more indispensable figure in the automobile industry, probably, than the automobile tester, who takes the complete chassis sent to him from the assembly department of the factory and works it into a smoothly running unit. If there is a fault in the construction, material, adjustment or workmanship, the tester can be depended upon to find it.

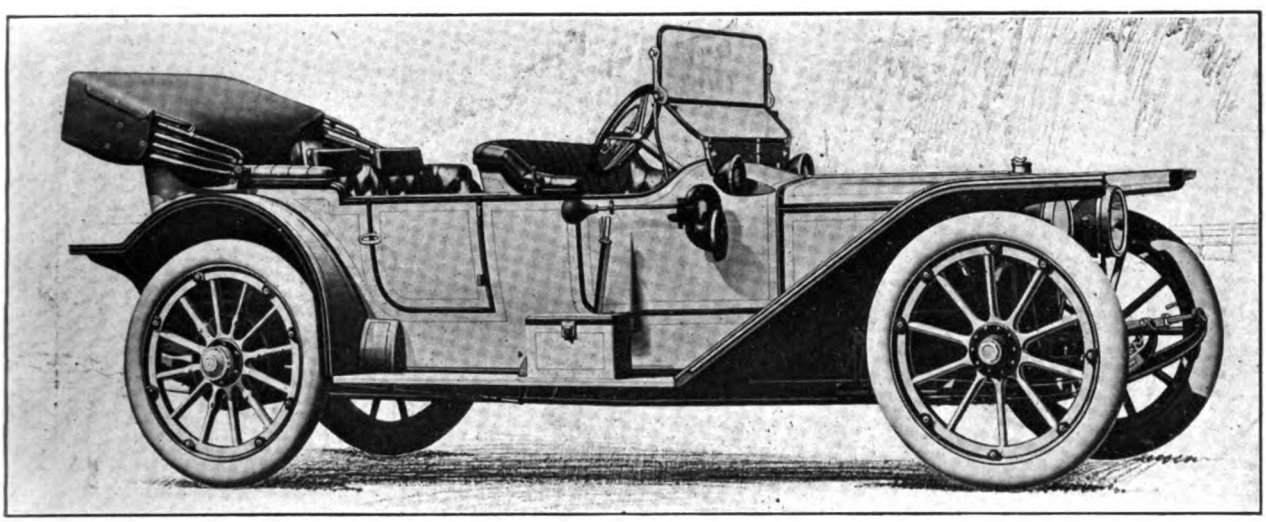
Two Views of the R-C-H Testers Trying Out Chassis on Particularly Sandy Strip of Roadway Near the Factory in Detroit.

About four miles from the factory of the R-C-H Corporation, Detroit, there is a strip of sand road that would strike terror to the heart of the average motorist, but which has proved a veritable mecca for the R-C-H testers. Driving an automobile through this sand strip is one of the hardest features of trials to which the product of this concern is subjected.

First, they pass through it on high gear, passing completely over the entire length without shifting the gear, if possible. Then they return and deliberately stop on one of the worst spots of the road. The machine is consequently given the task of pulling out of the sand. At first, the sand flies in clouds, as the accompanying photograph plainly shows. This furnishes far more strenuous work than any car would be called upon to perform under anything like ordinary conditions, but the extreme test only assures the efficiency of the machine before it is placed upon the market.

TOURING WITH ELECTRICS.

In an effort to extend the touring scope of the electric cars, the Empire State Gas and Electric Light Association held a meeting at Rochester, N. Y., at the request of the Automobile Club of America, and immediate steps were taken to install charging stations along the road between Poughkeepsie, Schenectady, Amsterdam, Utica, Rochester and Buffalo. Hitherto it has been impossible for the owner of an electric to go far from the city lines, owing to the lack of facilities for recharging his car. The matter promises to be agitated in various parts of the country as there is much interest in touring with electrics.



STRONG GOES TO INDIANAPOLIS.

E. T. Strong, new manager of the Indianapolis branch of the Buick Motor Company, succeeding R. H. Losey, recently resigned, has assumed full charge of his new positon. For the past few weeks he has been in charge of the branches in Indianapolis and Buffalo, N. Y., he having been manager of the latter before being transferred to Indianapolis. Mr. Strong has been one of the main factors in the Buick organization for several years and his promotion to the Indianapolis field is in line with the company's policy to advance the men whose work has been found to be the most meritorious.

THREE AMERICAN MODELS FOR 1913.

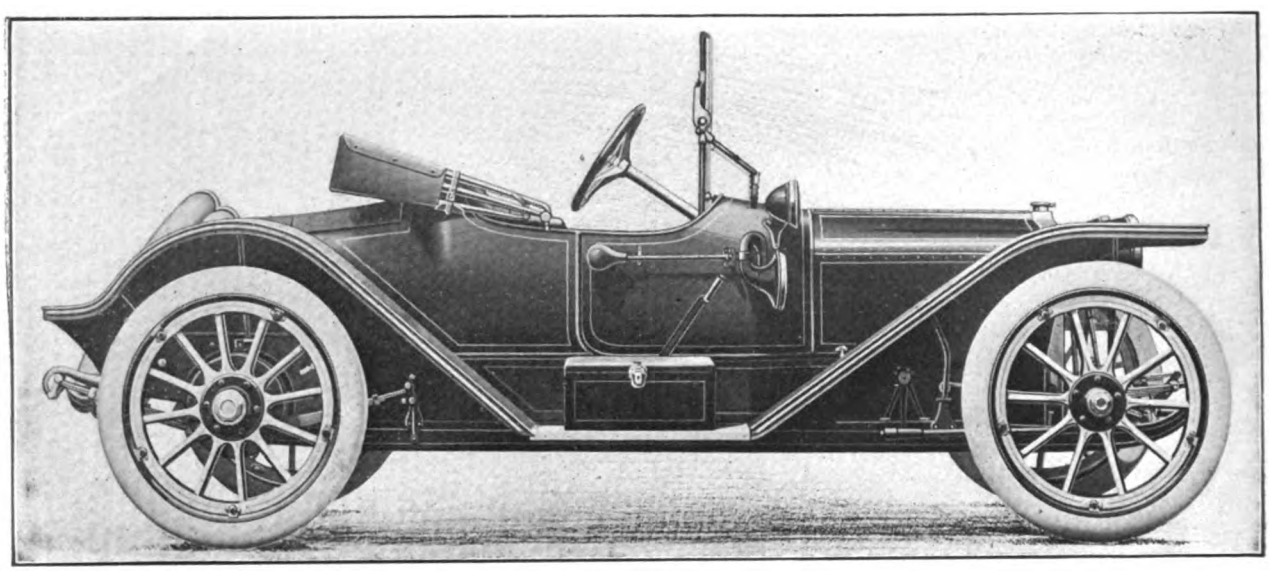
THE American Motors Company, Indianapolis, Ind., announces that for the season of 1913 it will continue the production of three types of cars, type 56 becoming 56-A, type 34 becoming 34-A and type 22 becoming 22-A. All of these chassis will be underslung, which design was originated by this company, and after eight years' experience there has been no reason to depart from what has been so thoroughly tried and satisfactorily proven. Type 56-A is known as the American Traveller, type 34-A as the American Tourist or Roadster, and type 22-A as the American Scout, and these are rated as 46, 32.4 and 22.5 horsepower, respectively. All have motors of the four-cylinder, water-cooled design and generally conform to conventional construction.

The American Traveller, 46 Horsepower, as Built for 1913.

But little change has been made in the design of either the Traveller or Tourist chassis, but improvements have been made that are distinctly conveniences and make for the comfort of the occupants. Considering the Traveller model specifically the car is fitted as regular equipment with an electric starter and an electric lighting system, so that the vehicle is as easily managed by a woman as by a man. The electric motor will turn the engine at 200 revolutions a minute, and when the engine is operating the motor becomes a generator for charging the storage battery and lighting the vehicle lamps. In addition the equipment is very complete and high grade, including a windshield and a Warner auto-meter and clock, and the finish is decidedly artistic and enduring. The upholstery is exceptionally luxurious and is the best that can be procured.

The Tourist model is continued with practically no change, but it, too, has been refined and improved by the addition of a Disco starting installation and the use of an electric lighting system which charges a storage battery, from which current is supplied to the head, dash and tail lamps. There is the same high class equipment of the vehicle and it is in every way comfortable and commodious. The roadster model is a two-passenger body with a large baggage compartment at the rear of the driver's seat, which is water and dust proof, in which two coat cases may be carried. In this model there is greater rake to the steering column than in the touring car.

The Scout model, however, has been materially improved and in this there is what may be regarded as an entirely new power plant. This to a considerable degree resembles the motor assembly of the Tourist chassis, but it is a design with a distinctly long stroke engine, the bore of 3.75 inches and the stroke of five inches, giving a bore to stroke ratio of one to 1.333. While the rating by the S. A. E. formula is 22.5 horsepower, it is stated that the engine has developed in excess of 30 by brake test. The American Scout is fitted with but one body, a roadster, and this is designed for two passengers, but with the power available the machine is adapted for all kinds of touring, although especially desirable as a runabout.



The motor differs from conventional construction in that it is en bloc with the water jackets

Digitized by Google

and the upper section of the crankcase cast integral. It is a T head design with the intake at the right side and the exhaust at the left, with the valve stems, springs, guides and tappets operating in recesses beneath the valve pockets, these recesses being covered with aluminum plates. With these covers in place the motor is extremely sightly in appearance and nothing moving is exposed. The cylinder block is cast from a superior quality of gray iron with the crankcase section, carrying the pump housing and the water inlet manifold connection, as well as the water jackets, integral. The top of the block is left open and this insures the complete cleaning of the water spaces and the unobstructed flow of water. The water inlet is at the left side of the motor and it is within the recess housing the valves. The design necessitates a large amount of machine work on the casting, which is first bored, aged, reamed and then ground. The carburetor manifold is cast integral with the block, but the exhaust header is securely bolted to the cylinder.

The lower section of the crankcase is an aluminum casting and the bottom of this forms the oil reservoir. The supporting arms of the crankcase are cored for lightness and at the rear of the arms two yoke arms extend that are channel section, these meetings two similar yoke arms that are cast integral with the transmission gearset case. These yokes surround and protect the flywheel and clutch and afford them efficient support. The filler for the oil reservoir is in the top surface of the left motor arm. The forward end of the motor is carried on a cross member and the arms are bolted to the chassis frame.

The crankshaft differs from the usual en bloc practise in that it has three bearings, the centre bearing being mounted in a strong cross web. These bearings are two inches diameter and 3.625 inches and 4.125 inches length at the front and rear, respectively, and 2.5 inches diameter and 1.5 inches length at the centre. These are firmly anchored in the lower section. By loosening the bolts retaining the sections the cylinder block and the upper half may be swung off the lower so as to afford easy access to the main bearings and the connecting rod bearings. By lifting the upper section the crankshaft, camshafts, connection rods and pistons may be exposed for examination or work. The other auxiliaries of the motor, the water pump, magneto, oil pump, etc., are all carried on the cylinder casting and do not have to be removed before opening the crankcase.

The American Roadster, 32.4 Horsepower, with 1913 Equipment.

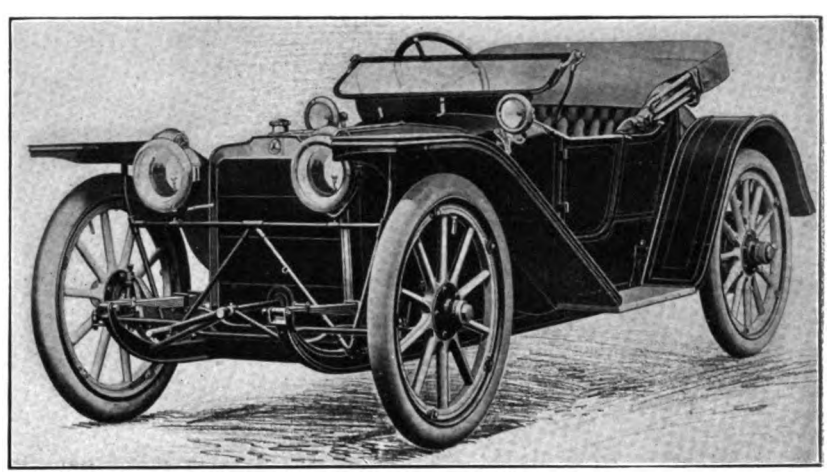
The pistons are cast of the same material as the cylinder block and are turned and carefully ground to size. They are channelled for three rings that are accurately fitted. The connecting rods are special steel drop forgings and the wristpins are of steel, hardened and ground. The camshafts are of a high grade steel with the cams integral with the shaft, hardened and accurately ground. These are carried in three bearings. All of the motor bearings are a special die-cast metal that has high efficiency and long life.

The valve ports are two inches diameter and .3125 clearance, making for complete scavenging of the cylinders and ample charges of fuel. The valves are specially designed to endure under all conditions of service. They have large springs and are operated by tappet rods that are hard-

Digitized by Google

ened and ground and are actuated in large guides that are retained in the cylinder block by yokes. The tappets are adjustable for wear and they contact with the cam surfaces, minimizing the noise. The camshafts are driven by wide faced gears that are housed by an oil and dust proof case at the front of the motor.

The motor is cooled by a circulation of water through the cylinder block driven by a centrifugal pump that is actuated by an outside shaft that is operated by a gear from the timing gear case. From a pulley on this shaft a six-bladed fan that is carried on an adjustable bracket on the forward end of the cylinder block is driven by a flat belt that may be always kept at proper tension. The water enters the block at the base of the exhaust valves and flows to the radiator through a large manifold that is retained to the top of the block by a series of studs. The radiator, of the honeycomb type, has a capacity of 2.5 gallons.



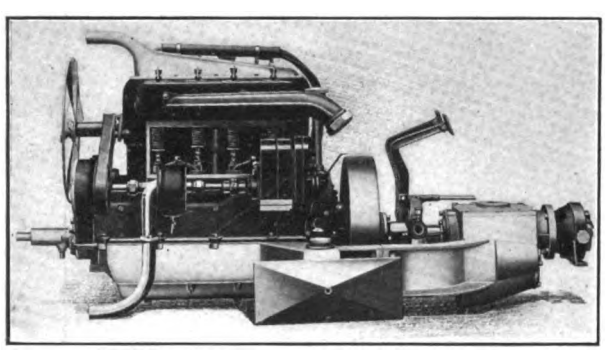
The lubrication is a splash system with the lubricant maintained at a constant level by a cam-actuated plunger pump that is operated at one-fifth camshaft speed. A series of troughs are cast in the sides of the crankcase, through which the oil is caused to flow from each compartment to the compartment ahead of it, and is drained from the front compartment to the rear container or reservoir, so that an equal volume of oil is in each. The sweep of the connecting rod big ends into the lubricant carries the oil over the crankshaft, camshaft, connecting rod and wristpin bearings, and to the cylinder and piston walls and valve tappets. The quantity of oil in the compartments is always perfectly maintained.

The ignition is by a dual system from an Eisemann magneto in combination with a storage battery, there being one set of spark plugs located directly above the intake valves. The wiring leads are short and are well protected from oil, water and dust, and the entire installation is extremely simple and accessible. The magneto is driven by an extension of the shaft that actuates the water pump. The motor is started by a Disco starter, the gas being supplied from a tank carried on the left running board.

The clutch is a cone type that is incorporated with the flywheel, the cone being faced with a high grade anti-friction material, under which springs are placed to insure easy engagement and to eliminate all jolts and harshness. The clutch design is such that the cone may be removed with decided ease.

The transmission gearset is a sliding selective type with three forward speeds and reverse. The shafts and gears are large diameter, cut from special analysis steel, and carefully hardened. The shafts are mounted on special imported annular ball bearings of large size. The gearset case is firmly bolted to the motor case and there is always perfect alignment, and at the same time perfect accessibility.

The transmission case at the rear supports a large socket that carries the globe or ball at the forward end of the torsion tube, this globe enclosing the universal joint at the forward end of the driving shaft. The socket is anchored to a frame cross member and this takes the thrust of the torsion tube in the drive. The coupling of the transmission and driving shafts is with a view of giving a straight line drive when the vehicle contains its complement of passengers. The torsion tube is bolted to the rear axle housing. The rear axle is a full floating type with the housing of the differential and axle shafts a one-piece drawn steel tubing. The bevel and differential gears are a special steel, of unusually large diameter and hardened and heat treated. The driving shafts are a high grade alloy steel which carry at the outer ends flanges that engage with the flanges of the wheel hubs and constitute the clutches. All thrust loads are taken by large adjustable ball bearings and all radial loads are carried on extra large imported annular bearings. The wheels are fitted with generous imported annular ball bearings.



The American Scout, 22.5 Horsepower, as Equipped for 1913.

The front axle is a special analysis steel drop forged I section, two inches deep and the steer-

Digitized by Google

ing knuckles are drop forgings of alloy steel that are held by large king pins. These knuckles are carefully heat treated to secure maximum strength. The wheel spindles are large and the wheels are mounted on large imported annular ball bearings, the hubs being designed with a view to excluding all abrasive matter from the bearings. The tiebar is forward of the axle, being protected by the form of the chassis. The steering linkage is unusually strong and sufficient.

The frame is a pressed channel section of high carbon steel of great tensile strength, the channel having a maximum width of 4.25 inches, the metal being .15625 inch thickness. The frame is stiffened by cross members and gusset plates. The frame is carried on semi-elliptic springs that are 30 inches length forward and 47 inches length at the rear, the frame being below the axles and securing the fullest resiliency of the suspension. The wheels are a wood artillery type, 10 spokes forward and 12 spokes rear, of second growth

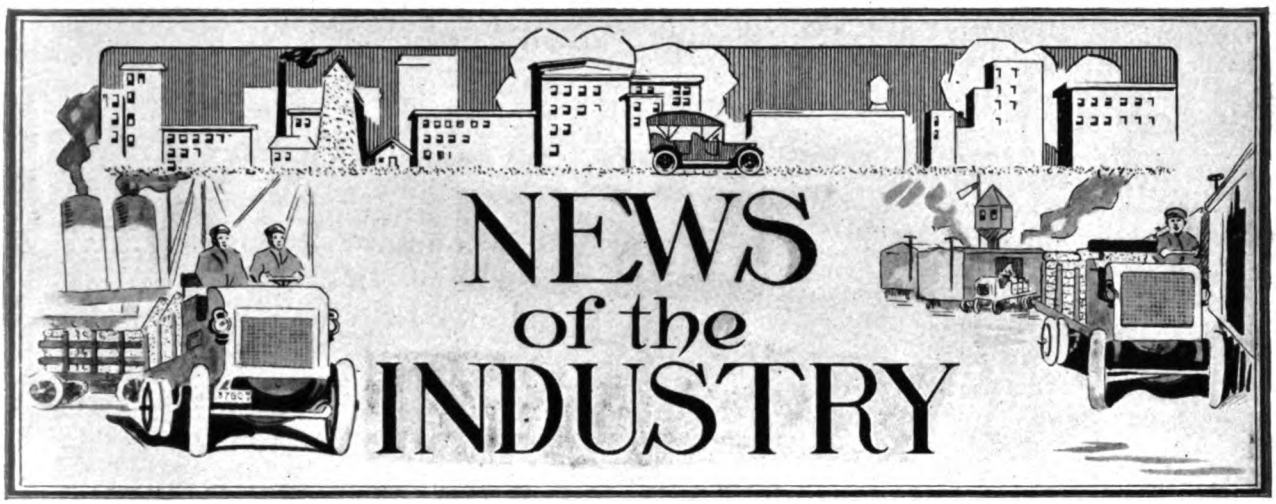
The Unit Power Plant of the American Scout, Exhaust Side.

hickory, and fitted with 36 by 3.5-inch tires. The wheelbase is 105 inches.

The steering gear is a worm and gear type that is irreversible and the steering column is with a decided rake. The connections are all exceedingly well proportioned and are very durable, with adjustments to compensate for wear. The spark and throttle levers are carried on a quadrant above the large hand wheel. The clutch and the service brake are controlled by the customary pedals and the emergency brake and the speed changes by the hand levers at the right side. The brakes are external expanding within drums on the rear wheels, the drum for the service brake being 14 inches diameter and the emergency brake 10 inches diameter. The brake drums have two inches face. The brake shoes are in halves and are retained by springs from contact with the drums. Between the shoes at one side are cams that rotate and expand the shoes when the brake is used, and between the shoes at the other side are similar cams that are used for adjusting the shoes, which may be set to afford any desired clearance or pressure.

The body is extremely well constructed, there being a white ash frame that is strongly reinforced with angle iron, and there are no stresses upon the sheet steel forming the body itself. All mouldings are swedged into the sheet steel before it is made into the body and as the metal is held by large wood screws, with the heads countersunk and soldered, nothing can work loose and mar the appearance of the finish of the car. The body is upholstered with high grade curled hair and machine buffed leather. The head lamps are supplied from a gas tank and the dash and tail lamps are lighted by current supplied from a large storage battery. Behind the seat is installed an oval tank that will contain 22 gallons of fuel, of which five gallons is a reserve. The gasoline is supplied to the motor by a pressure pump on the engine and this can be supplemented by a hand pump located on the foot board between the front seats. Back of the gasoline tank is a storage compartment, on which may be carried the spare tires.

The equipment of the car is high grade throughout and includes a fine mohair top, a top boot and curtains, windshield, speedometer, extra tire rim and the other accessories and conveniences stated.



HALL SECURES PROMOTION.

J. V. Hall, for five years a valued employee of the Olds Motor Works, Lansing, Mich., and for the last three years manager of the Chicago branch of the concern, was recently appointed general sales manager by General Manager O. C. Hutchinson. The promotion, according to Manager Hutchinson, was made on merit alone.

FORD PLANT IN CHICAGO.

The Ford Motor Company, pursuant to its policy of locating sub-factories in several of the large cities of the United States, has acquired several parcels of land for this purpose at Chicago. Four new tracts have been recorded for the company, the total space being 43,520 square feet. The total consideration named in the transfers is less than $11,000. It is understood that the Ford Company will not make complete cars at its sub-factories, but will construct parts only, which are to be shipped to the parent factory.

Digitized by Google

AGAIN INCREASES SPACE.

Maker of Paige-Detroit Cars Finds It Necessary to Secure Second New Factory Building.

It is announced in Detroit that the Paige-Detroit Motor Car Company has just closed a deal whereby it has acquired and will take over one of the United States Motor Company's plants located on Lieb and Larned streets, that city. This large factory will be devoted entirely to the manufacture of Paige motors, the motor department thereby being separated from the main plant, and leaving all the space in the latter for the other departments. The new motor plant is being equipped with the finest automatic machinery of the latest design and will have a capacity of 75 motors a day.

The latest addition by the Paige-Detroit concern has caused considerable talk in automobile circles, for it is the second time this company has increased its factory capacity this season. In March the demand for its product was so heavy that it was decided to double the factory capacity and for this purpose an entire building, located on the property adjoining the original Paige plant, was acquired.

CHANGE OF NAME.

Kelly-Racine Rubber Company Drops the First Portion After Two Years of Business.

The Kelly-Racine Rubber Company, Racine, Wis., has changed its firm name to the Racine Rubber Company. The concern has been organized for two years, during which time it has done an exceedingly good business in the manufacture of automobile and bicycle tires. The officers are: President, George B. Wilson; secretary and treasurer, Stuart Webster; general sales manager, H. L. McClaren.

The latter but recently joined the forces of the company. He has been in the rubber business for the past 12 years, starting with Morgan & Wright in 1900. He was with that company until the formation of the United States Tire Company, from which company he resigned as assistant to the central district manager in order to go to Racine.

SIMMS COMPANY PLANS.

Reorganizes with Additional Capital and Will Begin Production at Once.

The Simms Magneto Company, Bloomfield, N. J., has been reorganized with a capital stock of $1,750,000, of which $1,000,000 is represented by the old stock of the company, all common; the remaining $750,000 representing the new issue, of which $500,000 is preferred. The new preferred stock has been subscribed, and after the proceeds have been used in paying outstanding debts it is expected $350,000 will be left to take care of production, which will commence at once. The reorganized company will manufacture practically the same line as did the old Simms organization.

C. G. Stoddard, formerly connected with the Dayton Motor Car Company, and more recently with the Edwards Motor Car Company, has been elected president, F. R. Simms, who up to the reorganization was president, having resigned. Simms remains a director, and his associates are Edwards, A. A. Fisher, acting treasurer, who occupies a similar position with the Assets Realiza-

Digitized by Google

tion Company of New York City, which company is financing the project; Campbell Carrington and H. M. Kilborn, the latter vice president of the National City Bank.

WILL DOUBLE OUTPUT.

Maker of Cutting Automobiles Will Occupy New Factory Addition This Month.

The Clarke-Carter Automobile Company of Jackson, Mich., maker of the Cutting automobiles, has nearly completed the large and extensive four-story addition to its present plant. The completion of this new building, which will so greatly facilitate manufacturing for the season of 1913 that the company will be enabled to double its production, will be occupied, it is expected, some time this month.

At present the Clarke-Carter factory is so congested that the concern has been experiencing difficulty in keeping abreast of its orders. Consequently the addition to the plant was made necessary, and it is planned to supply all the 1913 cars that can possibly be sold by the company's able corps of salesmen.

NEW LOZIER MODEL.

Plans for Reorganization Completed with Election of Jewett as President.

Plans for the reorganization of the Lozier Motor Company of Detroit and Plattsburg, N. Y., which have been under way for several weeks, were completed at a recent meeting of the directorate in Detroit. H. A. Lozier, president of the company, resigned, and Harry M. Jewett of the Paige-Detroit Motor Car Company, also of Detroit, was named as his successor. Raymond B. Fosdick of New York was elected vice president and treasurer, and E. P. Earle and H. E. Kahler of New York were made members of the board of directors.

Coincident with the reorganization comes the announcement that the Lozier company will increase its capacity very materially and also add to its line of cars. Heretofore the Lozier has had nothing to offer except a 50 horsepower machine. It plans to have ready for delivery in about 10 weeks a model of less horsepower, but in every way up to the standard set by the Lozier company—the best for the money. The company will also add in the near future to its machine shops and the necessary financial backing for the increase in capacity and building have been made.

Harry M. Jewett is best known as one of the most successful coal operators in the country, although he has gained consideration since Jan. 1, 1911, as an important factor in the automobile industry, that date marking his connection with the Paige-Detroit concern. Raymond B. Fosdick, the new vice president, recently tendered his resignation as commissioner of accounts for New York City, to take effect Sept. 1. Mr. Earle is one of New York's best known business men, and Mr. Kahler is the junior member of the firm of O'Connor & Kahler, Wall street bankers.

The addition of Messrs. Jewett and Fosdick to the staff of the Lozier Motor Car Company does not mean a change in policy. On the contrary, it will continue along practically the same lines as in the past. Mr. Lozier will continue to take an active interest in the affairs of the concern. The balance of the organization, made up principally of Detroit men, will remain the same.

WILL STAY IN CLINTONVILLE.

Four Wheel Drive Concern Decides Not to Accept Offers from Other Cities.

After having received offers from several cities in the Middle West, the Four Wheel Drive Automobile Company, maker of the Four Wheel Drive car, has decided to remain in its present location, Clintonville, Wis. Among the offers made to the firm when removal from Clintonville was considered was one from a combination of business men in Appleton, Wis., who agreed to buy $100,000 worth of stock and provide shops.

Following its decision not to accept any outside offers, the company at once commenced plans for enlarging its factory at Clintonville and start its first regular issue of cars, including 11 commercial vehicles in 1.5 and three-ton capacities for the United States War Department. The directors have been given authority to place $25,000 of the treasury stock on the market for purchase. The capitalization of the concern is $250,000.

GROWTH IN OHIO.

Census Figures Show Remarkable Increase in Automobile Industry During Five Years.

The report of E. Dana Durand, director of the 13th census, shows a remarkable growth in the automobile industry in the state of Ohio. Ohio ranked second among the states of the Union in the manufacture of automobiles, including bodies and parts, both in 1909 and 1904. The total value

Digitized by Google

of the products in the former year was $38,838,754. This represents an increase of $32,480,590, or 510.9 per cent., in value of products in five years.

In 1909 the total number of automobiles manufactured in Ohio was 14,299, valued at $23,550,112. The number was 409.2 per cent. greater than in 1904 and the value 353.1 per cent. greater. In 1909 Ohio was first among the states in the number and value of both electric and steam machines, producing 42.9 per cent. and 72.1 per cent., respectively, of those manufactured in the country. As all the steam cars were made by one establishment, they are included under the item "Electric and Steam" to avoid the disclosure of the operations of an individual concern.

In the item for "All Other Products" which includes the manufacture of additional parts, supplies, and other items not separately called for, an enormous increase is shown—from $1,160,804 in 1904 to $15,288,642 in 1909.

The following table indicates the increase in the industry in the five years, and other points of interest:

	1904.		1909.	
	No.	Value.	No.	Value.
Buggies, runabouts and touring cars..	*2,808	$5,197,360	11,539	$18,356,985
Limousines and cabs	**	**	1,185	2,775,891
Service vehicles.....	**	**	904	1,788,186
Delivery wagons....	**	**	469	242,105
Trucks and all others	**	**	202	386,945
Other products, including bodies, parts and repair work		1,160,804		15,288,642
Totals	2,808	$6,358,164	14,299	$38,838,754
Gasoline cars.....	1,811	3,853,621	10,947	17,999,332
Electric and steam cars	997	1,343,739	3,352	5,550,780

*Includes "business vehicles" to avoid disclosure of individual operations.
**Not reported.

In another way the growth of the industry is shown as follows:

ADDS MERCEDES TRUCK.

General Vehicle Company Will Manufacture Gasoline Vehicles as Well as Electrics.

The General Vehicle Company of Long Island City, N. Y., has secured the American right to manufacture and sell the Mercedes gasoline truck, built in Europe by the Daimler Motoren Gesellschraft, and President P. D. Wagoner of the company says that after 12 years of deep study on the manufacture of commercial vehicles, he has concluded that the Mercedes is the best truck in the world for long haul work in America. President Wagoner, accompanied by his factory manager and engineer, made a three months' tour of Europe in an effort to find what they regarded as a suitable gasoline truck for manufacture in this country.

P. D. Wagoner, President, General Vehicle Company.

The General Vehicle Company has held strictly to the manufacture of electric trucks, these being especially adapted to city work and all short haul demands. For longer haul cross country work, the gasoline vehicle was admittedly superior and when demands for trucks for that kind of work were received the General Vehicle company cheerfully advised its customers of that fact. It was realized that the company should possess a complete commercial vehicle equipment for all lines of business and the acquirement of the American manufacturing and selling rights to the Mercedes fills this need.

Digitized by Google

A study of the American trucks convinced President Wagoner that they were built mostly for competition in the field of the electric vehicle and in his opinion were not well adapted to long cross country hauls. The Mercedes, he found, gave exceptional service in mountainous sections and rural districts and after some difficulty he succeeded in securing the right to import and sell the German commercial vehicles. The machines will be imported pending the completion of manufacturing arrangements. The American built Mercedes will be constructed from the original drawings of the Daimler Motoren Gesellschraft, which will also furnish materials, tools, jigs and fixtures.

NEW COMPANY FORMED.

Organization in New Orleans to Build Trucks and Conduct Service Station.

The Automobile Maintenance Company is a new enterprise just organized in New Orleans, La., with the support of a number of automobile owners. It is proposed to manufacture motor trucks and delivery wagons, and at the same time operate a maintenance plant, equipped to do every kind of work on all kinds of automobiles.

While the concern will begin in a modest way, the promoters expect to develop along lines that will eventually result in a real live industry. J. Raynaud is president; J. L. Blair, mechanical and consulting engineer, is vice president and Abner Powell is secretary and treasurer. Negotiations are pending for the erection of a building in Canal street to house the plant, and it is expected that operations will commence in a few months.

BUYS BUICK PLANT.

Imperial Automobile Company Is to Quadruple Its Present Output of Pleasure Cars.

The Imperial Automobile Company of Jackson, Mich., has closed a deal for the purchase of the Jackson plant of the Buick Motor Car Company, with headquarters in Flint, Mich., which gives the Imperial two splendidly equipped factories. The new plant will have an additional capacity of 8000 cars, bringing the total output to 10,000 or over. It will employ 800 men and afford eight acres of floor space.

The Imperial company has been making cars for the past five years, and Col. T. A. Campbell, general manager, and the organization behind him, have been known for almost a quarter of a century from coast to coast as makers of carriages of exceptional merit. The additional production of cars and the possibilities of this greatly increased plant place the Imperial firm among the really big manufacturers in the automobile business in this country.

FORMS FOREIGN ALLIANCE.

American and British Engineers Combine to Promote Accessory Business Abroad.

Joseph A. Steinmetz of Janney, Steinmetz & Co., Philadelphia, and a member of the Society of Automobile Engineers, has become associated with R. W. A. Brewer of London, England, in a consulting capacity with a view to an exchange of opinions relating to American inventions and devices that may be used to advantage in Europe. Mr. Brewer will in turn advise Mr. Steinmetz as to such foreign improvements and inventions as may be applied with success to the American automobile output. The arrangement should prove of decided value to manufacturers in the United States, particularly those engaged in the production of motor car accessories.

In addition Mr. Steinmetz has purchased the American rights under a series of United States patents for the manufacture of the famous Sharpe silencer or muffler for automobiles. This device is known all over Europe and won the first, second and third awards at the official Autocycle Club tests relating to gasoline engine mufflers. It is made in all sizes and for all capacities, and can be designed for any case requiring individual consideration. As marketed by Janney, Steinmetz & Co., it will be produced in seamless steel, rather than in cast aluminum or cast iron, thereby increasing its efficiency, it is maintained.

Mr. Brewer has ordered a complete sample line of the seamless gasoline tanks, made by the Philadelphia concern, and will recommend these goods to the European pleasure and commercial car trade.

NEEDS OF EXPORT TRADE.

Striving to Secure Better Representation of American Interests Abroad.

American manufacturers and exporters have long recognized the need of some additional facilities by which they could be placed in closer touch with foreign buyers, particularly those in South America, Africa, Asia, Australia and other parts of the world where the markets are open.

Digitized by Google

The lack of definite plan in this regard has impelled the Commercial Bureau Company of 50 Church street, New York City, to undertake the establishment of a foreign commercial bureau, which is sending to all American consulates card catalogue files, showing American manufacturers of all interests.

Branches have been located in South America, Africa, Asia and Australia, which points will act as distributing centres, and in which catalogues may be examined by buyers requesting them. It is estimated that this service will place the American manufacturer in direct touch with at least 10,000 purchasers from all parts of the world, each being an actual prospect, with a credit standing, and concerning whom information will be supplied.

MANUFACTURERS IN SESSION.

Midsummer Meeting of National Association Takes Up Several Important Matters.

The midsummer meeting of the National Association of Automobile Manufacturers was held at the summer home of the general manager, S. A. Miles, Christmas Cove, Me., July 30. This was a meeting of the executive committee, but arrangements were perfected for a convention of the entire association, to be held late in the fall or early winter. It is anticipated that a date some time in October will be selected, inasmuch as it will be at that time that drawings will be made for the shows in New York City and Chicago.

The Motor Car Manufacturing Company, Indianapolis, and the Warren Motor Car Company, Detroit, were admitted to membership, the former being represented by W. C. Teasdale and the latter by Lucius E. Wilson. H. F. Campbell of the Ideal Motor Car Company, Indianapolis, was selected to succeed E. G. Sourbier, Gleason Murphy to succeed J. F. Corl of the Rapid Motor Vehicle Company, Pontiac, Mich., and H. S. Stebbins to succeed A. M. Bentley of the Reliance Motor Truck Company, Owosso, Mich.

In considering the matter of the show circuit, St. Louis was eliminated, because the dealers in that city will hold an exhibition in October. Some discussion of the proposition to hold a midsummer truck show in 1913 was had, and the opinion of the members seemed to be about equally divided. The secretary of the commercial vehicle committee was instructed to secure the views of the motor truck manufacturers upon the subject.

Albert Pope, chairman of the traffic committee, reported progress in connection with freight rates, and also on insurance on commercial vehicles. He stated that fire underwriters were of the opinion that the risk was greater while the truck was on the road than while in the garage, and that the Automobile Underwriters' Conference is considering a reclassification of rates on these.

DEPARTMENT HEADS CHOSEN.

President Handley of Marion Motor Car Company Announces Factory Assistants.

President J. I. Handley of the Marion Motor Car Company of Indianapolis, Ind., announces the names of four men of particular prominence in the automobile world as the men who will constitute his executive staff in the reorganized Marion company. They are J. M. Edsall, M. B. Morgan, J. B. Myers and W. McKay White, all of whom are widely known in connection with their successes in the industry in recent years. For several weeks Mr. Handley has been arranging to secure men of most extensive experience to handle the big plans made for the production and distribution of the Marion cars. Already the factory has been occupied by the new interests and manufacturing on a large scale is thoroughly under way.

Mr. Edsall will be in charge of the finances and general accounting; Mr. Morgan will direct the designing and engineering; Mr. Myers is in charge of the factory production, and Mr. White of the advertising. All these men have been connected with the automobile industry in their respective departments for several years and each has an enviable record in the trade. During the next few weeks it is probable that one or two others will be added to the organization Mr. Handley is gathering about him and it is already known that the new men will be those of equally extensive experience and note in the motor car industry.

COLER MADE MANAGER.

To Have Charge of Advertising with Willys Group of Factories.

Ernest Coler, for a number of years connected in one way and another with the automobile industry, was recently appointed advertising manager of the John N. Willys group of motor car factories. He will supervise the work of the departments of the Garford Company at Elyria, O., the Gramm Truck Company, Lima, O., and

Digitized by Google

the Willys-Overland Company, Toledo, O. His headquarters will be established in the general executive offices of the Willys interests.

Identified with the automobile business for a number of years, the new head of the advertising department of this immense concern is an expert on technical matters. Previous to joining the Willys forces he was assistant general advertising manager of the United States Motor Company, going to the latter concern after being advertising manager for the Maxwell-Briscoe Motor Company.

NEW SALES ORGANIZATION.

Well Known Tire Men Combine to Handle Lee Company's Entire Product.

No combination of recent years in the automobile tire industry should prove of more interest than that just completed by Charles F. U. Kelly, formerly president and principal organizer of the Kelly-Racine Rubber Company, and Harry E. Field, formerly vice president and general sales manager of the Hartford Rubber Works Company. They have just closed a deal with the Lee Tire & Rubber Company, of Conshohocken, Penn., to market its entire production of tires, tubes and other automobile accessories.

This combination brings together in one selling organization, two of the strongest, best known and most popular salesmen known to the trade, men who have the confidence of motorists from the Atlantic to the Pacific. Mr. Kelly began his tire career in 1893, with the Hodgman Rubber Company, then manufacturing bicycle tires. Shortly afterwards he joined the forces of the B. F. Goodrich Company, with which company he was associated for several years. He has since been continuously in the rubber field. Mr. Field, also a pioneer in the rubber tire business, is president of the T. B. Jeffery Company of New York, where he will remain until the expiration of his contract, which was accepted after his resignation from the Hartford Rubber Works Company, at the time of the formation of the United States Tire Company.

ABBOTT COMPANY'S HEAD.

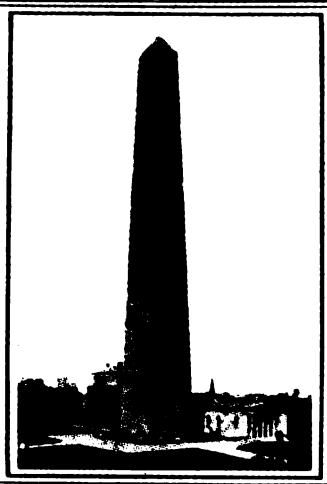
Senator Knapp Succeeds the Late President Jamieson in Directing Concern's Policy.

State Senator F. M. Knapp of Warren, Penn., was elected president of the Abbott Motor Company, Detroit, at a meeting of the directors of the company July 27. His election fills the vacancy caused by the recent death of President C. W. Jamieson. H. M. Preston, also of Warren, formerly second vice president of the company, was elected vice president to fill the place made vacant by Senator Knapp's promotion. F. B. Jackson, who several months ago was appointed manager of the Jamieson estate, was elected a member of the board of directors. No other changes were made in the board.

President Knapp is heavily interested in a number of large business enterprises in the East, but will arrange to pass a considerable portion of his time at Detroit. At the meeting of the directors the company's business was reviewed in detail and expressions of gratification at the progress made during the last year were voiced. General Manager M. J. Hammers stated that announcements concerning the 1913 models would appear immediately. The company has already contracted for the disposal of practically its entire output of 1913 cars, 3500 in number, and new connections with many of the most enterprising agencies in the country have been effected.

ADDITION TO MERCER PLANT.

New Structure to House Assembling, Finishing and Painting Departments.



Ground has just been broken in Trenton, N. J., by the Mercer Automobile Company, maker of the Mercer car, on which an additional factory building will be erected. The new structure, which will be 160 by 161 feet, was made necessary because of the growing business of the concern and the plans for an increased output in 1913.

The building will be of the saw-tooth type, and will house the assembling, finishing and painting departments, as well as the tin shop, riveting shop and storeroom. New machinery has been purchased and will be installed. Plans are also being drawn for a new office building.

OVERLAND INCREASES CAPITAL.

The increase in capital stock of the Willys-Overland Company, Toledo, O., from $6,000,000 to $15,000,000 has been formally approved by the secretary of state at Columbus. The Willys concern contemplates extensive improvements in the near future as a result of the increase. An addition to the present factory in Toledo is one of the principal improvements planned. The company, it is stated, is to produce several new models for the 1913 season.

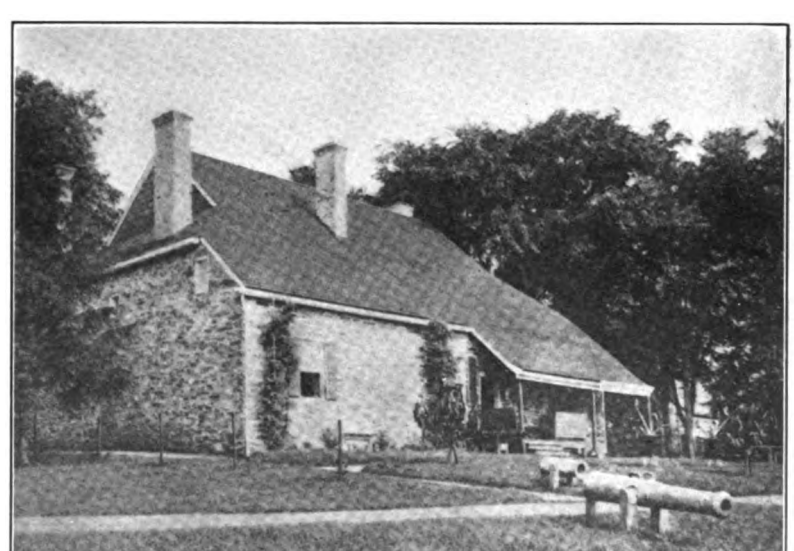
From Bunker Hill to the Gettysburg Battlefield



SINCE Americans have become imbued with the idea of "Seeing America First," many people have been surprised to learn how easy it is to combine the scenic beauties of the mountains and valleys with the historic memories of the past. New England is recognized as ideal touring ground, and New England and the East are replete with scenes which serve to recall the early history of this country. The itinerary outlined herein takes the tourist from Boston, the seat of Revolutionary activity, through territory in which many of the battles of that conflict were waged, to Gettysburg, Penn., one of the landmarks of the Civil War, and return by way of Philadelphia, New Jersey, New York City and the so-called shore line route. It is estimated that the distance may be covered easily in eight days, giving the motorist a pleasant week's vacation.

TOUR NO. 50.

Leaving Boston the first day, the way leads to Worcester, over splendid macadam. South Sudbury is near the scene of the contest between Indians and settlers in 1676, when 70 men marching to the relief of Marlboro were ambushed by the natives and 26 were slain. Here also is the site of the old tavern of Colonial days, the "Wayside Inn" of Longfellow's poems.

Worcester is the second city of the commonwealth, and here may be noted the old Exchange hotel, where Washington and Lafayette stopped for conference. Time might be spent with profit in the museum of the American Antiquarian Society, rich with Revolutionary and Indian relics, and handsome paintings of Cotton Mather and other noted Puritians.

At Brimfield, in the churchyard, is the grave of Gen. William Eaton, consul at Tunis, during the trouble between the United States and Tripoli. In 1805 he planned the restoration of Hamlet, the presumptive Basha of Tripoli, and marched from Cairo, Egypt, at the head of 400 Moslems and 100 Christians, making a brave attack on Derne. In the meantime, the United States concluded peace with the reigning Basha, and

Hasbrouck Mansion at Newburgh, N. Y., Where Washington Was Offered a Crown.

Digitized by Google

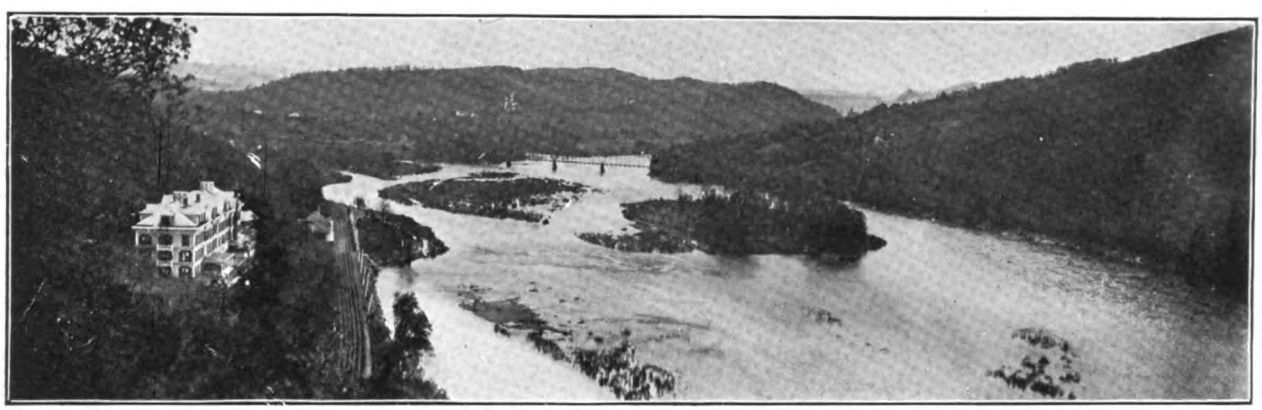
Gen. Eaton was forced to abandon his plans.

After visiting Stafford Springs, Conn., the beneficial effect of whose waters were known by the Indians years before the arrival of the white settlers; Rockville, a charming manufacturing city, surrounded by hills, woods and lakes, and East Hartford, the home of the Podunk Indians, whose chief, Totanimo, could bring 200 bowmen into the field, the first day's run ends at Hartford.

This is the "Queen City of New England," and was settled by the Dutch in 1633. However, in 1636, when Thomas Hooker led his band through the wilderness from Newton, the Dutch abandoned their two-gun fort and the English took possession of the settlement. The city possesses a number of handsome parks, and much of historic interest.

New Hartford is an example of the passing of the times. In the days before the railroad, this was a stopping place on the wagon route between Hartford and Albany. It was a town of decided importance on the way, and was actively engaged until within a few years in the manufacture of cotton and steel goods.

Winsted, at the head of the Naugatuck valley, is the centre of exceptional scenic beauty, particularly around Highland lake, which is skirted by a handsome boulevard. This natural charm extends to Norfolk and Canaan, over some of the highest land in the state, and in full view of the Berkshire hills to the north and the Litchfield hills to the south. Many caves of unknown resources are to be found in these hills, which overlook a number of pretty little lakes.



At Salisbury, the iron mines will attract deserved attention. Lakeville shelters an interesting summer colony of New Yorkers. More iron mines are passed on the way to Sharon, and the tour then enters New York State, through Dover Plains, Pawling and a number of other small towns to Newburgh, the night stop. The latter part of the day's run becomes a descent into the Hudson valley, and should prove very interesting and beautiful toward the close of the afternoon.

Just south of Newburgh is the old Hasbrouck mansion, an antique stone house which was Washington's headquarters in 1783, while the Continental Army was encamped here to watch the British at New York. It was during his stay at this house that the petition was circulated looking toward the establishment of a monarchy, with Washington as king. The noble Virginian spurned the offer in an earnest address before a council of his officers.

Splendid roads greet the tourist on the third day's run through the Suffern hills to Port Jervis, and then down the Delaware river to Milford, Dingman's Ferry and Bushkill to Delaware Water Gap. Some of the most delightful scenery in the East is to be found on this portion of the trip.

The fourth day's route leads past Kittatinny mountain to Nazareth, an old Moravian village, famous for Nazareth hall, built as a mansion by Count Zinzendorf in 1775 and afterward used as a Moravian school for boys. At Bethlehem is the old Moravian church, while a short distance away are the Bethlehem steel works and the handsome residence of Charles Schwab.

Beyond Allentown is Kutztown, famed for its crystal cave. Then comes Reading and Lancaster, the latter of which was the capital of Pennsylvania from 1799 to 1812, when it was transferred to Harrisburg. It was a famous stopping place for the old

Where the Delaware River Has Worn Its Way Through the Kittatinny Mountains at Delaware Water Gap.

Digitized by Google

Splendid Automobile Road in the Valley of the Delaware.

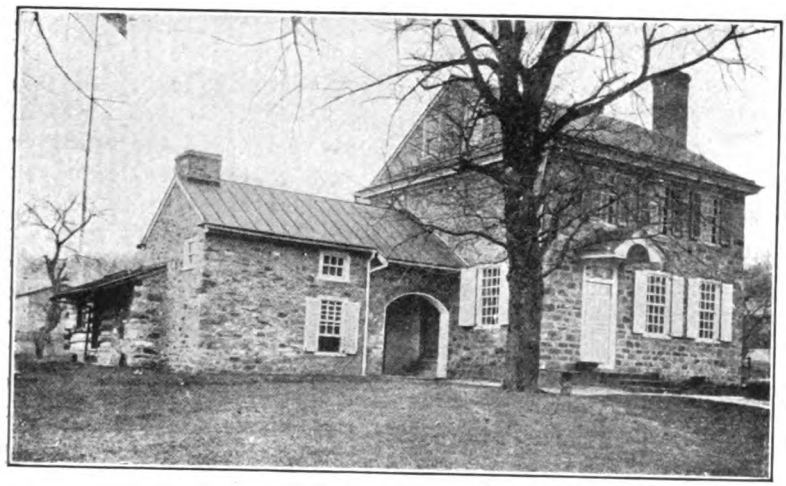
stage line which operated between Philadelphia and Pittsburg, but its present importance is due to the farm produce raised in its environs.

Gettysburg is known as the scene of the chief battle and crisis of the Civil War, July 1-3, 1863. This battleground lies a little to the south of the city and covers about 25 square miles. It is dotted with monuments which tell the story of the memorable conflict.

A portion of the fifth day's run is a reversal of that taken the previous day, visiting York, with its slate quarries and sulphur springs, to Lancaster. Thence the way leads to Philadelphia through Paoli, the birthplace of "Mad" Anthony Wayne and the scene of British success over the Americans, Sept. 20, 1777. Devon is a popular summer resort, and Bryn Mawr is the site of the famous girls' college by that name. Just before reaching Philadelphia, it is possible to make a short detour for the purpose of visiting Valley Forge.

Leaving Philadelphia the sixth day, the way leads first to Camden, N. J., thence to Burlington, where Howe defeated Washington in 1777, resulting in the British occupancy of Philadelphia. Near here the Pennsylvania state fleet of 27 gunboats bravely fought the British squadron as it attempted to ascend the Delaware.

Bordentown was selected by Joseph Bonaparte, a brother of Napoleon, who made him king of Naples, as a refuge after the disaster at Waterloo. He purchased an estate of 1400 acres just north of the city and lived there until 1832. Later the state purchased the estate and it is now known as Bonaparte park.



Beyond Trenton, the state capital, is Princeton, the site of Princeton University, founded in Elizabeth in 1746 and removed to this city in 1757. The battle of Princeton was one of the early and signal successes of Washington's campaign against the British. Nassau hall was utilized as a barracks for a time during the war, and later the Continental Congress held sessions there.

The rest of the journey across New Jersey is full of interest, and after the night stop in New York City, the way leads into Connecticut along the north shore of Long Island sound. Near Greenwich is an old cemetery where stood the church around which Gen. Israel Putnam and his band of 60 men fought off the British as long as possible, and then, since leaving by the highway

Along the Pennypack River in Southern Pennsylvania.

Digitized by Google

Washington's Headquarters During His Occupancy of Valley Forge.

would expose him to danger, he drove his horse down a flight of stone steps. Next day Gen. Putnam made a successful attack upon the enemy at Stamford.

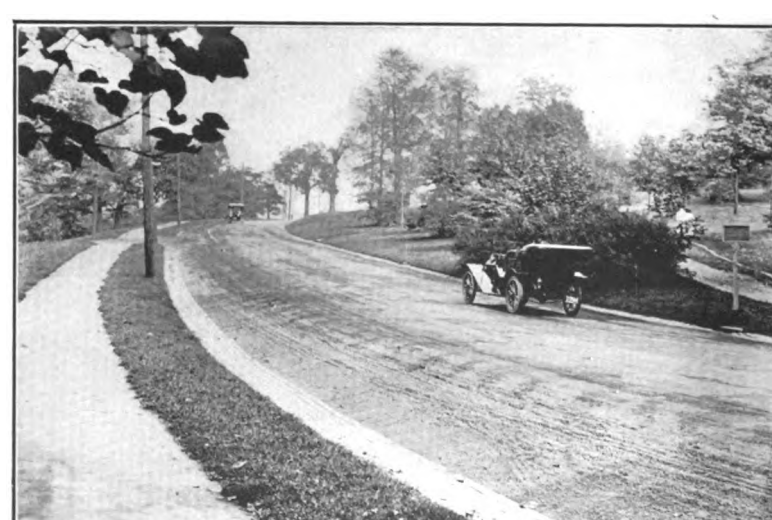
New Haven is best known as the seat of Yale University, but it ought also to be remembered that near this city is the old cave, in which the English regicides were hidden for a time, and at Guilford, the house in which they were sheltered is still standing. Saybrook was the town in which Yale college was chartered and there it remained for a number of years before removal to New Haven. Near this town, on Saybrook point, was an old fort which effectually estopped the Dutch vessels from entering the Connecticut river in order to reinforce Hartford in 1675.

New London, the last night's stop, was laid waste by Benedict Arnold Sept. 5, 1781, only a few houses remaining. One of these is still standing. During the Revolution, Connecticut's navy of 26 vessels made this harbor its chief port. Capt. Kidd is said to have buried much treasure on Gardner's island, which was recovered by the Earl of Bellamont, governor of Boston, in 1639.

The remainder of the distance into Boston is over the well known route through Narragansett Pier, Providence, North Attleboro, Wrentham and Dedham. All these towns and cities are rich in historic lore, and the scenery along Narragansett bay is unsurpassed by any throughout the entire tour. Road conditions are ideal.

TOUR NO. 50.

Boston, Mass. — Hartford, Conn. — Newburgh, N. Y.—Delaware Water Gap, Penn.—Gettysburg, Penn. —Philadelphia, Penn.—New York City—New London, Conn.—Boston.



Eight Days, 983.6 Miles.

First Day, Boston to Hartford, Conn., 125.7 Miles.

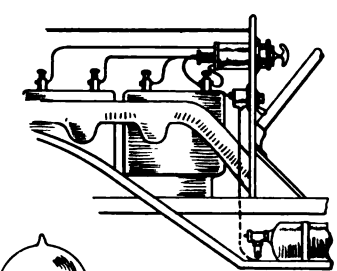
NEW AND NOVEL ACCESSORIES THAT APPEAL TO MOTORISTS

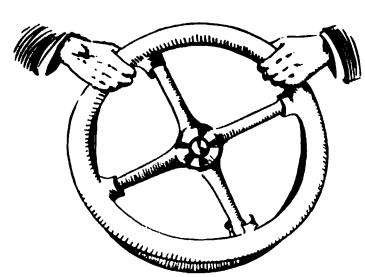


The Knight Non-Skid tire is manufactured by the Knight Tire & Rubber Company, Canton, O., and for it is claimed high grade material and workmanship. It is also stated that the thickness of the regular tread is such that the fabric is fully protected and that the anti-skid feature provides a shoe making for durability and long life. The traction is secured by two rows of elevations, these being in the shape of a letter K, and it is claimed by the maker that these with the depressions also prevent side slip. The casings are made in different types and sizes.

★

The Air-Gas Starter, produced and marketed by the Troy Auto Specialty Company, Troy, N. Y., is a self-starting device utilizing acetylene from a regulation tank, the gas being mixed with air and pumped to the cylinders by hand. The acetylene is led to a patent combination gas and air valve located on the dash, the device being equipped with a graduated dial and handle, by means of which the mixture may be controlled and the best results noted. To operate the starter, the valve lever is moved into its proper position and the handle of the pump drawn forward, after which it is depressed. The movement forces a mixture of acetylene and air to the cylinders through small tubing and the vapor is ignited by the usual spark. A feature of the system is the provision made for motors not equipped with priming cups. By the utilization of a specially constructed spark plug, the mixture is introduced through an aperture in the shell of the plug, and it is held by the maker that the car may be operated on acetylene alone by the proper adjustment of the gas and air valve. It is stated that the system may be installed easily, as it is free from complicated connections.

Knight Non-Skid Tires



Troy Air-Gas Starter

Cello Adapter

States Cigar Device

Steerease

★

The Cello Adapter will appeal to motorists who desire to install an electric lighting system, as with the device the oil lamps may be converted into electrical units and without interfering with the service of the former. The device is installed easily by cutting a small hole in the lamp and is secured by two lock nuts. It is also provided with a bronze covered cable attached to a brass socket. The Cello adapter is manufactured by A. S. Campbell, Boston.

★

The States Cigar Device, marketed by the States Manufacturing Company, 1035 West Adams street, Chicago, is a cylindrical aluminum holder in which the cigar is inserted and held. Its design is such that ashes and sparks are prevented from being blown into the faces of the other occupants of the car. It is provided with a lid for removing the ashes, and it is pointed out by the maker that a cigar will burn twice as long, as the member is protected from the wind.

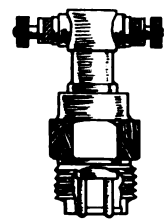
★

Steerease, as the name implies, is designed to eliminate vibration to the hands when operating a motor car. It comprises a soft, flexible, corrugated rubber covering which is split for attachment to the hand wheel. It is fitted and applied easily, being retained with cement, is made in different sizes, two colors, and is inexpensive. It is manufactured

Digitized by Google

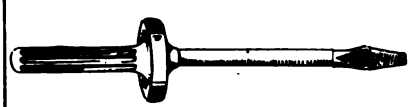
by the Goodyear Rubber Hose & Packing Company, 221 Chestnut street, Philadelphia.

★



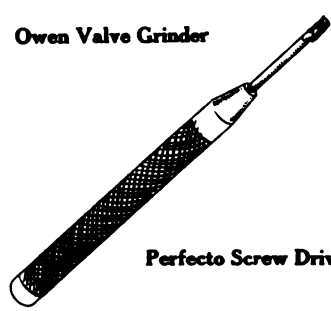
The Superior Double Spark Plug, marketed by the Superior Motor Specialty Company, 44 North Fourth street, Philadelphia, is provided with two electrodes and a like number of terminals, permitting the utilization of independent ignition circuits if desired. Two simultaneous sparks are obtained increasing the efficiency of the motor as well as making for economy in fuel. The plugs are made of high grade material and it is claimed by the maker that the points are self-cleaning. They may be employed in the same manner as a single plug if desired.

★

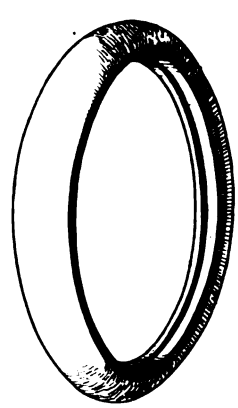


The Owen Valve Grinder is made by the Stewart Grinder Company, 171 Broadway, New York City, and is designed to take the place of the screw driver, or brace and bit. The weight of the tool is such that no downward pressure is necessary in grinding a valve, the device simply being rotated in the usual manner. The handle is corrugated and the grinder is nicely finished. Its price includes a supplementary spring for lifting the valve. The company also markets Gryndyn, a valve grinding compound which comes in screw top tin boxes and which is inexpensive.

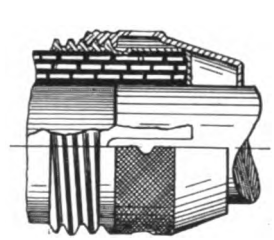
★



The Perfecto Screw Driver is produced by E. Edelmann & Co., 221 West Illinois street, Chicago, and being three inches in length is adaptable for making fine adjustments. The handle is knurled, providing a firm grip, and the blade is made of a high grade carbon steel, nickel plated. The device costs but a few cents and



Superior Double Plug



Owen Valve Grinder

Perfecto Screw Driver

Bourn-Goodyear Tire

Lavigne Hose Coupling

should prove a valuable addition to the tool equipment.

★

The Bourn-Goodyear Tires, manufactured by the Bourn Rubber Company, Providence, R. I., are extra high grade, guaranteed shoes of the wrapped tread type. They are vulcanized by an improved single cure process which, combined with high grade material and workmanship, make for a durable and efficient casing. Each tire is carefully inspected and guaranteed. They are produced in standard sizes and types, also interchangeable members for motorists desiring to fit a larger casing to a regular sized rim.

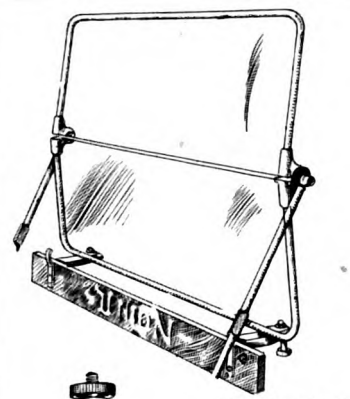
★

The Lavigne Hose Coupling, manufactured by the Lavigne Hose Coupling Company, Detroit, will appeal to motorists who undertake their own repairs and who have experienced difficulty in making water tight the connections between the radiator and cylinders or other components of the cooling system. The design of the device is such that it may be applied by the hands, the maker pointing out that tools are not necessary. It is slipped over the hose, which is compressed by screwing up the coupling. The latter is made in different sizes, of steel or brass and is inexpensive. The maker points out that in assembling manifold or nipple the coupling should be .03125 inch smaller than inside diameter of hose.

★

The Union Windshield, produced by the Union Auto Specialties Company, Brookville, Penn., is made in three models and is nicely finished. It is fitted with the Union patented automatic lock which provides

Digitized by Google

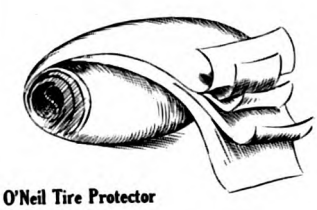


three different positions as well as security. By means of the lock the shield is easily and quickly adjusted by one hand and it is claimed by the maker that after the desired positions have been obtained the lock automatically engages and is held rigidly. Absence of rattling is also claimed for the shield which provides ventilating features.

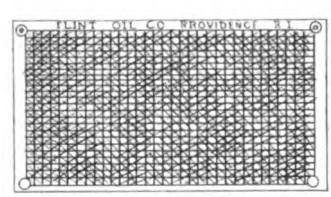
★

The Reflex Spark Plug, of the motorcycle type, is manufactured by the Reflex Ignition Company, Cleveland, O., and although designed for racing purposes is adapted for ordinary service as well. The electrodes are protected from oil or soot by a peculiar formation of the shell, which is globular in form and pierced by small holes. The insulation is a high grade mica although porcelain members are supplied upon special order. They are made in .5-inch standard, .87518 and metric threads, and each plug is covered by a liberal guarantee.

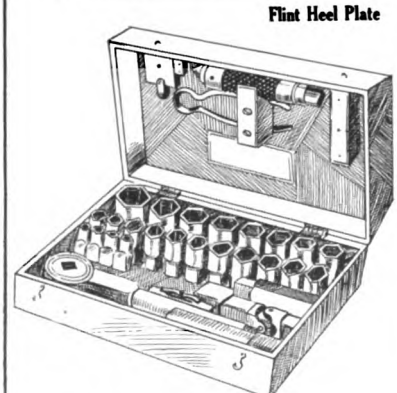
★



The O'Neil Tire Protector is marketed by the O'Neil Protector Sales Company, Cleveland, O., and is utilized to reinforce the casing irrespective of whether the member is old or new. It is composed of five distinct plies of fibre, thoroughly vulcanized and it is claimed by the maker that it protects the inner tube from punctures, as well as enables considerable service from an old casing. The protector is very flexible and is inserted easily, covering the entire inner surface of the shoe from bead to bead. It conforms to the shape of the tire, does not wrinkle or pinch the inner tube, and it is stated that it may be utilized indefinitely, as the protector is constructed of heavy material.



Union Windshield



Reflex Spark Plug

O'Neil Tire Protector

Flint Heel Plate

Starret Ratchet Wrench

Flint's Heel Plates are marketed by the Flint Oil Company, Providence, R. I., and comprise an aluminum member five by eight inches. They are designed for attachment by screws to the floor boards, preventing the deterioration of the rubber matting by constant contact of the heels. The device may also be utilized to cover worn places and being corrugated prevents slipping of the foot. They are inexpensive, readily installed, and being of aluminum are maintained easily in a serviceable condition.

★

The Starrett Ratchet Wrench, is a patented tool manufactured by the L. S. Starrett Company, Athol, Mass., well known maker of machinists' instruments. The outfit comes in a neat box and comprises a ratchet wrench with a reversible pawl, and an extension; a spark plug socket, universal joint, screw driver, drilling attachment holding standard square shank drills, .125 to .5 inch; holder or friction wrench for drilling attachment, drift pin and thrust plate for drilling attachment. The outfit also includes 28 hexagonal steel sockets, varying in size by thirty-seconds from .3125 to 1.25 inches. The parts are constructed of the very best material and nicely finished and are designed especially for motor car service.

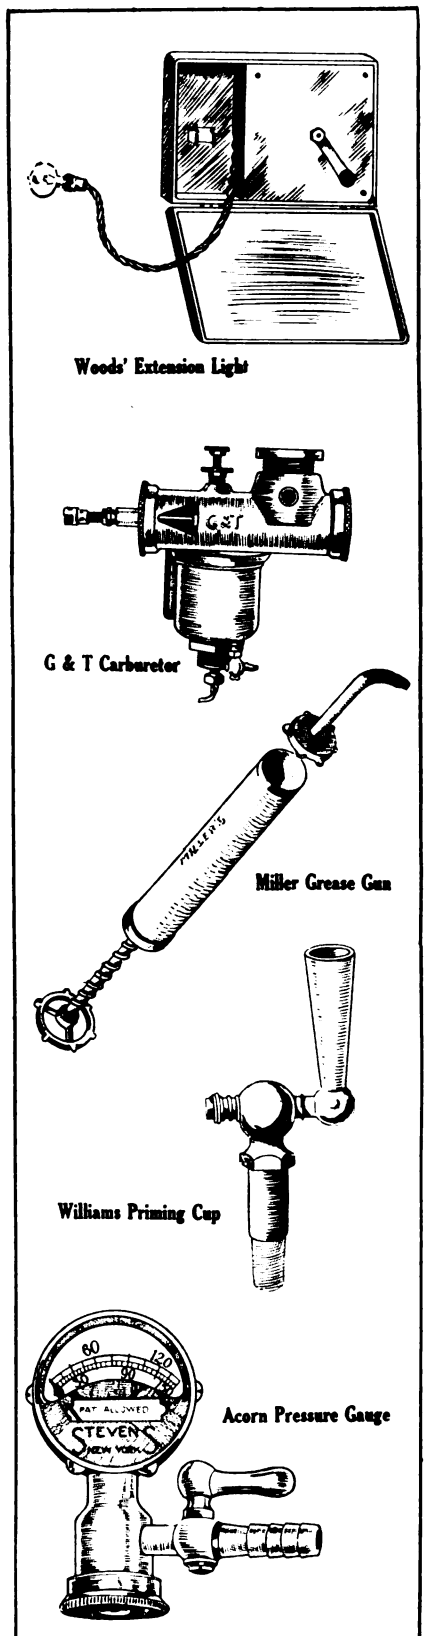
★

Woods' Extension Light varies from the usual inspection lamp in that the lamp itself is provided with a socket switch which is operated in the same manner as an ordinary electric lamp. The wires leading from the battery are always alive, an arrangement making for economy of time when the service of the light is desired. The en-

Digitized by Google

tire apparatus is carried in a neat case, 4.5 by seven inches, and the device is installed easily on the car by three small screws. It is pointed out by the maker that the box may be concealed from view and fitted as convenient. It may be connected to the usual ignition batteries if desired. It is produced by the Flint Extension Light Company, Flint, Mich.

—— ★ ——



The G & T Carburetor is marketed by the Gallagher-Tompkins Company, 1876 Broadway, New York City, and a feature of the device is that it has but one wearing part. It is also claimed that the specific gravity of the fuel does not affect its proper operation. It has but one adjustment, springs are not employed and it is stated that the mixture is so controlled mechanically that the proper amount of air and gasoline is admitted at all speeds. A double nozzle is utilized, one set and the other mechanical, and the air is regulated by double intakes of a similar construction.

—— ★ ——

The Miller Grease Gun, is manufactured by Miller & Starr, 250 Greene street, Brooklyn, N. Y. The plunger is actuated by a double spiral worm, and it is claimed by the maker that the device may be filled and emptied in 30 seconds, the operation involving eight turns of the wrist. The gun is fitted with a practical handle and it is stated that a stream of grease 30 inches long may be produced by one turn. The barrel is 17 gauge, made from heavy bronze and is said to be indestructible.

—— ★ ——

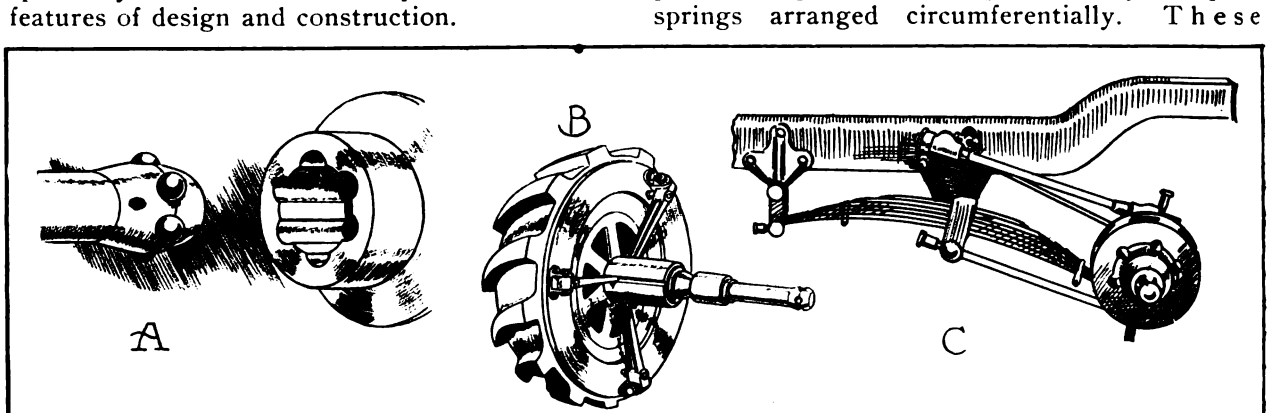
The Acorn Air Cock, produced by Stevens & Co., 375 Broadway, New York City, is designed for attachment to the end of the hose supplying pressure to a tire, and by utilizing the petcock attachment the supply may be regulated or shut off as desired. The gauge registers the pressure up to 150 pounds and is sturdily constructed of high grade material. The instrument is equipped with the patented Acorn device which eliminates screwing of a nipple to the valve stem.

—— ★ ——

The Williams Priming Cup, marketed by the D. T. Williams Valve Manufacturing Company, Cincinnati, O., presents novel features, inasmuch as the operating lever or handle is funnel shaped and when placed in its proper position its opening registers with that of the cup, permitting the flow of gasoline to the cylinder. Another advantage is that when the handle is turned down or closed, the entrance of dirt is prevented. The cup is equipped with a spring key which automatically adjusts itself to any wear. It is made in three styles, adapted to any type of motor.

Carbo-Sol is marketed by the Neustadt Auto & Supply Company, 3200 Locust street, St. Louis, Mo., and the maker guarantees that it will remove carbon from the cylinders without injury to the members. It is a fluid which is poured into the cylinders through the spark plug openings, and in addition to removing the carbon will displace rust, gummed oil, etc. It is also useful in the repair shop for loosening joints, bolts or nuts that have become frozen. Another use is for cleaning rubber goods coated with grease, one ounce of Carbo-Sol being utilized with an equal amount of water.

Digitized by Google



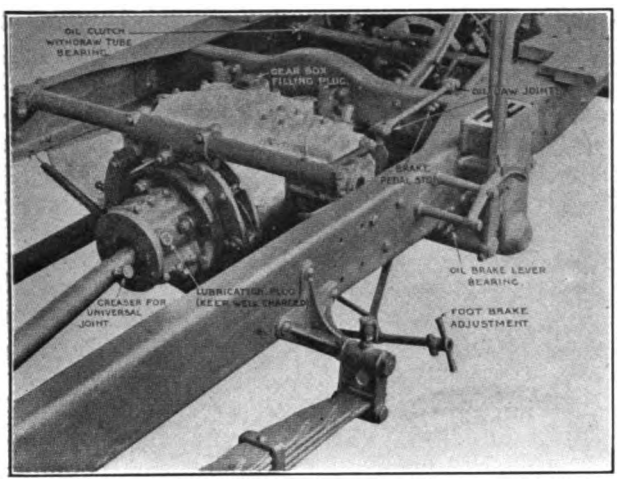
Luxurious motor carriages of moderate power, comfort being the keynote, is the description of the Siddeley-Deasy, Knight-engined models, furnished by the maker, the Deasy Motor Car Manufacturing Company, Ltd., Parkside, Coventry, England. In amplification of this statement it is maintained that motor car comfort consists of five qualities, coming under the headings of reliability, silence, insulation from road shocks, freedom from vibration and general convenience in handling. It follows therefore that in the construction of the vehicle these five points are considered as vital.

Concerning the engine, it is sufficient to state that it is of the Knight sleeve valve type. Three models are produced, these being the 14-20 horsepower four-cylinder, the 18-24 horsepower four-cylinder and the 24-30 horsepower six-cylinder, respectively. The bore and stroke of the two large motors are the same, 3.5 by 5.1 inches, while the smallest has bore of 3.1 inches and stroke of 5.1. This gives a rating under the Royal Automobile Club's formula, which is the same as that of the Society of Automobile Engineers in America, of 20.1, 30.2 and 15.9, respectively. All three motors present the same features of design and construction.

The cylinders are cast in pairs, each pair having a common inlet port and separate exhaust ports. The cylinder heads are detachable, their jackets being provided with external ducts, which connect them with the cylinder jackets. The eccentric shaft for actuating the sleeve valves is located at the right side of the engine, and immediately below the exhaust pipe is the horizontal shaft, which drives the Bosch dual, high-tension magneto at one end and the centrifugal water pump at the other.

The radiator is of the flat tube type, and is located in front of the dash, the bonnet being so arranged that it lifts from the front. Lubrication is by forced feed and splash and the lubricant is thoroughly filtered before being put into circulation again.

One of the special features is the clutch, which is completely enclosed within the flywheel. As will be seen by an accompanying sketch, the rim of the flywheel carries a disc with a dished aluminum centre, and spoked as indicated in the drawing. Supported in these two members are three sliding pins, the shoulders of which abut against a flat ring, which is in turn supported by the pins and is pressed into engagement by six spiral springs arranged circumferentially. These



Some Constructional Features of Siddeley-Deasy Cars: A, Universal Joint Arrangement; B, Patented Clutch; C, Rear Spring Suspension.

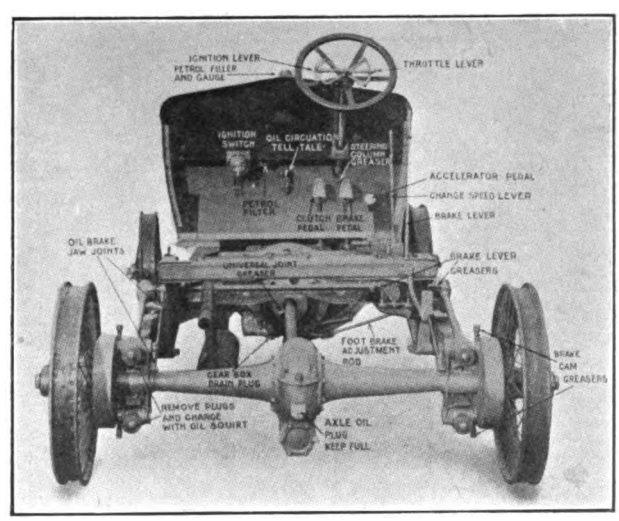
Digitized by Google

springs are carried in the web of the flywheel in brass thimbles.

Between the ring and the inner edge of the rim is interposed a disc carried in the aluminum centre, within which it is free to rotate. Mounted on the rim and ring are circles of asbestos fabric. The effect of the springs is to grip the centre of the plate between the fabric lined surfaces, and it is held that only comparatively light springs are necessary. A thrust ring carried concentrically with the clutchshaft and actuated by the clutch pedal operates three rocking levers pivoted to the rim of the flywheel. These levers carry thrust pins, which press against the outside ends of the pins and pressure upon the pedal therefore allows the clutch members to run free of one another. A small additional spring is introduced on the clutchshaft to allow the disc, when the pedal is depressed, to run clear of the rim surface.

Three-Quarter View of Siddeley-Deasy Chassis, Presenting Levers, Brake Adjusting Means and Other Components.

Another feature is the peculiar universal joint construction, which is brought out in one of the accompanying sketches. The transmission is of the selective sliding type, giving four speeds forward and reverse. Gear changes are made by a side lever working in a gate quadrant, and it will be noted that this is in a separate housing from that of the emergency brake lever member.



Final drive is by a worm gear of the Lanchester and Hindley type. The worm itself is placed below the wheel, this arrangement having been decided upon because of the possibility of giving it a plentiful supply of lubricant. Two sets of brakes are employed, that operated by pedal being on the propeller shaft and that by hand on the rear wheels. A particular feature of the brake assembly is the provision for adjustment, this being by means of a handle which extends slightly beyond the chassis side frame member. This handle actuates a screw which forms a link connecting the two halves of the brake and by which they are operated equally and simultaneously.

The spring suspension is also unique. Long semi-elliptic leaf springs are employed in front, but the rear suspension is constructed under Lanchester patents. It consists of an inverted semi-elliptic leaf spring at each side, in combination with a parallel link motion. The spring is fixed in a bracket, which is pivoted as shown in the sketch. Its front end is attached to a shackle on the side frame, while the rear end is housed in a slide attached to the ends of the rear axle.

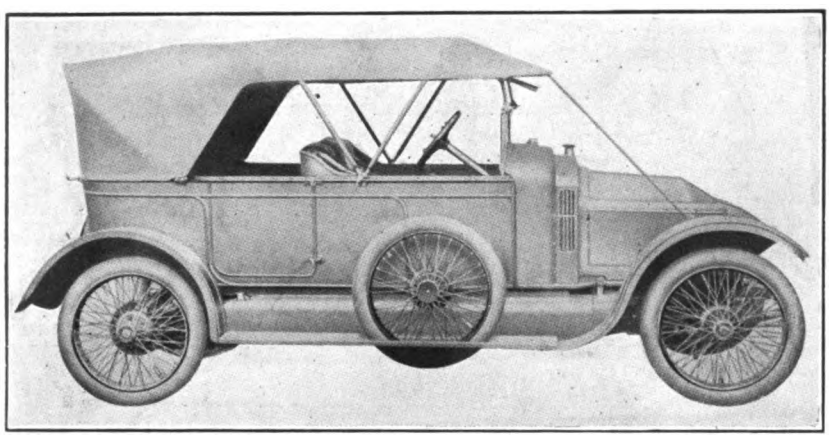
An accompanying illustration shows the 14-20 horsepower, special light weight torpedo model, and its neat and attractive appearance is such as to make a direct appeal to the discriminating motorist. It will be noted that wire wheels are fitted, and that provision is made for carrying one extra wheel. The equipment is complete in every way.

—— ★ ——

An American consular officer in a European country has forwarded a copy of a letter to the bureau of manufactures at Washington, D. C., from a business firm in his district, requesting certain information in regard to low priced American automobiles, and containing particulars regarding the cars which it wishes to handle and the conditions upon which it desires to obtain the agency. This firm is anxious to hear from

Rear View of Siddeley-Deasy Chassis, Showing Worm Driven Axle.

Digitized by Google



factories making large quantities of low priced cars, that will do much advertising, and with which business can be done for some years to come. Further information may be secured from the bureau, referring to file No. 9204.

—— ★ ——

A Mercedes car, driven by W. von Guttmann, was the winner of the Austrian Alpine contest, recently held, under the patronage of Austrian royalty. Opel cars drew second and third places. Eighty-four machines started, 23 finishing with perfect scores. The tourists experienced all sorts of difficulties in hard hill climbs and bad roads.

—— ★ ——

The total value of completed automobiles shipped from Belgium during the past year was $2,796,409, compared with $1,790,374 for 1910. The United Kingdom was the best customer in this line, taking twice as many as any other country. Other markets were Australia, New Zealand, Germany, Argentina and France. The total value of automobile parts imported last year was $470,106, against $555,328 for 1910, and the exports $1,607,164 and $1,537,933 for the two years, respectively. Of the 342 completed machines imported last year, as against 379 for 1910, 32 were received from the United States. These were valued at $19,903.

Siddeley-Deasy Torpedo Model, Fitted with Knight Engine of 14-20 Horsepower.

—— ★ ——

Where formerly over 200 automobiles were owned in Merida, the capital of Yucatan, at the end of 1908 only about 40 cars were in commission. According to the present tax records there are 103 private automobiles in the city, six of which are electric. The most popular types are the five-passenger touring car and the runabout. A chauffeur's license costs 75 cents, and an automobile license for any kind of a car costs $5 monthly. There are four garages in the city, but they do not carry a large supply of repair parts. Commercial vehicles have not been introduced. The decline in number of machines used is accounted for in the falling off in the price of sisal, the chief product of the district.

—— ★ ——

The annual Saltburn speed trials were run recently on the sands at Yorkshire, Eng., the attendance being larger and more enthusiasm being displayed than in any similar event ever held. An R-C-H car, made by the R-C-H Corporation, Detroit, was third in the second heat of the event for touring cars whose cubic capacity did not exceed 2836 cc. The final was won by a Crossley with a speed of 48.6 miles an hour. A Ford, made by the Ford Motor Company, Detroit, was the winner of the first heat and Fords were first and second in the second heat of the event for touring cars whose cubic capacity did not exceed 2950 cc. A Straker-Squire just succeeded in defeating George's Ford in the final, its speed being 50.4. In the event for cars the price of which, including tires, did not exceed £200 ($973.30), Fords were first and second in the first heat, and first and third in the second heat. The final was won by A. E. George's Ford at 52 mph. A Ford finished fourth in the second heat of the event for cars, the chassis price of which, including tires, did not exceed £350 ($1708.27). In the event for the associates of the R. A. C., in which the competitors had to run over a trial course and were handicapped on their performance, a Ford finished 15th and an Overland, made by the Willys-Overland Company, Toledo, O., was 19th. Each race was run over a measured kilometre (3280.8 feet).

—— ★ ——

An R-C-H car, made by the R-C-H Corporation, Detroit, and driven by the company's agent, recently made a remarkable trip in the Philippine Islands, going from Manila to Baguio and return, a distance of 250 miles in each direction. P. W. Tinan, a newspaper man, accompanied the R-C-H agent. In many places it was necessary to drive the machine across trackless rice fields, and time and time again it was necessary to cross streams where there were no bridges, either taking to the water where shallow, or floating the car across on a hastily con-

Digitized by Google

structed bamboo raft. The last 22 miles into Baguio was a continuous ascent, around a winding, twisting trail, where vehicles travel on block signal, similar to that used on some street car lines in this country, to avoid collision. The car was driven into Manila on the return in perfect running order and little the worse for the experience.

—— ★ ——

An accompanying illustration shows Czar Nicholas II of Russia inspecting the victorious fleet of White cars, made by the White Company, Cleveland, O., at the conclusion of the recent Russian army trials. The American squadron consisted of two five-passenger, 30 horsepower touring cars, two 30 horsepower field ambulances and a 1.5-ton truck, all of the White make. After covering some 1960 miles of rough roads, the machines were subjected to a rigid technical examination, and later were purchased outright by the Russian government. The White Company is particularly gratified at the outcome of the test, since its product showed up to much better advantage than that of many well known European manufacturers. In the picture, the Czar is standing just at the right of the telegraph pole in the centre. The third figure to the left of the pole is Gen. Suchomlinoff, minister of war. The officer standing at the Emperor's right is Gen. Dobrecshin, who was in command of the trials.

Czar Nicholas II Inspecting Fleet of White Cars After Completion of Recent Russian Army Trials.

President Robert P. Hooper of the American Automobile Association has appointed J. B. Richie, Studebaker dealer in Johannesburg, South Africa, special representative for the association in that country.

—— ★ ——

The Japanese imperial household department recently decided to use automobiles for the reception of all distinguished foreign visitors. The Emperor's sanction was secured for the erection of a garage in Tokyo, and the building is now in process of construction. It will cost approximately $25,000, and will be sufficiently large to house 15 cars.

—— ★ ——

During 1911 both the exports and imports of motor vehicles in Germany showed very material gains. There was unusual activity in the industry, many of the German plants being enlarged and others working over time to fill orders. To what extent the business increased can be seen from the following comparative figures for 1911 and 1910:

	1911.		1910.	
Imports.	No.	Value.	No.	Value.
Cars and chassis	1244	$2,342,634	1229	$2,263,856
Motorcycles	445	59,500	258	37,366
Commercial cars	134	390,082	67	193,018
Exports.				
Cars and chassis	5136	$10,057,642	3399	$6,930,560
Motorcycles	2489	395,794	1857	287,742
Commercial cars	345	973,658	225	627,368

MAGNETO IGNITION.

It is surprising to note the large number of motorists who are unfamiliar with the magneto and whose knowledge is limited to its lubrication and operation of the switch lever. Many owners who mastered the details of the battery and coil type of ignition have neglected to acquaint themselves with the magneto because of its reliability, and in the event of trouble with the wires or connections are at a loss to know how to proceed. Failure to set up snugly the terminals of the leads, or the careless handling of tools in making

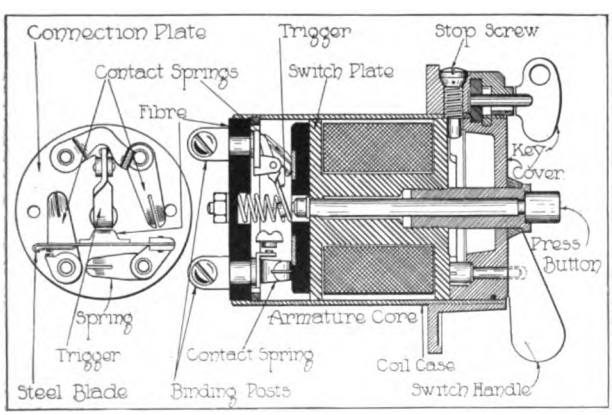

Fig. 1—Outlining Components of Coil and Switch of Bosch Duplex Ignition System.

repairs to the power plant, may be productive of future trouble, such as short circuits, etc.

It is the intention of the writer to present in non-technical manner the different ignition systems in vogue with modern motor cars, outlining the wiring plans and making suggestions for facilitating the work of locating and remedying troubles. In describing each system the components of the magneto will not be touched upon other than those which may be adjusted by the motorist and in accordance with the instructions of the maker. Few automobilists are capable of effecting repairs to the instrument itself, a task which should be left to the maker or the expert at the service station.

Bosch Duplex Ignition.

The Bosch duplex ignition system, manufactured by the Bosch Magneto Company, New York City, provides dual ignition, inasmuch as it affords two entirely distinct sources of current either of which may be utilized independently of the other, and in connection with but one set of spark plugs. The magneto differs from those of the independent type in that it is equipped with a commutator and the system requires a primary coil which is combined with the switch. The latter carries a press button which when operated with the lever at "battery" permits the motor to be started on the switch, provided, however, the cylinder is charged with gas and the motor has not stopped in such a position that the magneto contacts are closed. Under these conditions, the engine will have to be cranked, which may be done successfully at slow speed because the low-tension current of the battery is built up or strengthened.

At Fig. 1 is presented a sectional view of the coil and switch members, the former being a simple primary coil enclosed in a cylindrical housing equipped with a flange for attachment to the dash. The iron core carries a movable switch plate and both ends of the wire winding are connected to metal segments on the plate, which may be brought into contact with the contact springs on the connection plate. The iron core also serves as a support to the cover, which is fitted with a switch handle by which the cover and switch plate may be moved as a unit from one switch position to another. The binding posts are attached to the contacts of the connection plate and these are wired in accordance to the diagram presented at Fig. 2.

The press button extends through an opening in the centre of the core of the coil, being provided with a spring, and when the button is de-

Digitized by Google

pressed the other end of the rod comes in contact with a trigger, operating the make and break device. The latter comprises a steel blade, one end of which is secured to one end of the connection plate contact connected to binding post, "magneto" 1. The other end of the blade carries an auxiliary blade having a platinum point. The movement of the trigger causes the platinum point to come in contact with and then to separate from a second platinum point carried on the connection plate contact connected to binding post "magneto" 2.

When the switch lever is moved to "battery" position and the push button is depressed and released, the battery circuit is made and broken twice during each movement of the rod. Upon the motor starting, current to the plugs is supplied by both the battery and magneto until the lever is shifted to "magneto" when the battery is cut out. Failure to start upon the push button may be due to the cylinder not being charged with gas, etc., or because the motor has not stopped with the crankshaft in an approximately horizontal position when the magneto interrupter will be open. The interrupter and press button contacts are in parallel only when the above condition exists and pressing the button when the interrupter is closed will not break the circuit. It is also obvious that if the timing of the magneto has been changed in the overhaul, the interrupter is likely to be closed, preventing the utilization of the press button for starting on the spark.

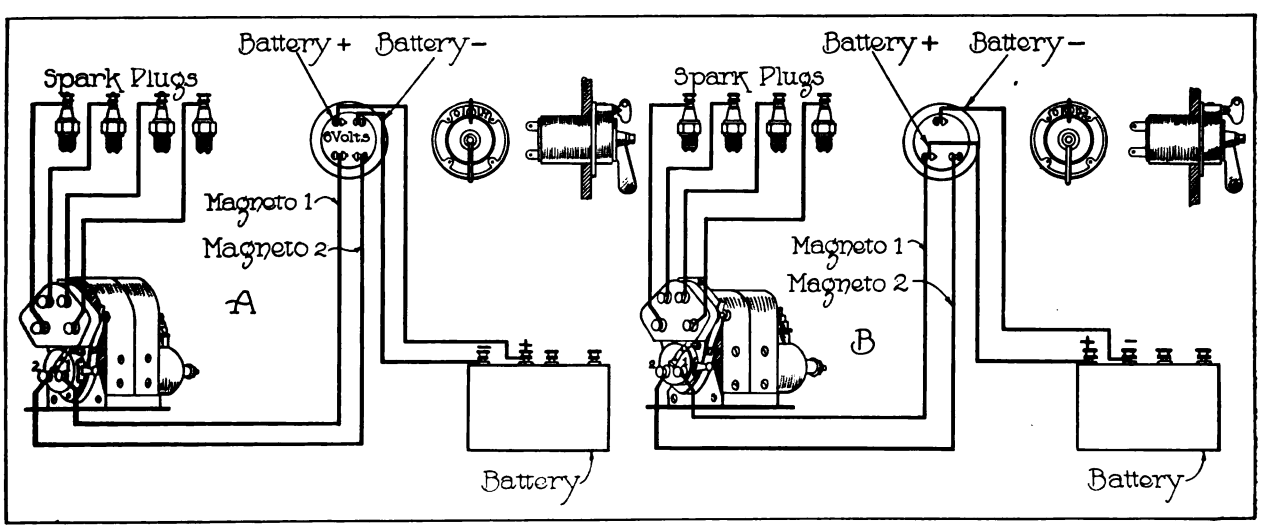

Fig. 2—Depicting Wiring of Bosch Duplex Ignition System: A, Showing Method When Coil Is Equipped with Four Terminals; B, How Wired When Three Terminals Are Employed.

Wiring Connection Important.

It is important that the wiring connections be made properly and at Fig. 2 are presented the wiring diagrams, that at A having four terminals and that at B three, both of which are utilized. It will be noted that the binding posts of the coil device are marked 1 and 2 as are those on the magneto. The leads from the battery are also clearly defined and in attaching these the polarity should be observed that is, the —, negative, should be connected to the negative of the connection plate and the +, positive, to the positive post. If the wires are attached in an opposite manner the flow of magneto and battery currents are opposite in direction and no sparks will be produced at the plugs.

When the motor starts upon pressing the button, but stops after it has made a few revolutions, it may be accepted that the battery is not properly connected. By reversing the connections, either at the battery or the coil, the trouble may be overcome. The reason for the action of the motor is that with the magneto inoperative, there is no opposition to the flow of the battery current, and it acts upon the armature winding in a normal manner. With the starting of the motor, however, the flow of magneto current is opposite in direction to the flow of the battery current.

It is vitally important that the battery system be not grounded and in the event of failure of the motor to start upon the battery, and the latter shows proper strength, the wiring should be examined for chafed places. If dry cells are installed they should be separated and be kept dry as moisture is a conductor of electricity. The maker points out that the coil rarely gives trouble if properly wired and that the magneto will require no attention other than lubrication. Disassembling either should not be attempted, but left to the expert or the maker.

TIRE EFFICIENCY.

There is decided variation in tire efficiency. Given two cars of the same model and equipped with the same size and make of shoes, one owner will obtain 5000 miles service while the other driver will secure less than the guaranteed mileage.

Although the roads travelled enter into the problem, the care given the casings is the important factor and unsatisfactory service is due to inattention. Many owners who have sought adjustment for apparently faulty shoes are surprised to note that the tire expert can read the history of the casing through an examination of the member and that its destruction was due to neglect.

The secret of efficiency is living up to the letter of the instructions of the maker, these including maintaining the proper pressure, repairing cuts in

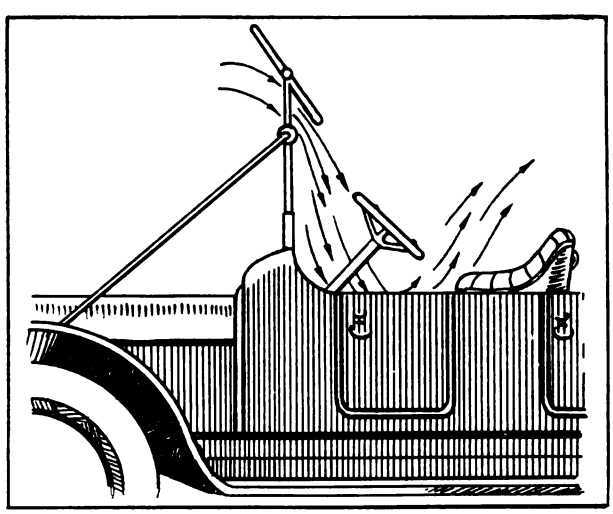

Fig. 3—Suggestion for Ventilating Fore Door Bodies by Means of Windshield.

the tread, etc. It should be borne in mind that preservation of the fabric is important and that when moisture is allowed to reach it through cuts, its deterioration is only a matter of time. The shoe should be vulcanized or the cuts treated with a preparation for this purpose and there are several of these on the market which are practical if applied properly.

Tires should be removed from the rims occasionally, the tubes taken out and the interior of the casings inspected for breaks or weak places in the walls. Shoes should be run in alternate directions from time to time and the demountable rim makes this an easy matter. Changing the rear shoes to the front wheels also makes for efficiency. By making periodical examinations of the tires, which takes but a few seconds, not only is considerable trouble and inconvenience saved, but the life of the tires is greatly prolonged.

VENTILATING FORE DOOR BODIES.

Although makers of fore door bodies incorporate devices for ventilation during warm weather, some cars are not thus equipped. At Fig. 3 is presented a suggestion of an owner for ventilating the forward part of the body. As will be noted, the upper section of the windshield is swung backward and the air striking it is deflected downward and out as indicated by the arrows. The motorist states that the amount of air may be regulated by the opening, and that he has found the hint of value during warm weather.

SPARK PLUG SUGGESTION.

A motorist who experienced considerable trouble with the plug of the No. 1 cylinder becoming sooted and covered with oil, this being due to the fact that the points of the plug set too deeply in the cylinder, adopted the kink outlined at Fig. 4 B. A .5-inch standard spark plug bushing was purchased and screwed into the valve cap, and a metric plug fitted, one having a short thread. This raised the plug as will be noted at A, which also depicts the bushing and plug assembled. The automobilist states that the scheme eliminated the trouble and that the bushing prevented oil from being thrown onto the gap of the plug. As far as he could ascertain, the operation of the motor was not affected by the pocket formed by the bushing.

ADJUSTING FORD BRAKES.

Although the construction of the emergency brakes of the model T Ford is such that they do not require adjustment only after continuous service, the proper setting of these members is important as, should the operating rods be made too short, the brake will bind, causing heating and a loss of power.

The rods are fitted with an adjustable turnbuckle at the forward part of the car, while the other member is integral with the rod. To adjust the emergency lever is moved to an extreme forward position which will facilitate the removal of the pins.

The turnbuckle is then rotated an even number of turns, this depending upon conditions. It is advisable to try two or four half-turns, replace the pin and throw on the brake to note if the

Digitized by Google

shoes hold properly. It is important that the brakes of both wheels hold as nearly equal as possible and this may be determined by jacking up both wheels and setting the brake lever a notch at the time, testing each wheel.

If the machine has seen considerable service it may be possible that the turnbuckle is frozen and care should be exercised in screwing up the member else the rod is likely to become broken. The threads should be cleaned and kerosene applied and if the turnbuckle does not yield to ordinary pressure, heat will have to be employed. In replacing these members rust will be prevented by smearing the threads with graphite and oil and the same preparation should be used on the retaining pins. It is also important that the turnbuckles line up else friction will be set up and the operation of the brake rods affected. After adjusting the brakes and with the lever in neutral, the wheels should turn easily. It is an excellent plan to examine the brake drums after a short run to note if the members are unduly warm. If so, and the brakes bind, they should be readjusted.

CARE OF SPRING SHACKLE BOLTS.

The motorist who neglects to comply with the instructions of the maker relative to lubrication, invites trouble upon the road to say nothing of paving the way for a large repair bill in the future. It is surprising to note the large number of owners, who although particular as to the filling of the oiling system, transmission and differential, neglect to lubricate other components, such as steering knuckle, tie and reach rod connections, control shaft, brake shaft, spring pads, spring shackle bolts, etc. All these require attention and the careless driver slights the members, being content with an occasional turning of a grease cup and only when he happens to think of it.

There is a growing tendency among makers to fit grease cups to all parts subject to friction and if the owner gives these proper attention, wear is reduced to a minimum and economy is effected. Many old cars are not equipped with grease cups, requiring the application of lubricant by the oil can, and invariably considerable dirt is carried to the bearing in the process.

An example of neglect to lubricate properly the spring shackle bolt was noted by the writer recently and although the car had not been in service for any great length of time, the bolts were worn badly as will be noted by the drawing at Fig. 4 C. The members were not provided with grease cups and had become badly rusted, so much so that oil was prevented from reaching the bearing surfaces by the deposits. New bolts were fitted and these were made to take grease cups. The members were drilled as denoted by the dotted lines and a slot was cut on the face of the bolts for a grease way.

In connection with spring shackle bolts fitted with grease cups, it may be mentioned that if the cup is not given a turn or two in accordance with the instructions of the maker, the grease ways are likely to become clogged. It is the attention to the small details of the motor car that reduces the cost of maintenance to a minimum.

ROADS ORGANIZATION FORMED.

Delegates from all the principal cities and towns in Connecticut gathered recently in New Haven to discuss plans for building and maintaining roads throughout the state, with the result that a permanent state organization was formed looking toward a solution of the paving problem. It was the consensus of opinion that it is desirable that the cities and towns co-operate in the care and construction of the streets, as it was the impression that better results could be gained by so doing. The following officers were elected: President, W. Scott Eames, New Haven; secretary, C. J. Bennett, Hartford; executive committee, James H. Macdonald, state highway commissioner; Messrs. Bennett, Mitchell and Ford. A. H. Terry, Bridgeport; City Engineer Ford of New Haven and City Engineer Mitchell of Willimantic were appointed a committee on organization to prepare bylaws, etc.

PREVENTION OF THEFT.

Until very recently the offense which provoked the quickest action and the severest penalty, notably in the West, was that of horse stealing. Today, in many of the states, the theft of an automobile is still treated as a misdemeanor, and usually the offender escapes with a light fine or brief confinement in a penal institution.

It is almost impossible for the horse thief to so change the appearance of the animal that it cannot be identified instantly by the rightful owner. On the other hand, it is a decidedly easy matter to completely renovate the automobile in a short time, so that its identification becomes exceedingly difficult. Moreover the comparison of the investment involved leaves no room for doubt as to which offense should be considered the more serious.

Since the judicial protection afforded the automobile owner in this respect is not at all commensurate with the nature of the offense, it becomes necessary for the motorist to consider means for protecting his property. Until such time as it is possible to convince state legisators of the desirability of stringent laws covering this matter, and the courts that such laws should be rigorously enforced, some means must be provided for safeguarding the valuable equipment. In any event, the problem becomes one of applying the adage concerning the locking of the door before the horse is stolen, to the newer conditions.

THE PRICE OF SHOES.

It has been deemed advisable by the manufacturers of shoes to cause a general advance of 20 per cent. in the retail price. Finished leather is utilized to some extent in upholstering the seats of pleasure and commercial automobiles. Therefore, the increasing demand for motor cars is responsible for the additional cost of shoes. Verily, the law of cause and effect is most remarkable at times.

Carriages and wagons have been on the market for a number of years. Finished leather is sometimes used in upholstering the seats of these vehicles. It may seem strange at first thought that such employment of leather was never considered an adequate reason for advancing the price of shoes.

Incidentally, the price of cotton cloth has increased 20 per cent. very recently. Cotton is sometimes used in automobile tops. Undoubtedly the increasing demand for motor cars also has its effect upon the retail price of cotton cloth, although no such claim has been made.

It might be argued that the more general use of automobiles, at least for commercial purposes, has the effect of reducing the cost of transportation. This might have some direct bearing upon the ultimate retail price of necessities, were it not considered more advisable to assign reasons for advances which can have no possible basis in fact.

COURTESY ON THE ROAD.

While, of course, there is no reason for countenancing any attempt at racing motor cars on the public highways under semi-touring conditions, there are times when it is absolutely neces-

Digitized by Google

sary that cars be permitted to pass other machines on the road. This applies particularly to physicians, etc. In any event, it is a matter of common courtesy to grant the request implied by sounding the warning signal.

Sometimes, it so happens that operators of low powered cars hesitate to draw to one side, thereby permitting a higher powered machine to pass. There should be no reason for such action, since it will be admitted that the larger car will soon be sufficiently far ahead so that the resulting dust will be no offense to the occupants of the smaller machine, while on the contrary, the little car can be a source of much annoyance to others in this respect.

In the interests of all concerned there is every reason why a car proceeding in the centre of the travelled way should turn out when requested by a machine in the rear. This is an application of the golden rule, the infringement of which on the part of horse drawn wagons and other slowly moving vehicles causes condemnation on the part of those who are most often guilty when the situation is reversed.

GOOD ROADS CO-OPERATION.

A significant sign of the times lies in the organization of good roads associations, in which the motorists are found as moving spirits, but in which all classes of road users meet on common ground. Interest in the proposition has been created, and it is now coming to be accepted that methods must be devised for the construction of permanent ways, which shall result in an economical expenditure of highway appropriations.

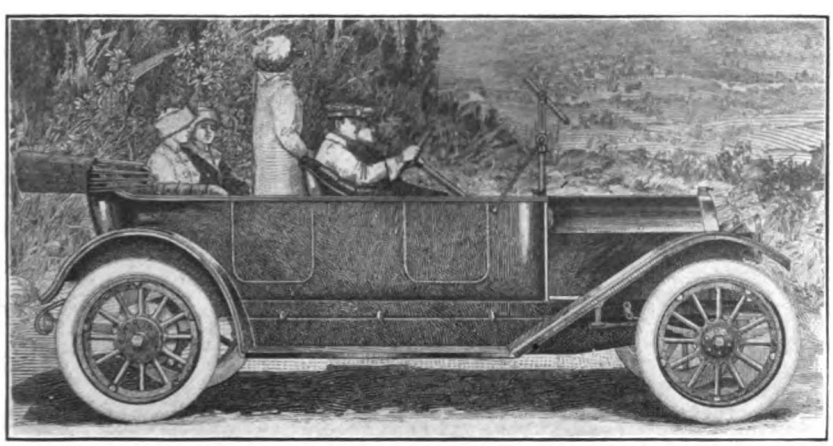
It has been pointed out in these columns that there has been a lack of systematic endeavor to connect cities with the improved through state highways. Many motorists have become convinced that the reason for this lies in the failure of state and city authorities to co-operate in this matter.

Connecticut appears to have taken the lead in offering a solution of the problem. An association has been formed there for the express purpose of interesting city highway departments in co-operating with the state highway commission, to the end that through routes shall become such in every sense of the word. It is a matter of no small moment that the state highway commissioner has identified himself with the movement by accepting office in the new association, working in conjunction with motorists who have been somewhat inclined to criticise his methods in the past.

THE MATTER OF EQUIPMENT.

Those who have studied the 1913 announcements of motor car manufacturers cannot help but recognize the fact that more and more attention is being paid to the matter of accessories and fittings. The design and construction of the modern automobile have reached a point where they may be regarded as standard. Long experimentation has developed a machine that is thoroughly dependable in every respect.

The demand for comfort and convenience has resulted in producing a car that comes to the purchaser well supplied with the features which make for these results. The situation indicates that the motoring public has been paying decided attention to these details. In this respect, at least, the manufacturer of accessories and fittings has quite as much at stake as the maker of the car.



While there has been no diminution of desire on the part of owners and drivers for complete information regarding the components of the machine itself, there has on the other hand been a decided increase in the study of parts and appliances. The allied industries do well to take note of this situation and exert themselves in supplying the required information.

This has been an equipment year, as evidenced by the interest manifested in electric lighting systems, self-starters, demountable rims, and practically every fitting, at all the big shows of last winter. Unless all signs fail, 1913 will be even more marked in this respect. In the last analysis the accessory manufacturer must make his appeal to the buyer, and there is every reason why the purchaser should be made aware of the merits of the production.

Digitized by Google

SINGLE CHASSIS FOR GREAT WESTERN.

THE Great Western cars, built by the Great Western Automobile Company, Peru, Ind., will for the season of 1913 be a series of differing body equipment installed on a single chassis. The bodies regularly provided as stock include a two-passenger roadster, a four-passenger touring, a five-passenger touring and a four-passenger sedan, the last specified being an enclosed type that is adapted for all the year round work, and is unusually desirable as a town car. The chassis has been materially refined and perfected and the bodies have been much improved. Emphasis is made of the excellence of the finish and the high class of the upholstery, and it is claimed for these machines that they have unusually attractive appearance, and have every quality of power, endurance, comfort and equipment to be found in a machine of moderate price.

The Great Western Five-Passenger Touring Car for 1913, Rated at 40 Horsepower.

The Great Western car is the development of eight years of automobile building and 11 years' experience with gas engine construction prior to engaging in the industry, and the policy has been to concentrate the endeavors of the company on a single machine and perfect this in every detail. The design and proportions are what are believed to be the best adapted for all classes of service, there being ample power without excessive cost of operation and simplification of construction with a view of economies in upkeep and maintenance.

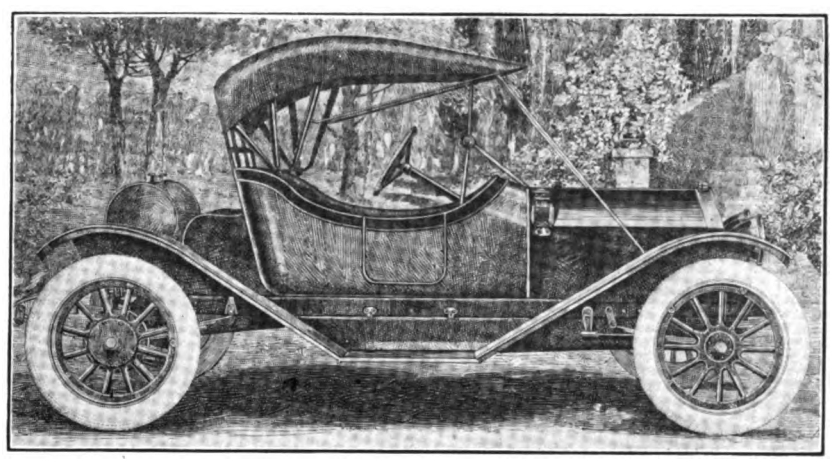
In the latest production the unit power plant has been adopted, this being of a type in which the engine and the gearset case are united by a sturdy frame which carries the clutch, instead of the assembly being of three distinct units carried on a sub-frame. This is in keeping with the advance in gas engine practise and is a design that has been largely approved by the best of motor vehicle engineers. The power of the engine has been somewhat increased by lengthening the stroke, and it is conservatively rated at 40 horsepower, although by the S. A. E. formula it is given a rating of 28.9.

The motor is now an L head type and is distinctive in that it has the cylinders cast singly, each unit having webs at the right side, which form pockets below the valves, so that by the use of small cover plates the entire valve mechanism may be enclosed and protected. The cylinders are constructed from a fine quality of gray iron with the water jackets integral, with bore of 4.25 and stroke of 5.5 inches, this giving a bore to stroke ratio of one to 1.2941. The cylinders are cast with wide base flanges to insure stability and strength. The units are bored, reamed, aged and then ground to the top of the combustion chamber to minimize the accumulation of carbon deposits. The machining is very accurate and the limit of the work is 1-2000 of an inch. The water jackets are extremely large, to insure free flow of water and to give the greatest cooling influence at the heads of the cylinders. The cylinders are offset, it being maintained that this construction minimizes the side thrust of the piston and the wear upon the cylinder walls.

The pistons are unusually long and are constructed with convex heads, this giving maximum strength with extreme lightness and reduces the probability of carbonization. The pistons are channelled for four eccentric rings that are ground on the peripheries and the edges to an accurate fit, and with six oil rings that collect the lubricant and distribute it evenly throughout the movement of the pistons. One of these rings is drilled with holes to afford drainage through the piston walls, this preventing an excess accumulation of oil and averting all possibility of creating smoke while the motor is operated.

The crankcase is an aluminum casting with bridge construction to afford strength and lightness, there being three transverse webs besides

Digitized by Google



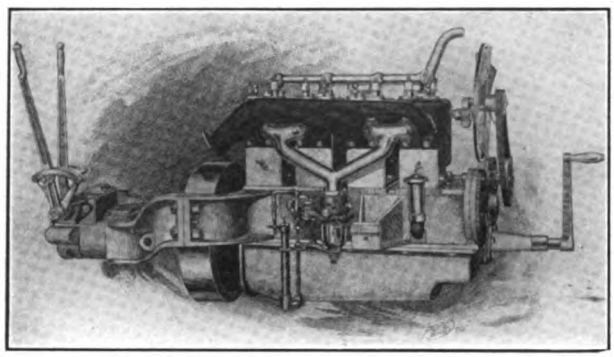
the end webs, all of these carrying the main engine bearings. The bearings are five in number with a total length of 15.6875 inches, this giving a stability that is especially rigid and insuring long life for the motor. The lower section of the crankcase contains the oil reservoir and this may be removed without disturbing the main bearings, but the bearings of the crankshaft, camshaft and the connecting rods may be reached through large hand holes at the left side of the bottom portion of the case. The upper half of the case is cast with cored arms at either side between the first and second cylinders which support the assembly forward. At the rear are two yoke arms that form the forward section of the frame carrying the flywheel and clutch, to which are bolted yoke arms that extend forward from the gearset casing. This upper section of the engine case is especially solid. At the forward end the timing gears are enclosed by housings.

The crankshaft is a special steel drop forging with a heavy integral flange to which the flywheel is bolted. The shaft is of large diameter and is carefully ground. The bearings are die cast nickel babbitt that are long enduring. The bearings are mounted in the upper crankcase section by long steel bolts that extend from the bearing caps to the cylinder flanges, securely anchoring the bearings and affording great strength to the entire construction, relieving the casing of much of the usual stresses. The camshaft is drop forged from special steel with the cams integral and it is mounted in three bearings of phosphor bronze of large proportions. The camshaft may be removed from the forward end of the motor without dismounting any other portion of the mechanism.

The connecting rods are I section special steel drop forgings and the big ends are fitted with nickel babbitt bearings, with the caps retained by bolts and nuts. The wristpins are hollow, hardened and ground, of large size, and are fitted with oil holes to insure lubrication. They are forced into the pistons and are retained by rings that prevent contact with the cylinder walls. The wristpin bearings are of phosphor bronze. The engine is given perfect balance by machining the pistons to weight.

The valve ports are of large size to secure adequate charges of fuel and to insure complete scavenging of the cylinders, and the valves are made with cast iron heads electrically welded to the steel stems. The valve tappets are carried in substantial guides and have yokes at the lower ends, which carry hardened steel rollers that contact with the cam faces at all times, minimizing wear and eliminating noise. The upper ends of the tappets are fitted with hardened adjusting screws and nuts. The valve springs are large and so protected from the heat as to insure the continuance of the strength and elasticity.

The timing gears in the compartment forward of the crankcase proper are spiral cut and operate noiselessly. The camshaft operates the valves and at the left side of the engine is an outside shaft driven by a gear that actuates the water pump at the rear end, and the forward extension carries a pulley from which by flat belt the fan is operated. The tension of the belt is adjustable.



The Great Western Two-Passenger Roadster for 1913.

The engine is lubricated by a mechanical feed system in combination with splash, there being a plunger pump mounted in the right side of the engine case which is operated from the camshaft and forces a quantity of oil each revolution of the shaft to the main bearings, the entire reservoir capacity, two gallons, being used in two minutes. The filtered oil is drawn from the reservoir and after flooding the bearings it is drained into the oil compartments in the engine case. Into these pools of lubricant the big ends of the connecting rods sweep and the splash fully supplies the camshaft bearings, cams and valve tappets, rollers and guides; the wristpins and their bearings and the cylinder and piston walls. Drainage from the forward main bearing effectually lubricates the timing gears.

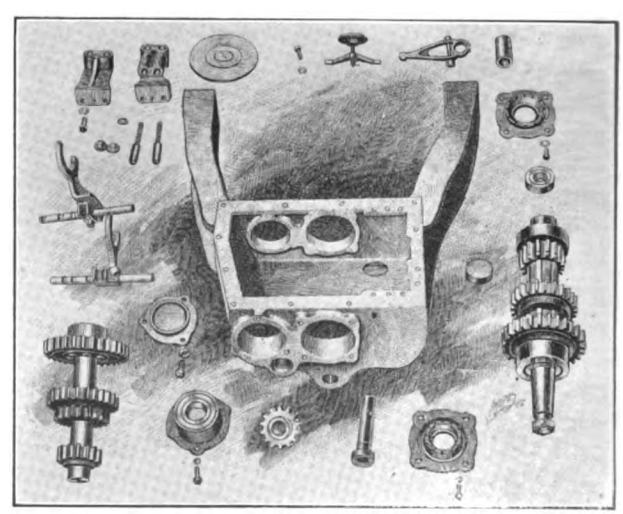
The motor is cooled by a circulation of water from the extra large cellular radiator through the

Digitized by Google

water jackets of the cylinders by a centrifugal pump. It enters the cylinders at the base of the water chambers and is forced from the cylinder heads through a manifold of large tubing, and by

The Great Western Long-Stroke Unit Power Plant, Valve Side of Motor.

a six-bladed fan that is mounted on a bracket on the forward cylinder. This fan bracket is adjustable to maintain a good driving tension of the belt. The water manifolds are aluminum castings.



The ignition is by a Remy low-tension magneto and transformer coil, the coil being of the invisible type with lock switch, and by storage battery, which may be used for starting and for a reserve. The wiring is especially heavy and is well insulated throughout. The fuel is carburetted by a carburetor of an automatic float feed type, fitted with an automatic auxiliary vacuum valve that is said to afford a uniform mixture at all speeds.

The clutch is a cone type incorporated with the flywheel, with the aluminum cone of skeleton design faced with Raybestos. The angle of the cone has been changed to insure an engagement that will avoid all harshness and prevent possibility of slipping. Six flat springs beneath the facing insure the ease of engaging desired. There is a universal joint between the clutch and the gearset case, this preventing driving stresses upon the engine shaft and bearings. The gearset is a selective form that gives three forward speed ratios and reverse. The casing is of aluminum and is provided with hand and inspection holes. The shafts and gears are of large proportions to secure certain endurance and strength and the shafts are mounted in New Departure ball bearings. The rear of the transmission case is supported by a heavy cross frame member. This frame member serves as the support of the yoke that carries the forward end of the torsion tube, and the transmission shaft and the driving shafts are coupled by a large universal joint.

The torsion tube is bolted to the forward side of the rear axle housing and in this the driving and pinion shafts are mounted on heavy bearings. The axle is of the full floating type in which the differential is carried on heavy duty Hyatt roller bearings and the wheels are equipped with New Departure ball bearings. The differential may be examined by the removal of a large cover plate at the rear. The driving shafts are of large diameter and clutches that engage with the wheel hub flanges insure full tractive effort. The forward axle is a special nickel steel drop forging of I section with heavy yokes and pivots and spindles. The wheels are mounted with roller bearings. The tiebar is behind the front axle to protect it from striking road obstructions.

The chassis frame is a pressed steel channel section with the forward end cambered to secure a wider wheel lock and shorter turning radius. It is well reinforced by heavy cross members and gusset plates, and the rear end gussets are extended beyond the side members, to these being attached the forward ends of the three-quarter elliptic chrome vanadium steel springs. These springs are 47 inches length. The forward springs are of similar metal and are 40 inches length, being semi-elliptical. The springs are so constructed that spreading of the leaves is impossible. The wheelbase is 118 inches. The wheels are fitted with 36 by four-inch tires on demountable rims.

The drive is at the right side and the steering

The Great Western Transmission Gearset Disassembled and Removed from the Case.

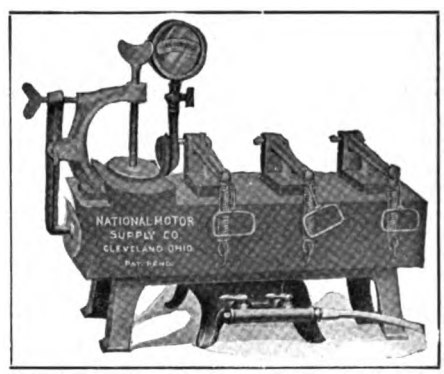
gear is of the worm and gear type with a large steering wheel carrying the ignition advance and the throttle levers. The left pedal operates the clutch and the right pedal the service brake, and

Digitized by Google

the usual hand levers at the side control the changes of speed and the emergency brake. The brakes are both internal expanding in 12-inch drums on the rear wheels and the brakes are equalized. The gasoline tank capacity of the touring bodies and the sedan model is 17 gallons, and the roadster has a tank that will contain 27 gallons.

The bodies are constructed of steel and wood and are upholstered with hand-buffed leather. The finish is stated to require 18 separate operations. The bodies are distinctive for the colors, the five-passenger touring being a deep blue, the four-passenger a maroon, the roadster an orange with ivory black striping, and the sedan a dark blue. The bodies have abundant room, the five-passenger body being 49 inches wide at the tonneau. The four-passenger touring body has a detachable tonneau. A feature of the roadster body is the luggage compartment built behind the seat, this affording considerable stowage space. Between the front seats is a small space for memoranda, etc. The door hinges are concealed and sides of the bodies are free and clear. All the metal body trimming and hardware is nickel plated and black enamelled.

The equipment of the cars is very complete and includes a high grade silk mohair top, a Fairfield rubber dust cover, a rain vision ventilating plate glass windshield, Stewart & Clark speedometer, Prest-O-Starter, Solar electric lights (including 11-inch head lamps, inset electric dash lamps and electric tail lamp), Typhoon electric horn, foot rail, robe rail, gasoline tank gauge, extra demountable rim, tire irons, tire pump, tire repair outfit, tool box, kit of tools and jack.



ACROSS CONTINENT IN COLUMBIA.

Dr. H. Benton Young of Trenton, N. J., driving a Columbia car, made by the Columbia Motor Car Company, Hartford, Conn., recently started on one of the most unique trips in the history of transcontinental touring. The doctor and his companion, A. C. Fort, left Trenton to win a $10,000 wager, made with William B. Kumpf of Mt. Holly. Starting with only $5 in his pocket, the terms of the wager stipulate that Dr. Young must motor from Maine to California and return in six months' time, with ample proof to show that he earned at least $10 in every place he stops for more than two hours. He must not practise his profession, beg or steal, but must earn the specified sum in some other perfectly legitimate manner.

NATIONAL GARAGE VULCANIZER.

Many proprietors of garages and repair shops realize the large profits from repairing inner tubes and shoes, but have not installed suitable equipment owing to the cost of the apparatus as well as knowledge of proper operation. Realizing that there is a demand for a simple, practical vulcanizer, adaptable for the garage, the National Motor Supply Company, Cleveland, O., has produced a tire repair outfit, which is moderately priced, and which is styled the National Garage Vulcanizer. The machine, which is depicted in an accompanying illustration, will repair three tubes and two casings at the same time and in an efficient manner.

The vulcanizer was designed by a man of extended experience with a leading tire manufacturer. The water is placed directly in the machine and heated by a gas or gasoline burner, these coming with the outfit. The vulcanizer may be connected, if desired, to a steam line. It takes less than 25 minutes to generate steam with the burner device and the cost of fuel to maintain the proper temperature is about .5 cent an hour.

The National Garage Vulcanizer, the Product of a Cleveland, O., Concern.

A high grade steam gauge and safety valve are provided. The body of the machine is of semi-steel and all other parts are of cast iron. All vulcanizing surfaces are carefully machined and the maker points out that there is nothing to get out of order. It is claimed that about $120 worth of work can be turned out in 10 hours and that the entire outfit weighs but 70 pounds. The company is making a special offer for the present.

ADVERTISING BOSTON SHOW.

Chester I. Campbell, general manager of the Boston automobile show, has sent placards throughout the country, advertising the dates of the 1913 shows in Boston. The cards bear the announcements that the pleasure car show will be held in Mechanics building, March 8-15, and the commercial car show March 19-26.

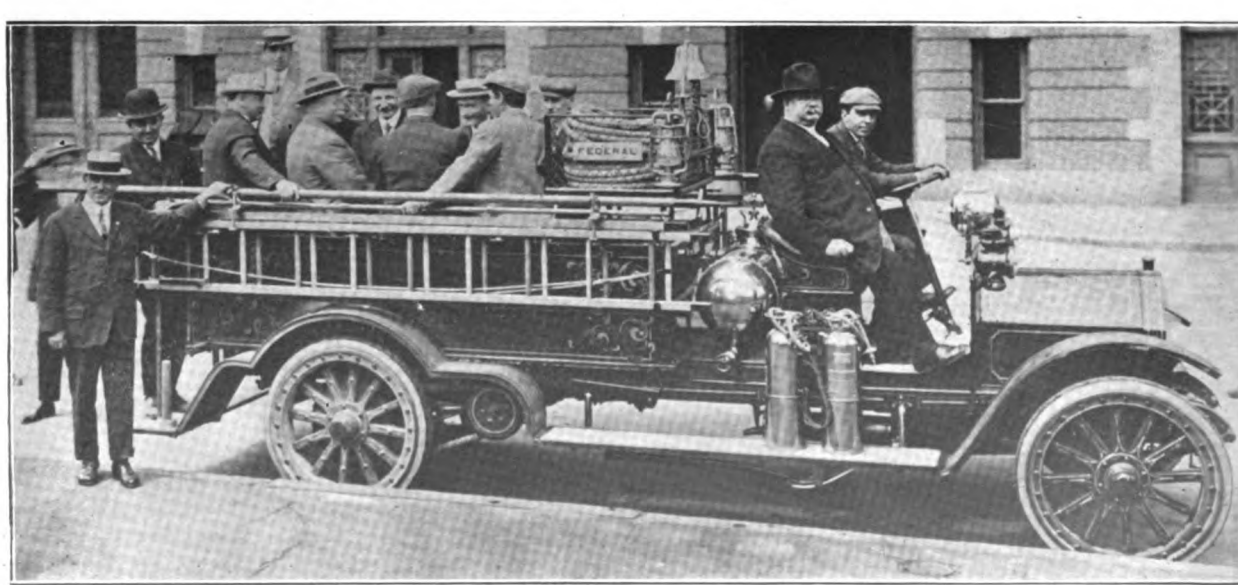
IN THE Commercial Vehicle Field

New Trucks and Applications, Time and Money Saved, and Other Items of Interest.

SPEEDWELLS EFFECT SAVING.



L. V. Lynch and R. Harry Croninger of the Speedwell Motor Car Company, Dayton, O., recently induced the Calaveras Copper Mining Company of Copperopolis, Cal., to purchase four six-ton trucks, with the result that a very material saving has been effected, when a comparison is made with the cost of horse haulage, under the original plan. Figures show that by the use of the Speedwell trucks ore is hauled from the mines at a cost of 80 cents a ton as against $3.50 when horses were used.

KISSELKAR PULLS BIG LOAD.

A remarkable feat was accomplished by a KisselKar three-ton truck, made by the Kissel Motor Car Company, Hartford, Wis., in Kansas City, Mo., recently, when it pulled a 37,000-pound boiler, placed on an old-fashioned wooden wheeled truck weighing 6500 pounds, a distance of 1.25 miles in 40 minutes, up a three per cent grade. Originally 12 horses had been assigned to the work, and it was estimated that it would take 10 hours. The up-grade part of the route was over asphalt and the weight of the trailer and boiler was such that the wheels at times sunk as much as two inches into the pavement.

FEDERAL TRUCK FOR MIDDLEBORO.

A Federal one-ton chassis, fitted with a body designed and constructed by the Monahan Vehicle Company, Providence, R. I., was recently delivered to the town of Middleboro, Mass., for use in the fire department. The sale was made by the Whitten-Gilmore Company of Boston, New England agent for the Federal Motor Truck Company, Detroit. The equipment was also provided by the Providence concern. It is the claim of the body builder and the agent that the ma-

Federal Combination Chemical and Hose Wagon Recently Delivered to the Fire Department in Middleboro, Mass.

Digitized by Google

chine is particularly adapted for fire fighting purposes in small municipalities equipped with hydrant systems, where a machine is desired that meets all requirements as measured by fire department demands, and is still reasonable in price.

The chassis is a Federal model D, with a wheelbase of 144 inches and a weight of 3300 pounds. It has an L head type of four-cycle, water-cooled motor, rated at 30 horsepower. The bore is 4.25 inches and the stroke 4.5. The engine is designed for heavy duty and is equipped with a governor to limit the speed.

Ignition is by an Eisemann high-tension magneto, with no spark advance. The gasoline is fed by gravity, the carburetor being adjusted for a fuel level at the factory. The gas control is by a foot accelerator, with no throttle lever. The power plant is at the forward end of the chassis frame, the engine being supported on four large cored arms bolted to the frame side members. The motor is lubricated by splash from constant levels maintained in oil pits in the bottom of the engine case by a gear driven pump. A left hand drive is provided, power is transmitted by a leather faced cone clutch through two universal joints and a shaft to a selective sliding gear transmission, giving three forward speeds and a reverse.

A deep body is fitted, with two hose crates, open at the rear ends and at the sides, the crates having a capacity for 1000 feet of regulation fire hose, this being coupled and packed, 500 feet at either side. The tops of the crates provide seats for the firemen. Above the forward end of the body is a heavy wire basket for 150 feet of chemical hose.

There is a 25-foot extension ladder at either side of the body and a 16-foot pike pole. Behind the driver's seat is a 40-gallon Badger chemical tank. The fuel tank is beneath the driver's seat, which may be lifted on hinges to permit filling. Oil lamps are mounted at the sides of the dash, and in the centre of the dash is an acetylene searchlight, mounted on a swivel. Other equipment includes a crowbar, axes, cotton hooks and similar tools, also two hand fire extinguishers which are fastened to the running board. The wheels are shod with cellular solid tires.

KNOX COAL DUMPER.

The seven-ton Knox coal dumping truck, made by the Knox Automobile Company, Springfield, Mass., shown in the accompanying illustration, was recently delivered to the Fall River Iron Works, Fall River, Mass. The model differs considerably from any that had been manufactured previously by the Knox company.

Seven-Ton Knox Coal Dumper, Designed for Manufacturer in Fall River, Mass.

Although of seven tons capacity, the dumping arrangement is operated by hand, the maker claiming that the mechanism was designed and built in such manner that the windlass would afford a powerful leverage with minimum friction. The chassis has a short wheelbase, so that the body permits a satisfactory balance of the load, thereby facilitating delivery. The body is of heavy oak, reinforced with metal sides on the outside, and is flared toward the end to prevent the coal from packing when being dumped.

The Fall River Iron Works began experimentation with a Knox truck 18 months ago to handle its product, cotton cloth, and the resulting success was such that when it was decided to purchase a second machine to haul coal the Knox company was asked to solve the problem.

Digitized by Google

PEERLESS FOR BREWERY DELIVERY.

The Maier Brewing Company, Los Angeles, Cal., recently placed in commission a Peerless truck, made by the Peerless Motor Car Company, Cleveland, O., an illustration of which is shown herewith. The machine has travelled scores of miles in the city and vicinity and has given ample demonstration of its efficiency and economy.

As is true of all Peerless trucks, 80 per cent. of the weight distribution is over the rear driving wheels, making it possible to use light, easy riding springs in front. These, it is claimed, preserve the mechanism from destructive jolts. Seated on the hood of the machine will be noticed Fritz, who occupies the position throughout a day's work. Formerly Fritz followed on the horse drawn trucks, replaced by the motor vehicle.

Peerless Car in Service with the Maier Brewing Company at Los Angeles, Cal.

MORGAN REPLACES TROLLEYS.

A five-ton Morgan truck, made by the Morgan Motor Truck Company, Worcester, Mass., was sent to Portsmouth, N. H., a short time ago. It will be used in place of a trolley line between that city, Kittery, Me., and other points of interest in the vicinity. The machine will accommodate 30 passengers, seats having been arranged sidewise. The body is of special design, being built something after the style of a trolley car.

MOTORS TO REPLACE HORSES.

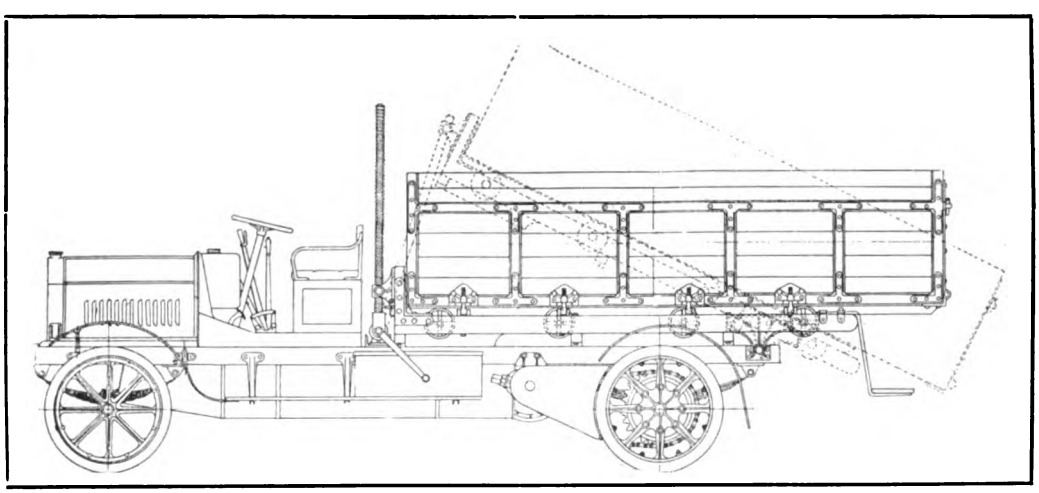
The heavy horses and drays of the Pennsylvania railroad in Harrisburg, Penn., are to be displaced by motor trucks. A large number of teams has been used about the shops in the past, but these will be entirely replaced. A garage for the storage of the motor vehicles is being erected.

ACCESSIBILITY OF IDEAL TRUCKS.

The Ideal Auto Company, Fort Wayne, Ind., maker of the Ideal truck, in designing its product has seriously considered accessibility and throughout has incorporated mechanical features making for simplicity and easy maintenance. With the body fitted to the chassis, the components of the latter may be inspected and lubricated readily with no undue effort on the part of the operator. Three models are made, these being known as H, I and G, and their carrying capacities are 1500, 2000 and 3000 pounds, respectively. These differ also in body types.

Models H and I are similar in chassis construction, with the exception that certain components of the larger car are strengthened to meet the requirements of larger loads. Model G differs in clutch and motor, the latter being rated at 35 horsepower, as compared with 24 for the smaller.

Both models H and I are fitted with four-cylinder four-cycle, water-cooled motors. A three bearing crankshaft is employed. This revolves in bearings of ample size and as these bearings are carefully adjusted, it is claimed they will operate thousands of miles without any other attention than lubrication. Both intake and exhaust manifold are retained by stirrups mounted upon studs and the intake member is of the T type.



Carburetor and magneto are located on the left hand side of the motor, leaving the right of the engine remarkably free from obstructions.

Digitized by Google

Ignition is by true high-tension magneto, although option of a double ignition system and storage battery is given. Lubrication is a self-contained, constant level force feed and splash, the oil being circulated by a gear driven pump.

Cooling is by the thermo-syphon system assisted by a belt driven fan. A feature of the radiator, which is equipped with vertical tubes, is its suspension. It is mounted on hinges which permit the cooler to be swung outward when desired. The clutch utilized is patented, and is of the expanding wedge type. The transmission is of the sliding gear type, providing three speeds forward and a reverse. Final drive is by side chains. Solid tires are fitted as standard equipment on models H and I, although pneumatics may be had if desired. It is claimed that either machine may be turned in 20 feet.

Both service and emergency brakes are of the internal expanding type, the total braking surface being 270 square inches. The steering gear is of the gear and sector type. The spark and throttle levers are mounted upon the steering column, which is located at the right. The seat unit and motor housing may be taken from the chassis by loosening two bolts, making the motor particularly easy of access. The standard body sizes are eight feet by 44 inches and eight feet by 58 inches, although the company provides for special bodies to meet individual requirements.

Side View of Lacre Interchangeable Standard Dumping Body, Hand Operated, for Municipal Service.

Model G differs from the smaller vehicles in that the motor is cast en bloc and is rated at 35 horsepower. Cooling is by centrifugal pump, and a double ignition system, consisting of magneto and battery with coil, is utilized. The clutch is a cone in place of the wedge type.

REPEAT ORDER FOR ALCOS.

The American Express Company, a short time ago, placed its 10th repeat order for Alco trucks, made by the American Locomotive Company, New York City and Providence, R. I. A fleet of five 3.5-ton machines is specified in the contract, and these will be placed in commission in the heavy duty service in New York City. Their routes will include night trips between the offices of the company and shipping terminals, in addition to a day schedule. In keeping comparative figures of the cost of motor and horse haulage, the express company has found every argument in favor of the former. In the past three years 46 Alco trucks have been added to the equipment.

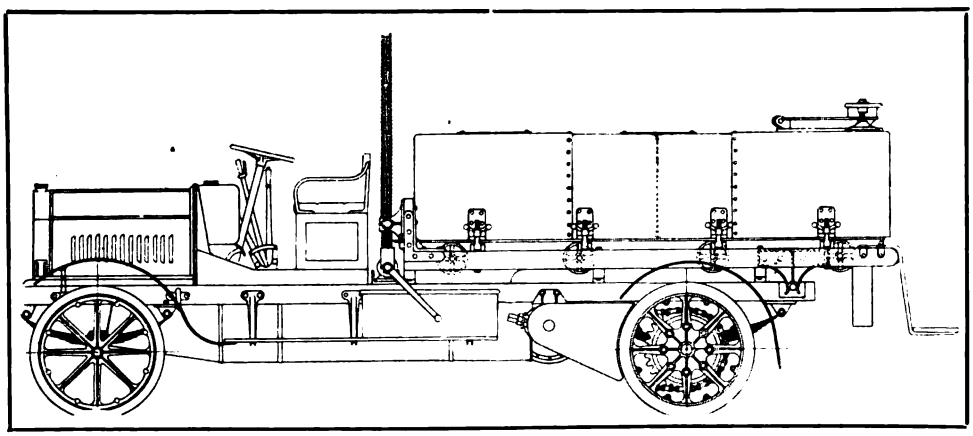
BAKER TRUCKS SAVING MONEY.

Among the many Baker trucks, made by the Baker Motor Vehicle Company, Cleveland, O., none probably attracts greater attention than the two-ton model recently put into service by the H. J. Heinz Company, Boston, Mass. According to Frank N. Phelps, the Boston distributor, the machine can run more than 60 miles a day at a cost for current of about one cent a ton-mile. The tire cost, it is estimated, is about the same. The Heinz company is high in its praise of the service being given by the machine, and makes particular mention of the saving as compared with the work formerly done by horse drawn vehicles.

WILLYS BECOMES VICE PRESIDENT.

John N. Willys, president of the Willys-Overland Company, Toledo, O., was recently elected vice president of the Hexter Motor Truck Company of New York City, which company has handled the Gramm trucks in the metropolitan territory, and George W. Bennett, also closely connected with the Willys interests, was made a

Digitized by Google



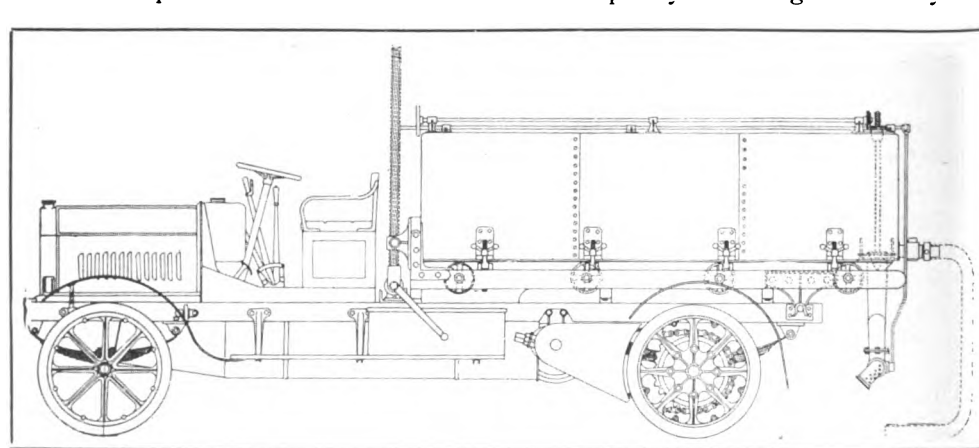
director of the New York concern. This action followed Mr. Willys' securing control of the Gramm Motor Truck Company, Lima, O. P. H. Hexter remains president and general manager, and Arthur A. Alexander continues as secretary and treasurer of the sales company.

WESTFIELD FOR EXPRESS COMPANY.

The Seymour Motor Express Company, recently incorporated in Connecticut, has purchased a two-ton truck, made by the Westfield Motor Truck Company, Westfield, Mass., and plans to conduct a delivery business between Seymour and New Haven by the way of Woodbridge. The car will be equipped with seats later so that it may be used in passenger carrying service.

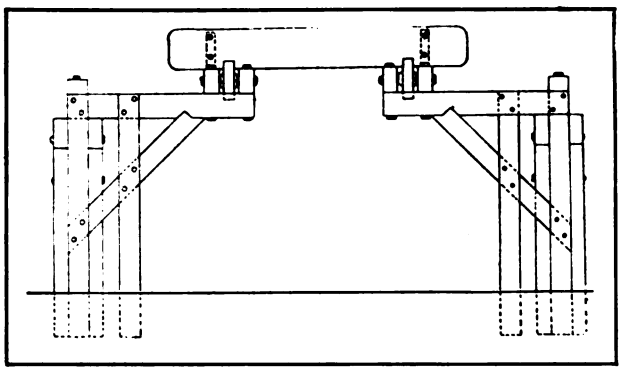
NEW LACRE BODIES.

The Lacre Motor Car Company, Ltd., Letchworth, Eng., has been paying particular attention of late to the construction of special bodies for municipal service. Accompanying illustrations show sketches of a set of bodies that may be used on a four-ton chassis, it being the intention of the company to supply cities with bodies for different classes of work, even where it is considered advisable to have but one chassis. Although designed for the four-ton model, the units may be secured for other sizes of Lacre chassis, to meet the requirements of the purchaser.



Indicating Detailed Construction of Lacre Sewage Disposal Body, Interchangeable with Dumper.

The dumping body, shown here, may be regarded as standard. Note may be taken that the lower structure and tipped gear are fixtures on the chassis, and while they may not be needed with some of the bodies, this plan is thought to be the most practical. The lower structure includes the roller device for transferring the bodies to and from the chassis. The body is retained in position when in use by swivelling clamping screws on either side, and retaining pins in front, which make for rapid and efficient fastening.



Interchanging is a simple and easy matter as the rollers run in angle iron guides fitted to the bottom of the body, similar rollers being fitted to the platform that receives the body when not in use. This work may be accomplished in 10 to 15 minutes, without the use of crane or tools of any kind. The roller platform is so arranged as to be at the same height as the chassis platform, facilitating the removal and replacement of the body.

The dumping body has a capacity of 153 cubic feet, and is capable of being tipped to any angle. The sewerage disposal body has a capacity of 112 cubic feet, or approximately 730 gallons. A water tank with capacity of 800 gallons may also

Another Type of Body, Utilized for Street Cleaning Purposes, in Lacre Combination Outfit.

Digitized by Google

End View of Roller Platform Utilized with Lacre Interchangeable Bodies.

be had, this being equipped with a sprinkling system and apparatus for flushing gutters. Valves operating the sprinkling device are placed at the driver's seat, making it necessary for but one man to accompany the car on the road. Still other bodies can be fitted, according to the needs of the municipality.

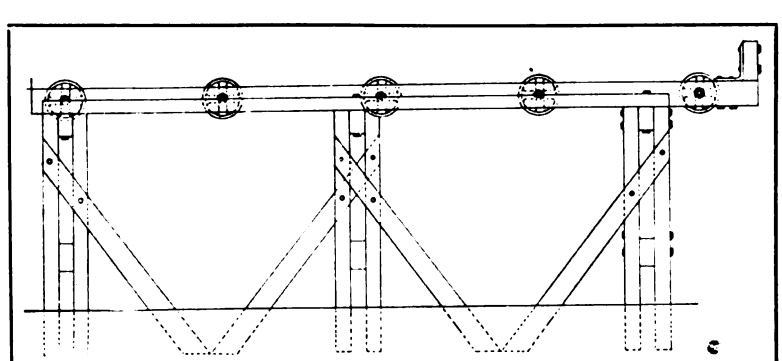
TO MANUFACTURE NEW MODEL.

The Newark Auto Truck Company was recently formed in Newark, N. J. The plant of the concern will be operated in Newark, where offices have been established. A new design of motor truck will be manufactured and placed on the market soon. Several men, well known in the motor truck field, it is understood, have become associated with the company, which will announce further plans in the near future. The incorporators are L. W. Babbage, H. H. Poole and John T. Welsh.

TO HOLD GOOD ROADS MEETING.

Plans are being made to hold a tri-state good roads meeting either at Bowling Green or Mammoth Cave, Kentucky, the latter part of September. The preliminary arrangements were discussed recently at a meeting of representatives of the commercial bodies and Automobile Club of Louisville, when it was decided to invite delegations from the commercial, automobile and good roads associations in Kentucky, Tennessee and Indiana to participate in the convention, which will be preceded by sociability automobile runs from Louisville and Nashville. Speakers of national and state prominence will be asked to take part in the proceedings, Gov. Hooper of Tennessee having already consented. The delegates will discuss road improvement and traffic laws. One of the entertainment features will be an old-fashioned barbecue.

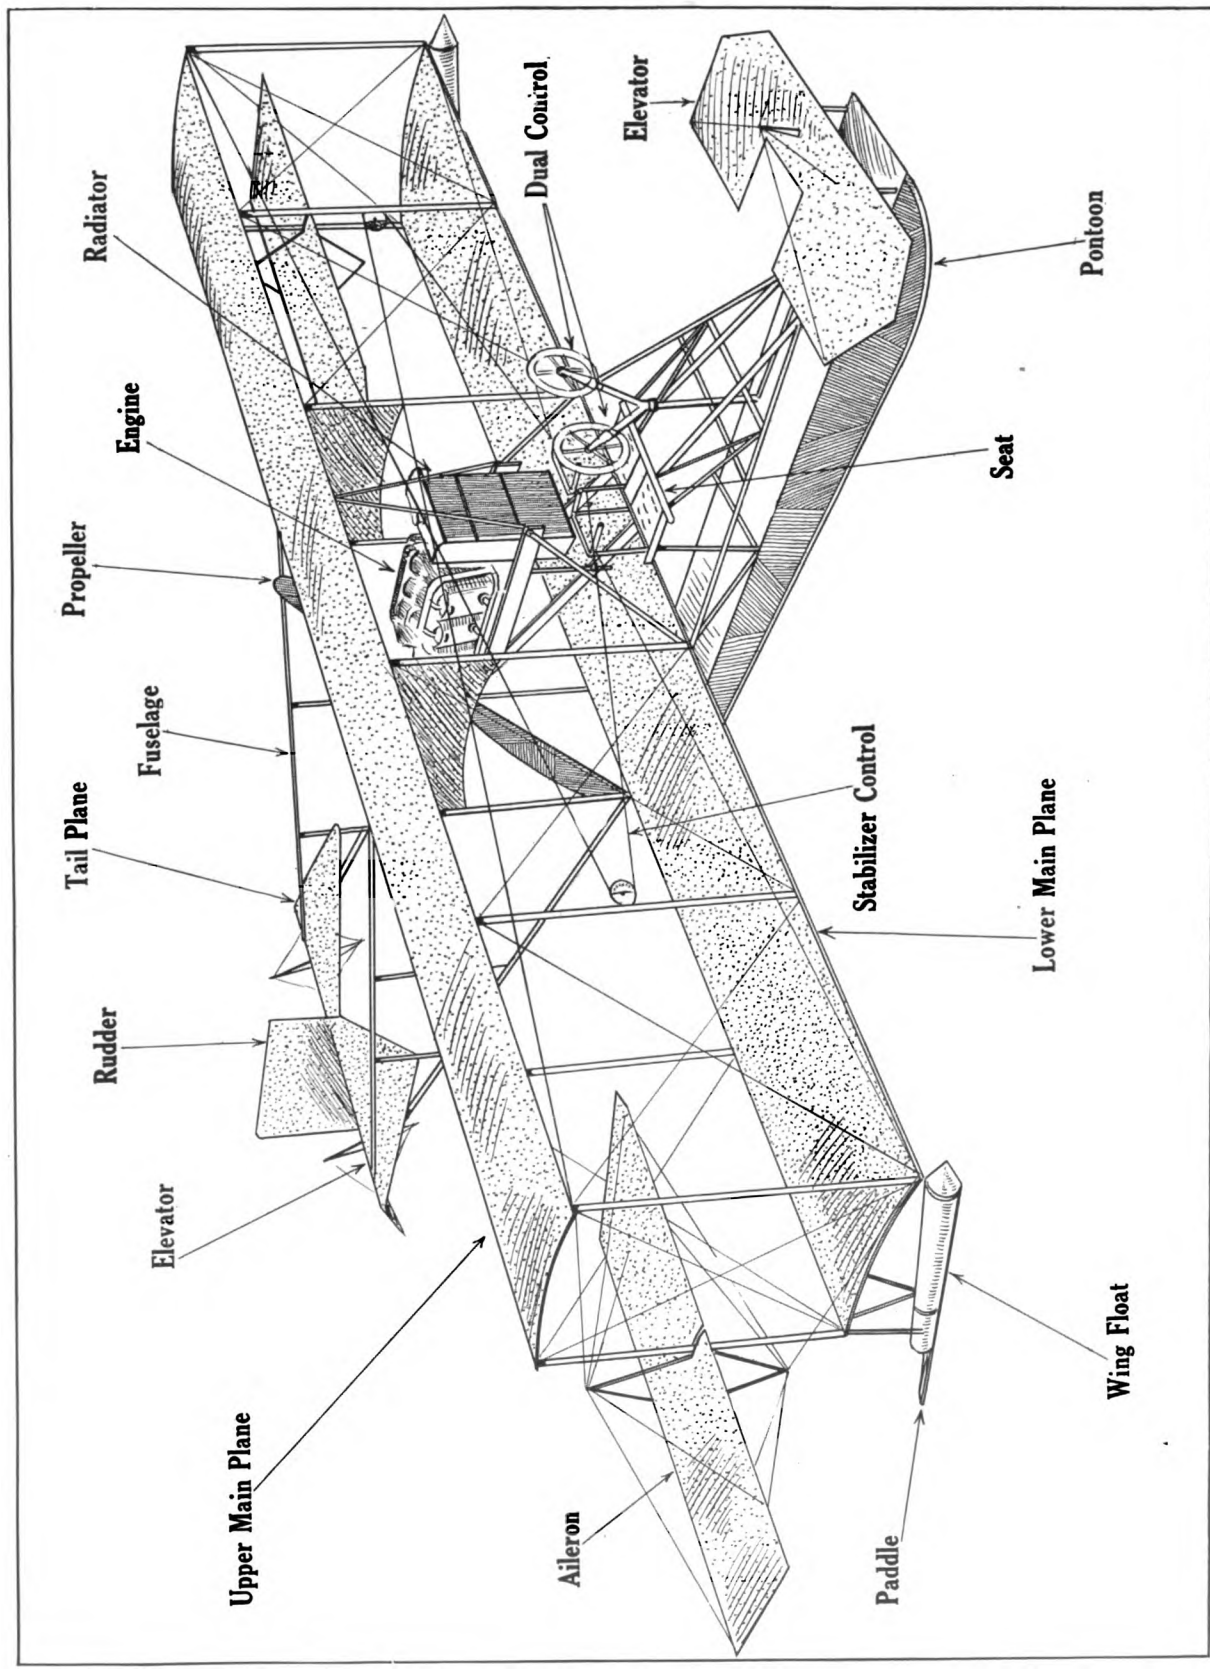
TIRE CHANGING OUTFIT INSTALLED.



The Goodyear Tire & Rubber Company, Akron, O., recently installed a new hydraulic press and tire applying machine for motor trucks in its Philadelphia branch, the work being done under the direction of C. W. Martin, Jr., manager of the motor truck tire department of the concern. The new machinery includes a 75-ton hydraulic press, hooping plate, small drill press, band saw, radial drill and other up-to-date devices.

MOTOR CARS FOR TRACK WALKERS.

The purchase of 10 motor cars for railroad tracks to take the place of track walkers is being contemplated by the Boston & Albany division of the New York Central Railroad, it is said. Handcars for section gangs and track walkers are considered by the officials as dangerous for up-to-date railroad traffic. The new cars will be similar to those propelled by hand, save they will have four flanged wheels, and will be equipped with a two and three-cylinder type of motor.



TAKE OVER JENKINS PLANT.

Representatives of the Cole Motor Car Company in Rochester, N. Y., recently took over the entire plant of the Jenkins Motor Car Company in that city, when the latter organization discontinued the manufacture of gasoline motor vehicles. They have acquired new capital and will do business under the name of the Shafer Decker Company. Frederick J. Decker, a member of the Society of Automobile Engineers, and former engineer for the Jenkins people, is the new partner in the Rochester Cole organization.

Perspective View of the Curtiss Hydroaeroplane, the First Successful Machine Designed and Constructed to Arise from the Water.

Digitized by Google

Progress of Aerial Navigation.

Mechanical Details and Features of Construction.

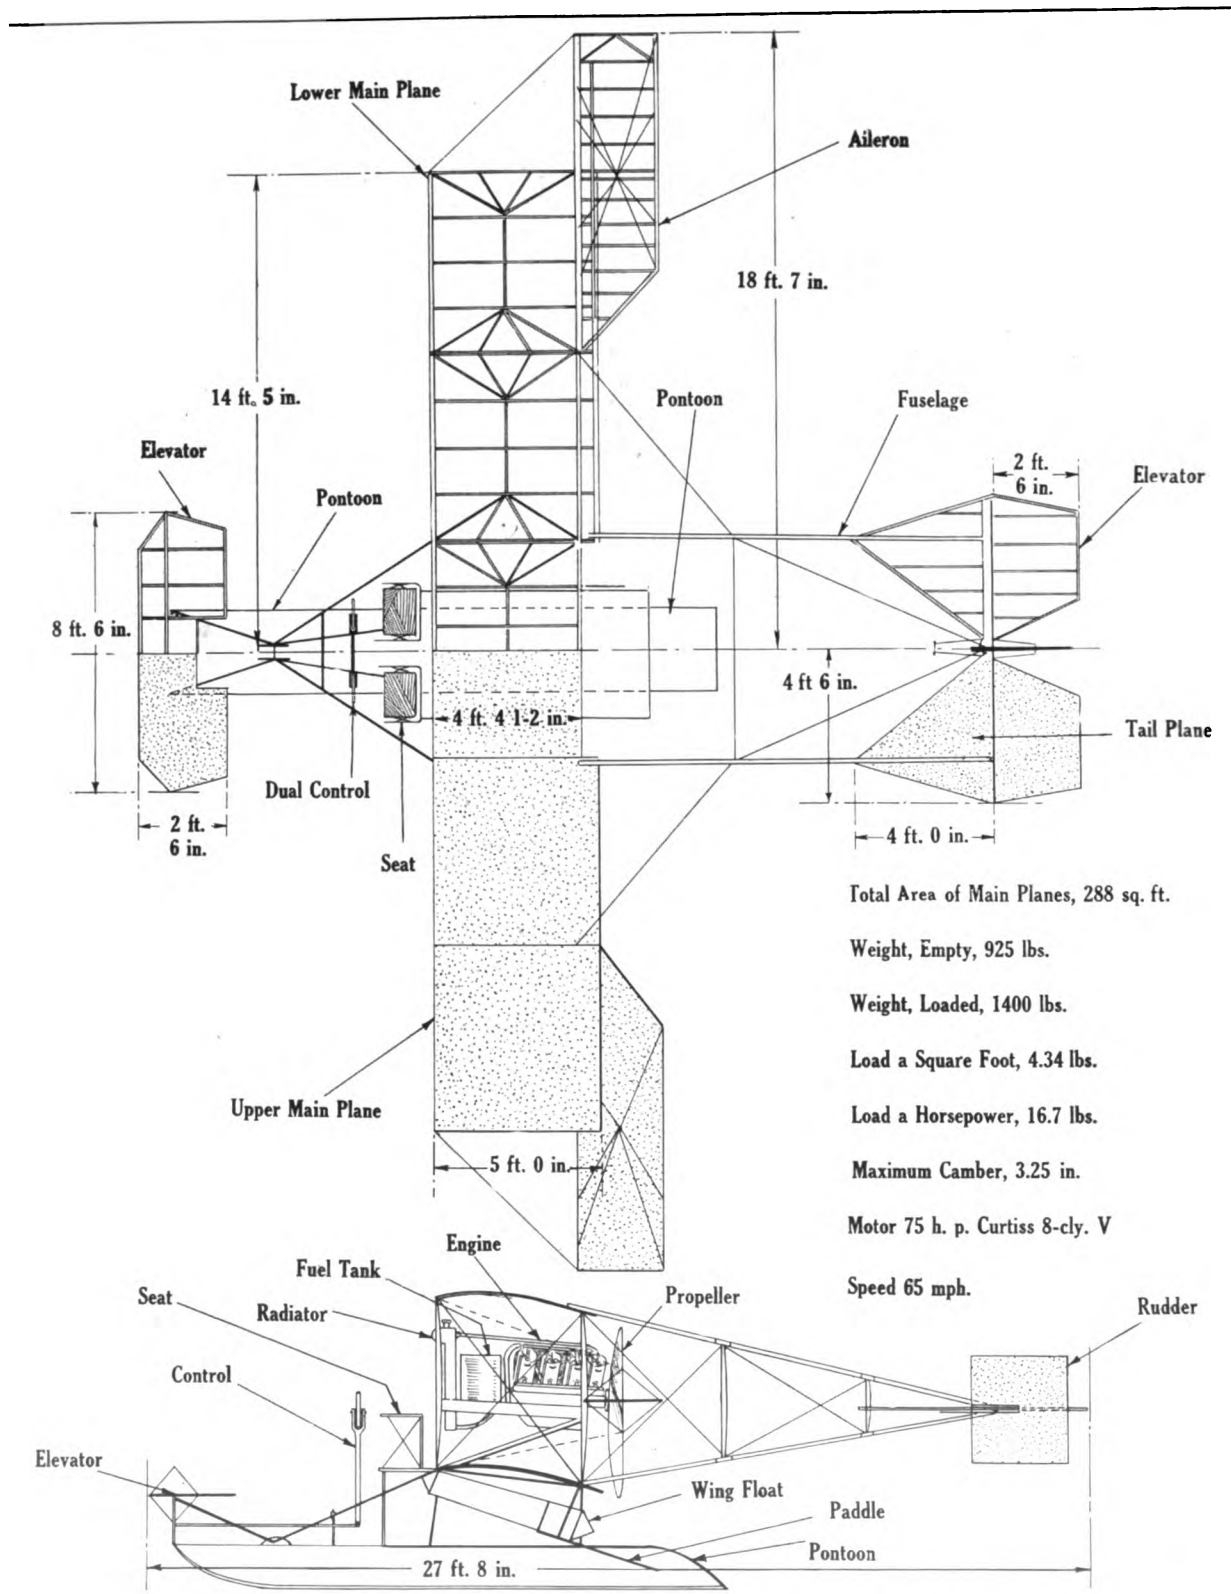
THE CURTISS HYDRAEROPLANE.

While hydraeroplaning must be considered a newer branch of the science of aviation, it has made rapid strides in securing popular attention since the first actual rising from the surface of the water in an aeroplane equipped with hydro attachment in the early part of 1910. Although Glenn H. Curtiss must yield to another in the matter of first solving the problem, to him belongs the honor of inventing the first successful hydraeroplane,designed and built as such, and the Curtiss hydraeroplane must be recognized as the pioneer in this line.

The terms "hydroplane" and "hydraeroplane" are somewhat confusing to the amateur student of aviation. An hydroplane really is a plane, or any number of planes, projecting from the hull of a submarine boat. Its principle is that of cutting through the water in about the same manner as an air plane cuts through air, with practically no displacement. An hydraeroplane is an aeroplane fitted with one or more pontoons, the pontoon displacing the water according to its bulk.

Experiments were made with hydroplanes by Froude, an English engineer, in 1872, but these were without result. The real inventor of the hydroplane was Comte de Lambert of France, later a well known aviator and aviation engineer, who produced the first successful craft of this type in 1897.

The first to fit pontoons to an aeroplane was William Kress, an Austrian engineer, in 1898. His hydraeroplane was a triple monoplane design, fitted with two parallel elongated floats, a 30 horsepower motor and two propellers. It gave fairly good results in the water, but failed to arise from it. The first machine was destroyed by wind in 1901, and a second attempt the following year was abandoned from lack of funds.



In 1905, 1906 and 1907, Ernest Archdeacon, Gabriel Voisin and Louis Bleriot in France, Prof. Enrico Forlanini in Italy, Dr. F. A. Barton and F. L. Rowson in England, Israel Ludlow and the Wright brothers in America, made more or less satisfactory attempts to solve the problem. Some of these machines attained an altitude of 50 feet, when towed behind motor boats or naval tugs, but the experiments failed to reach the point where it was deemed wise to risk man flight in them.

The first man to leave the water's surface in a power driven hydraeroplane was Henri Fabre, a French engineer, who created a machine of original design, fitted with a 50 horsepower Gnome motor, and succeeded in leaving the water and returning to it without mishap at Martigues, France, March 28, 1910. The altitude record for this flight was six feet and the distance 1000 feet. May 17, a better flight, about one mile, at a height of 30 feet, was made at Monaco, but the craft was wrecked in alighting, and Fabre discontinued further experiments.

About the same time Glenn H. Curtiss was using pontoons on his biplane at Lake Keuka, near Hammondsport, N. Y. This was preparatory to his Albany-New York flight, and the pontoons were attached to the biplane during that trip, although they were not employed in alighting on the Hudson. They were installed simply as a precautionary measure. However, the impression gained on that flight resulted in more extended experimentation during the following winter.

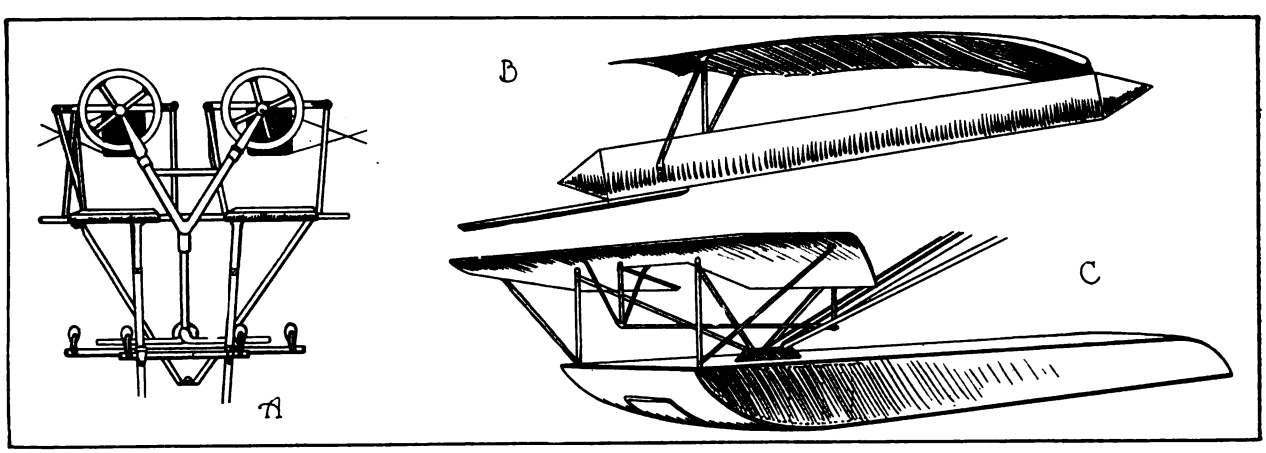
The first success came at San Diego, Cal., Jan. 26, 1911, and from that time the Curtiss hydraeroplane was an accomplished fact. Three weeks later the new craft alighted alongside the cruiser Pennsylvania, was drawn on board, lowered over the side, and flown back to shore. The machine

Digitized by Google

Plan View and Side Elevation of Curtiss Hydroaeroplane, Showing Detail Dimensions and Principal Components.

Digitized by Google

has undergone certain modifications and improvements, but in all essential details the Curtiss hydraeroplane of today is the same as that with which this memorable flight was undertaken.



In many respects the general design is identical with the later types of the Curtiss biplane. The main difference is in the replacement of the landing chassis by the single pontoon. It should be mentioned, however, that some Curtiss hydraeroplanes utilize two pontoons, although the design presented herewith is that produced for the United States Navy, and sold to the navies of foreign countries.

These pontoons are constructed with water tight compartments, six being employed for the single-pontoon design. It is maintained that three of them will support the machine under average conditions. Recent experiments with a Curtiss hydraeroplane of this type abroad, revealed the fact that the water tight compartments were highly effective. The drain plugs were removed from two of the compartments, after which the machine with pilot and passenger was allowed to stand 30 minutes in order to allow that portion of the pontoon to fill with water, after which a flight was made without the slightest difficulty.

One other distinction lies in the location of the front elevator, which is attached to the forward end of the pontoon, and gives an impression not unlike the so-called headless types, one of which has been produced by the Curtiss Aeroplane Company for racing purposes. Of course there are attachments besides the pontoon which were designed primarily to assist the machine in resting upon the water, or in alighting or arising. These will be explained in proper sequence.

Perhaps the best method of describing the Curtiss hydraeroplane is to set forth the plan of operation. While the machine may be started on the water, the preferable way is to have it resting on the land with the head toward the water. The operator takes his place and upon opening the throttle gradually, the thrust of the propeller slides the apparatus along the ground, or planks if the earth's surface be unsuitable, and into the water. The pontoon being fitted with steel shod runners, it is possible to start on rocks, gravel, or in fact almost any reasonable surface.

Once out upon the water the operator rapidly increases his speed by opening the throttle, taking care, however, to accelerate gradually, to allow the pontoon to mount the surface without throwing an unnecessary amount of water upon the propeller. When a speed of 25 to 30 miles an hour has been obtained, the pontoon skims lightly over the surface. As the ailerons do not become effective until the machine acquires considerable speed, the small floats on the ends of the lower main plane maintain the proper balance until the necessary speed is acquired.

Some Interesting Details of the Curtiss Hydraeroplane: A, Dual Control, Pedals and Arrangement of Seats with Wires Leading to Ailerons; B, Wing Tip Float and Flexible Paddle, with Method of Attachment; C, Construction of Pontoon and Location of Front Elevator.

These wing floats serve a dual purpose. One has just been explained. It will be noted that there is a small flexible wooden paddle at the rear of each tank, and these slide over the water, exerting a great lifting effect. In alighting upon the water, they also prevent damage to the wing tips, by reason of the fact that should one wing strike the water before the other, the paddle causes a glancing blow, which levels the machine automatically.

When the machine has acquired a certain speed it leaves the water in exactly the same manner as the aeroplane leaves the land, and immediately increases its speed, due to the absence of friction from the water. It also has a slight

Digitized by Google

tendency to jump into the air, due to the released motion between the pontoon and the water. Once in the air the operation is the same as the regular Curtiss biplane.

The landing is accomplished in the ordinary manner, bearing in mind to keep the pontoon as near level fore and aft as possible, and if the water be very rough, to allow the empennage to settle on the surface first. This will prevent any possibility of sticking the bow of the pontoon into an unexpected wave.

In the matter of control, the system is the same as has been utilized with splendid success on all Curtiss biplanes, with the exception that the Curtiss hydraeroplanes are fitted with the newer dual control. This was designed for the purpose of permitting alternate operation of the machine by either passenger, and was brought out because of the demand for such driving on long distance flights, where one operator became fatigued. This is made in two forms, that presented herewith being equipped with two hand wheels, so that the second pilot may take up this work without intermission or delay. The original type of dual control produced by Curtiss actually was an alternate control, the wheel swinging through a segment at the top of the divided post.

The ailerons are moved by means of ingenious wiring leading to a pulley on either side, thence to the aileron and to the opposite wing tip. These wires are attached to a shoulder yoke above the seat, which also serves as a brace for the operator's back. Inclining the body to the right raises the aileron on that side and lowers that on the left, and vice versa.

Moving the steering wheel forward or backward operates the front and rear elevators in conjunction. The rudder is manipulated by turning the steering wheel in a manner similar to that of an automobile. Control of the throttle and ignition is by pedals, located conveniently to the footrest.

With respect to hydraeroplane flying, Hugh Robinson, who has been operating the Curtiss hydraeroplane almost since its first appearance, both in this country and abroad, declares there is nothing to compare with it. In this opinion he is borne out by nearly all who have had any experience with the sport. Robinson says:

"It is the fastest motor boat in the world. To be able to approach a launch and jump over it, observing the consternation of the passengers is the keenest pleasure imaginable. It may be used solely as a motor boat if desired, at a speed of 60 miles an hour, without a drop of water ever touching the passengers, or if weather be favorable, flights may be made at the will of the operator.

"It is possible to rise in an ordinary land machine with too little power to make a turn or climb fast, and as a result get a bad fall. Owing to the fact that there is suction between the water and the pontoon, it requires more power actually to leave the water than to fly once the plane is in the air. This prevents an hydraeroplane taking flight with too little reserve flying ability, and once in the air the operator may be sure of considerable reserve power to enable him to fly strongly and safely under all conditions."

SHEEP HERDER USES E-M-F.

A sheep herder of Idaho is using two Studebaker cars, made by the Studebaker Corporation, Detroit, Mich., one a 30 horsepower E-M-F and the other of the touring car type, to do work about his ranch, formerly requiring the use of 46 horses. The first mentioned car is used for hauling all sorts of supplies to the outlying parts of the ranch and to town. Its longest trip was to Denver, Col., and on the return it brought back a 900-pound gasoline engine. The other machine is used to carry shearers and other help about the ranch.

STUDENTS VISIT GOODYEAR PLANT.

A group of students from the Massachusetts Institute of Technology, accompanied by Dr. F. H. Thorp, one of the professors in charge of the chemical engineering course, recently visited the factory of the Goodyear Tire & Rubber Company, Akron, O. The visitors were taken over the entire plant, studying each process, from the initial one of washing crude rubber to that of finishing tires for use.

FOR AUTOMOBILE PARADE.

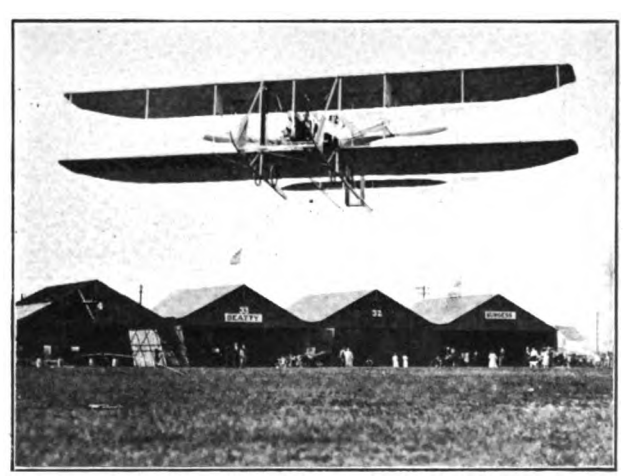
One of the features of the Blue Grass Fair, to be held at Lexington, Ky., this month will be an automobile floral parade. Committees from the Blue Grass Automobile Club are working in conjunction with committees from the fair association and the Commercial Club of Lexington in arranging for the event, and it is planned to make the affair a memorable one. All owners of cars in central Kentucky will be asked to take part. The fair association has offered cash premiums for the best decorated cars, while special donations are to be made by individuals.

Digitized by Google

In The Aviation Field

With the Manufacturer and Operator in America and Abroad

Marshall Earle Reid, has been engaged by the Aero Club of Pennsylvania to make the daily intercity passenger and mail flights between Stone Harbor and Ocean View, N. J. In addition to this announcement comes the information that the club has established headquarters at Stone Harbor, where Secretary George S. Gassner is in charge of the first aeroplane passenger ticket office in the world. Flights are scheduled to take place between the two cities, daily, except Sundays. Passage may be booked at the Stone Harbor office at any time. The Postoffice Department has established a regular aeroplane mail route between the two cities. An accompanying illustration shows Reid and a passenger in flight at Mineola, L. I. His machine has now been fitted with pontoons, so that it may alight upon the water if found necessary.



Flying a Curtiss hydraeroplane at Annapolis, Md., July 25, Lieut. Theodore G. Ellyson, U. S. N., created a new world's record for machines of that type, by reaching an altitude of 2850 feet.

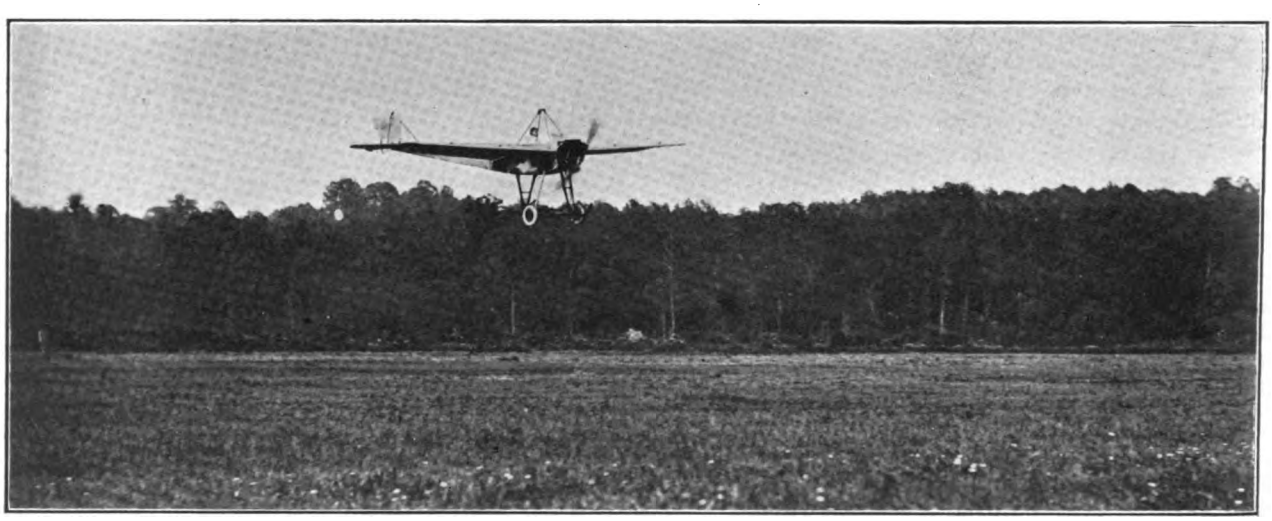
Rear Admiral Philip Andrews, U. S. N., acting Secretary of State, has made public the requirements for navy aeroplanes which contractors will supply. Responsible manufacturers are invited to notify the department not later than Aug. 15, as to whether they will submit designs for machines to satisfy these requirements, which follow:

The maximum speed must be at least 55 miles an hour with full load, and during a four-hour test, starting with full load, it must average at least 50 miles an hour. Full load means that the machine must carry two persons weighing 350 pounds together, besides sufficient fuel for a flight of four hours, and needed wireless and other instruments.

A considerable range of speed is desirable, and manufacturers are requested to state the minimum speed at which the machine will fly with full load. The maximum and minimum speed tests will each be the mean of 10 runs over a measured mile, five with the wind and five against it.

The endurance test will be made over a convenient triangular circuit of at least five miles, to be selected, the speed being recorded by a tested recording anemometer, read before the start and again at the end of the flight.

Marshall Earle Reid and Passenger in Flight with Wright Biplane at Mineola, L. I.



The machine will be required to arise from the water with full load in a dead calm during a run of not more than 1000 feet, to turn with full load without skidding, stalling or sliding in a circle of 400 yards diameter; to climb at the rate of —— feet a minute on leaving the water to an altitude of 1500 feet in a spiral ascent, which will include at least one complete turn, and to glide with power shut off from an altitude of 500 feet to a landing on the water throughout a horizontal

Digitized by Google

distance of at least 2500 feet, or throughout a distance greater in the same proportion if the power be cut off at a higher altitude.

Manufacturers may use engines and propellers of any known make, although an air-cooled motor is regarded as preferable. The power must be self-starting from the seat of one operator, and controlled by either operator. Special consideration will be given to any efficient motor operated by fuel oil or any fluid that is not dangerous to carry on board ship, an extra price or premium being contemplated for the purpose of a satisfactory motor of this kind.

The machine must be fitted for hoisting on board ship from the water intact, and capable of easy and speedy disassembling. The buoyant parts of the hydraeroplanes must be subdivided into water tight compartments provided with convenient means for relieving them of leakage.

Paul Peck Flying the Columbia Biplane, Fitted with Gyro Motor, with Which He Secured a New American Record for Duration.

Sufficient stability must be provided to permit of riding adrift safely in a 20-mile breeze in open water and with motor stopped.

An accompanying illustration presents Paul Peck in flight with a Columbia biplane, made by the Washington Aeroplane Company, 8th and Water street, S. W., Washington, D. C. It will be remembered that this is the machine with which Peck created a new American duration record of 2:18:00 at Augusta, Ga., covering 138 miles. The machine is fitted with a seven-cylinder revolving Gyro motor, made by the Gyro Motor Company, 774 Girard street, Washington.

Mlle. Helene Dutrieu has cabled the Aero Club of Illinois for permission to start in the fourth international race as an added entry from France. Inasmuch as the Aero Club of Illinois has no jurisdiction in the matter, the rules governing the entry of aviators for this prize being formulated by the Federation Aeronautique Internationale, it is probable that her application will be declined. However, she will be urged to make entry for other events on the programme during the Chicago meet.

In response to a question as to whether or not the Wright Company was constructing special Wright biplanes which would be utilized at Chicago in the international race, Orville Wright has renewed the statement that the Wright Company was entirely out of racing. It is well known that many interested in aviation sought to influence the late Wilbur Wright to construct a machine with which to defend the cup, but he explained that he was opposed to the development of speed to the neglect of passenger carrying, lifting and climbing contests.

The Massachusetts Institute of Technology, Boston, is the first college in the country to make the announcement that during the coming year, in connection with the department of mechanical engineering, it will establish a course in aeronautics. The object is to present knowledge of aviation, with a view to making it more safe.

During the recent flying meet at Wien, Germany, all the machines to start were equipped with Bosch magnetos, except one monoplane. Lieut. Blacshke, with a passenger, secured a new altitude record of 4360 feet, utilizing a Lohner

Digitized by Google

monoplane, fitted with a Bosch equipped Austro-Daimler motor. Naturally, this result is very gratifying to the Bosch Magneto Company, New York City.

Representative Hardwick of Georgia has introduced a bill in the lower house of Congress, giving soldiers and sailors assigned to aeroplane service double pay while thus engaged.

The Moisant Bleriot type monoplanes recently delivered to the Mexican Army, by the Moisant Aviation Company, New York City, have been placed under the command of Gen. Huerta and are now in use in connection with the campaign in western Chihuahua.

The Defender Syndicate of Chicago, has been organized by members of the Aero Club of Illinois for the purpose of defending the Gordon-Bennett cup in the fourth international race. The 160 horsepower Gnome engine, which will be fitted to the monoplane now being constructed by Burgess Co. & Curtis, Marblehead, Mass., for the syndicate, has arrived at Marblehead. During its trials it developed a speed of 135 miles an hour. It is expected to exceed 110 miles an hour when placed in the new machine. Marcel Tournier has been secured as operator.

Moreau of France recently tried out a new monoplane fitted with an automatic stabilizing device at Combe-la-Ville, with which he claims to have flown 30 miles without touching any of the control levers. The device comprises an oscillating pendulum contrivance underneath the main portion of the aeroplane. Additional information will be awaited with interest.

Having decided that the international specifications regarding the necessary tests for securing a pilot's license are not strict enough to mark a flyer as competent to handle his machine under unusual conditions, the Aero Club of America announces that in the future it will issue "expert aviator's certificates." Among other things, the applicant will be required to undergo a physical examination.

It appears that Belgium is to be represented by three aviators in the international race, although but one, Charles Morok, was named originally. Each nation is entitled to three representatives, but when Morok was announced, no other names were mentioned and it was supposed that he would be compelled to uphold the honor of his native land alone. The Aero Club of America has now received a cablegram from Brussels, advising that Leon De Brouckere, one of the wealthiest aeroplane constructors in Belgium and himself a retired pilot, will send two additional representatives. Their names have not been made public.

The elimination trials for the French team in the fourth international race for the Gordon-Bennett cup at Chicago, Sept. 9, held last month, resulted in the selection of Jules Vedrines, Maurice Prevost and Andre Frey. The first two fly Deperdussin monoplanes and the last an Hanroit monoplane. Guillaume Busson and Alfred Liger will accompany them as substitutes.

Vedrines, who it will be remembered was severely injured early in the summer and was considered as entirely eliminated as a possible entrant for the forthcoming race, drove his 140 horsepower machine at a speed of nearly 105 miles an hour, securing new world's records from 10 to 200 kilometers, exceeding his own former marks, as follows:

Kilos.	Old Record.	New Record.
10	3:34.4	3:33.0
20	7:14.0	7:08.0
30	10:53.8	10:41.0
40	14:32.2	14:14.0
50	18:10.4	17:46.0
100	36:23.2	35:23.0
150	54:37.6	53:03.4
200	1:15:20.8	1:10:49.2

At the same time Frey created new world's records for a flight with one passenger from 10 to 150 kilometers, exceeding those previously held by Legagneux, as follows:

Kilos.	Old Record.	New Record.
10	4:45.8	4:30.2
20	9:32.0	9:01.0
30	14:21.4	13:30.0
40	19:09.0	18:01.0
50	23:59.0	22:31.2
100	48:03.4	44:56.2
150	1:13:04.0	1:07:19.0

The Aero Club de France has arranged an hydraeroplane meet which will take place in the Bay of St. Malo, Aug. 24-26. Prizes aggregating 41,000 francs have been offered for a series of events, among which is scheduled a race from the Bay of St. Malo to the Isle of Jersey and return.

The Austrian minister of war has given orders for the construction of 35 additional aeroplanes, which will place 51 machines at the disposal of the army.

The Italian government has decided to organize a regiment of aviators, divided into two companies, the officers being a lieutenant-colonel, major, 12 captains and 24 lieutenants and sub-lieutenants.

DEVICES THAT DETECT INEFFICIENCY.

Modern Conditions Require Some Means of Revealing Misuse of Both Pleasure and Commercial Cars—What Has Been Accomplished in Solving the Problem.

WITH the growing importance of the motor car as an economic factor in the business life of the world, certain problems have arisen, many of which are by no means easy of solution, unless some special means is undertaken. The so-called pleasure car is no longer regarded strictly as such. Even when it is employed a considerable portion of the time as a means for securing enjoyment, there are many hours of the day when it is utilized solely for business purposes.

As an illustration in point, let it be assumed that a business man owns a car which is at the disposal of his wife and daughters a greater part of the time. They utilize it in shopping, in making social calls, in taking daily drives in the park or into the country, etc. It is called into service in the morning to take the owner to the office, and in the afternoon to bring him home again. This is the general use to which the car is put, and a false nomenclature has bestowed upon a machine thus employed the designation of pleasure car. It will be seen, however, that the service is in every way necessary, and while it would be equally as incorrect to term it a commercial vehicle, it nevertheless occupies an important place in the daily life of that family—of the business life of the home.

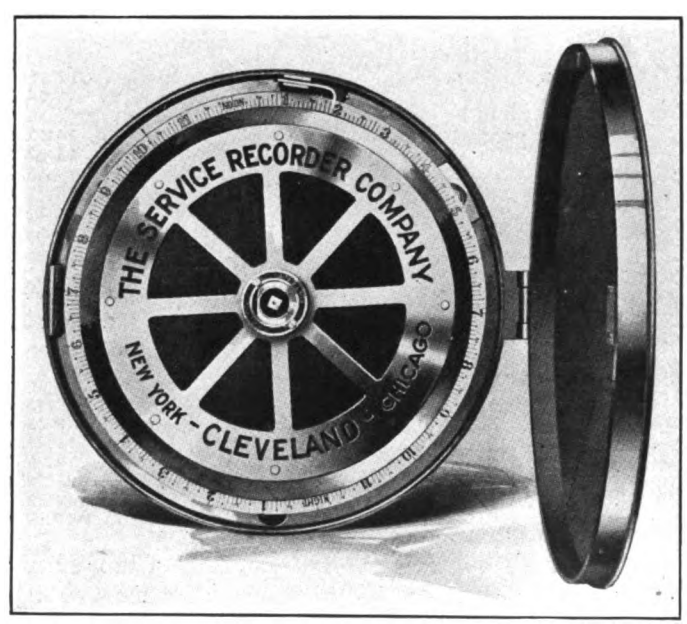

Fig. 1—ServiS Recorder in Its Metal Case, Open for Inspe tion.

Under such circumstances, and in numerous other instances of a like character, it devolves upon the chauffeur to assume the responsibility for the machine. It matters little whether the car is housed in a private garage or at a public service station, it is to the chauffeur that the owner must look for its proper condition at all times.

This brings up one of the problems that has confronted the public garage proprietor ever since the automobile became a practical institution. Some provision must be made for guarding against improper use of the machine, and it manifestly is unfair for the garage proprietor to be expected to accept a responsibility that should rest upon the owner or the chauffeur. In most cases some rule is adopted with reference to permitting the car to leave the garage at certain periods of the day or night without the owner's knowledge. It may be that a written order is required, or the car will be delivered to the chauffeur upon a telephone message. In any event it is fully understood that the owner must at all times assume the risk of false representation on the part of the chauffeur or others.

In the matter of the motor truck, or the car that is utilized solely for commercial purposes, there are other problems that enter into the consideration. That the mechanical transport is a factor for economy is generally admitted, but it has been indicated by careful study of the situation that the greatest economy is realized only when the maximum efficiency is secured. Certain leaks must be eliminated, but it first becomes necessary to learn where the leaks exist. And here, the chauffeur, or operator, is often called upon to assume responsibilities that belong elsewhere.

It is impossible in a discussion of this nature to point to all the circumstances which make it desirable that the owner of either a pleasure or commercial car shall be in a position to know at all times just how his machine is being employed. Any automobile means an investment of some moment. It is unwise to depend upon chance

Digitized by Google

when it is possible to obtain accurate knowledge. Any owner will be able to supplement the examples recalled herein by others which indicate in like manner the desirability of securing absolutely dependable information of this character.

There are a number of instruments in the market which were designed primarily for the purpose of supplying this need. They are applicable to all types of vehicles, whether motor driven or horse drawn, but it will be agreed that the peculiar demands of the motor car situation were responsible for their appearance. It is not the object of this discussion to suggest the advantage of one type over another, but merely to present the demand which they aim to fill and the claims made by the manufacturer of each. It is assumed that the owner, chauffeur, garage proprietor or business man will be interested in these descriptions and be able to decide for himself where they will be applicable to his needs.

"The man in the box" is the name which has been applied to the ServiS recorder, made by the Service Recorder Company, 2344 East 105th street, Cleveland, O. The designation is signally appropriate, since the device is enclosed in a neat little brass case, which may be located at any convenient place on the car—on the dashboard, under the driver's seat, or as is the case with many department store vehicles, fastened on the wooden frame of the top above the driver's seat. It is claimed by the maker that so long as it is installed parallel with the axle it will register.

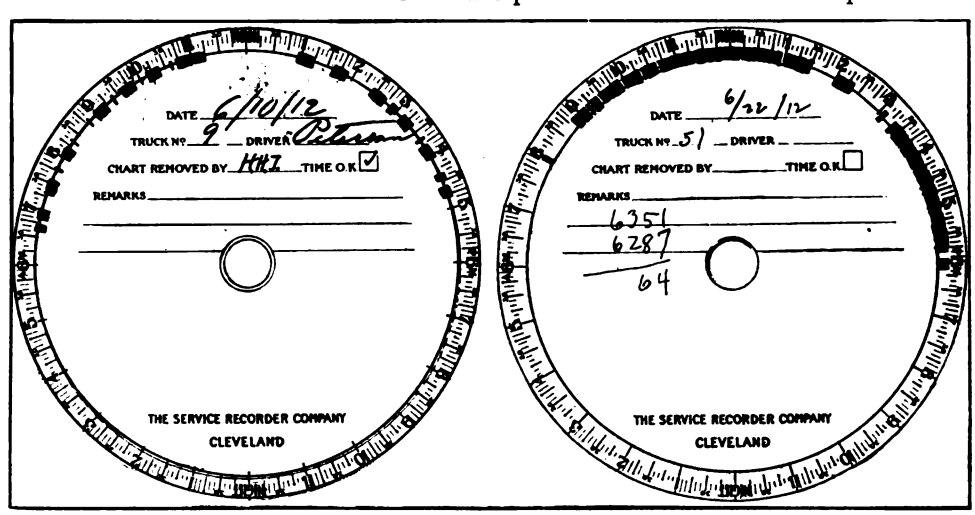

Fig. 2—Typical ServiS Charts: At Left, Utilized by Manufacturing Concern; at Right, by Department Store Delivery System.

The principle is one which may not have become noticeable even to many observant persons; that no motor car, horse wagon, locomotive, or other vehicle can be moved in a forward or backward direction without perceptible oscillation. Even the lightest running automobile cannot be moved across the garage floor without the recorder registering the motion. It is claimed, however, that jarring vibrations and the like are not recorded as travel.

The instrument is patented and has two main mechanical features, the timing and recording mechanisms. The former is a specially designed Seth Thomas eight-day, jewelled movement, built and calibrated to withstand vibration, and securely protected in a sealed housing. It revolves a brass disc once every 24 hours, past a jewel pointed stylus, which registers travel and stop periods on a printed chart of sensitized paper which lies flat on the disc and revolves with it. The stylus, being attached to one end of a free swinging pendulum, marks a thin, clear line on the chart so long as the vehicle is quiet and the pendulum at rest. But when the car is in motion the pendulum is agitated to and fro and the stylus records on the chart a broad "travel" line about .25 inch wide. It is said to be absolutely impossible to fake these lines.

The chart is printed to resemble a 24-hour clock dial, the smallest graduation representing a five-minute period. The travel and stop lines are registered faithfully on the margin of the chart, indicating the exact length of every stop and the duration of every travel period, as well as the exact time at which each occurred, so that the owner has at any time a detailed, legible, accurate record of the car's movements—a complete check on his vehicle. The value of this is, of course, obvious at once.

In the case of the pleasure car, the owner always is informed as to when his machine left the garage, how long it was used, how far and how fast it was driven, what time was utilized in waiting; in fact, a complete record of its movement throughout the day or night. The garage proprietor has nothing to worry him concerning the vehicle thus equipped. The reliable chauffeur has nothing to fear, while the unsatisfactory man is detected at once.

Digitized by Google

With the commercial car, the owner or the delivery superintendent can tell at a glance whether his cars are working to their full capacity, and is enabled to determine just what is holding up the equipment. Not only does the device remove the temptation to use the car improperly or to loaf and then make up time on the road, but the chart brings to light the capable man whose ability perhaps was not fully realized before.

Accompanying illustrations present the device and set forth its method of operation in a measure. It so happens that the two charts at Fig. 2 were taken from cars utilized solely for business purposes, but they indicate the completeness of the record obtained. That at the left depicts one day's work with a manufacturing concern in Cleveland, O. It shows that the driver started at 6:35 in the morning, and that he was busy making deliveries, some of them close together and others far apart, some stops being of short duration and others longer, until 11:30, at which time, it is presumed he went to lunch. The car resumed operations at 1 in the afternoon and continued its delivery work until 4:50, when it was through for the night.

The chart shown at the right of Fig. 2 represents one day's work with a department store in the same city. Here the driver was at the garage just before 8 in the morning and took the car around to the store, where it was standing until 8:50, getting its load. It was busy making deliveries, with very few long waits, until 1:30 in the afternoon, when it returned to the store and made another short run before lunch at 2:20. After lunch it was driven to the store, loaded a third load and was busy until 5:50. After returning to the store at this hour, there was nothing more to do that day, and it was driven to the garage, where it arrived at about 6:05.

Another Cleveland product of the same nature is the Travelog, made by W. H. Brown, 706 Rose building. While it may be stated that the principle upon which it works is similar, it differs materially from that previously described, in that it permits the recording of an entire week's work, instead of one day only. The object sought is the same; namely, a complete record of the day's work, showing starting time, time of all runs and stops, quitting time, overtime, and all other details which will enable the owner or superintendent to detect leaks and suggest a remedy.

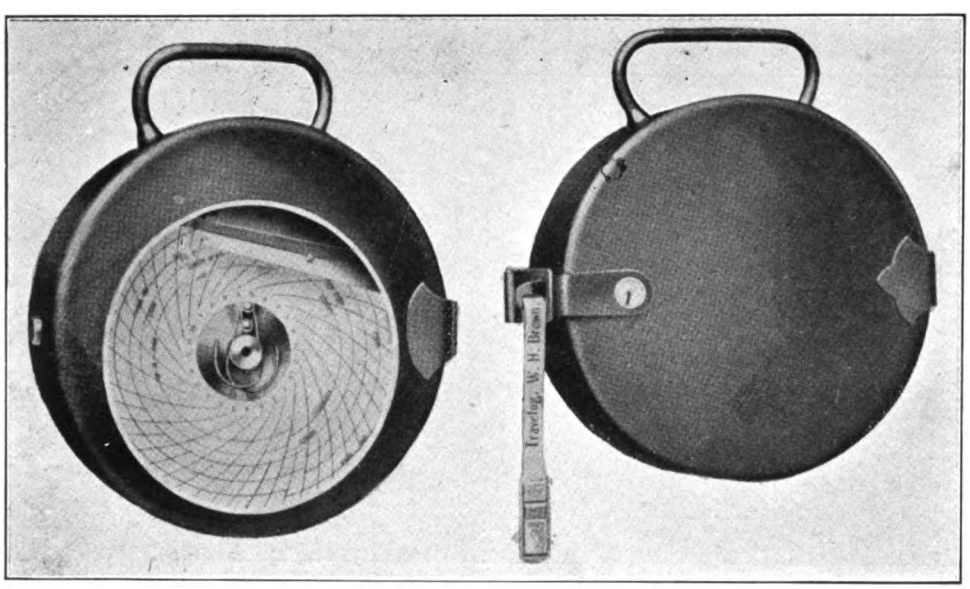

Fig. 3—Front and Rear Views of the Brown Travelog Instrument, Locked and Ready for Installation.

The maker cites the fact that although a large majority of men are conscientiously working for the better interests of their employers, the time clock has been found a necessity. These usually are installed indoors, where most of the work is done under the eyes of the directing foreman. If some method of detecting leaks is recognized as important under such conditions, it must follow that similar arguments will apply outside, where drivers are placed in charge of expensive installations that are utilized under conditions which limit the watchful supervision.

This does not necessarily imply that the driver is lax in his duties, as already has been pointed out. The object of the Travelog is to show where the delays occur, and it transpires more often than otherwise that these are due quite as much to the routing system adopted, as to the inefficiency of the operator. The Travelog possesses a number of special advantages, as well.

The maker claims the device is so sensitive that it records even when the car is touched, the principle employed being that it is actuated by the vibration of the car. The mechanism com-

Digitized by Google

prises an eight-day, 11-jewel standard Howard clock movement, with actuating parts of cold rolled steel, enclosed in a pressed steel case and secured with a Yale lock. It may be located on any part of the car, a bracket attachment being furnished with the case.

Two of the Travelog charts are shown herewith, and it will be noted that provision is made for automatically making a whole week's record without removing the chart. The clock also is wound weekly. The instrument is installed with an open or glass front, possessing the added advantage of affording the operator opportunity to see his record in the making, as well as to read the time of day. The case is about 7.5 inches in diameter, and the chart is a six-inch disc of prepared paper divided into 24-hour periods indicated by radial lines with hour numerals at the centre, half-hours being indicated by half-lines and shorter intervals being measured by sight. The marker traces a fine circular line while the vehicle is standing, and a broad brand while running. Each succeeding day the marker drops toward the centre to delineate a new circle.

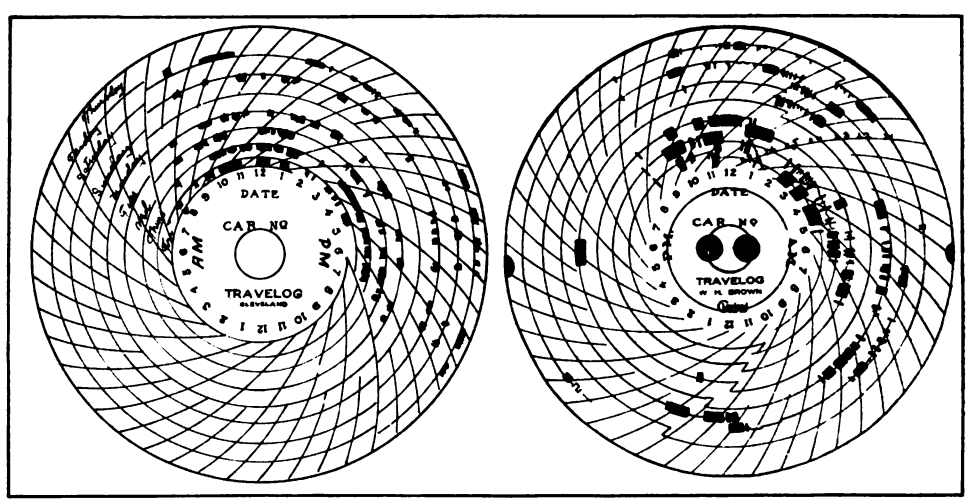

Fig. 4—Specimen Travelog Charts: At Left, Truck Hauling Machinery; at Right, Special Car on Night Work.

The Travelog chart at the left of Fig. 4 was made on a truck hauling machinery. In order to explain fully the runs and stops for the first two days, as an example, it may be stated that the first day, Thursday, the chart was put on at 11:30 in the morning. The truck was moving from 12:40 until 1; 1:25 to 1:35; 1:50 to 2:05; 2:15 to 2:20; 2:30 to 3; 3:30 to 3:55; 4:15 to 4:25, and quit for the day. Friday, the crew left the garage at 6:25 and drove to the storehouse, arriving at 6:35. It left the storehouse at 7:10 and was moving until 7:50. There was a wait until 9:15, after which it ran until 9:40, and ran as follows throughout the remainder of the day: 9:45 to 9:50; 10:15 to 10:25; 10:35 to 10:55, with short stops intervening; 11:15 to 11:50; 1 to 1:05; 1:10 for a short time; 1:45 to 1:50; 2 to 2:10; 2:40 to 2:50; 3:50 to 3:55 and 4:15 to 4:20, when it quit for the day. It also will be noted that the truck began operations each day as follows: Friday, 6:25; Saturday, 6:45; Sunday, rest; Monday, 6:45; Tuesday, 7; Wednesday, 7; Thursday, 7; Friday, 7:20. It quit each day as follows: Thursday, 4:25; Friday, 4:20; Saturday, 4:25; Sunday, rest; Monday, 5:30; Tuesday, 5:30; Wednesday, 5:40; Thursday, 4:15; Friday, taken off at 9 in the morning.

The other Travelog chart was taken from a special car on night work. It shows that the crew boarded the truck at 5:50 in the afternoon of the 21st and started work at 7, going off at 11:30 the next morning. The second day the crew took charge at 6 and the vehicle was in service from 7 in the evening until 5:45 in the morning, with a long hold-up between 11:45 to 3. The 23rd the crew did not show up until 7:40 in the evening, and the truck did not start until 10:05. At 11:25 it was held up until 1:45, and the crew quit work at 6:40 in the morning. The 24th was Sunday, but Saturday it appears the car was used for about an hour between 2:30 and 3:30 in the afternoon, evidently on another job.

While all of these charts present examples with cars of the commercial type, it will be admitted that the result would be the same with so-called pleasure vehicles. Undoubtedly the record might not prove as interesting in a general way, but it would mean quite as much to the individual owner.

The garage proprietor also has an interest in the matter, inasmuch as it can be demonstrated that the utilization of some device of this character will place the owner in a position to detect at once any tendency upon the part of his employee to overstep the bounds of proper service, and put him upon his guard against further lapses. This is a phase of the situation which will be taken up in more detail in a subsequent installment.

MOTORING LAWS AND THEIR ENFORCEMENT.

North Dakota Makes Adequate Provision for Automobile Theft---Interesting Information Concerning Automobile Regulation in the Several States.

A perusal of the motoring laws in the various states would seem to indicate that the legislators had given little thought to the matter of taking a motor vehicle without the owner's permission. Very few of the statutes mention the subject in any manner, and whenever it has become necessary to prosecute offenders in this regard, recourse has generally been had to the common law, although in some instances it has been impossible to secure a conviction, because the court has held that no law existed under which the action could be brought.

North Dakota appears to have taken an advance step in this regard, carrying the matter much further than the actual taking of the car without permission. Under the law of this state, act of 1911, it would be possible to reach the small boy who delights in sounding the signal horn, when the machine is left unattended at the curb. The language of the statute is most explicit, as follows:

Section 13—No person shall tamper with or drive or operate or use a motor vehicle without the permission of the owner, and no person shall, without authority of the person in charge, climb upon or in any automobile, whether the same is in motion or at rest, or hurl stones or other missiles at the same, or the occupants thereof, or shall, while such motor vehicle is at rest and unattended, sound the horn or other signalling device or attempt to manipulate any of the levers, starting crank, brakes or machinery thereof, or set such vehicle in motion, or otherwise damage or interfere with the same.

Any person who enters any warehouse, garage or building of any kind and takes and removes therefrom for his own use or that of others any automobile or motor vehicle, without the knowledge and consent expressed or implied, of the owner thereof, shall be deemed guilty of a misdemeanor, and upon conviction shall be punished as provided in section 18 of this act.

The fact that such automobile or motor vehicle was voluntarily returned to its original place by the party taking the same before or after the owner discovers such removal, or the fact that the party taking the same was then and there in the employ of the owner of such property, shall not be deemed a defense in the prosecution of such offender.

Section 18—Any person who shall violate any of the provisions of this act shall be guilty of a misdemeanor, and shall be punished by a fine of not less than $10 and no more than $50, and if default is made in the payment of such fine such person or persons shall be committed to the county jail until such fine is paid; conditional, however, that each day's service in jail shall be equal to $2 of such fine.

Some surprises will be noted, particularly when it is remembered that North Dakota was a portion of that frontier country, in which swift and certain punishment was meted out to those who violated the law with respect to horse stealing. A fine of not less than $10 or more than $50 for the theft of an automobile, which most assuredly is covered by the wording of the statute, presents a decided contrast with the penalty attached to the older offense, which was by no means regarded as a misdemeanor.

ILLINOIS PROTECTS OWNERS.

Illinois is another state in which the matter is given consideration, although the wording of the statute is not quite as explicit. It simply states that "No chauffeur or other person shall drive or operate any motor vehicle or motor bicycle upon any street, or highway in this state in the absence of the owner of such motor vehicle or motor bicycle without said owner's consent." Although a violation of this provision also is termed a misdemeanor, the punishment provided is a fine of not more than $200. The remainder of the section is of even more interest:

No chauffeur or other person having the care of a motor vehicle for the owner shall receive or take directly or indirectly any bonus, discount or other consideration for the purchase of supplies or parts for such motor vehicle or for work or labor done thereon by others; and no person furnishing such supplies or parts, work or labor, shall give or offer any such chauffeur or any other person having the care of a motor vehicle for the owner thereof, either directly or indirectly any bonus, discount or other consideration thereon. Any person violating any of the provisions of this section shall be guilty of a misdemeanor, and upon conviction shall be fined the sum not exceeding $200 or imprisoned in the county jail for a period not exceeding six months, or both, in the discretion of the court.

MASSACHUSETTS TOWNS LIABLE.

The recent decision of the Massachusetts supreme court setting forth that towns are liable for damage to automobiles or other vehicles by water breaks in the highway is of decided interest to the rural sections of the entire country. From time immemorial it has been the habit of road superintendents in these country towns, when dealing with the problem of hill roads in particular, to construct these water breaks at short intervals and at such points as they deem necessary to divert surface water following heavy rains or melting snows and prevent serious erosion of the roadbed, which otherwise would result therefrom.

Rural dwellers have driven over these water breaks year in and year out, have suffered uncom-

Digitized by Google

plainingly, jolts to themselves and to their butter and eggs and other farm produce, in the belief that they were a necessary evil. Now comes the automobile, with its entirely new class of travellers, and the court finds that neither its occupants nor those of horse drawn vehicles are compelled to submit any longer. Of course, this means better roads, for the country resident as well as the motoring tourist, for no town can afford to shoulder the possibility of constantly recurring damage suits, and some method must be evolved of overcoming the necessity for the offensive water breaks.

MECHANICAL TRAFFIC SIGNAL.

New York City is testing a device invented by Lehman Weil and designed to assist traffic officers at intersecting streets. It is known as the Herz-Van Rust street traffic signal, and consists of an iron standard from which rises a rod 10 feet high. At the top of the rod are two signs, carried at right angles to each other, somewhat similar in appearance to the guide posts at country road crossings. One of these reads "Stop" in red letters, while the other reads "Go Ahead" in black.

The traffic officer is stationed in the centre of the street, as at present, and when he wishes to attract the attention of moving vehicles, he pulls a lever which rings a bell. At the same time the signs are revolved into a position indicating which line of travel shall have the right of way. The whole thing folds into compact carrying space, and weighs less than 10 pounds. It is stated that it can be placed in position in a few seconds.

MANUFACTURER'S TAGS IN JERSEY.

The motor vehicle department of New Jersey has sent out a number of warnings to automobile drivers using manufacturer's license tags. There has been considerable complaint about the use of such tags on cars in general service, whereas the law states that they are to be employed only on machines used for demonstration purposes. Three cases of alleged violation were before the department recently for a hearing.

RESPONSIBILITY FOR BAD ROADS.

The Maine State Automobile Association has taken a determined stand in the matter of protecting motorists in that commonwealth. Sections of the road in Fryeburg and Bridgton were found by the association's representatives to be in dangerous condition, resulting in the following communication to the selectmen of these two towns, signed by President Walter B. Parker of the association:

I wish to notify you that the main road between Bridgton and Fryeburg is in a dangerous condition. Kindly consider this legal notice of the same that the Maine Automobile Association will hold your town liable for any damages that may occur hereafter.

OPERATOR MUST SHOW LICENSE.

Supt. Birmingham of the police department in Bridgeport, Conn., has notified motorists and automobile operators that on and after Aug. 1 it will be wise for them to have their licenses with them at all times. July 29 an order was posted in all of the city precincts, directing the street men to hold up all parties against whom suspicion directed and to compel them to show their licenses. Tourists would do well to remember this order when approaching Bridgeport.

CHILDREN IN THE STREET.

Motorists in Biddeford, Me., have registered a protest with the police department against the practise of allowing children to play in the streets, thus endangering their lives and limbs and the peace of mind of those who drive machines. The statement sets forth that the youngsters will not move even when they hear the warning signal, but remain as long as possible in the highway, jumping aside only at the last moment.

Undoubtedly, Biddeford is not so very different from many other towns in this respect. It will be interesting to note the result of this protest. It would appear, however, that the motorists acted wisely in bringing the matter to the attention of the police, rather than waiting until something happened, for which the operator of the car certainly would have been blamed.

MASSACHUSETTS POLICE ACTIVE.

The police in Weston, Mass., are enforcing the law with respect to sounding the warning signal. The duty of seeking compliance with the law in this respect has been assigned to Constable Ketchum. The name is signally appropriate, to say the least.

The police in Winchester and Pittsfield, Mass., are watching for violations of the law with respect to the use of the muffler cut-out. In Ipswich and Springfield motorists are advised to be particular about sounding horns at street crossings, etc.

BYPASS DEVICE FOR CARBURETORS.

The condition of some motors, especially those having seen considerable service, makes it difficult to adjust the carburetor so that the engine may be throttled, start easy and obtain a maximum efficiency at higher speeds, as well as satisfactory mileage to the gallon of fuel. A bypass device for carburetors has been brought out by an English engineer and for it is claimed features which will interest those who are experiencing difficulty in securing proper carburetion.

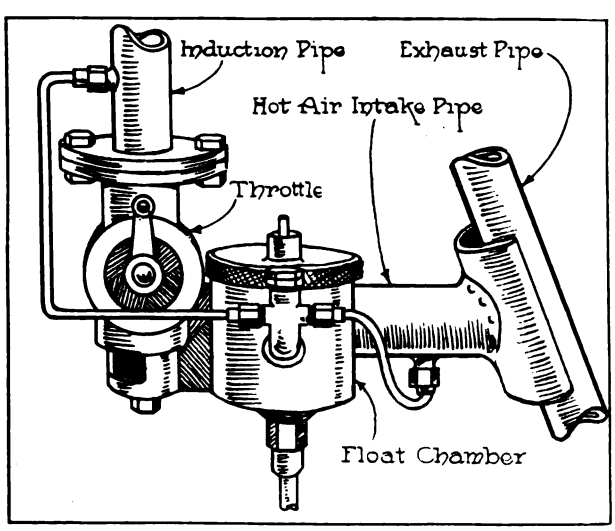

Fig. 1—Bypass Carburetor Device Recently Brought Out Abroad, Which Is Claimed to Make Starting Easy and to Permit of Throttling Motor to Low Speed.

At Fig. 1 is depicted the bypass which is in the form of a small jet chamber, designed for screwing into the float chamber of the carburetor, whence it takes its supply of gasoline. Over the jet of the bypass is an adjustable set screw having a locking nut. By means of this screw the proper mixture may be obtained or the volume of supply regulated.

A mixture is obtained by air passing over the jet, being taken from the main hot air intake of the carburetor through a small copper pipe. A similar tube leads from the bypass to the intake pipe, the entrance being above the flange of the vaporizer.

When the throttle of the vaporizer is closed the vacuum in the intake pipe causes a rich mixture to pass to the motor from the bypass, the amount being such as to enable the engine to be throttled down, it is claimed, to unusually slow speed. It is also stated that when the throttle is in any position other than fully open the partial vacuum in the intake pipe draws a small quantity of gas from the supplementary supply, assisting to keep the strength of the mixture constant and correct at a time when it naturally tends towards weakness. Because of this feature greater flexibility is claimed. Provided the bypass was adjusted properly it appears practical for making easy starting of the motor.

HACO MOTOR STAND.

Any device that is a time saver is a valuable acquisition to the shop. The garage that keeps abreast with the times by installing labor saving equipment is bound to increase its clientele as better service is given and the amount of the repair bill greatly reduced thereby. In the thorough overhaul of the motor it is necessary to change its position frequently in order that it may be convenient for the workman. With the ordinary motor stands one or more men have to be called upon to place the motor in the desired position, an operation taking time.

The Hawthorne Auto Company, Mason City.

Digitized by Google

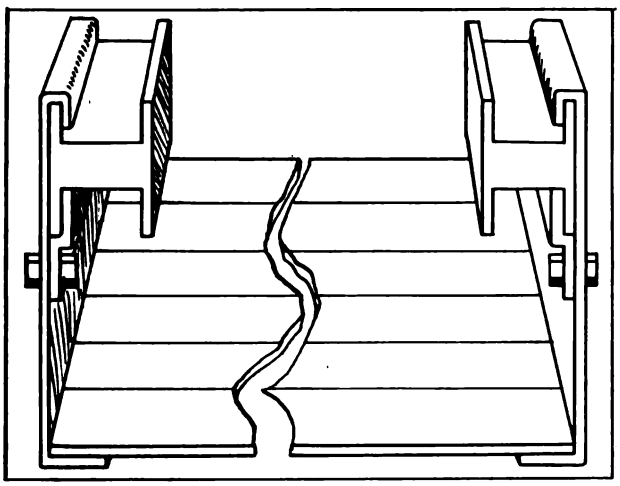

Fig. 2—Method of Utilizing Girder for Shelf Supports, Showing Manner of Attaching Supports.

Ia., is manufacturing the Haco motor stand, which presents many commendable features, as it is so designed that it may be adjusted easily to take any type or size of motor. The stand which is illustrated at Fig. 3 is provided with a swinging frame operated by a worm and worm gear which is self-locking in any position. Motors of the three point suspension type are handled easily by utilizing a cross bar. Another interesting feature is that the flywheel of the motor may be belted to any convenient pulley in order to work in the bearings. Being sturdily constructed and of high grade material danger of breakage to the power plant is eliminated.

DRILLING LICENSE PLATES.

The repairman is frequently called upon to fit new license plates and often the owner desires to have the tags so placed that the members will have to be drilled to take bolts. Some types of plates are covered with a heavy enamel and in drilling, this material is broken easily, detracting from the appearance of the member. The following kink is recommended by a repairman: Place the plate upon a flat piece of wood, clamp in a vise and feed plenty of turpentine to the drill. This will allow the drill to cut a clean hole and without damage to the enamel.

A GIRDER SHELF KINK.

It is surprising how fast old material will accumulate about the repair shop, occupying valuable floor space. This is especially true of the one-story garage. When the building is of wood, it is an easy matter to rig shelves to take care of old lamps, seats, etc., but it is more difficult in the modern brick and concrete structures.

The writer recently noticed a simple method of utilizing the metal girders of a brick garage to support hangers to which were attached shelves. At Fig. 2 is presented the method which consisted of taking .375-inch thick iron strips and forging them to the shape shown. The larger piece was bent to pass over the projection of the girder and another of similar shape was bolted to the large section. The lower end of the main member was bent and drilled for the purpose of securing the boards. The girders being several feet apart the shelf provided considerable space for storage. As will be noted by the drawing four hangers will be needed, two at either end.

AKRON-WILLIAMS VULCANIZER.

In view of the fact that practical and efficient vulcanizing outfits are being marketed it is surprising that more attention has not been given this subject by the repair shop or garage, especially the latter. A large amount of work is being taken by the garage and its customers to regular tire shops, and under such circumstances the commission is very small; that is, the difference between the cost to the owner and dealer is slight.

There is good profit in vulcanizing inner tubes and the garage having the proper equipment should be able to turn out a large amount of work during the year, and in addition, its customers would not be compelled to go outside to have the work done. Believing that there is a field for a low priced, high grade vulcanizer, the Williams Foundry & Machine Company, Akron, O., is marketing what is termed as its No. 0 equipment. The company points out that with it repairs may be made to inner tubes as well as to casings, and

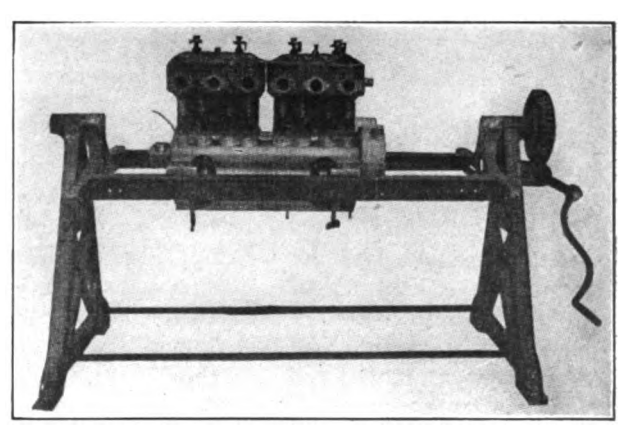

Fig. 3—The Haco Motor Stand, a Design for Holding Engine in Any Desired Position by Means of Worm and Worm Gear Attachment.

Digitized by Google

that the services of an expert are not necessary.

The plant is depicted at Fig. 4 and consists of an eight by 20-inch inner tube vulcanizer with

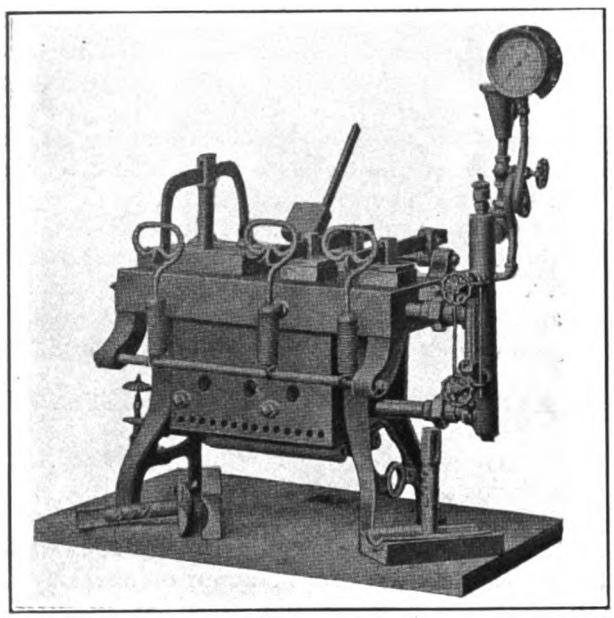

Fig. 4—Moderate Priced Steam Vulcanizing Outfit Designed for Garage Service.

three pressure bars, combined with an efficient steam generator which is fitted with burners for gas or gasoline as desired. The steam generator is complete with burners, steam gauge, safety valve, water gauge and filling funnel. In addition to the presssure bars for inner tube work a set of three blocks with inner cores to cure small casing repairs is provided. The entire outfit is well finished, substantial and of first class material. The maker points out that free instruction will be given, if necessary, as to the proper use of the equipment. Its shipping weight is about 275 pounds.

ABELL TIRE PUMP.

There is a growing tendency among owners to equip their machines with a tire pump operated by the energy of the motor. Some types of motors do not lend themselves readily to installation because of lack of room. The Standard Thermometer Company, Boston, is marketing the Abell tire pump, which is claimed to be the smallest device of its kind and one that is fitted easily to any power plant.

It is of the three-cylinder type, as will be noted by Fig. 5, and is thrown into action by either sliding or clash gearing. The cranks are connected to each other through mitre gears, eliminating a multiple throw crankshaft as well as making a compact unit. The piston has but one set of check valves, these being on the delivery side. The intake supply is through ports in the side of the cylinder, these being uncovered by the piston at the bottom of each stroke. The check valves for the delivery end are steel balls on a bevel bronze seat working against a spring plunger, preventing leakage.

A feature emphasized of the pump is the small amount of clearance between the top of the piston and the cylinder head when the former has attained the end of its stroke. It is pointed out that this clearance is about one or two per cent. of the stroke and that the construction makes for efficiency under high pressure. Ball bearings are utilized throughout, eliminating and preventing lubricant from being pumped into the tires. The device is very light, weighing but six pounds, and it is stated by the maker that it will inflate a 34 by four-inch tire to 80 pounds in 90 seconds when the motor is turning 450 revolutions a minute. Because of its small size it is possible to attach it to the half-time shaft. Each pump is fitted with adjustable brackets, 15 feet of hose, with swivel connection, and a pressure gauge. The Abell pump is constructed of high grade material and is guaranteed for one year against defective material or workmanship.

AN EFFECTIVE DIRT REMOVER.

A contributor to one of the foreign motoring publications recommends the following mixture for removing dirt and grease from the hands:

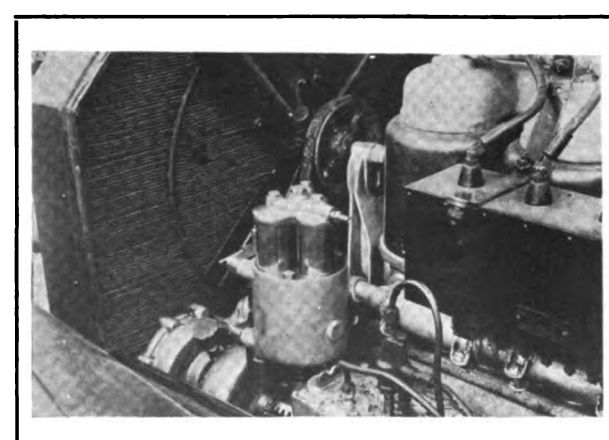

Fig. 5—The Abell Tire Pump, Having Three Cylinders and Weighing but Six Pounds.

Take four ounces of chloride of lime, four ounces of salt and four ounces of water. The ingredients should be well mixed and scrubbed into the hands

Digitized by Google

with a brush. Rinse the hands afterwards with soap and clean water.

SIMPLEX CHARGING SWITCHBOARD.

By the installation of a switchboard the charging of ignition and lighting storage batteries is possible with the small garage equipped with electricity. The improvement made in batteries makes charging more practical by the small shop and as the switchboards are not expensive when properly handled, they should be the means of increasing the yearly profits.

The Electric Storage Battery & Manufacturing Company, Cincinnati, O., is marketing the Simplex switchboard illustrated at Fig. 6 and as will be noted the member is compact, being 11 by 16 by 2.5 inches. A feature of the board is that it is equipped with a bell which rings whenever the rate of charge rises or falls below the proper amount or if the line supply be cut off or reversed. It is claimed by the company that the utilization of charging boards in the garage has not been successful because the rate would be too high or low at times, due to lack of attention, to an open circuit, etc.

The Simplex board utilizes a direct current, although the concern manufactures members adapted for alternating currents. It will charge from two to 45 two-volt storage cells or from one four-volt battery to 15 six-volt members connected in series with each other. The charging rate may be adjusted by means of a small switch lever to two, 2.5, three, 3.5 or four amperes and regulated with the large lever in accordance with the number of cells to be charged.

The board is operated as follows: The large lever is placed on the "start" button, the smaller lever on for example, 2.5 amperes. The batteries to be charged are attached to the binding posts on the bottom of board, these being marked "negative" and "positive." The large lever is then moved to the right until the alarm bell rings, which will be at a point slightly above 2.5 amperes. It is then moved back a button or two until the bell ceases ringing. The bell is then in a sensitive condition and will ring if anything goes wrong; that is, if the charging circuit opens accidentally, by corroded binding posts or purposely, the bell will ring until the trouble is removed. If one or more batteries are removed from the circuit and the rheostat is not reset to the proper rate by the workman in charge, the bell sounds until he does so. If the line supply be cut off or reversed from any cause, the bell rings until the three pole switch at the top of the board is opened. If the ampere rate increases from any cause, the signal is sounded until the large lever is reset.

It is stated by the maker that in practise it is noted that the attendant may not be depended upon to reset his rheostat after removing one or more batteries that are fully charged. This causes an increase of charging rate on those left in circuit. Any such neglect is indicated by the bell. There are no relays or adjustments to make other than setting two switch levers, and the ringing of the bell depends upon the unalterable voltage of the polarization cell at the lower left

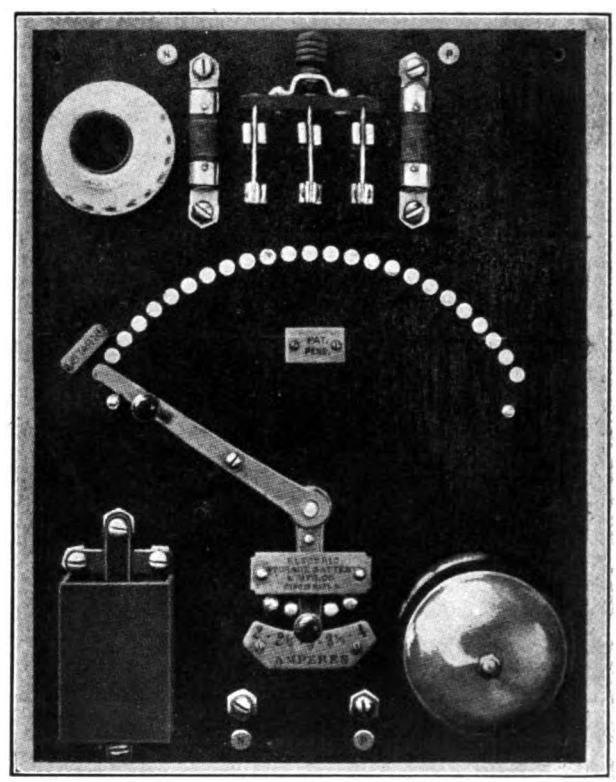

Fig. 6—The Simplex Charging Switchboard Provided with Bell Which Rings When Rate of Current Rises or Falls, Etc.

corner of the board. The latter is nicely finished and is moderately priced.

DRIVE KISSELKARS TO OZARKS.

Four St. Louis owners of KisselKars, made by the Kissel Motor Car Company, Hartford, Wis., started early in the month for a trip to Blue Lodge Springs in the Ozark mountains, a place considered inaccessible by many motorists. The distance is only 270 miles, but the route is an unceasing continuation of difficult hills of the short and steep sort that takes a car with a powerful engine to overcome.

NATIONAL CONTEST AND RACING NEWS.

Results in the Farm and Ranch Tour in Texas—Flanders Electric Routing for Glidden Tour—Plans for Elgin Road Events—Pabst Trophy Becomes a Classic Award—Contest Board Accepts Pacific Coast Records.

Fourteen cars in the touring class finished with perfect scores in the Farm and Ranch tour in Texas, which came to an end in Dallas, July 27, the prize of $1000 being divided equally among the 14, as follows: W. R. Bishop, Carrollton, Franklin; J. M. Howe, Forney, E-M-F; W. R. Mickle, Plano, Chalmers; J. R. Pennington, Whitewright, Buick; R. B. Dunn, Bryan, Mitchell; B. W. Bean, Howe, Studebaker; D. W. Rutherford, Waxahachie, Maxwell; O. L. Sims, Paint Rock, Overland; J. Mantel, Dallas, Hudson; H. V. Kendrick, Malakoff, Hupmobile; W. H. Camp, San Gabriel, Reo; W. R. Newton, Hillsboro, Ford; R. G. Roach, Dallas, Ford. The Holland trophy was awarded to Camp's Reo. In the second division the only car to finish with a perfect score was a Maxwell driven by L. B. Blair of Alvarado.

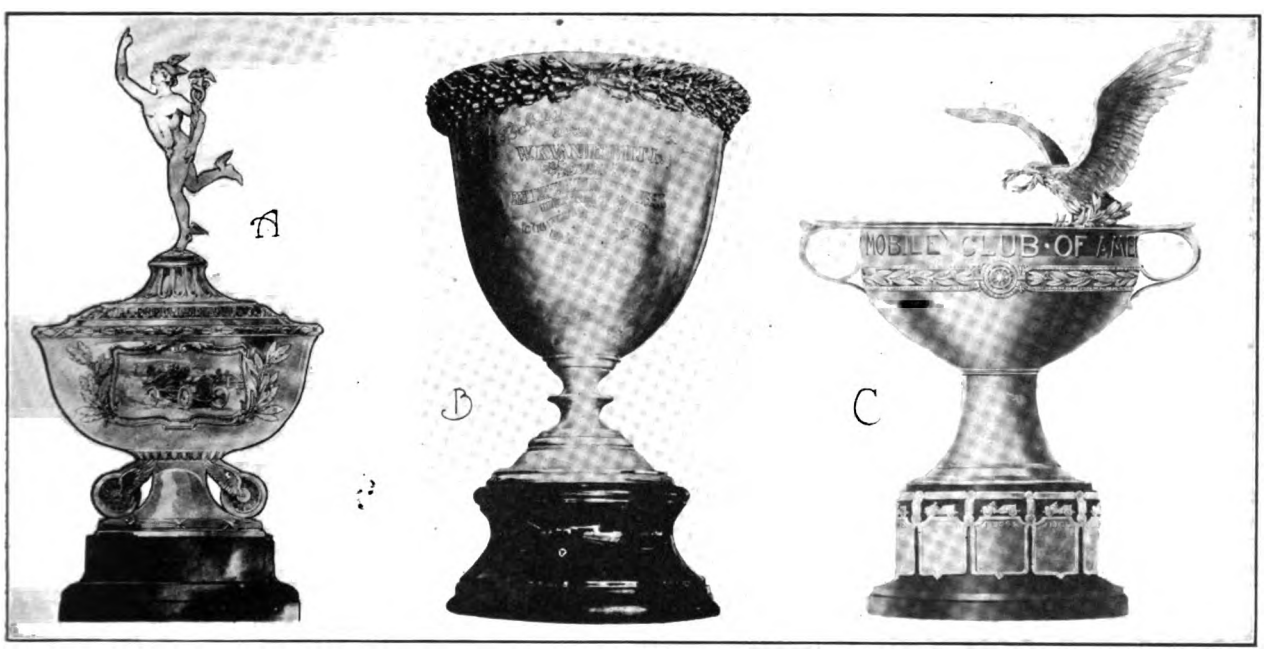
So-Called Cemetery Corner on the Course Selected by the Milwaukee Promoters for the Vanderbilt Cup, Pabst Trophy and Grand Prize Events.

FLANDERS ELECTRIC PATHFINDER.

A Flanders electric car, made by the Flanders Manufacturing Company, Pontiac, Mich., is now on its way from Detroit to New Orleans, laying out the route for the national reliability tour of the American Automobile Association, formerly known as the Glidden tour, which is scheduled to start from Detroit, Oct. 7. This is the first electric machine ever selected for such an undertaking, and its progress is being awaited with much interest.

The route from Detroit to Fort Wayne, Indianapolis and Louisville is familiar, but little is known of that portion below the principal city of Kentucky. From Memphis to Jackson, Baton Rouge and New Orleans the tour will pass over country that has been travelled by private parties, but never has been raised to a standard route. The exact schedule will not be announced until after the pathfinder has completed its trip. It is said the Sunday stop will probably be made in Memphis.

The application for entry blanks and information give proof that the event will be a bigger success than ever before. Three Everitt cars, made by the Everitt Motor Car Company, Detroit, have secured the entry numbers 1, 2 and 3. In the tour the Glidden trophy will be for team competition, the same as last year, while the Anderson cup will be for the runabout class. An added prize will be the A. A. A. cup for the touring car division, and thus every entrant will have something to compete for.



ELGIN ENTRIES MANY.

Since the announcement that the Chicago Automobile Club would assist in the Elgin road races, plans for which were abandoned recently by the Chicago Motor Club, arrangements have steadily progressed, entries are now being received and there is promise of every success in the undertaking. Owing to the shortness of the time the contest board of the American Automobile Association, under whose sanction the events are

Digitized by Google

to be held, has granted an extension and the races will be held Aug. 30-31 instead of Aug. 23-24.

Four events are to be run, including a 100-mile race for light cars, a 300-mile contest for medium cars, a free-for-all and a contest for cars of less than 600 inches. A number of American drivers are included among those whose entries have been received, and attempts are being made to secure Boillot, the French road champion, who won the recent Grand Prix. David Bruce-Brown was the first to file an entry blank. It is not determined what car he will drive. Four Stutz cars are entered, to be driven by Knipper, Zengel, Merz and Anderson. Two Fal-Cars, drivers unnamed; a Mercer with Hughes, and a Benz to be driven by Bergdoll are among the other entries received. It is anticipated that many of the well known drivers will be seen in the various events.

Three Classic Racing Awards: A, the New Pabst Trophy; B, the Vanderbilt Cup; C, the Grand Prize.

THE PABST TROPHY.

Aided by authorities on art and automobile racing, Col. August Pabst of Milwaukee has had designed a trophy for the winner of the light car event to be run in connection with the Vanderbilt and Grand Prize races, that when finished will have few, if any equals. Having in mind the idea of making the Pabst trophy race the light car classic for several years to come, designs were secured from 22 makers in this country and Canada. That drawn by the Louis Esser Company, Milwaukee, was accepted.

The cup will be wrought entirely of sterling silver and will stand over three feet high. Surmounting it will be a winged Mercury, a foot high, its left foot meeting a domed base surrounded by cantas leaves. The dome is removable, leaving the cup proper about 16 inches in diameter. Standing out in bold relief on the bowl is a shield, depicting a car at high speed on a country road. Oak and laurel leaves adorn the sides of the panel, which is in Louis XIV. style. At either side of the base are two winged automobile wheels, symbolic of victory. The whole rests on a beautiful polished ebony base, several inches high, and slightly smaller in diameter than the rim of the cup itself. Undoubtedly it is destined to be one of the blue ribbon features of the automobile industry and of permanent value to it.

Entries are being received rapidly for the three events to be held in Milwaukee the middle of September. The Mercer Automobile Company will make its debut in these international classics, having entered three cars, one for each race. Hugh Hughes will probably pilot the car in the Grand Prize. E. E. Hewlett of Los Angeles, has announced his intention of entering three Fiat machines, and David Bruce-Brown will drive the same Fiat he used in the French Grand Prix race over the Dieppe circuit. Ralph Mulford will probably drive a Benz in the Grand Prize.

Work already has begun toward putting the course in first class condition for the contests and practise will be permitted in the near future.

NEW RECORDS ACCEPTED.

At a meeting of the contest board of the American Automobile Association in New York City, Aug. 2, the original ticket tape of the automatic timing instrument used in the Santa Monica road race of May 4, and at the motordrome meet in Los Angeles the following day, were presented and new records accepted as follows:

Santa Monica road race—Free-for-all, non-stock, 303.012 miles in 3:50:57, Tetzlaff in Fiat; 231-300 class, non-stock, 151.506 miles in 2:10:43.85, De Palma in Mercer; 161-230 class, non-stock, 101-104 miles in 1:37:57.9, Josrimann in Maxwell.

Speedway records, regardless of class—Three miles, 1:54.83; four miles in 2:33.37, and five miles in 3:11.75, all won by Bragg in Fiat.

Class C, speedway records—161-230 inches, 25 miles in 21:12.42, Tower in Flanders special; 231-300 inches, one mile in 0:45.6; two in 1:31.53, three in 2:17.17, four in 3:02.7, five in 3:47.34, 10 in 7:27.33, 15 in 11:11.17 and 20 in 14:56.05, all by De Palma in Mercer; 231-300 inches, 25 miles in 18:53.2, J. Nikrent in Case.

PORT JEFFERSON HILL CLIMB.

J. W. Fallon, a well known promoter of Port Jefferson, Long Island, recently announced that he would endeavor to arrange a hill climbing contest on the Port Jefferson course early in the fall, probably in September. He plans to have the event take place between the Elgin road races and those at Milwaukee. He has the support of a number of influential residents in Port Jefferson and vicinity.

NATIONAL AT WILKESBARRE.

A National car, driven by Whalen, was the most consistent winner in the classes in which it was entered in the races at Wilkesbarre, Penn., recently. Good showings were also made by the Mercer, Buick and E-M-F. The summary:

Three Miles, Non-Stock.

Car.	Driver.	Time.
Buick	Williams	4:21.5
E-M-F	Burke	....
Ford	Douglas	....

Five Miles, Non-Stock.

Buick	Ringler	8:09.5
Mercer	De Palma	....

Five Miles, Non-Stock.

National	Whalen	7:08.0
Mercer	De Palma	....

Cutting	Schaubert	....

Digitized by Google

The Automobile Journal cordially invites the owner, driver, repairman, sales agent and manufacturer to discuss subjects pertinent to the motor car, motorcycle and aeroplane in these columns, believing that the automobile industry and those closely allied with it will be benefited thereby. Complete information dealing with the construction, operation, maintenance and repair of these machines will be published upon the receipt of a communication addressed to the editor of The Automobile Journal. Suggestions or discussions of a mechanical nature, or those facilitating repairs and adjustments, should be accompanied by a rough sketch which will be redrawn for publication. Detailed touring information will be supplied by The Automobile Journal's Touring Bureau upon request. All communications should be accompanied by the full name and address of the sender, but for publication purposes the name will not be used unless desired.

Adjusting Babbitt Connecting Rods.

(1412)—The connecting rods in my model T Ford need adjusting, instructions for which are given in the book. I notice it is stated that they should not be taken up too tight. How is one to determine this? The book says the connecting rod should barely turn of its own weight when inclined in a horizontal position. This would be possible if the cylinders were removed, but I wish to adjust the bearings without going to this trouble.

W. D. M.

Pepperill, Mass., July 19.

It is an excellent plan to follow the instructions of the maker in the matter of operating and adjustment. The rods may be taken up as stated by thinning down the shims a trifle at a time, and replacing and tightening up the connecting rod and bolt, trying the snugness before replacing the cotter pin. The rod should move to and fro fairly easily on the crankpin when a little pressure is applied. Some repairmen make it a practise to take up the bearings very snugly, but if one is not familiar with the work it is best to have them a little loose rather than too tight. If the shims have to be filed care should be exercised in making the surfaces even. Set up each bolt and nut as hard as possible and fit the cotter pin.

Heating Carburetor in Summer.

(1413)—I had considerable argument with a repairman over heating the carburetor in the summer. I maintained that it was not essential to utilize the hot water jacket of the vaporizer and that it should be disconnected in hot weather. The expert maintains that it should be used. Who is right?

ARGUMENT.

Wilmington, Del., June 24.

The object of the circulation of hot water is to aid in the vaporization of the fuel and the jackets were designed for service during cold weather. Several makers of carburetors suggest shutting off the water and fit petcocks for this purpose. The writer is of the opinion that it is unnecessary to heat the carburetor in warm weather and that no material advantage is gained by the use of hot water.

Straight Storage Battery Lighting.

(1414)—Am interested in electric lighting of the automobile and purchased a new car this season which is not fitted with electric lights. I wish to do away with the trouble of lighting the oil lamps when operating nights about the city and on short runs. I have a 60-ampere battery which I took out of my old machine when I traded it in. The new car also has a storage battery. I desire to fit electric lights to the side and tail lamps and use the old battery. Kindly furnish me with information as to proper lamps, how long they would burn, wiring plan, etc.

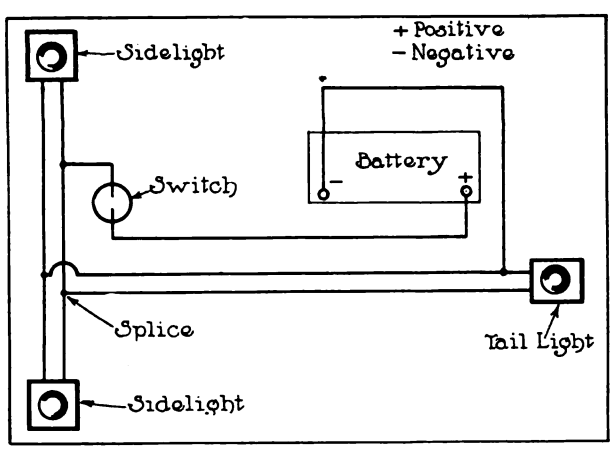
INTERESTED READER.

Newark, N. J., Aug. 1.

Much depends upon the battery as to the success of the lighting equipment, and although the type of battery was not stated, if it is an ignition member it is not adapted for lighting purposes owing to the discharge rate. The writer knows of motorists who are utilizing ignition batteries for lighting and they claim that they obtain efficient service. Electrical engineers, however, point out that a lighting battery only should be employed where the discharge is constant while the lamps are in circuit.

The oil lamps may be converted into electrical units by fitting adapters or converters, the operation involving the cutting of a hole in the side of the lamp for the insertion of the device or drilling holes to permit of the entrance of wires. There are several makes and styles being marketed, the choice being optional with the purchaser.

Regarding the lamps, Mazda or Tungsten members should be used as they are decidedly more economical in the matter of current consumption. Four or six candlepower members are generally employed for the side lamps and a two candlepower for the tail light.



Assuming that four candlepower members were to be utilized in side lights and a two candlepower in the tail, this would make a total of 10 candlepower, which would consume approximately 12.5 watts or two amperes an hour. As the battery is of 60 ampere-hour capacity it is obvious that 30 hours lighting would be obtained. It should also be considered, that as the voltage of the battery falls below a certain point the brilliancy of lamps will become affected. By utilizing two candlepower bulbs in each lamp, the to-

Digitized by Google

tal candlepower would be six, consuming 7.5 watts or 1.2 amperes an hour. The hours burning of the battery would then be 38 hours.

Herewith is presented a simple wiring diagram and it will be noted that the battery leads are marked — and +, denoting negative and positive. The latter is led to the switch, through that member and spliced to the sidelight circuit. The positive lead is spliced to the tail light circuit, which in turn is spliced or cut in on the side lamp circuit as indicated in the drawing.

In wiring, the ignition circuit should not be cut into; that is, one lead from the battery should not be grounded to the frame or the latter utilized as one side of the lighting circuit. The wires should be of flexible cable, thoroughly moisture proof and not smaller than No. 10 or 12. All splices should be well and carefully taped. Connectors should be installed between

Depicting How Side and Tail Lights May Be Lighted by Electricity, Utilizing a Storage Battery.

the leads and lamps so that the latter may be removed easily and another advantage is that a trouble lamp may be fitted into the socket if desired.

The choice of switch is optional, although one of the selective type, permitting the cutting out of the side lamps would effect a saving of current when the acetylene headlights were in service. In selecting the lamp equipment it must be remembered that the voltage is important; that is, the member must correspond to that of the battery. If it be desired to economize on current the tail light and left side lamp may be connected on a circuit by themselves if the statutes of the state permit such a practise.

Annealing Boxes for Small Parts.

(1415)—Referring to an article, "Annealing Boxes for Small Parts," which appeared in your June issue, wherein was recommended for this purpose a piece of pipe threaded at both ends and when packed to screw plug at either end, would say that this method causes a pipe to be pressure tight and is liable to cause accidents as you will agree with me that charcoal contains more or less moisture and consequently with a screw plugged pipe the steam generated cannot escape and will cause an explosion.

It is the better policy to tap one end of the pipe only and employ a screw plug at that end and seal the other with a loosely fitted piece of metal luted with fire clay. It is also advisable to have a small vent at the luted end. I recall several accidents caused by this method and take the liberty of submitting my suggestions.

A. A. BLAICH.

Chicago, July 25.

Elmore Motor Car.

(1416)—Please mail me all the information possible about the Elmore automobile, model 1908, two-cylinder, 30 horsepower. Would like to know what kind of an engine a two-cycle valveless is, as this is the type the car is equipped with. I should like to know whether it is a vertical or horizontal engine and whether they are noisy or not, and if the valveless motor has proven successful.

RAYMOND HILL.

Thebes, Ill., Aug. 2.

The Elmore Manufacturing Company, Clyde, O., will supply all detailed information relative to the model to which reference is made.

The two-cycle motor is valveless, the mixture entering the combustion chamber through ports or openings in the cylinder walls, and these may be two or three, depending upon the design. These openings correspond to the intake and exhaust valve of the four-cycle motor, and are covered and uncovered by the movement of the piston, which draws the mixture from the crankcase by suction.

The term "two-cycle" refers to the cycle of operation. With a motor of this type a power stroke or impulse is obtained every other stroke or one complete revolution of the crankshaft, whereas with the four-cycle an impulse occurs but once in four strokes or two complete revolutions of the crankshaft.

Regarding noise, the two-cycle motor is quiet in its operation, provided, however, it is in good mechanical condition and equipped with an efficient muffler. The two-cycle motor has proven successful, particularly the marine type, and is employed on several makes of motor cars.

Storage Battery Electrolyte.

(1417)—Can you inform me as to the correct proportions of water to chemically pure sulphuric acid that should be used in a storage battery? I have a National battery and desire to replenish the electrolyte, and not possessing a hydrometer do not know how to mix it. If you cannot give me the correct proportions, can you tell me where to purchase a hydrometer. I have a Ford car and they say use a solution of sulphuric acid of 11.75 density, which does not mean specific gravity.

A. H. SHELDON.

Electra, Tex., Aug. 4.

One of the most important factors in efficient service from the storage battery is the condition of the electrolyte. This must be a chemically

Digitized by Google

pure, dilute sulphuric acid of 1285 degrees specific gravity, or 32 degrees Baume. The condition of the electrolyte is ascertained by the use of a hydrometer and the fluid should be tested occasionally when the battery is fully charged.

In the event one is not provided with a hydrometer the solution may be mixed by taking one part pure acid to 2.75 parts of distilled water by bulk or volume. Never use ordinary water, as the iron will injure the plates.

The level of the electrolyte should always be about .25 inch above the tops of the plates, and, as evaporation takes place, should be replaced by distilled water. Always note if the plates are covered before starting to charge. At the end of the charge the specific gravity of the electrolyte should read 1280 degrees. If the gravity is below this point, take out some of the electrolyte, employing a rubber bulb, and add a stronger solution, not exceeding 1350 degrees specific gravity or 37.5 degrees Baume. If the gravity be high, add distilled water. Before testing after either water or higher acid has been added, the solution should be allowed to mix thoroughly.

Hydrometers may be purchased at any motor car supply house and are not expensive. They may be obtained from Chas. E. Miller, 97-103 Reade street, New York City.

Grinding Valves.

(1418)—I have been interested in automobiles for eight years and always have had my valves ground once or twice a season. I found two veterans recently who do not believe it necessary at all. One has run a Rambler 20,000 miles and has never ground the valves. The other ran his E-M-F about 12,000 miles without grinding his. I would like your opinion on the subject.

F. LEINBACH.

Ephrata, Penn., July 22.

There is no set rule relative to grinding valves other than they should receive attention when needed. The material, workmanship and design enter largely into the argument as well as the subject of lubrication. It is obvious if excess lubricant is utilized there will be a tendency to deposit carbon and the exhaust valves will be affected.

Valves may be ground too often, and the writer is of the opinion that some owners perform this work unnecessarily when the lack of compression is due to carbon accumulating on the members through the use of too much oil.

Instances of motors being operated several thousand miles without grinding in the valves are recorded and one is noted in England where an owner ran his machine 30,000 miles after which it was disassembled. The photograph of the valves showed that the members were true in every respect, and quite free from signs of burning or pitting, and the compression was very good.

Cases referred to in the communication are not uncommon and many motorists claim they have operated from 10,000 to 20,000 miles without having to grind the valves and that the members were in good shape when examined. As previously stated, valves should be ground when necessary and as there is a great variance in conditions, it is difficult to mention any stated time.

Intermittent Missing of Cylinder.

(1419)—One cylinder of my E-M-F "30" misses, then picks up and runs smoothly and well. The cover to the switch coil is broken and crimped. It is gutta percha. Have examined every part from switch to magneto, including distributor. It is a Splitdorf. I have put in new spark plugs and had an expert work on it half a day, but it runs just as usual, smooth, then misses, bucks and jumps. Kindly suggest a cure for the trouble.

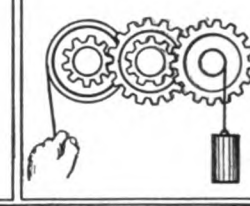
C. C. DUNSWORTH.

Nobility, Tex., Aug. 3.

The trouble indicates faulty ignition and may be due to the switch member being damaged as the missing is spasmodic. If the magneto is in proper condition, and the skipping is present when the car is being operated on the batteries, look for faulty wiring or connections. Try out the ignition with the switch eliminated, making the necessary connections by wires.

If the trouble continues examine troublesome cylinder and note if valves operate properly. It may be that one sticks at times. Sometimes a leaking secondary wire will present the same symptoms.

FORMS AUTO CART COMPANY.



The Auto Cart Company was recently formed in Hallowell, Me., and it is the intention of the incorporators to begin at once the manufacture of commercial motor vehicles. The concern is capitalized for $150,000, and it plans to place on the market gasoline and electric cars. The backing of well known business men in Augusta, Gardiner, Hallowell and other Maine cities has been secured.

DAYTON CLUB ELECTS.

At a recent meeting of the Dayton Automobile Country Club the following officers were elected: President, W. W. Stroop; first vice president, E. A. Deeds; second vice president, Walter S. Kidder; secretary, W. L. Winning; treasurer, S. Rufus Jones. Road improvement and road posting were considered at some length, permanent committees being appointed to have charge of these branches of the club activity.

RECENT MOTOR VEHICLE PATENTS

Clark Spring Protector.

A patent for a spring protector and shock absorber has been granted Robert P. and William H. Clark, Fresno, Cal. A rigid bar is fitted and secured to the usual spring member by clips at the centre and the shape of the bar is such that a space is provided at its ends. To the latter is pivotally connected links having rollers which bear and move on the upper face of the spring when the latter is depressed. The bar device is also equipped with elastic bumpers to check the downward movement of the spring. It is claimed that the roller controls the movement of the spring in such manner that violent shocks are eliminated.

Lloyd-Horry Muffler.

A muffler for internal combustion engines that presents novel features, inasmuch as one of its walls is flexible, has been patented by Alfred Lloyd-Horry, assignor of one-half to Horace Otto Little, San Francisco, Cal. It comprises a chamber having a wall of flexible material which is clamped along its edge portions, and having its body portion free to move under varying pressures within the chamber. The usual inlet and outlet openings are provided, the outlet pipe extending into the chamber and being provided with a number of perforations. The expanding chamber is enclosed in a casing.

Burrowes Horn Device.

Edward T. Burrowes, Portland, Me., has patented an attachment for the bulb type of signal horn which is designed to prevent operation of the member when the machine is left unattended in the street or garage. A valve is incorporated between the bulb and horn, in proximity to the former, and means are incorporated for locking the valve. The latter is locked by moving the bulb into a stated position, the mechanism including a co-operating lug notch and also a spring for retaining the lug in engagement with the notch. The spring is so arranged and located between a part of the valve and wall of the casing that a constant air passage is provided. The valve structure is provided with a large opening when service of the signal is desired, and a smaller discharge aperture for egress of the air when the device is locked.

Stuller Motor Starter.

A self-starting device for internal combustion motors and utilizing compressed air, has been patented by William L. Stuller, Detroit, assignor of one-fourth to George W. Soules, one-sixth to Edward C. Campau, one-sixth to Thomas R. Bell and one-sixth to William H. Soules of the same city. The periphery of the flywheel of the explosive motor is provided with gear teeth which mesh with a pinion on the driving shaft of the starting device which is an air motor, being operated by a tank of compressed air. The pinion is attached to the shaft which moves it into or out of engagement with the flywheel as desired. The piston of the air motor actuates the pinion and the energy is controlled by a manually operated valve and means are incorporated for returning the piston to normal position.

Day Protected Spark Plug.

George F. Day, Winthrop, Mass., has been granted a patent for a protected spark plug, the plug proper being similar in construction to the ordinary members, but is equipped with a protective cover or hood. Instead of utilizing the usual packing nut a circular housing is screwed into the shell and the former serves for a dome like cover or cap. The cable is led through an opening in the side of the circular housing and the aperture being inclined, prevents the entrance of water or foreign elements.

Pierce Carburetor Heater.

A novel method of heating the carburetor is noted in the patent granted Burt Neulon-Pierce, Indianapolis, Ind. The heat of the exhaust of the motor is utilized, it being taken from the exhaust pipe and led through a valve and tube to the vaporizer. A valve is incorporated in the connection at the exhaust member and is operated simultaneously with the throttle of the carburetor, its object being to increase the amount of heat in proportion to the fuel utilized.

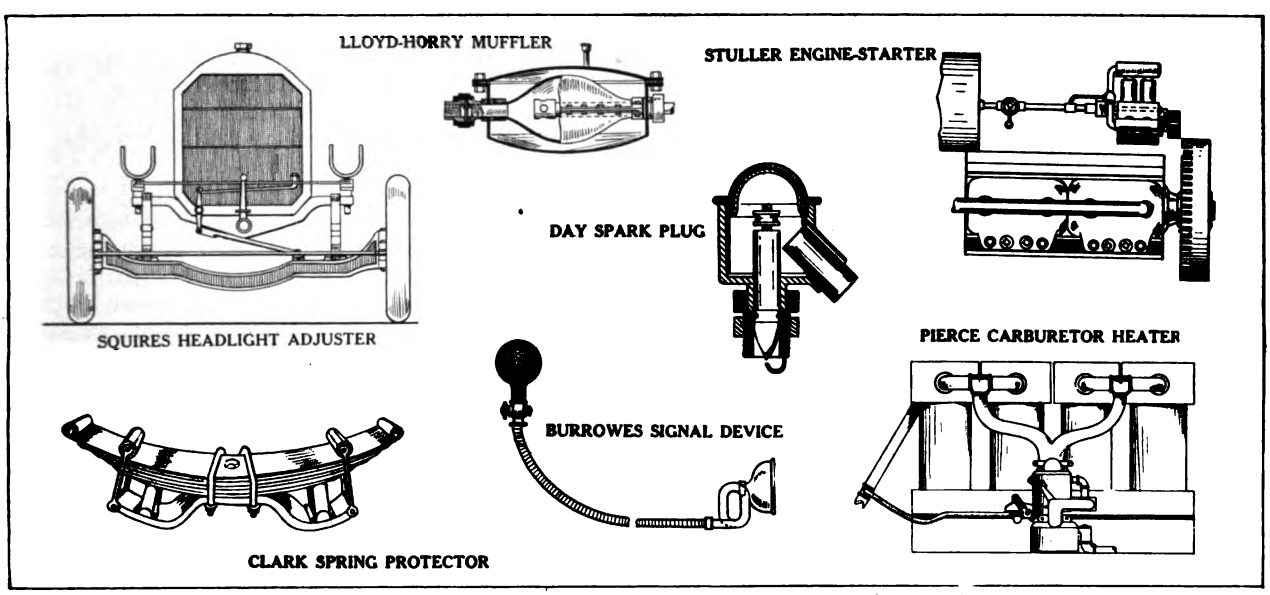
Digitized by Google

Squires Headlight Device.

Among the more recent devices for controlling the direction of the headlights in proportion to the movement of the front wheels, is the invention of Pembroke N. Squires, Canon City, Col., to whom letters patent have been granted. The lamps are pivotally mounted and connected by a rod which is actuated by another rod secured to a pivotally mounted arm on the front cross member of the frame. Mounted on the axle is an arm secured at its middle, and attached to this member is an operating rod secured to the steering mechanism. Another rod connects the axle lever with that on the frame.

OTHER PATENTS GONE TO ISSUE.

Vehicle Wheel, John Sinnott, Philadelphia. A vehicle wheel comprising a hub, a rim, two sets of shoes, one or base of friction material, and a built-up series of overlapping strips of fabric with V shaped ends, united by strips of cementing material, suitable breaker, complemental beads and a rubber tread.



Lathe Dog, Ralph H. West, Cleveland, O. A lathe dog having an opening for the work, a tail piece and a threaded opening for a set screw at substantial right angles to the opening for the work. The body is provided with an integral set screw guard which bridges and overlies the set screw opening.

Vehicle Tire, Howard M. Ambler, Philadelphia. A pneumatic tire having a flanged tread and a solid tire mounted upon flanges which fit those on the casing.

Engine Starter, Ernst A. Bostrom, Atlanta, Ga. The combination of a shaft and crank, an intermediate coupling and means for preventing the reverse direction of crank.

Nut Lock, Charles Thomas Hunt, Los Angeles, Cal. A nut lock comprising a thin annular washer, with a narrow slot therein, and a tooth at each end of the slot projecting inwardly and adapted to engage the bolt.

Carburetor Temperature Regulator, Davis Barnard, Los Angeles, Cal. A thermostatic air regulator, a casing means to conduct cold or hot air to casing, one inlet being regulated by a manually operated shutter while the other side is actuated by a thermostatically operative damper, and a thermostat to operate said damper.

Some of the More Recent Inventions Applicable to the Motor Car, Including a Muffler with Flexible Wall, Self-Starter Operated by Compressed Air, Novel Shock Absorber, Locking Device for Horn, Etc.

set being arranged alternately to the other, and springs between the fixed and movable members, also springs in the spoke housings.

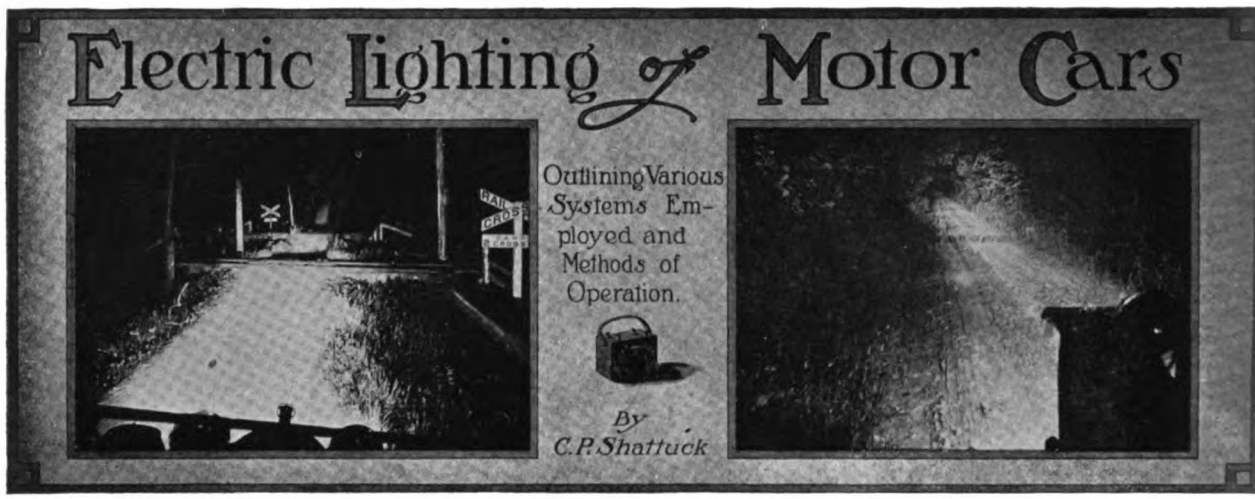
Lubricator, Alexis R. Pribil, Detroit, assignor to the Penberthy Injector Company of the same city. A lubricating cup for explosive motors, having a sight chamber and a ball valve, also means for regulating, starting and stopping the flow of oil.

Battery, Charles F. Burgess and Carl Hambuechen, Madison, Wis. A primary battery having a zinc container with bottom soldered in place; a tar paper disc over said bottom and a porous paper lining, said lining having its upper edge trimmed to lie directly in contact with said container.

Exhaust Purifier, Paul Gerli and Guido Blenio, New York City. A device for purifying the exhaust of an internal combustion motor, comprising a tank located below the muffler and divided by transverse partitions into two end compartments, these constituting inlet and outlet members The chambers are connected by tubes and another compartment is provided with an agitating device.

Vehicle Tire, Le Roy Hess, Joliet, and Adelbert S. Burdick, Lockport, Ill., assignors to Samuel J. Drew, Joliet, Ill. A shoe for pneumatic tires comprising an inner wall

Sanding Device, Earnest Heller, West Nottingham, O. A sanding device for motor cars including a hopper, discharge pipe and spout, means for operating device by pedal, also for automatically restoring spout to normal position and for actuating same.



Automobile Buffer, Allan L. McGregor, Chicago. An automobile bumper device having a buffer bar, clamps for securing to side bars and slidably mounted cushioning springs on arms.

Exhaust Silencer, Franz Emil Wolf, Nowawes, near Potsdam, Germany. A muffler having a plurality of plates fastened together in space relation and so arranged that the noise of the exhaust is throttled.

Puncture Proof Inner Casing, Thomas F. Shiels and Willis Ray Bolter, Lowell, Mich. An inner casing for pneumatic tires comprising a puncture proof fabric formed of an outer layer of canvas, layers of woven cane and other layers of fabric and rubber, the members being vulcanized together. A ring device is utilized for securing the casing.

Wrench, Charles A. Bancroft, Norfolk, Va. A wrench having a nut engaging device mounted in the body portion, a pawl pivotally mounted and means for engaging rotating member operated in either direction.

Digitized by Google

Part XII—Gray & Davis Dynamo System.

CONSTANCY of voltage is vitally important with any electric lighting system utilized with the motor car. Irrespective of the source of energy, whether it be a storage battery or a mechanical generator, the strength of the current should be uniform else the lights will flicker and the efficiency of the equipment be greatly reduced thereby. This fluctuation of current, when generated by a dynamo, is due to the variable speed of the motor of the automobile, and to overcome these speed changes designers of lighting systems employ mechanical or electrical devices, some of which have been outlined in previous installments.

Dynamo-electric machines are classified by the manner of their winding, and when utilized to charge a storage battery are, as a rule, shunt wound. With a dynamo of this type the field magnet coils are placed in a shunt to the armature circuit, so that only a portion of the current generated passes through the field magnet coils, but all the difference of potential of the armature acts at the terminals of the field circuit. In a shunt wound dynamo an increase in the resistance of the external circuit increases the electromotive force, and a decrease in the resistance of the external circuit decreases the electromotive force, a reverse of the series wound dynamo.

Operation of Shunt Wound Dynamo.

In a shunt wound dynamo a continuous balancing of the current occurs, the current dividing at the brushes between the field and external circuit in the inverse proportion to the resistance of these circuits. If the resistance of the external circuit becomes greater, a proportionately greater current passes through the field magnets, and so causes the electromotive force to become greater. If, on the contrary, the resistance of the external circuit decreases, less current passes through the field, and the electromotive force is proportionately decreased.

It is obvious that if the speed and load be constant, the voltage at the brush terminals will be con-

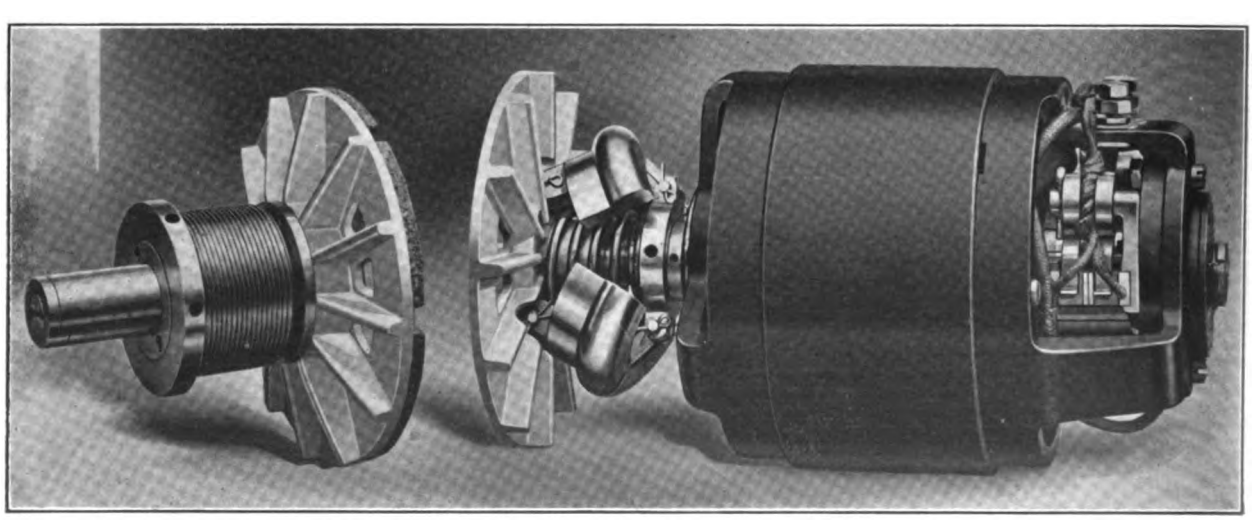


Fig. 79—Components of Gray & Davis Dynamo Removed from Housing to Depict the Simplicity of the Friction Clutch and Governor Components.

Digitized by Google

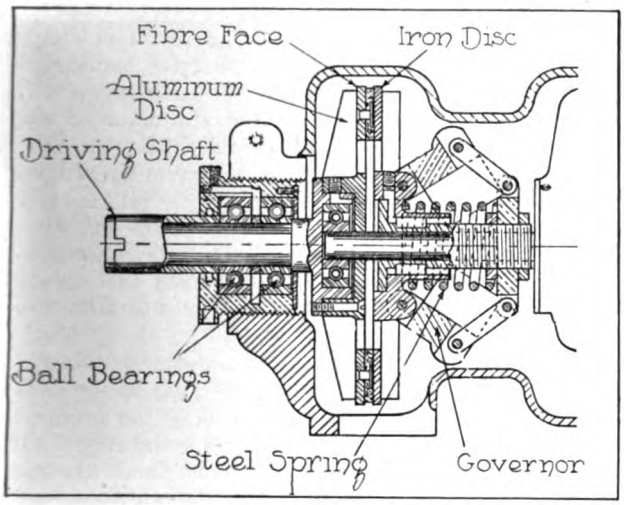

Fig. 80—Outlining Friction Clutch Device and Governor Controlling Operation of Discs.

stant also, but as pointed out, the ever changing speeds of the motor car alter the strength of the current. This is one of the several problems which have confronted electrical engineers in designing a practical dynamo lighting system for the automobile.

Another important factor is the proper charging of the storage battery, as an auxiliary source of current must be provided when the dynamo is inactive or not developing the proper voltage. Means must also be incorporated to disconnect the battery from the dynamo when the latter is operating below the charging speed.

These problems have been solved in the Gray & Davis dynamo lighting system, manufactured by Gray & Davis, Inc., Boston, which comprises a compact dynamo, driven at constant speed and provided with an automatically controlled friction clutch; an electric cut-out for disconnecting the generator from the battery when running below charging speed; a battery, junction box, switch, armored cable and high efficiency lamps.

Features of Dynamo.

A feature of the dynamo is that its speed is held constant and the voltage consequently is closely held. Through the arrangement of the switch connections it operates as a shunt wound machine when charging the battery and as a compound wound dynamo when supplying the lamps directly. This feature is held to be of great importance by the designer as by it the battery is automatically given a tapering charge. Operating at a constant speed of 1200 revolutions a minute, the machine generates a current of six volts and has an effective capacity of 60 watts, 10 amperes, at this voltage. As the group of five lights on the car requires 38 watts, it is obvious there is ample reserve electricity for ignition, signal horn, trouble lamp, cigar lighter, etc.

The variable speeds of the automobile are taken care of by a friction clutch and governor, the latter being of the well known centrifugal type, and controlling the pressure of the contacting plates. The components are depicted at Fig. 80, and it will be noted that the aluminum disc having an .125-inch face of asbestos fibre is secured to a shaft positively driven from the motor car. The other clutch face is a smooth cast iron disc on the dynamo shaft and contact is maintained by a large vanadium steel spring, the latter being actuated by a pair of centrifugal governor weights.

Function of the Governor.

When the dynamo is operating at 1200 revolutions a minute there is no slipping; that is, the contact between the discs is maintained, but when the speed of the explosive motor exceeds this figure the governor weights come into action, causing the iron disc to move more or less out of contact with the aluminum member. The governor weights are so proportioned that the pressure of the spring at normal speed will drive the dynamo with a 50 per cent. overload, but will release completely at five per cent. overspeed. In operation, the clutch faces are held in contact by the spring as the engine speeds up, until the aluminum disc exceeds 1200 revolutions a minute, when the clutch slips enough to hold the dynamo speed at 1200 revolutions a minute, whether the engine speed corresponds to a car speed of 13 or 60 miles an hour.

The secret of the success of the device is due to the proper proportions of the governor weights and the correct resistance of the steel spring, and the problem was solved after considerable experimentation. It is interesting to note in connection with the slipping clutch, inasmuch as it is suggestive of friction and wear, that the company conducted a severe test of the device. The driving clutch disc was revolved at a speed of 3000 revolutions a minute, while the dynamo speed was 1200 revolutions a minute. Under

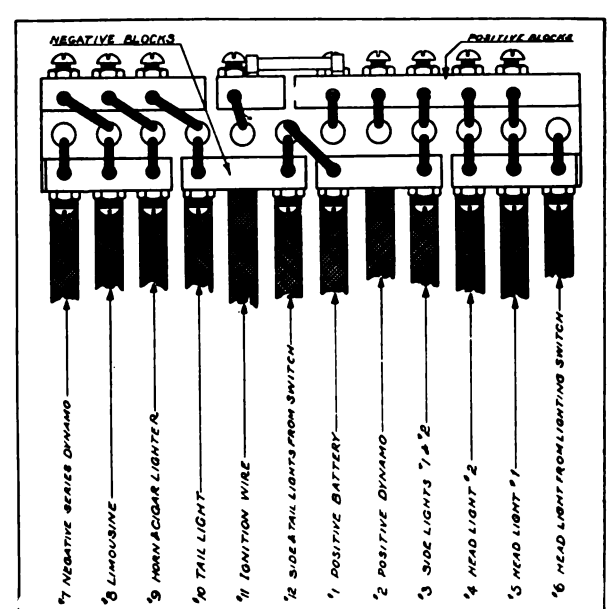

Fig. 81—Junction Box Utilized with Gray & Davis System, Simplifying Wiring of Various Circuits.

Digitized by Google

Fig. 82—Selective Type Switch Employed with Gray & Davis System.

these conditions, the dynamo was allowed to carry its full rated load for 350 hours, corresponding to 10,500 miles of car travel at 30 miles an hour. At the completion of the test the surface of the plates showed no appreciable wear, this being due to the friction surface, which is 16 square inches, and that the heat is dissipated readily by the fan shaped radiating arms on the friction plates, which keep the temperature rise very small. The same air current which ventilates the clutch also serves the dynamo, tests showing a rise above the surrounding air of only 50 degrees Fahrenheit for the dynamo and 60 for the clutch.

A feature of the clutch is that it is adjustable, changing the output of the dynamo should the automobile be employed a greater period at night than in the daytime. All machines, however, are adjusted to carry the full load of side, head and tail lights, 7.5 amperes. The adjustment is a simple matter, being made easily by turning a nut and without opening the dynamo case. The setting is facilitated by the ammeter which records the flow of the current. During the operation, however, the battery is disconnected.

The dynamo may be driven by gears, silent chain or laminated chrome belt, a positive drive being recommended by the company where the installation will permit. When driven by belt, the minimum of the dynamo pulley is three inches and the clearance around the pulley one inch. The maximum horsepower required to operate the dynamo with full load is but .165, which with the compactness of the machine and light weight of 19.5 pounds presents commendable features. The dynamo is furnished to operate clockwise, but it may be run in an opposite direction by simply changing a few wires.

Throughout, the highest grade material and workmanship are incorporated and each dynamo is subjected to exhaustive tests before leaving the factory. Satisfactory service is included in the guarantee. All working parts are enclosed fully and proof against moisture or foreign elements, and although easily accessible the brushes do not require any attention whatsoever, as the commutation is such that these members do not need cleaning oftener than once in every 20,000 miles.

Care of Varying Loads.

The method of maintaining the speed of the dynamo constant has been explained and the next step is caring for the varying loads; that is, when the number of lights turned on or off is increased or diminished. With the Gray & Davis dynamo these variations are balanced by providing the field with a series winding, making the machine compound wound. This series winding is in operation only when the dynamo is supplying current to the lamps. The same electricity that goes to the lamps then flows through the series field winding, with the result that the greater the number of lamps turned on, the stronger will be the magnetic field, thus maintaining constant voltage at the bulbs.

Utilization of Battery.

The battery is utilized to furnish current to the lamps when the dynamo is inoperative and when the speed of the automobile is below 12 miles an hour. The demand upon the battery is such that only a small member is necessary and it is pointed out by the company that being subject to light service and

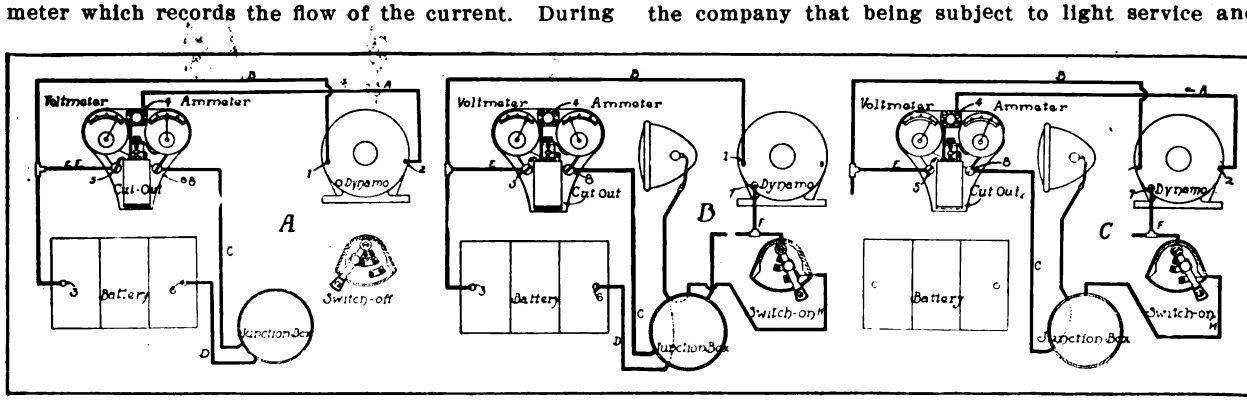

Fig. 83—Operation of System: A, Lights Inoperative and Dynamo Charging Battery; B, Lights Burning, Current Being Supplied by Battery, and Dynamo Inactive; C, Battery Disconnected, Dynamo Furnishing Current to Lamps.

Digitized by Google

being properly charged it is assured of long life. As previously explained the switch connections are such that the dynamo operates as a shunt wound machine when charging the battery, and when the voltage of the cells is low, the charging current is about 10 amperes, diminishing automatically as the voltage of the battery rises during the operation.

Function of Electric Cut-Out.

The office of the cut-out is to cut in the current to the battery when the voltage of the electricity generated by the dynamo reaches a predetermined strength, and to break the connection when the voltage of the dynamo falls below that of the battery, this being necessary to prevent the discharge of the member through the dynamo. The service is performed by an electro-magnet having a compound winding, the fine wire part of which is connected across the dynamo terminals. When the voltage of the dynamo is equal to that of the battery the current through the fine wire winding of the cut-out is strong enough to attract the magnet armature, and this closes the circuit to the battery through the coarse wire winding of the magnet, increasing the pull on the armature and making a contact of low resistance at the points.

When the voltage of the dynamo falls below that of the battery, the latter sends a reverse current through the coarse wire winding of the magnet, weakening the pull on the magnet armature, and causing the dynamo circuit to open and remain in this position until the voltage of the dynamo equals that of the battery. The contacts are made correctly even though considerable vibration is set up by the automobile. Another feature emphasized by the maker is that the dynamo is cut into the battery circuit when the car speed is 12 miles an hour, but is not cut out again until the speed drops to eight miles an hour. This arrangement eliminates that wear which would ensue were the contact points opening and closing continually.

Components of System Outlined.

By a little study of the general plan of the Gray & Davis system outlined at Fig. 84 its operation will be made clear. The connections on the dynamo are as follows: The two brush leads B— and B+ are connected direct to the main terminals on the top of the dynamo, T— on left hand side and T+ on right, when facing the commutator end. The shunt field wires, S 1 and S 2 are also connected to T— and T+. The latter is connected to the No. 2 terminal of the dynamo switch mounted on the instrument base, then through main circuit of cut-out, ammeter and junction box to the positive terminal of the battery.

The negative terminal T— is connected to the — terminal of the battery and this terminal is also connected to the No. 3 terminal of the instrument base, and to the potential coil of cut-out solenoid B and — terminal of voltmeter. When the lights are on they are connected directly to battery except on the positive pole.

Compound Connections.

The compound connections of the dynamo are as follows: One end of the compound wire C is connected to negative dynamo terminal T— and the other C 1 is connected to lever arm No. 1 of the lighting switch, making the necessary combination by means of the switch lever with tail, side and headlights through connections Nos. 2, 3 and 4. These are wired to correspondingly numbered terminals of the junction box. The positive pole of battery + is connected to terminal

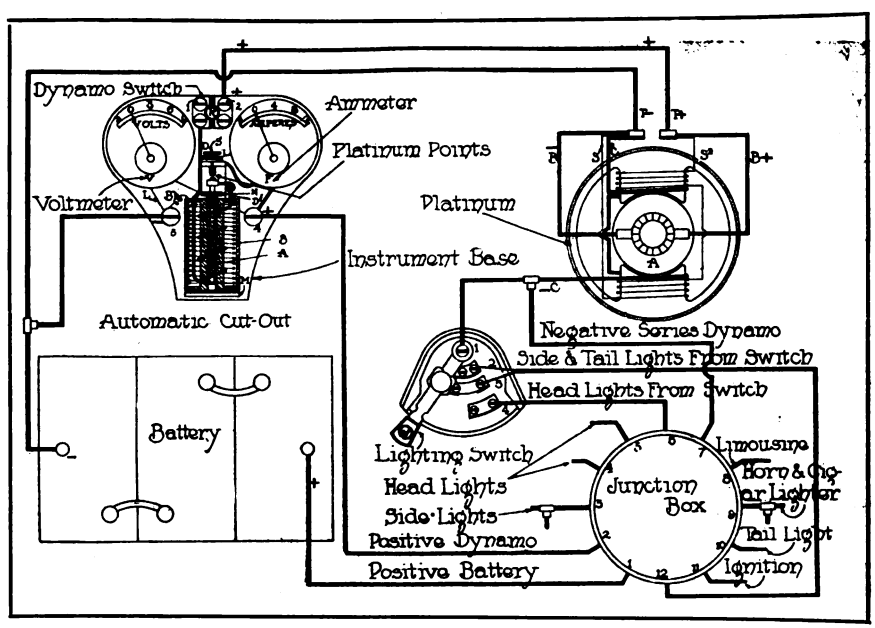

Fig. 84—General Wiring Plan, Showing Path of Current and Location of Components of System.

No. 1 of junction box. The battery ignition circuit is attached to the positive side by a glass enclosed fuse, and thence to ground, this arrangement protecting the lighting system from short circuits. The connections for the lighting groups are defined at Fig. 81, depicting wiring of the junction box, which may be installed as desired.

The automatic cut-out is located on the instrument base together with the voltmeter and ammeter, and dynamo switch R, and the connection for the main dynamo circuit is through the large platinum points indicated in the drawing. Adjustment is provided by the nut N which is compressed by the spring A, keeping the contact points apart when the dynamo voltage falls below six.

A selective type of switch is utilized having a detachable handle, and any combination of lamps may

Digitized by Google

be lighted or cut out. A high grade combined voltmeter and ammeter is included, this member being fitted to the dash facing the operator and by it the operation of the system is noted readily as well as the slightest leak in the wiring detected. A corrector is provided so that in case the indicating hand becomes bent or damaged it can be corrected instantly.

Operation of System.

At Fig. 83 A is presented the circuit when the lights are not being utilized and the dynamo is charging the battery. As the former charges the battery by means of the shunt winding the path of the current may be traced by starting at the dynamo and following it through the cut-out and battery back to the dynamo.

From the positive terminal of the dynamo (terminal No. 2), the electricity flows through wire A to plug switch at cut-out terminal No. 4, through plug switch, cut-out magnet, contact points and ammeter to terminal No. 8 of cut-out; through wire C to positive block of junction box and through wire D to positive terminal of battery (terminal No. 6), through battery to positive terminal of latter No. 3, and through wire B to dynamo terminal No. 1. Wire E is utilized with wire B to supply a negative current to the cut-out in order to connect the battery when the dynamo has attained the necessary speed.

Battery Supplying Current.

At B is shown the condition existing when the dynamo is inoperative, and the battery supplying current to the lamps. Current flows from the positive terminal of the battery (terminal No. 6), through wire D to the positive block of the junction box to the lamp circuit; through lamp, thence back to negative headlight block of junction box to wire H; to the headlight contact of switch; through switch to wire F to series wire of dynamo (terminal No. 7); through series field of dynamo to terminal No. 1, and through wire B to negative terminal of battery (No. 3). The wires C and E carry the battery current to the voltmeter and therefore do not affect the lighting circuit.

Battery Disconnected.

At C is shown the battery disconnected and the dynamo supplying current to the lamps. Beginning at the positive terminal of the dynamo (the No. 2), the current flows through wire A to terminal No. 4 of cut-out through magnet, contact points and ammeter to terminal No. 8, through wire C to junction box, and then to the lamps. From the lamps the current passes through junction box to wire H, and through switch to wire F to terminal No. 7. The current lighting the lamps is supplied by the compound winding of the dynamo (terminals Nos. 2 and 7). Wire B leading from the No. 1 terminal of the dynamo to wire E (terminal No. 5 of the cut-out), is necessary for supplying current to operate the cut-out.

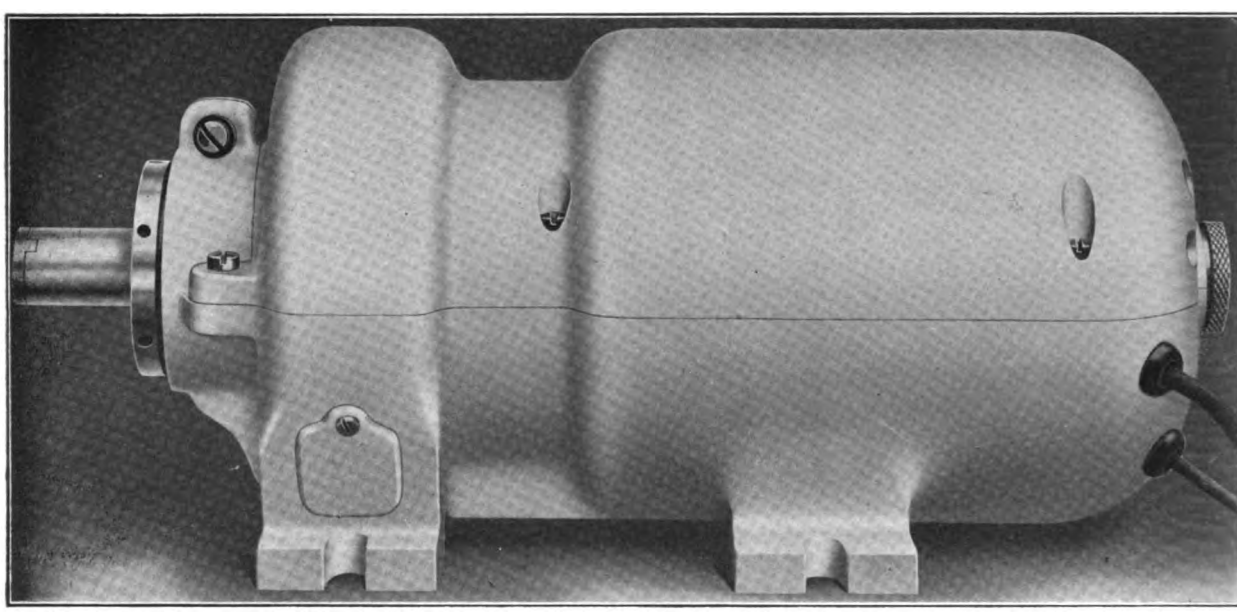

Fig. 85—Gray & Davis Dynamo Which Operates at Constant Speed Regardless of That of the Automobile, Supplying a Steady Voltage to the Lamps.

The battery furnished with the system is a six-volt, 80 ampere-hour member, and is specially designed for the work it has to perform. It is stated by the maker that it will operate all lamps for a period of eight hours and that it should endure as long as the car.

Gray & Davis, Inc., manufactures a large variety of high grade lamps especially adapted to the lighting system but these members, installation and wiring are listed as extra. The equipment is covered by a liberal guarantee and the company points out that its unit has been adopted with success by leading manufacturers of motor cars and has given satisfaction in every respect.

ELEMENTS OF MOTORCYLE CONSTRUCTION.

Part XVI—Continuing the Complete Overhaul of the Mount—Outlining the Renovation of the Power Plant and Pertinent Hints on Doing the Work.

(By C. P. Shattuck.)

THE overhaul of the power plant should be very thorough and in disassembling the unit each and every part ought to be subjected to a minute examination for wear. For this work special measuring instruments will be necessary, such as inside calipers or micrometers for determining the wear of the piston and cylinder walls, etc. This does not mean that the novice will be compelled to purchase the measuring devices, because, as a matter of fact, it will require the services of one familiar with the work to make fine measurements such as thousandths. It is a simple matter, however, to take the parts to a machine shop or expert for the needed inspection.

Previous to this work the motor will have to be disassembled and it is first stripped of all parts such as spark plugs, priming or compression cocks, etc., if these and the cylinder or cylinders were not removed when the engine was in the frame. If the power plant was displaced as a unit, it is carried to the bench and the magneto removed, taking care to note the location of the timing gears and their method of assembly. These members should be inspected as well as the retaining mechanism, as lost motion will affect the timing of the spark and consequent operation of the motor. If the machine be of the battery type, the commutator or timer will have to be removed and to insure correct replacement and timing, the shaft and cam may be marked, although it is an easy matter to retime the ignition.

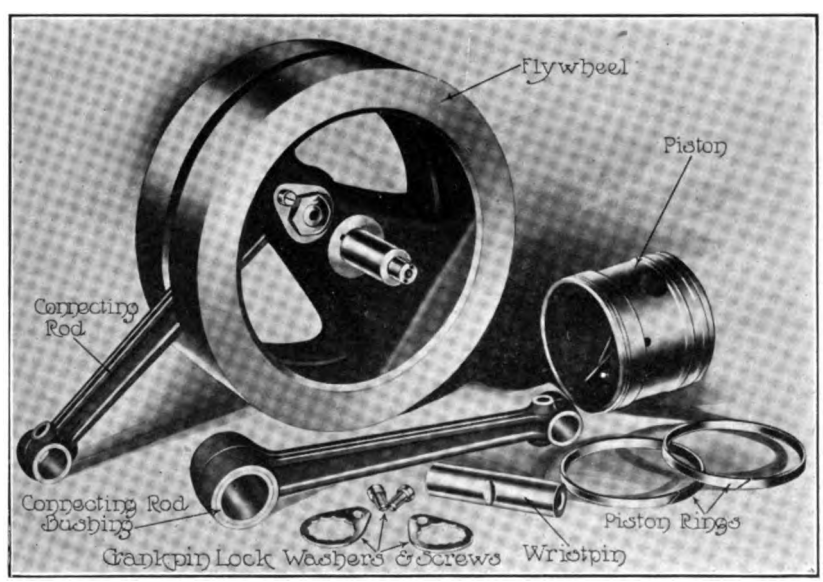

Fig. 91—Depicting the Motor Disassembled and Illustrating Parts Subject to Wear and Needing Adjustment.

Proper Use of Tools.

The next step is to remove the bolts retaining the halves of the crankcase and in performing this work the novice should learn to use his wrench properly, setting up the jaws snugly on the faces of the nut if a monkey wrench be employed, as the slipping of the tool rounds off the edges of the nut, making it difficult to replace it, as well as creating an impression of careless work. After displacing the crankcase members, the flywheel and piston are taken out, washed in gasoline and laid aside until the inspection of the cylinder is completed.

Remove All Carbon.

All carbon should be removed from the cylinder head and in performing the work do not use a sharp tool, one that will scratch the walls, as carbon collects more quickly on rough surfaces. In handling the cylinder it is well to remember that the fins are broken easily. Clean the exterior as well as interior of the cylinder and try it for wear in an oval direction with inside calipers or a micrometer. If not familiar with the work, the cylinder can be taken to the expert and if he discovers that it is as much as four or five thousandths of an inch out, or that serious scores are present, it should be ground, otherwise it may be allowed to pass for the present.

Next measure the largest diameter of the cylinder very carefully at a point about two inches below the top of the travel of the piston and compare the measurement by the aid of outside calipers and feeler gauges with the diameter of the

Digitized by Google

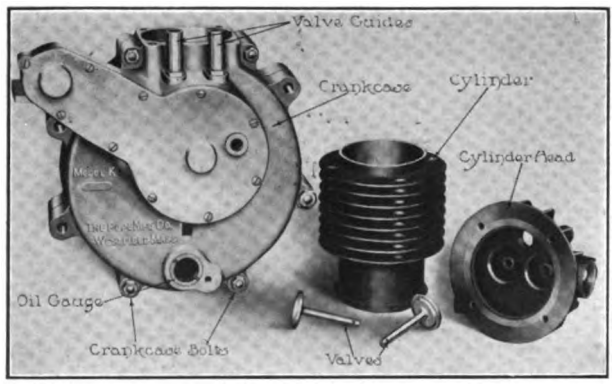

Fig. 92—Outlining Crankcase with Cylinder and Head Removed, also Method of Retaining Halves of Crankcase.

piston across the divisions between the rings. If there is a difference of as much as twenty-five thousandths scrap the old piston and order a new one, as the best fitting rings would only give indifferent service under such conditions, and would be likely to break. If it be decided to regrind the cylinder, another two thousandths should be added to the actual measurement of the piston at its largest diameter. This work, however, should be performed by firms making a specialty of grinding and fitting new pistons.

Fitting New Rings.

Many people make a mistake in thinking they have made a good job in fitting new piston rings when they are only just able to make them enter the mouth of the cylinder. This section is subject to less wear than any other part, and a ring which will barely pass it may have a gap of something like .125 inch when it expands higher up in its working position. Obviously, it is of no use to make the ring larger because of the fact that it could not be placed in the cylinder.

If the cylinder be not scored and is worn larger where the piston travels, it may be lapped out by hand by utilizing a wooden dummy covered with emery cloth. The dummy should be a fair fit in the mouth of the cylinder, and fine emery and oil may be employed from time to time. As the work progresses, the dummy should be enlarged by placing paper between it and the emery cloth. The process is a tedious one and will require considerable patience, but can be performed successfully. If the original piston is retained, care should be exercised to note that the sides of the ring grooves are parallel. If not, the new rings will bind in the grooves, and even if they do not break, will cause excessive friction and wear upon the cylinder walls.

The piston should be thoroughly cleaned, inside and out, as the accumulation of carbon and dirt adds weight to the reciprocating parts, affecting the balance of the motor. In connection with this work the wristpin should be examined for play and any looseness taken up. Several methods of retaining these members are outlined at Fig. 94, the illustration at A depicting how a loose wristpin wears its seat, also showing new, worn and recut ring grooves. As previously pointed out, fitting new rings requires experience and if the cylinder needs grinding and a new piston and rings, the work had best be left to the expert.

If the cylinder is in good condition, it will only be necessary to clean it and the rings. The latter should be removed from the piston as carbon is apt to collect in the grooves, and in taking off the rings care should be exercised as the members are very fragile and broken easily. It is a simple matter, however, to remove and replace them by utilizing thin strips of metal as outlined at Fig. 93. The strips are inserted between the rings and grooves as depicted at A, beginning with the first or top ring and taking the others in order. The carbon is then scraped from the grooves and these examined, after which the rings are replaced, and in this work the order is reversed, as indicated at B, the bottom ring going on first and the others in order. In connection with the rings it should be mentioned that it is important that the slots do not register with each other. If three rings are fitted to the piston and are not pinned, the slots should be spaced evenly from one another as with the openings in line loss of compression will ensue, affecting the efficiency of the motor.

How Valves Are Ground.

The valves may be ground in before or after completing the work on the piston and rings, this being optional with the workman. If mechanical

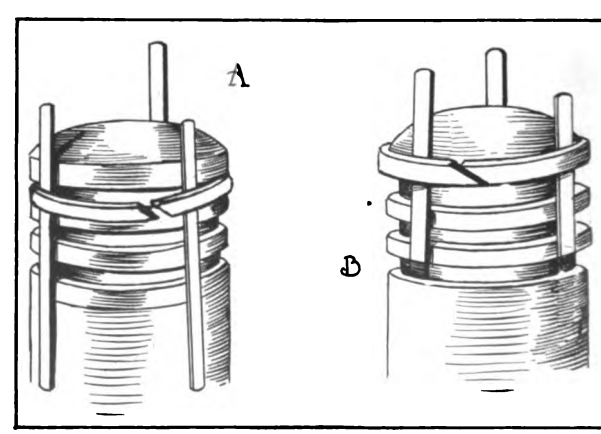

Fig. 93—Piston Rings Should Be Removed to Clean Out Carbon: A, Method of Utilizing Strips of Metal; B, Replacing Rings.

Digitized by Google

valves are employed, both for the intake and exhaust, the valve spring will have to be compressed to remove the retaining cotter pin or key, and for this work a valve lifter will be found useful, although the operation may be performed with a screw driver as a lever. If the valve sticks because of carbon on the stem, try a little kerosene. It may refuse to pass through the guides because of a burred stem as illustrated at Fig. 95 A.

It is important that the exhaust valve seat properly and this member is likely to be pitted or burned if it has not been given attention. If the valve is in bad condition, such as depicted at A, it will have to be refaced and a new seat cut, a task for the expert unless one is equipped for the work. If the valve is in good condition; that is, only slightly pitted, the pits may be removed by grinding. Although there are many excellent

Testing Valve Seats.

The valve is ground until all pits are removed and is smooth. The seat may be tested, if desired by utilizing prussian blue, noting the high spots and continuing the work until a perfect seat is secured. It will be found that the intake valve will not require as much grinding as the exhaust, and upon the completion of the work the valves and cylinder should be thoroughly washed with gasoline. This is important as should any of the abrasive be left in the cylinder, the walls and rings would be cut and damaged. In replacing the valves care should be exercised not to mix the members. If the motor is fitted with an automatic intake valve there will not be any danger of trouble and the member may be ground easily by grasping the stem and rotating it with the fingers. Upon the completion of the work the cylinder may be sent to be nickeled if the owner

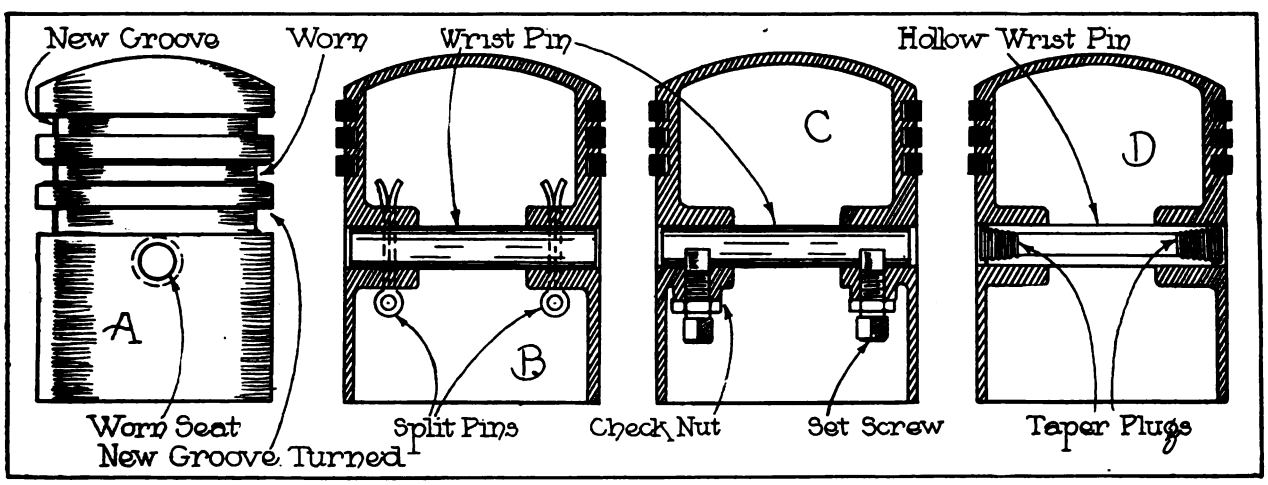

Fig. 94—Outlining Methods of Wristpin Retention: A, Showing How Ring Grooves Wear; B, Securing Wristpin by Split Pins; C, Utilization of Set Screws; D, Fitting Taper Plugs.

grinding preparations upon the market, the writer has obtained good results with the finest carborundum mixed with oil. It is a rapid cutting abrasive and plenty of lubricant should be used.

An ordinary screw driver, one having a round handle being preferred, is employed in grinding and the method of holding the tool is shown at B. The screw driver is rotated in alternate directions and but little if any pressure should be exerted upon the valve; just enough to keep the blade of the tool from slipping. Occasionally the valve should be lifted to prevent the abrasive from lumping in one spot. From time to time remove the valve, wipe off the old compound from it and the seat in the cylinder, and replace with new material. It should be applied only to the valve and not too thickly.

is very particular as to the appearance of the motor.

In connection with valves the kink outlined at Fig. 96 A will prove of interest, it being applicable to the exhaust member and the plan serves a double purpose, inasmuch as it facilitates the work of grinding as well as saves wear of the valve seat. The device consists of a dummy valve seat constructed of hard cast iron. The wood pattern is made similar to the casting required and can be manufactured by anyone possessing mechanical ability.

The pattern is made solid, the holes being bored out afterwards. The seat may be trued up from time to time in a lathe, if required, by running a good fitting mandrel through the valve stem holes, placing this between the centres and putting the carrier on the end guide itself. The

Digitized by Google

dummy should be made roughly of the proportions shown in the drawing, so as not only to withstand a fair amount of hard service and reseating,

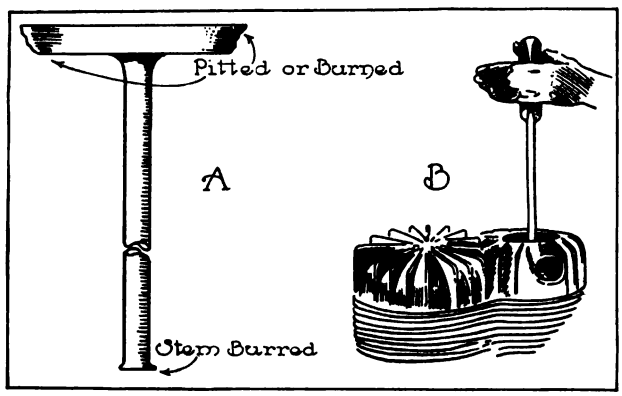

Fig. 95—Valves Should Seat Perfectly: A, Seat Badly Pitted and Stem Burred; B, Showing How Grinding Tool Is Held.

but also to prevent springing when being worked in the lathe.

Those familiar with grinding in valves have probably noticed that a good seat is obtained in the cylinder with but comparatively little work. All the subsequent work required to produce a good seat on the valve wears away and weakens the seat in the cylinder. The old valve should be ground into the dummy first till the valve is bright all around, then grind it in the cylinder till this is also in good shape. The difference will be that very much less grinding will be necessary on the cylinder seat itself owing to the valve seat having already been ground in on the dummy.

Valve Opening Important.

Continued grinding of the exhaust member may cause a decided loss of power and at Fig. 96 B is shown a cylinder seat which was found to be nearly .125 inch below the proper level. Although the compression was good, the ignition and carburetion correct, etc., the mount would not develop speed or climb hills satisfactorily. This was due to the fact that the valve had only about half its effective opening, and that it was practically opening late and closing early at the valve head, although the appearance of its stem was such as would tend to convince one that the member was timed correctly. The drawing also depicts clearly the throttling effect, as the valve head is very little smaller than the recess it had worn away, thus preventing any appreciable valve opening until the head had moved out of the pocket.

Connecting Rod Bearings.

Having completed the overhaul of the cylinder or cylinders, the connecting rod and its bearings are inspected. The small or wristpin end may have too much vertical play. Rocking or side play does not matter in either end; in fact, to a certain extent they are necessary. If too much exists and this cannot be taken up by adjustment, a new pin will have to be fitted or if the old one is retained, a new bushing made. Play in the large end should be treated in a similar manner, except in cases where the crankpin requires replacement, when this should be made a trifle larger and the old bushing lapped out. All oil holes and grooves must be cleaned out carefully and scratches and scores removed.

If plain bearings are utilized for the crankshaft it is a simple matter to estimate the amount of wear left in them. It is important that the bush is a tight fit in the crankcase. When the mount is equipped with a ball bearing crankshaft it must be treated with care and it should be borne in mind that when once wear has taken place to any great extent ball bearings are less liable to resist the resulting hammering effect than the plain bearing. The bushings throughout the timing gear need attention, especially those supporting the exhaust cam wheels.

How to Adjust Bearings.

In performing this work it is important that the crankpin be inspected for wear and if oval should be placed in the lathe and trued up. In removing the boxes care should be taken to note if they are marked to denote proper location and if not they should be to prevent being replaced improperly. In adjusting the large connecting rod or crankpin bearing, it should be set up snugly but not too tight. A simple method of testing

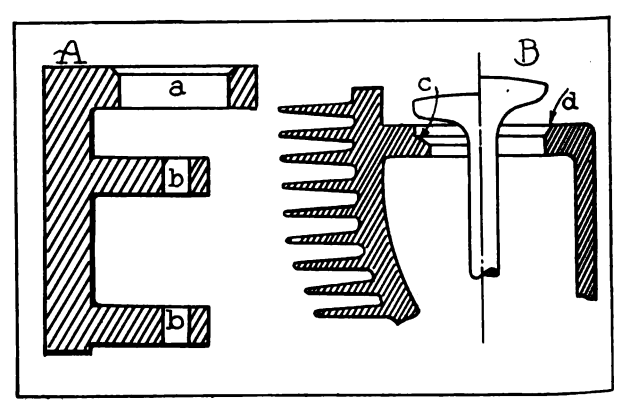

Fig. 96—Hints on Valve Seating: A, Dummy Exhaust Valve Seating; a, the Seating; b, b, Holes for Exhaust Valve Stem; B, Depicting How Seat Is Worn by Repeated Grinding; c, Denoting Reduced Opening; d, Outlining Opening When New.

the adjustment is to place the rod with piston attached in a vertical position and if the rod may be moved to and fro easily, or barely turn of its

Digitized by Google

own weight when inclined in a horizontal position, it may be assumed that the adjustment is correct.

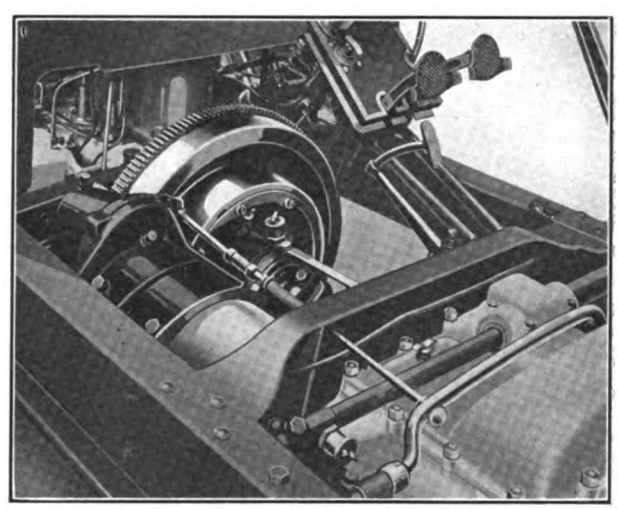
In reducing the boxes, care should be exercised to have the surfaces even. It is quite a knack to file these members true and the novice will accomplish the work more successfully by utilizing a flat board on which is placed a sheet of emery cloth, with the abrasive surface upward. The box is then grasped in the hand, laid upon the cloth and moved back and forth. The member should be tried upon the shaft from time to time for fitting, as this will prevent the mistake of taking too much off the box.

(To Be Continued.)

PERFECTION TIRE FILLER.

An elastic, resilient material designed for replacing air in pneumatic tires, known as the Perfection tire filler, is being introduced by the Perfection Tire Filler Company, 619-621 Old South building, Boston, with factory in Somerville, Mass. It is the result of experimentation covering a period of years, the initial test having been made in December, 1907, and is being sold with a guarantee that it will not disintegrate, oxidize, rot or run, and that it is absolutely unaffected by extreme heat or cold.

It is expected to appeal to all motorists, and particularly to those concerns which have found difficulty in utilizing hard rubber tires on light delivery wagons, etc. The policy of the officials has been that of demonstrating under all road and weather conditions that the new filler was a success, before placing it in the market. Among the claims made for it, are that it will double tire mileage, eliminate tire troubles, hold its original form and maintain resiliency. It is stated that under tests made by the company, shoes in which the Perfection filler was employed remained in service until the fabric eventually wore through entirely.



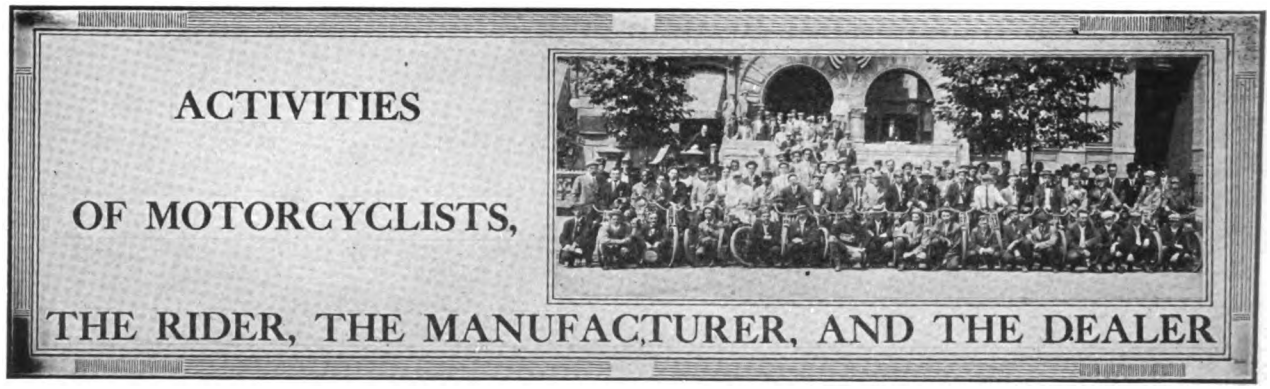
The company is composed of men who are prominent in New England motoring circles, and the factory has been especially fitted for the manufacture of the product. The laboratory is in charge of an expert chemist, and it is maintained by the concern that it is in a position to carry on an aggressive sales campaign.

The Fisk Rubber Company, Chicopee Falls, Mass., has awarded the contract for the erection of two new buildings, one of six stories, 250 by 90 feet, and the other of four stories, 200 by 60 feet.

PEERLESS ADOPTS ELECTRIC STARTER.

Announcement is made by the Peerless Motor Car Company, Cleveland, O., that its six-cylinder models will be equipped with an electric motor starting device which differs in many particulars from those in use. It comprises three separate units, a motor, generator and storage battery, and the motor which was designed especially for the work, is carried on a frame just back of the engine. The motor is mounted in such a manner that it permits of the engaging of a gear with a similar member on the flywheel of the explosive engine, as depicted in the accompanying illustration. Operation is by pedal, which may be so controlled as to permit of the full energy of the 120 ampere-hour battery.

The starter, which is the product of the engineering forces of Gray & Davis, Inc., Boston,



Electric Motor Starter Adopted by the Peerless Motor Car Company, Which Operates at Six Volts.

was subjected to severe tests by the Peerless engineers and it was demonstrated that the device was capable of spinning the largest of Peerless motors for a period of over 30 minutes. It is stated that it will start the largest model Peerless car with clutch in and high gear engaged and propel the machine until the engine picks up. A Peerless 48-six was driven half a mile on the high gear, and it is stated that ample reserve capacity was left in the battery for a number of starts. One of these tests included driving a car up a seven per cent. grade, an eighth of a mile long.

A feature of the starter is that its operation is by a six-volt current, a pressure that is standard in car lighting and favored by the insurance companies. It also eliminates electrical appliances where starting and lighting systems are a unit.

Convention Results.

Aside from the election of officers and the determination of a new national champion, mention of which was made in the last issue of The Automobile Journal, it would appear that the chief results of the annual convention of the Federation of American Motorcyclists were:

Adoption of an amendment to the constitution abolishing the districts and district vice presidents, and substituting therefor state commissioners, as outlined in a previous issue.

Abolishing the committees on touring, hotels and transportation facilities, and creating a touring bureau with a paid manager.

Adoption of a resolution condemning tank riding and the use of the muffler cut-out.

Providing that in case of a vacancy in any elective office, it shall be filled by a two-thirds vote of the entire board of directors.

Providing that it shall require a majority vote of the delegates present at any national assembly to elect any national officer except members of the board of directors, in the selection of which a plurality vote shall be sufficient.

Providing that on petition of at least three directors, any act of any F. A. M. official shall be called up for approval or nullification by the entire board.

Defining an amateur rider as one who has never received, either directly or indirectly since 1906, any compensation whatever for engaging in a motorcycle competition or exhibition; who has never knowingly competed in any sport against a professional, or who has never sold or realized pecuniary benefit from a prize.

Defining a professional as one who has competed for cash, or who since the adoption of the rules has been connected either directly or indirectly with a person or firm that manufactures, assembles, sells or repairs motorcycles, motor vehicles, or internal combustion engines, or operates them as a trade or profession, who competes on tracks where the public is charged an admission, or who has otherwise failed to observe the above rules applied to an amateur.

According to Dr. J. P. Thornley, chairman of the competition committee, this last classification does not mean that anyone connected with the trade automatically becomes a professional rider, but that he remains an amateur so long as he does not compete on tracks where the public is required to pay an admission fee.

ANGOLA ERIE COUNTY NEW YORK

Brockton Riders' Outing.

Brockton, Mass., motorcycle riders to the number of about 30 recently took a run to Providence, R. I., and to other points of interest in the latter state. A shore dinner was served on the Pawtuxet river, following which the riders started on the return trip. The delegation was headed by George V. Gove, his son, Clarence, and Charles Helander, who have been active in attempting to form a club in Brockton to affiliate with the F. A. M.

Jones Speedometer Efficient.

An accompanying illustration presents the members of the police department in Chicago, selected by Capt. A. J. Stiles to look after the violators of the automobile speed law. Each is equipped with an Excelsior mount, on which is fitted a Jones speedometer, made by the Jones Speedometer Company, New Rochelle, N. Y.

G. L. Holmes, general manager of the company, is in receipt of a letter from Capt. Stiles, in which he states that he has tried various makes of speedometers for the purpose of determining that best adapted to this class of work. That the Jones was selected would seem to indicate that in his opinion, at least, there was none better. As is well known it is constructed on the principle of centrifugal force, which is claimed to be absolutely impervious to heat or cold, and therefore especially adapted to the most severe service conditions.

Praises Mobiloil.

The Vacuum Oil Company, Rochester, N. Y., recently received a certificate from Basho Takematsu, its agent in Osaka, Japan, concerning which it has every reason to feel gratified. A translation of the certificate reads as follows:

"On the occasion of the motorcycle race held at Naruo race course, Settsu, on May 5, 1912, under the auspices of the Osaka Chohosha, your Gargoyle Mobiloil "B" was used on the B. S. A.

JOIN THE F. A. M.

which is the National Organization fostering the interests of motorcyclists along legislative and other lines. Cut this out, mail it, and you will get the reasons.

motorcycle of 3.5 horsepower, manufactured in England and sold by us, which won the first championship. We are sure that the success is

Harley-Davidson Mount in Service with the Wisconsin Anti-Tuberculosis Association.

attributable to the excellency of this motorcycle as also to the superior quality of your oil, and hereby certify that Gargoyle Mobiloil "B" is most suitable for the lubrication of this particular machine."

Harley in Tuberculosis Work.

The utility of the motorcycle for campaigning and lecture work is being demonstrated by the Wisconsin Anti-Tuberculosis Association, which recently started a field worker on a tour of the state, carrying a stereopticon machine and an exhibit of 17 charts, together with his own camping kit, all of which is transported on a Harley-Davidson mount, made by the Harley-Davidson Motor Company, Milwaukee, Wis. An accompanying illustration shows the worker in the rural districts.

It is generally recognized by those familiar with this work, that tuberculosis is quite as prevalent in the country as in the cities. This is held to be due largely to the fact that no means has been found, hitherto, for carrying on an educational campaign in these sections. The Wisconsin association feels certain it has solved this portion of the problem through the use of the motorcycle.

Emblem Uses Kerosene.

Mr. and Mrs. M. E. Gale of Angola, N. Y., are enjoying a transcontinental trip on a special motorcycle, built for two, as indicated in an accompanying illustration. It is not at all strange that they should decide upon the Emblem, which is made by the Emblem Manufacturing Company of Angola.

The first portion of the ocean-to-ocean trip was undertaken on the way to the annual convention of the F. A. M. at Columbus, O., Mr. and Mrs. Gale joining the northeastern tourists at Evans Center, just beyond Buffalo. Incidentally it may be remarked that shortly before reaching Zanesville, O., this Emblem ran out of gasoline, and Mr. Gale was forced to secure additional fuel. The best he could obtain was some kerosene from a nearby farmhouse, and the Emblem special ran into Zanesville on this, quite as easily as if it had been gasoline of the very best test. It would appear that the owner of an Emblem was independent of fuel shortage.

Cox Leaves Pope Concern.

The resignation of J. Frederic Cox as general manager of the bicycle and motorcycle departments of the Pope Manufacturing Company, Hartford, Conn., was recently announced. After being with the Pope concern for 27 years, Mr. Cox is to devote his energies to the manufacture of wire screens, having been elected president of the E. T. Burrowes Company, Portland, Me., but a short time ago. L. D. Harden, for several years assistant manager of the bicycle and motorcycle departments of the Pope company, has been made general manager to succeed Mr. Cox, while Frederick W. Starr, for some time assistant manager

Mr. and Mrs. M. E. Gale of Angola, N. Y., Who Are Crossing the Continent on an Emblem Special.

of the bicycle plant of the concern in Westfield, Mass., has been promoted to Mr. Harden's former berth.

Home from Long Tour.

Second Assistant Secretary of State A. A. Adee, who has been taking an annual motorcycle trip through Europe for several years, has just returned to his duties in Washington from his 1912 outing. This year Mr. Adee travelled nearly 18,000 miles, his itinerary covering a large circle, beginning and ending at Havre, France, and approaching within a few miles of the Mediterranean on the south. Such is the pleasure he gets from these annual trips that Mr. Adee says he would not forego them for a great deal.

Hendee Company Gives Cup.

The Hendee Manufacturing Company, Springfield, Mass., maker of the Indian motorcycle, has offered an Indian loving cup to the rider making the best time on a seven horsepower Indian at the races to be held in Albuquerque, N. M., Sept. 2. The meeting, which will be for amateurs, will be the first under the auspices of the Albuquerque Motorcycle Club. Races will be on a half-mile dirt track.

Recent Affiliations.

E. M. Estabrook, chairman of the F. A. M. membership committee, announces recent affiliations as follows: Michigan City Motorcycle Club, Michigan City, Ind., No. 296; J. E. Edsall, secretary, 902 Pine street, 12 members. Champaign Motorcycle Club, Champaign County, Ohio, 297; F. A. Harenburg, 424 Louden street, Urbana, O., secretary, 22 members. Victoria Motorcycle Club, Victoria, B. C., 299; L. W. Lillie, box 1440, secretary, 21 members.

Two Extremes on an Indian.

That the motorcycle affords proper enjoyment for youth and old age is evident from the accompanying illustration, which presents Chester Robbins of Waltham, Mass., 24 years old, and Richard Osgood, of the same city, 74, on an Indian mount with tandem attachment. Mr. Osgood declares a man never should be too old to thoroughly enjoy a good ride on a good motorcycle.

New Pope Model Announced.

The Pope Manufacturing Company, Hartford, Conn., recently announced a new model, to be known as the Pope "Big 4." The motor equipment will consist of a four horsepower engine with offset cylinder, fitted with mechanically operated valves in centre of head. The clutch and idler is worked by one lever, and among the improvements is a new spring lock. The wheelbase is 56 inches and the wheel equipment 28-inch. The Eclipse free engine clutch is to be used, also an imported magneto.

The New Noiseless F. N.

The American F. N. Company, Newtonville station, Boston, Mass., is presenting the latest

The Pope Model K, a New Four Horsepower Single-Cylinder Machine Produced in Hartford, Conn.

run at a very low speed and permits of easy starting. An independent gasoline filter insures better separation of the impurities contained in the fuel, and is said to do away entirely with the trouble which so often arises from a choked jet.

The lubrication is automatic by a pump, which can work as a sight feed oiler, and at the same time make the lubricating mechanism as simple as possible. The pump is placed inside the tank, thus completely protecting it from shocks. An improved spring fork makes for comfort in riding, and a new second brake acts on the front wheel rim. The machine is completed by a very practical luggage carrier. A two-speed gear is listed as extra.

Club Notes, Here and There.

Clinton Hull, for some time president of the Tacoma Motorcycle Club, Tacoma, Wash., has been succeeded by John McGain, who will hereafter assume the duties of that office.

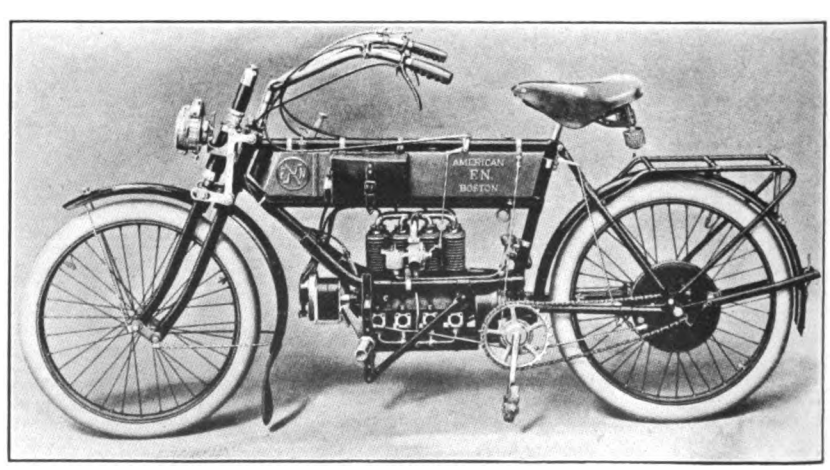
Floyd W. Baum, captain of the motorcycle club at the University of Illinois, is on his way around the world on his mount.

The Sodus Motorcycle Club was recently organized in Sodus, N. Y., and has a membership of 12. The officers are: President, W. H. Poweel; secretary, C. K. Knapp; treasurer, W. A. Northrup; captain, F. H. Turner. The club's first run was to Rochester and return, a distance of 102 miles.

The Kenosha Motorcycle Club of Kenosha, Wis., recently held an endurance run for members from Kenosha to Geneva, to Milwaukee and return, a total distance of 140 miles.

William Ward, Jr., and Richard Ward of Camden, N .J., recently started on a tour of the New England states on Pope motorcycles, made by the Pope Manufacturing Company, Hartford, Conn. While in Hartford they visited the Pope plant and also the bicycle plant of the company in Westfield, Mass.

Motorcycle clubs in various parts of the country are taking an unusual interest in the proposed ocean-to-ocean motorcycle relay which will probably be run this summer under the auspices of the F. A. M. A message will probably be carried from New York to San Francisco.



The Motorcycle Club of Lockport, N. Y., reports a membership of nearly 100.

Archie Olberg and Ed Schwalbe of LaCrosse, Wis., who recently rode their machines to Fremont, Neb., and return, covered 1500 miles in six days.

Douglas county, Nebraska, of which Omaha is the county seat, claims to have 350 motorcyclists.

The Flower City Motorcycle Club of Rochester, N. Y., recently held a 225-mile endurance run for its members. At the end of the run the annual picnic was held at Avon, N. Y.

The Rockford Motorcycle Club of Rockford, Ill., held an endurance run of 185 miles recently, the members starting from Rockford, thence to Janesville, Milton, Ft. Atkinson, Jefferson, Cambridge, Madison, Stoughton, Edgerton, Janesville, Beloit and back to Rockford.

Free Engine Model 350, a New Foreign Product Represented by the American F. N. Company.

The following companies have been incorporated recently to manufacture and deal in motor cars, accessories, etc.

Commercial Motor Sales Company, Cincinnati, O.; $10,000; incorporators, Walter G. Voesler, George Schorr, Edward W. Hoelscher, William G. Hoelscher, George Saline.

Kernodle-McDaniel Manufacturing Company, Frankfort, Ind.; $10,000; incorporators, W. T. Kernodle, P. McDaniel.

A. S. Lee Company, Providence, R. I.; $5000; incorporators, Daniel J. Healy, H. Ladd Walford, G. Otis Washburn.

Skaneateles Garage Company, Skaneateles, N. Y.; $6000; incorporators, George D. Cuddleback, Edward J. Scott, Florence K. Scott.

Premier Manufacturing Company, Newtown, Conn.; $10,000; to deal in automobile accessories; incorporators, Alfred C. Griscom, Julius Hartwig, Louise Hartwig.

Everett Auto Sales Company, Columbus, O.; $30,000; incorporators, Horace K. Dobson, Amos F. White, Elmer F. McConaha, H. H. Kellenberger, A. W. Raving.

Audobon Auto Service Company, New York City; $500; to operate an automobile service; incorporators, Michael P. Caffe, Edmond Huertstel, Julius M. Ferguson.

R. F. Flick Automobile Company, Cuero, Tex.; $10,000; incorporators, R. C. Flick, R. F. Flick, N. M. Crain.

Harlem River Garage & Repair Company, New York City; $900; incorporators, Edward Meltzer, Frank D. Tice, William T. Hookey.

Waite's Motor Vans & Storage Company, New York City; $25,000; incorporators, Francis T. Germain, Philip J. Dunn, Louis Burgess.

Chillicothe Automobile Supply Company, Chillicothe, Mo.; incorporators, John F. Heger, Asa T. Kirtley, Byron B. Stevens.

Simpson Automobile Supply Company, Grand Rapids, Mich.; $35,000; incorporators, Earl R. Corbin, E. W. Simpson, Frank J. Goders.

Darby Motor Car Company, Westfield, N. J.; $25,000; to manufacture automobiles and motorcycles; incorporators, L. D. Darby, H. C. Darby, A. B. Darby.

Model Auto & Sales Company, St. Louis, Mo.; $3000; incorporators, Oscar Sontag, Roy E. Stutts, Otto F. Karbe.

Burns-Ramsden Motor Car Company, St. Louis, Mo.; $10,000; incorporators, Louis N. Burns, James H. Ramsden, Harry C. Barker.

Galva Auto Company, Galva, Ia.; $10,000; to deal in motor cars; incorporators, G. W. Johns, R. B. Clemens and others.

Penn Tire Filler Company, Coudersport, Penn.; $5000; to manufacture tire filling compounds.

Central Garage Company, Indianapolis, Ind.; $5000; to operate a garage; incorporators, Walter Howe, Kirke Howe, H. R. Sterling.

Republic Motor Company, New York City; $500; incorporators, Frank H. Twyeffort, Stephen C. Fiero, Ernest J. Ellenwood.

American Steam Truck Company, Saginaw, Mich.; $500,000; to manufacture steam motor trucks.

Check-Spring Motor Company, Washington, D. C.; $100,000; incorporators, C. E. Hooper, A. S. Check, C. L. Lambert.

Auto Distributors Limited, Camden, N. J.; $200,000; incorporators, F. R. Hansell, I. C. Clow, John A. MacPeak.

Perth Amboy Transportation Company, Sewaren, N. J.; $25,000; incorporators, I. J. Freeman, Lena Chester, Isabella Robbins.

Orange Automobile Garage, Inc., East Orange, N. J.; $20,000; incorporators, S. L. Gedney, Jr., J. D. Gedney, H. R. Picking.

Scott Motor Company, Memphis, Tenn.; $10,000; incorporators, J. C. Scott, W. H. Hayley, C. L. Hunt, O. N. Bonney, J. C. Sims.

Southwestern Motor Car Distributing Corporation, Memphis, Tenn.; $50,000; incorporators, J. W. Bondurant, Noble S. Bruce, George C. Love, Thomas B. Crenshaw, H. J. Reiner, P. H. Phelan, Jr.

W. S. Motor Company, Newark, N. J.; $300,000; incorporators, J. M. Woods, C. H. Tebbets and L. F. Fetser.

King Valveless Automobile Whistle Company, Cleveland, O.; $25,000; incorporators, Delroy Feffield, Orville C. Snyder, George H. Burrows, R. E. McMasters, C. J. Lowrie.

Consolidated Automobile Supply Company, New Brunswick, N. J.; $1,000,000; incorporators, B. F. Hardesty, Arthur V. Dennan, Samuel A. Ross.

Metrix Automobile Company, Joliet, Ill.; incorporators, Earl D. Fuller, W. O. Dayton, J. T. Wilcox.

WITH THE MANUFACTURER.

The Otto Gas Engine Works, Philadelphia, original manufacturer of the Otto car, has no corporate connection with the OttoMobile Company of Mt. Holly, N. J., which has been acting as sales agent for the past year. It is understood that in the future the Philadelphia concern will handle its own product direct with dealers in this country and abroad.

The Nyberg Automobile Works, Anderson, Ind., maker of the Nyberg line of pleasure and commercial cars, recently entertained the 150 skilled mechanics in its employ at a dinner, at which a number of invited guests discussed matters concerning the welfare of the industry.

The Connecticut Telephone & Electric Company, Inc., Meriden, Conn., maker of Connecticut ignition equipment, etc., has established a New England branch office at 224 Pleasant street, Boston, in charge of F. C. Whitman, who has covered this territory for the company during the past few years. The Connecticut Shock Absorber Company of the same city, maker of the Connecticut shock absorber, will occupy space in the showroom.

The Stewart Motor Corporation, recently organized in Buffalo, N. Y., by T. R. Lippard and R. G. Stewart, who withdrew from the old Lippard-Stewart Motor Car Company, has secured the plant vacated by the Niagara Machine & Tools Works at Randall and Superior streets, in which manufacturing operations will begin at once. An accompanying illustration presents the building, where the new Stewart light trucks will be made.

The Broad-Oak Automobile Company, Columbus, O., has been purchased by R. M. Weaver and W. J. Miller, until recently connected with the Columbus Machine Company. Mr. Miller was superintendent of the machine company and was at one time a member of the Miller-Frayer Automobile Manufacturing Company. Mr. Weaver was general manager.

The Standard Motor Car Company, Scranton, Penn., recently purchased the plot of ground adjoining its plant in Dupont court and is arranging to build a two-story addition of glass and steel. The present buildings are to be torn down.

Digitized by Google

The Crosby Company, Buffalo, N. Y., manufacturer of automobile frames and stamped metal goods, is building an addition to its plant, 125 by 180 feet. It will be four stories high and of steel frame construction.

The Dayton Body Company, Dayton, O., has purchased a building site upon which a new factory will be erected for the manufacture of automobile bodies.

The American Top Company, Jackson, Mich., manufacturer of automobile tops, has merged its business into a stock company with a capitalization of $350,000. The company is considering an enlargement of its plant.

The Fisk Rubber Company has made E. L. Duffee the manager of its branch in Pittsburg, Penn. The offices are located in Baum street.

The Willard Storage Battery Company, is building an addition to its plant in Cleveland, O. The firm will have, after the building is completed, 25,000 feet of floor space. New offices were recently taken at 5716 Euclid avenue.

The Suspension Roller Bearing Company, Sandusky, O., is to erect a plant east of that of the Sandusky Auto Parts & Motor Truck Company on First street, to cost approximately $30,000.

The Louisville Lighting Company, Louisville, Ky., recently purchased six Waverley electric roadsters, made by the Waverley Company, Indianapolis, Ind., for the use of its trouble department. These are in addition to four light delivery wagons of the same make and for the same service. An accompanying illustration shows the latest

The Indiana Garage & Sales Company, 3316 East 15th street, Kansas City, Mo., recently closed a contract with the Lincoln Motor Car Works, Chicago, becoming distributing agent for Kansas City and vicinity for the Lincoln light delivery wagon.

A. Reis Meyer, for a number of years a well known automobile man, recently took a position in the new motor wagon department of the O. Armleder Company, Cincinnati, O.

The Piano & Heavy Box Truck Manufacturing Company, Toledo, O., has been incorprated with a capital stock of $20,000 to manufacture heavy trucks. A. T. Raynor, W. F. Runkle and others are the incorporators.

The Motor Manufacturing Company, Geneva, N. Y., is moving its plant to Dunkirk. David Reed is president of the company and R. J. Hall superintendent.

The Kenton Gas Engine Company has added a motor car repair department to its plant in Kenton, O. The company will handle a full line of accessories as well as the Kenton agency for the Knight tires. T. A. Taylor is the general manager.

The Railroad Motor Car Company, Marion, Ind., was recently formed with a capitalization of $200,000. The purpose of the company will be to manufacture and repair motor vehicles used on railroad tracks. The following are directors: William O. and John D. Worth, Hiram Beshore, George R. Stewart and Eben H. Walcott.

The Frontier Tire & Rubber Company, Buffalo, N. Y.,

Fleet of Waverley Electrics Recently Shipped by Waverley Company, Indianapolis, Ind., to Lighting Concern in Louisville, Ky.

shipment, with its equipment to carry tools and supplies for quick repair work.

Sales Manager Benson of the Studebaker Corporation, Detroit, recently announced the promotion of A. H. Brown, manager of the firm's branch in Spokane, Wash., to be the northwestern sales manager. In his new capacity, Mr. Brown will have charge of the distribution of more than $2,000,000 worth of Studebaker cars.

Walter C. Barnes of Springfield, Ill., was recently appointed publicity manager for the Moon Motor Car Company, St. Louis, Mo. Formerly Mr. Barnes was connected with the advertising departments of several newspapers in Illinois, Idaho and Oregon, and for the past year has been with an advertising agency in Chicago.

Fred A. Crooks, was recently appointed sales manager for the American Locomotive Company, Providence, R. I., and New York City, in the New York branch. Mr. Crooks has been identified with the automobile industry for five years, being formerly associated with the Darracq Motor Company and the Palmer & Singer Manufacturing Company.

Charles E. Riess of New York City, president of the American-Marion Sales Company, 1896 Broadway, recently closed 1913 contracts with the American Motors Company and the Marion Motor Car Company for the New York district.

has plans in preparation for an addition to its plant.

The Paris Auto Starter Company, Paris, Ill., has changed its name to the Paris Electric Starter Company, and increased its capital from $10,000 to $100,000.

The Kelsey Wheel Company, Detroit, Mich., manufacturer of automobile wheels, is erecting additions to its plant which will about double its capacity. The new structures will include a main building 180 by 360 feet.

The Cadillac Motor Car Company, Detroit, Mich., is to build a one-story factory building, 70 by 120 feet. The cost will be approximately $15,000.

The Shop of Siebert, Toledo, O., maker of the Siebert truck and automobile bodies, has commenced the erection of a three-story factory building, 75 by 105 feet, of brick and concrete construction.

The Hayes-Ionia Company, Ionia, Mich., manufacturer of automobile accessories, has arranged for the construction of a large addition to its machine shop. Four new dry kilns will be installed.

The Reo Motor Car Company, Lansing, Mich., has plans under way for the construction of several additional factory buildings. The cost will be approximately $100,000.

The Pullman Taxicab Company, Philadelphia, Penn., is preparing to build a new garage to cost approximately $25,000. The building will be 80 by 86 feet, and of fireproof construction.

GARAGE AND DEALER.

The Emil Grossman Company, New York City, will not renew its contract for the sales management of the Vanguard Manufacturing Company, Joliet, Ill., and hereafter will confine its energies to the manufacture of its Red Head spark plugs and other specialties.

Andrew J. Caron of Lawrence, Mass., is to open a garage and repair shop on Kirk street, that city.

The Como Automobile Supply Company, Charlotte, N. C., has moved its offices and store rooms from 209 South Church street to 302 North Tryon street. Larger quarters were necessary to care for an increased business.

William J. Damoth has opened a repair shop at Coopersville, Mich.

The Imperial Motor Car Company, Cincinnati, O., recently moved into a new service building and salesroom at 1609 Madison road, that city. The concern is agent for the Cole and Stearns cars.

The Lyon Motor Car Company of Durham, N. C., is to open a display room in Columbia, S. C. The new building is in course of construction and will be occupied upon completion.

William M. Hall, George W. Kilpatrick and Joseph C. Bily, Pittsburg, Penn., are to make application to the governor of Pennsylvania for the charter of an intended corporation to be called Gardner Garage & Supply Company. A general garage business will be conducted.

The N. C. Corbitt Automobile Company, Henderson, N. C., is planning the erection of a one-story factory building, 60 by 510. The building, it is said, will cost approximately $20,000.

The Colonial Motor Company is having a two-story garage erected at North avenue and Lovegrove street, Baltimore, Md. The building will be of ornamental concrete and brick.

The J. M. Dunn Auto Company, incorporated with J. M. Dunn as president and manager, Parker Barrett, vice president, and J. F. Dunn, secretary and assistant manager, has taken over the M. & F. Garage, Bakersfield, Cal., from Mason & Flickenger, and will continue to carry on a general garage and automobile supply and service station.

G. E. & H. J. Habich Company, Boston, Mass., state distributor for the Cole car, made by Cole Motor Car Company, Indianapolis, Ind., recently increased its sales force by the addition of Edgar A. Ordway, one of the best known automobile salesmen in the East.

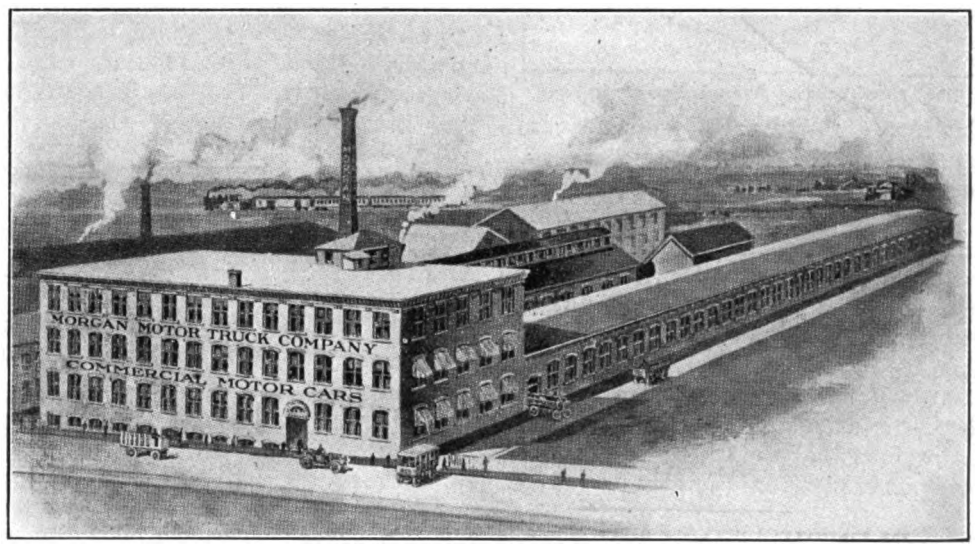
M. M. Spear and W. L. Tozier have taken a lease of the garage building on the causeway, opposite the depot in Gardiner, Me., and have opened a general accessory business.

Edward J. LaFountaine, who was the Warren-Detroit agent in Minneapolis, has associated himself with the Haynes Knutson Auto Company, Minneapolis, northwestern distributor for the Cole car.

Ebner Wooden, Stockton, Kan., has purchased the interest of William Shaw in the Hockett Garage.

The Lincoln Garage & Repair Company recently opened a large garage in Kankakee, Ill. The concern has the agency for the Warren, made by the Warren Motor Car Company, Detroit, Mich., and the K-R-I-T, made by the K-R-I-T Motor Car Company, Detroit. The garage will carry a complete line of cars at all times, and accessories and parts for repairs so far as possible. The members of the firm are F. A. Babel, Walter Cobb, Charles H. Cobb and L. J. Meyers.

The Bournonville Realty Company, New York City, will build a two-story automobile service station at 241 to 245 West 64th street, 75 by 100 feet. The foundation will be so laid that additional stories can be built. The officers of the new company are A. Cressy Morrison, Percy Kent and Charles B. Gales.



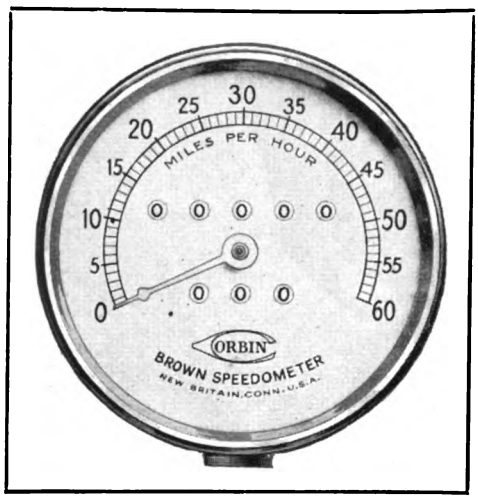
The Cole Motor Car Company, Indianapolis, has new representation in Omaha under the name of the Cole Motor Company. E. E. Butler is in charge of the new branch, which is temporarily located at 1102 Farnum street.

The Shaffer Auto Supply Company, 1240 Broadway, Denver, Col., is the name of a new concern which will handle standard accessories and supplies. The agency for the Blair truck has been taken for Colorado.

The J-A-R Company, located at 932 Kansas avenue, Topeka, Kan., has closed a contract with the Lincoln Motor Car Works of Chicago, Ill., whereby it becomes distributing agent for Topeka and vicinity for the Lincoln light delivery wagon.

C. Barnum Seeley is to erect a concrete garage, 52 by 104 feet, on State street, Bridgeport, Conn., for the Oston Motor Car Company. The building will be well lighted and up-to-date in every particular.

White & Durgin, Haverhill, Mass., recently had completed one of the most up-to-date garages in that section of the state. The building is located on Main street, and has a frontage of 50 feet and a depth of 102 feet. It is practically fireproof, being of reinforced concrete and steel construction. The structure will be heated by steam, lighted electrically and well equipped in every respect.



Factory in Buffalo, N. Y., Recently Acquired by the New Stewart Motor Corporation.

The R-C-H Corporation, Detroit, recently signed 1913 contracts with the following dealers: Henry Muntz Company, Elgin, Ill.; V. L. Rogers, Jr., Memphis, Tenn.; A. H. Ward, Arlington Heights, Mass.; J. B. Kelly, Chicago, Ill.; E. C. Miller, Milledgeville, Ill.; Schram Bros., Addison, Ill.; H. H. Collier, Belvidere, Ill.; Akron Auto Garage Company, Akron, O.; Sofield Automobile Company, Asbury Park, N. J.; R. E. Powell, Onancock, Va.; Pearson & Pearson, Edwardsburg, Mich.; Shattuck & Son, Covert, Mich.; Northampton Motor Company, Jackson, N. C.; R. H. Troutman, Statesville, N. C.; Hammond-Ballard Company, Long Beach, Cal.; J. J. Schutz, St. James, Minn.; Harvey Hertzler, Thompsontown, Penn.; James G. Klock Laramie, Wyo.; Weir-Moor Motor Company, Monmouth, Ill.; A. A. Sanford, Lodi, O.; Asheville Auto Company, Asheville, N. C.; C. L. Dobbs, Devils Lake, N. D.; William Heinen, Delano, Minn.; Bunn & Goembel, Pipestone, Minn.; Schroeder & Son, Chicago, Ill.; George H. Custer, Collingdale, Penn.; Don Chamberlain, Kennebunk, Me.; Lawton Motors Company, San Antonio, Tex.; J. A. Ewing and A. R. Atkins, Kent, O.; T. J. Collins, Northampton, Mass.; Weber Implement Company, St. Louis, Mo.; Charles E. Hammerly, Chicago, Ill.; John Bauer, Jr., Strasburg, Ill.; Niagara Falls Auto Transit Company, Niagara Falls, N. Y.; W. A. Struve, Bloomer, Wis.; W. Middleton Sheppard, Bridgeton, N. J.; George W. Turner, Shamokin, Penn.; Ulster Garage, Kingston, N. Y.; F. M. Cole, Osborne, Kan.

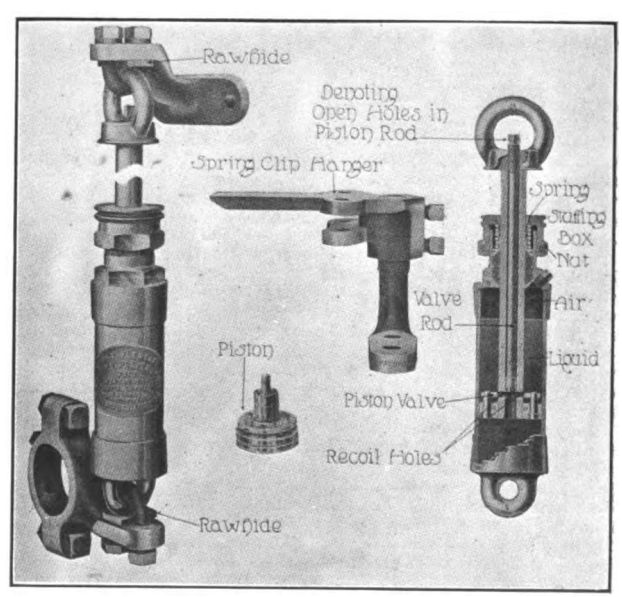
CORBIN-BROWN SPEEDOMETER.

The entrance of the Corbin Screw Corporation, a division of the American Hardware Corporation, New Britain, Conn., into the field of automobile accessories with the Corbin-Brown speedometer is of particular interest to the industry because of the reputation of the Corbin concern. This interest naturally extends to the product of the company, which is illustrated herewith.

The New Corbin-Brown Speedometer.

As will be noted the new speedometer has a number of exclusive features among which the maker calls attention to the provision for easy reading. The numeral 10 and its multiples are almost twice the size of the numeral 5 and its multiples. This lack of uniformity makes that contrast which safeguards against confusion when the car is travelling at a fast rate of speed. It is maintained that the Corbin-Brown device can be ready as easily from the rear seat as by the driver.

FLENTJE SHOCK PREVENTER.

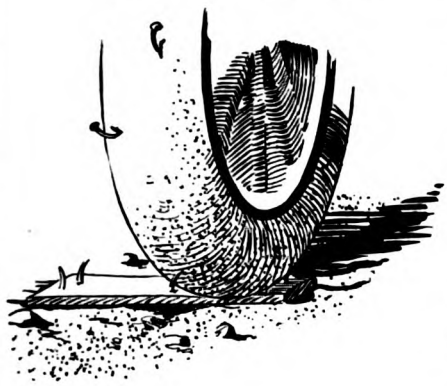


The successful and efficient shock absorber not only eliminates the sudden, downward movement, but the rebound or recoil of the springs as well, and these and other qualities are emphasized in the new improved Flentje automatic hydraulic jounce and recoil preventer, manufactured by Ernst Flentje, Cambridge, Mass. The principle is the same as utilized by the government in checking the recoil of heavy ordnance and as will be noted by the accompanying illustration the cylindrical section of the device is filled to within .5 to one inch of the top with a special liquid mixture called Oil-O-Mica, which is not affected by changes in weather. Within the cylinder is a hollow piston rod, the lower end of which is perforated, having seven ports through which the mixture passes freely in either direction, with practically no resistance when the machine is traversing smooth roads, because of the air space at the top.

When rough highways are encountered, the mixture, with the air on the top, is forced through the regulating hole in the piston rod. The air forms bubbles, expands the liquid and forms a soft cushioning movement of the piston. Upon the upward or recoil of the springs a clapper valve covering six ports, is closed automatically and the mixture is forced through one port in the piston rod which is adjustable by means of a needle valve. It is pointed out by the maker that the design is such that one passenger may ride as comfortably as seven in a machine, as the liquid percolates more slowly when the load is increased.

The Flentje device is hung straight up and down from axle and frame by a patented hanger and may be attached easily and without alterations to the automobile. The very best of material and workmanship are incorporated and the Flentje preventers are covered by an unusually broad guarantee.

JEFFERY COMPANY ENTERTAINS.



The annual convention of the salesmen of the Thomas B. Jeffery Company, maker of the Rambler car, was held recently at the factory in Kenosha, Wis. Seventy-five attended. Three days were spent at the plant, when plans for 1913 were outlined and discussed. Reports showed that the increase in sales for 1912, as against those for 1911, was 126 per cent.

The Flentje Automatic Hydraulic Shock Preventer, Which Presents Interesting Features.

If you could see your differential work you'd be mighty careful of its lubrication

IF we could see the actual workings of the human heart, we would swear off smoking and cut out heart weakening habits.

Not seeing, we make mistakes. But nature, the great compensator and adjuster, counteracts our blunders.

If you could see the actual service working of the differential of your car, you'd be filled with wonder and alarm.

You'd never neglect its lubrication, or consciously use a poor lubricant.

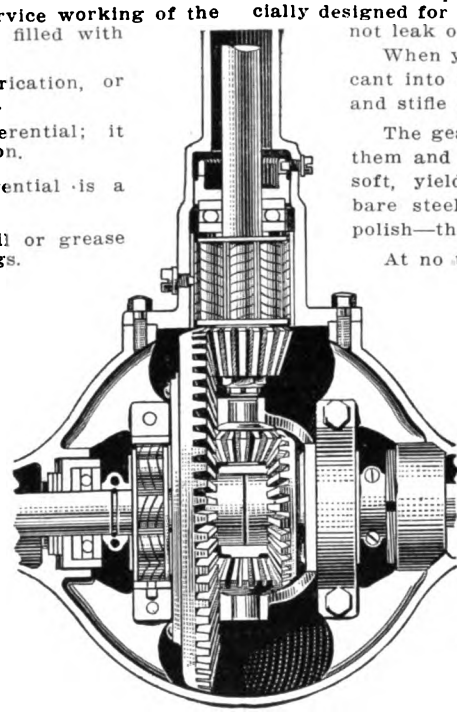
Nature doesn't help a differential; it harms it in the guise of Friction.

Carelessly speaking, a differential is a conglomeration of cogs.

Carelessly considering, any oil or grease is a safe lubricant for a lot of cogs.

But accurately speaking, a differential represents the highest form of gear assembly with bevels, spurs and pinions, running on ball and roller bearings.

Its duty is severe—speed, load, direction, everything variable.



Each side of every tooth gets wear; the load is thrown on instantly, nine times out of ten from a standstill.

Perfect lubrication at any price is no extravagance in a differential.

It is a real economy to use the best lubricant you can buy.

Every tooth must be coated heavily with good bodied lubricant, not merely wet with oil or filmed with grease.

Keeping the teeth enveloped is only one duty of the lubricant; immersing the ball and roller bearings is another; remaining within the differential housing is another. The lubricant must not escape.

THE DIFFERENTIAL

Use "K-No. 000" Grade or "K-00 Special" Grade Non-Fluid Oil for your differential.

The K-No. 000 Grade is a fairly heavy bodied lubricant for use in differentials where the housing would allow a lighter lubricant to escape.

The K-No. 00 Special is a light bodied product especially designed for fairly oil tight housings. This will not leak out where ordinary oil would.

When you have put a supply of this lubricant into the housing, you snuff out friction and stifle noise.

The gear teeth pick it up and it clings to them and coats them. The gears mesh in a soft, yielding cushion—Steel never touches bare steel. The only wear is a slow oily polish—there is no rapid abrasion.

At no time, under hot weather conditions or hard steady drives, does Non-Fluid Oil melt. Nine grease lubricated differentials out of ten, leak, proving the melting of grease. All oil lubricated differentials leak. Often the lubricant follows the axle and makes its escape through the brake drums. The brakes slip, wheels are smeared and tires rot.

Non-Fluid Oil means a clean rear axle, and a perfectly lubricated differential. If you will inquire, you will find that worn out differential gears invariably accompany grease or oil lubrication.

With Non-Fluid Oil the differential outlasts the engine itself. Non-Fluid Oil is amazingly durable. The supply is depleted only by being actually rubbed out of existence by the gears.

The ball and roller bearings are kept bright and never become gum-bound as occurs with rancid grease. Pitting is impossible. Non-Fluid Oil is acidless.

If your gears show wear or make noise, or if your lubricant melts and leaks out, you had better alarm yourself into a trial of

All leading dealers handle Non-Fluid Oil. Ask your dealer, but insist upon the genuine.

TRADE MARK REGISTERED IN UNITED STATES PATENT OFFICE

NON-FLUID OIL

In purchasing Non-Fluid Oil be sure the can is orange colored and bears this trade mark.

We are not talking of an expensive innovation. The actual yearly outlay for Non-Fluid Oil is less than for any other lubricant.

Post yourself further on the differential. And then post us a request for a free sample of either grade. Paste the attached coupon on a postal. Mention the grade you desire.

True Merit *and* Real Value Now Recognized

The only Anti-Skid device which can be relied upon and the only one in which absolute confidence can be placed.

Proven to be a necessity and not a luxury.

Weed Chains

"With the Creeping Grip"

No car is safe without them. They have stood the test of time and are regarded as the *most important* and profitable accessory handled and sold by automobile dealers. *Victory after victory* has perched on the banner of Weed Chains.

The courts, in emphatic language, after carefully considering the facts, have in numerous cases issued injunctions, *restraining infringers* from manufacturing or selling their infringing devices. Weed Chains are *the only genuine* Anti-Skid device—All others are infringements.

Join today the army of

"Anti-Skidders"

Consider your own safety---Consider the safety of other road users. Take no chances.

Wise Motorists are victorious in overcoming skidding accidents by the use of Weed Chains.

Cannot injure tires because they creep. *Absolutely necessary* on wet and greasy pavements, or on muddy, slippery roads. By our *new, secret process of hardening*, just adopted, the cross sections are more perfect and wear better than ever before. Packed and shipped in canvas bags.

Equip your own car with *Weed Chains* and *insist*, for your own protection, that other drivers do the same.

Recommended and sold by all reputable dealers.

AJAX TIRES

(GUARANTEED 5,000 MILES)

BUILT TO LAST

Tires should be judged by the Standard of Service only. Ajax Tires have stood the most strenuous tests of service in endurance contests and in the hands of individual owners. Our aim has always been to give the purchaser the greatest possible value for his money.

Again—What you want to know about any tire is the attitude its manufacturers are going to assume in case it gives trouble. Our business has increased as fast as we have been able to take care of it BECAUSE we live up to our 5000 Mile Guarantee.

Buy right and keep down operating expenses.

DEALERS.

There is only one foundation upon which you can build a successful and permanent business and that is the complete satisfaction of your customers. You can create satisfaction if you sell Ajax Tires.

A NEW VALUE

TO THE PURCHASING POWER OF FIFTY CENTS—A

"BLACK EAGLE" SPARK PLUG.

EFFICIENCY AND QUALITY WITHOUT EXTRAVAGANCE.

From all viewpoints the **"BLACK EAGLE"** Spark Plug represents the greatest advance in spark plug design and construction in recent years, and has given a new value to the purchasing power of fifty cents.

The base of the **"BLACK EAGLE"** Spark Plug provides double electrodes so positioned that they present a round surface to the action of the spark, absolutely eliminating pitting of the electrodes which indefinitely prolongs their life, and produces a uniform spark at all times.

When you have discovered that the price you pay for a spark plug has little to do with its service value, you will save 100% to 400% on this item of expense. Try a genuine

"BLACK EAGLE"

The 50c Spark Plug Without an Apology. **TRY THEM NOW.**

Don't wait until you are 10 miles from a Garage and find you need them.

Most jobbers and dealers sell **"BLACK EAGLE"** Spark Plugs. All can secure them; if you are unable to have your wants supplied we will forward them free of transportation expense upon receipt of price.

Burn Up the Miles
(Not the Oil)

A perfect lubricant means more miles per gallon without smoke and carbon.

Use COLONIAL and NOTE the DIFFERENCE

COLO GREASE
A real transmission grease
Will make your gears run smoothly and quietly because it is made especially for gear lubrication.

COLONIAL Timing Gear Oil
overcomes all trouble with your timing gear. Use it and NOTE the DIFFERENCE.

SILEX GREASE
The greasiest grease made
The real test of a grease is not its looks or the feeling but its lubricating properties. SILEX is made to lubricate and last.

Digitized by Google

"INVADER" GEAR OIL

"Puts Noisy Gears to Sleep"

INVADER GEAR OIL is a heavy, dark fluid lubricant, designed for the lubrication of sliding gear transmissions and differential gears. It can also be used for front gears where a heavy lubricant is required, if the case is tight and separate from the crank case.

This oil possesses peculiar properties which make it invaluable as a lubricant for gears. It contains no foreign matters, such as ground cork, sawdust, etc., but is 100% oil. It is stronger and more serviceable than any other lubricant made. Being free from water and chemicals, it will not foam in the gear case when running or allow the bearings to rust when idle.

Invader Gear Oil being a fluid lubricant it is only necessary to fill the case sufficiently to allow the gears to dip. It is not necessary to pack the case full, as is customary when grease is used. It faces the gears with a coating which is practically indestructible, thereby preventing wear and reducing *noise* and friction to a minimum. A trial will convince the most skeptical that "**Invader**" Gear Oil is the only practical and economical gear lubricant.

Sold in 10 lb. square cans, lithographed; 25 and 50 lb. wooden jacketed cans, special top; barrels and half-barrels

Classified Buyers' Guide

To facilitate selection in purchasing Motor Cars, Motorcycles, Accessories, Parts, Supplies, Fittings and Attachments, as well as Aviation Equipment, we present the following list of representative and progressive advertisers in our publications, addresses of their main and branch houses and the line of products handled by each.

ACCESSORY MANUFACTURERS AND JOBBERS.

Bi-Motor Equipment Co., 177-179 Portland St., Boston, Mass.
Branch: 113 Massachusetts Ave., Boston.

Caldwell Mfg. Co., 1756 Cranston St., Providence, R. I.

Hawthorne Mfg. Co., 29 Spruce St., Bridgeport, Conn.

Hopewell Brothers, Newton, Mass.
Branch: 1974 Broadway at 67th St., New York.

Miller, Chas. E., 97-103 Reade St., New York.
Branches: 202-204 Columbus Ave., Boston; Bridge and Dwight streets, Springfield, Mass.; 274 Trumbull St., Hartford, Conn.; 924 Eighth Ave., and 2782 Broadway, New York; 1421 Bedford Ave., Brooklyn, N. Y.; 318 North Broad St., Philadelphia; 824 Main St., Buffalo, N. Y.; 1829 Euclid Ave., Cleveland; 227 Jefferson St., Detroit; 66 Edgewood Ave., Atlanta, Ga.; 601-603 Baronne St., New Orleans, La.; 135 Central Ave., Albany, N. Y.; 274 Halsey St., Newark, N. J.

Milwaukee Auto Specialty Co., 128 Second St., Milwaukee, Wis.

Waite Auto Supply Co., 81 Exchange place, Providence.

ACETYLENE TANKS, (See Tanks.)

AIR COMPRESSORS AND TANKS.

Williams Foundry & Machine Co., Akron, O.

AUTOMOBILES. (See Cars.)

BALLS AND BALL BEARINGS.

Boyd, F. Shirley, 903 Boylston St., Boston. (R. I. V.)
Bretz Co., J. S., 250 W. 54th St., New York. (F. & S.)
New Departure Mfg. Co., Bristol, Conn.

BATTERIES.

Geiszler Bros. Storage Battery Co., 514 W. 57th St., New York.

Lincoln Electric Co., 1007 Atlantic Ave., Brooklyn, N. Y. (Hi-Po Waterproof Dry.)

Waite Auto Supply Co., 81 Exchange place, Providence. (Success.)

Willard Storage Battery Co., 5716 Euclid Ave., Cleveland. (L B A.)

BLOW-OUT PATCHES. (See Patches.)

BODIES—WOOD AND METAL.

Springfield Metal Body Co., 20 Medford Ave., Springfield, Mass.

BODIES, TRUCK.

Lynch Manufacturing Co., Hammond, Ind.
Branches: East Chicago, Ind.; South Chicago, Ill.

Motor Truck Body Co., 320 Franklin St., Detroit.

BRAKE BANDING OR LINING.

Royal Equipment Co., The, 422 Housatonic Ave., Bridgeport, Conn. (Raybestos.)

Standard Woven Fabric Co., Worcester, Mass. (Multibestos.)
Branches: 903 Boylston St., Boston; 237 Lafayette St., New York.

BRAKES.

Royal Equipment Co., The, 422 Housatonic Ave., Bridgeport, Conn. (Duplex.)

BRUSHES, WIRE.

Williams Foundry & Machine Co., Akron, O.

BUMPERS AND FENDERS.

Sager Co., J. H., 271 South Ave., Rochester, N. Y. (Diamond.)

CARBURETORS..

Mayer Carburetor Co., 2673 Main St., Buffalo, N. Y. (Mayer.)

Sumner, George, Inc., 1841 Broadway, New York; 755 Boylston St., Boston. (Rayfield.)

CARS—GASOLINE PLEASURE.

Atlas Motor Car Co., 104 Birnie Ave., Springfield, Mass. (Atlas-Knight.)
Branch: N. E. Corner Broadway and 64th St., New York.

Berkshire Motors Co., Cambridge, Mass. (Berkshire.)

Brush Runabout Co., 3 West 61st St., New York. (Brush runabout, Liberty-Brush.)

Buckeye Manufacturing Co., Anderson, Ind. (Lambert.)

Cartercar Co., Pontiac, Mich. (Cartercar.)

Clarke-Carter Automobile Co., Jackson, Mich. (Cutting.)

Cole Motor Car Co., See Henderson Motor Sales Co.

Columbia Motor Car Co., 3 West 61st St., New York. (Columbia.)

Dayton Motor Car Co., 3 West 61st St., New York. (Stoddard-Dayton.)

Haynes Automobile Co., 166 Main St., Kokomo, Ind. (Haynes.)

Henderson Motor Sales Co., Indianapolis. (Cole.)
Eastern Distributors. Colt-Stratton Co., Broadway at 68th St., New York.

Herreshoff Motor Co., 620 Harper Ave., Detroit. (Herreshoff.)

Hupp Motor Car Co., 1268 Milwaukee Ave., East, Detroit. (Hupmobile.)
Branches: Detroit, Buffalo, Chicago, Cleveland, Denver, Kansas City, Los Angeles, Minneapolis, Philadelphia.

Ideal Motor Car Co., Indianapolis. (Stutz.)

Imperial Automobile Co., Jackson, Mich. (Imperial.)

Jackson Automobile Co., 1400 Main St., Jackson, Mich. (Jackson.)

Kissel Motor Car Co., 174 Kissel Ave., Hartford, Wis. (KisselKar.)

Knox Automobile Co., Springfield, Mass. (Knox.)

K-R-I-T Motor Car Co., Detroit. (K-R-I-T.)

Lenox Motor Car Co., Inc., Boston. (Lenox.)
Branches: New York, Boston, Chicago.

Maxwell-Briscoe Motor Co., 3 West 61st St., New York. (Maxwell.)

Mercer Automobile Co., 1100 Whitehead Road, Trenton, N. J. (Mercer.)

Michigan Buggy Co., 147 Lay St., Kalamazoo, Mich. (Michigan.)

National Motor Vehicle Co., 1033 22d St., Indianapolis. (National.)

Nordyke & Marmon Co., Indianapolis. (Marmon.)

Paige-Detroit Motor Car Co., Detroit. (Paige-Detroit.)

Peerless Motor Car Co., Cleveland. (Peerless.)
Branches: 660 Beacon St., Boston; Broadway and 57th St., New York; Michigan Ave., and 25th St., Chicago.

Pierce-Arrow Motor Car Co., Buffalo, N. Y. (Pierce-Arrow.)

R-C-H Corporation, 107 Lycaste St., Detroit. (R-C-H.)

Reo Motor Car Co., Lansing, Mich. (Reo.)

Sampson Mfg. Co., Alden, 3 West 61st St., New York. (Sampson.)

Selden Motor Vehicle Co., Rochester, N. Y. (Selden.)

Speedwell Motor Car Co., 80 Essex Ave., Dayton, O. (Speedwell.)

Studebaker Corporation, Detroit. (E-M-F, Flanders.)

United States Motor Co., 3 West 61st St., New York. (Brush, Maxwell, Sampson, Stoddard-Dayton, Columbia.)

Warren Motor Car Co., Detroit. (Warren-Detroit.)

White Co., The, 828 E. 79th St., Cleveland. (White.)
Branches: 320 Newbury St., Boston; Broadway and 62nd St., New York; 629-633 North Broad St., Philadelphia; 138-148 Beatty St., Pittsburg, Penn.; 610 S. Michigan Ave., Chicago; Market St. and Van Ness Ave., San Francisco; 120-122 Marietta St., Atlanta, Ga.; 74 Victoria St., Toronto, Can.

THE 8-DAY HIGH GRADE "CHELSEA" AUTO CLOCK

Primarily intended for use inside the bodies of large enclosed cars, and for such use its case can be given a variety of fine finishes. It also makes an attractive clock for use on dashboards. Only made in 2¾-inch size.

The Justly CELEBRATED 8-Day, High-Grade "CHELSEA" AUTO CLOCK (*Trade-mark*)

NOW and for YEARS the RECOGNIZED STANDARD of EFFICIENCY

Clocks built with a view to stand the jars and jolts and rough riding of Automobiles. Reputation the highest. Used by parties demanding the BEST.

☞ **ALL SIZES STATED ARE THE APPROXIMATE DIAMETERS OF THE DIALS.**

All are 8-day High-Grade. All are in DUPLEX (patent applied for) polished cast brass cases, the most thoroughly waterproof case on the market. The "SPECIAL" clocks show dial on an angle; its inner cased clock, when removed from the outer (locked) case, is excellent for use on mantels, bureaus, etc., when touring; its outer case is screwed to dashboard by hidden screws. The "SPECIAL" clocks are in large demand from dealers for owners of finest cars.

The MOTOR CLOCK has the same clock movement which for years we have supplied for the hard use on Locomotives, Steam Fire Engines, etc.; its dial is of same appearance as the Auto Clock dial, but the Auto Clock movement has a somewhat finer train.

The 3½ MOTOR "OFFSET" is likely to prove a quick, ready seller. Very attractive.

Ask for our new Auto Clock Circular and Price List, dated Oct. 1, 1911, illustrating and pricing the above and three new models, C, D and E.

PRICE LIST (Per Clock)

		"Round"	"Offset"	"Special"	"Limousine"
"CHELSEA"	2¾-in. Auto Clock.....	$26.00	$28.00	$36.00	$28.50
	3½-in. Auto Clock.....	28.00	30.00	45.00	Only made in
	3½-in. Motor Clock.....	24.00	26.00	41.00	2¾-inch size

If wanted fitted with outside (patent applied for) stem-winding and stem-setting device—the best of its kind—**Add $3.00 to above Price Lists.** (Such device we do not apply to the "Motor" Clocks or "Special" Auto Clocks.)

For Use on AUTOMOBILES and MOTOR BOATS

Those Who Actually Know Which Is Best

USE

HARRIS

TRADE MARK REG. U.S. PAT. OFF.

OILS

The most constant users of HARRIS OILS are those who know most about lubrication.

We find that unbiased dealers, garagemen—experts on the automobile—recommend HARRIS OILS.

HARRIS OILS represent *real* quality. They are as good as a quarter of a century of experience can make them.

The fact that we use *highest grade* Pennsylvania, Premium Crude Stock as a basis, is evidence of our constant effort to make the BEST the market affords.

HARRIS OILS give *more* than satisfaction. They preserve the engine, add to mileage, reduce cost of maintenance and make the motor deliver its *maximum* horse power.

HARRIS
TRADE MARK REG. U.S. PAT. OFF.
TRANS
COMPOUND

Is the leading gear and transmission lubricant. See that you use both HARRIS OILS and TRANS COMPOUND. Ask your dealer.

Send for testimonial letters.

The truck of reserve power and excess capacity.

KisselKar truck design and construction take into consideration the occasions when stress of business will necessitate loading in excess of rated capacity. The wide power and capacity margin above ratings meet the needs of a growing business, and furnish a greater reserve strength which decreases upkeep costs.

Competitive tests have demonstrated KisselKar Trucks to be from 15% to 20% more economical of fuel than other trucks of same ratings.

These two factors—excess capacity and fuel economy, which are big items of annual saving, give KisselKar Trucks a wide service margin over trucks of average standard.

KISSELKAR SERVICE maintains every KisselKar at best working efficiency. This service is supplied by a national service organization maintained by the manufacturers. Specially constructed and equipped buildings at principal points of America are service-centers cooperating with sales agents in supplying a service that lowers operating costs, retards depreciation and insures uninterrupted service.

KISSELKAR TRUCKS

1500 lb., 1, 2, 3, 4, 5 tons.

A fleet of 4 KisselKar Trucks that supplanted 40 horses---owned by Alexander H. Revell & Co., Chicago.

Write for special KisselKar Truck Catalog, illustrating KisselKar Trucks now in use in every kind of haulage and delivery service. All type bodies—special bodies designed to meet special needs. Write for truck catalog.

Jackson

No hill too steep,
No sand too deep.

1913 Jackson "Olympic"—$1500

35 H. P. Long-Stroke (4 1-8x4 3-4) motor; 34x4 inch tires; 115 inch wheelbase; full elliptic springs; deep, roomy body with 10-inch upholstering; black and nickel trimmings. Regular equipment includes Self-starter, Mohair Top, Top Hood, Ventilating Windshield, Speedometer, Oil Gauge and Gasoline Gauge on Dash, Gas Tank, Demountable Rims, Extra Rim, Tire Carrier, Robe and Foot Rails in Tonneau, Pump, Jack, Tire Outfit and Tools.

Other Models.

The "Majestic" at $1850 has a long-stroke (4 1-2x5 1-4) motor of 45 H. P. Its wheelbase is 124 inches; tires, 36x4 inches; springs, full elliptic, front and rear. It is equipped with self-starter, mohair top, top hood, ventilating windshield, speedometer, oil gauge and gasoline gauge on dash, demountable rims, extra rim, tire holder, electric horn, foot rail, coat rail, pump, tools and jack. It has powerful electric headlights with parabolic reflectors, flush dashlights (electric) and an electric tail lamp. The current for the lights is supplied by a dynamo driven by the motor which charges a storage battery for use when the motor is not running. The car has black and nickel trimmings.

Watch for our new six-cylinder touring car. It will be announced in a few weeks, and will be ready for early delivery.

A New Jackson Policy Along With The New Jackson Cars

The public has just received, in the Saturday Evening Post, our first announcement of the new Jackson models for 1913.

And the announcement marks the inauguration of a new policy on the part of the Jackson Company.

This policy provides for the most forceful advertising campaign that has ever been undertaken.

In other words the strongest, most efficient cooperation we have ever given Jackson dealers in the way of national and localized sales publicity.

The new Jacksons are really sensational cars.

They are as comfortable, as easy riding, as silent as the highest priced.

For the first time, they place cars of moderate price in direct competition in these respects, with the costliest makes.

You can see instantly the advantage of these two features:—

Cars that have no superior in the three big things—and a national advertising campaign that will tell the facts to the public, in full page and double page copy, month after month, during the entire season.

Good dealers can build up a steady, substantial business on standard high-grade cars.

This is the kind of line we are offering.

A reputation of 11 years' standing, and an advertising campaign of tremendous force, will establish the Jackson dealer in a lasting and profitable trade.

Our full and double page advertisements will reach every possible automobile buyer in the country every month through at least three different publications.

These are the strongest weapons we have ever placed in the Jackson dealers' hands.

We expect them to make 1913 a record year for the Jackson—in the number of cars sold; in the number of satisfied owners; in the number of successful dealers; in Jackson prestige.

Every Jackson dealer will share in the benefits and the profits.

And a good many of the up-and-doing dealers who appreciate a winning combination are going after the Jackson line.

If you are one of that kind and want to participate, don't let the day go by without getting in touch.

The good news has spread around and we are signing new territory right now, and signing it fast.

Wire, write or telephone the sales manager for an appointment.

Our six-cylinder, seven-passenger touring car will be announced soon. Watch for it.

Jackson Automobile Company, 1203 East Main St. Jackson, Mich.

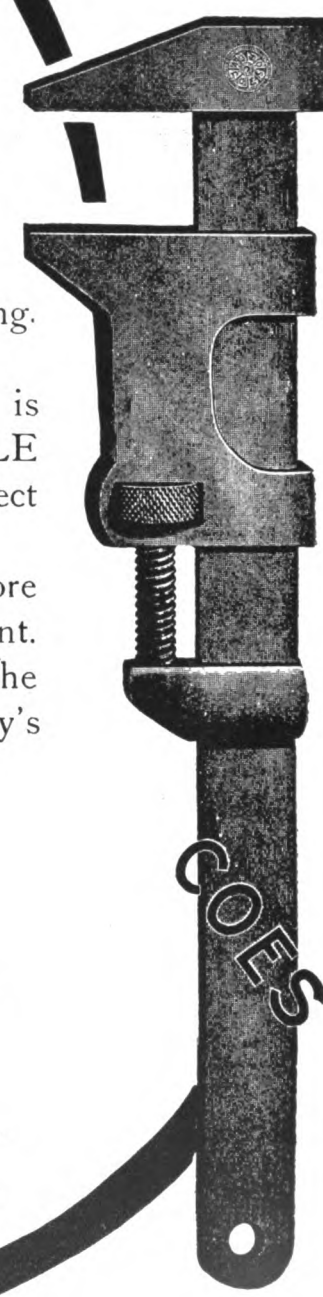
COES



THE
Wrench Supreme

Strength without bulk or clumsiness.
Ease of handling without slipping or bruising.
Perfect balance and right grip

Everything the motorist desires in a wrench is to be found in the "COES" AUTOMOBILE MODEL, and you will never know perfect wrench service until you pin your faith to it.

It stands to reason that the 5 per cent. more you pay for a "COES" wrench goes for 60 per cent. more quality and service—put this wrench in the tool kit and shop. You will get your money's worth.

TEXACO
MOTOR OIL

ASK any car owner to tell you his motor troubles. Usually he'll answer, "Tires and oil." Usually he'll put the blame on the products. Sometimes it belongs there, sometimes not.

The tire question *is* a difficult one. But, as a rule, a good tire well treated—kept fully inflated, not overloaded, not scraped against curves, not run in ruts or car tracks, will give good service.

The oil question is easy of solution. The answer is Texaco Motor Oil.

Texaco meets every demand of the man who drives a car. It lubricates perfectly, increasing the power of your motor, doing away with scarred cylinder walls and pitted valves. It burns absolutely clean, eliminating the sooting and clogging of spark plugs. It shows a zero cold test and will not congeal at that temperature. These are the three cardinal virtues of a lubricating oil.

But remember this—the best of oils like the best of tires must be properly used if it is to give a maximum of service.

We have prepared a booklet on the proper use of lubricants. It is called "About Motor Lubrication." We want every car owner to read it. For your copy, address Dept. D, 7 West St., N. Y. City

Cutting

Here are the biggest and best cars you can buy for the money, greater than last year's values.

WITH the factory running at full capacity and over half of the 1913 output already sold, the Clarke-Carter Automobile Company makes its annouucement with the optimistic prediction that within one month the entire output will have been contracted for and allotted to customers.

This assertion is based upon the experience of last year, at which time the Cutting was almost an unknown car.

Only a few dealers appreciated its value.

Only a few knew of the organization behind the product.

If ever cars were sold by demonstration, Cutting cars were.

As was said at that time, any new car to compete successfully with old established ones must possess an excess of value.

Cutting cars did.

They cost less per horse power and per wheel-base inch than any other car in the world selling for $1200.00 and over.

The moment that this truth became known, the cars began to sell.

In one week alone, 357 orders poured in and within a few weeks the product was oversold.

Cutting dealers then advised an increased output which was refused.

Instead, work was started upon the 1913 product with the idea of making it as much superior to the competitors' cars as the previous models had been.

This announcement has been purposely delayed until this date because the Cutting management desired to be sure of their ground in making the statement that Cutting cars are the best you can buy for the money, not only in length of wheel-base, size of body and horse power, but in material and structural details as well.

This year both wheel-base and horse power have been materially increased.

Space will not permit the enumeration of the many other points of Cutting superiority, but you are asked to note one thing which will show you the careful attention that has been paid to details.

In the assembling of most medium priced cars, where two parts are bolted together, the holes are ordinarily just drilled.

In assembling Cutting cars, however, the holes are drilled and hand rimmed to exact size, making a perfect fit. You can readily see the importance of such procedure inasmuch as a badly fitting bolt allows the joint to work loose and a noisy, shaky car is the result.

It is such details that mark the difference between high grade cars and mediocre ones.

Oakland

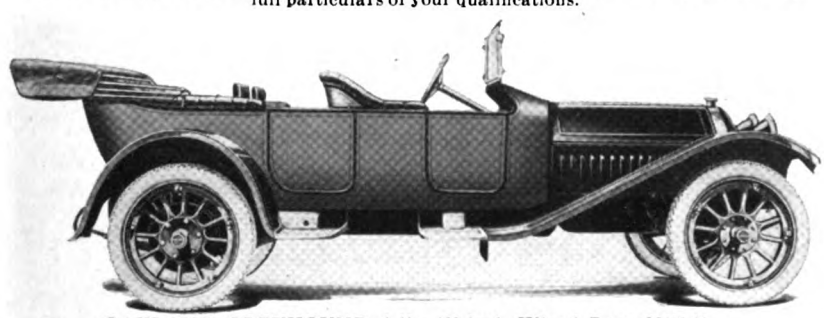
The Past, Present and Future of "The Car With a Conscience"

THE OAKLAND has a successful past, a remarkable present and is bound to have a wonderful future. From both the dealers' and owners' standpoint, the Oakland line looms up prominently as **The** important figure in the automobile industry, for it represents "the happy medium" in motor car construction.

The Oakland line for 1913 is the ideal combination, for dealers to concentrate their efforts upon, to make money and to satisfy and please their customers; for it is a wonderful line of motor cars in design, in quality and in appearance. Exclusive features, beautiful body lines and sound mechanical principles are to be found in every model. Unit power plants are used exclusively.

HERE IS THE LINE BRIEFLY DESCRIBED. READ IT.

The Greyhound 6-60—the new Oakland six cylinder chassis; wheel base 130 inches, double drop frame, unit power plant, cone clutch, sliding gear transmission, full floating rear axle, demountable rims, German silver radiator, "V" shaped; 10 inch upholstering, full nickel trimmings, and equipped with electric lighting and ignition system and a self starter at $2400. It will come in 4, 5 and 7 passenger bodies and a raceabout for two.



Model 45—7 passenger limousine; wheel base 120 inches, double drop frame, unit power plant, selective sliding gear transmission, cone clutch, Bosch magneto, $3000.

Model 42 chassis, 116 inch wheel base, double drop frame, unit power plant, cone clutch, sliding gear transmission, full floating rear axle, demountable rims, German silver radiator, "V" shaped; 10 inch upholstering, full nickel trimmings and equipped with electric lighting and ignition system and a self starter at $1600. It will come in a 5 passenger body, a close coupled 4 passenger body and the famous Sociable Roadster (3 passengers—single seat). Also a smart 4 passenger coupe on this chassis at $2500.

Model 40 chassis, 5 passenger touring car; 114 inch wheel base, single drop frame, unit power plant, selective sliding gear transmission, cone clutch, demountable rims, full nickel trimmings and equipped with a self starter at $1450.

Model 35 chassis, 5 passenger touring car, wheel base 112 inches, single drop frame, unit power plant, sliding gear transmission, cone clutch, demountable rims, full nickel trimmings and elecrically lighted at $1075. There will also be furnished on this chassis a 3 passenger (single seat) Sociable Roadster at $1000.

THE AUTOMOBILE JOURNAL

VOL. XXXIV, No. 2 AUGUST 25, 1912 Price, $1.00 the Year

WILL SECURE DYER PATENT LICENSES.

Automobile Boad of Trade Enters into Contract with Enterprize Automobile Company Under Conditions Recalling Famous Selden Patent Situation--- Held to Cover Practically All Forms of Sliding Transmission.

AS THE result of negotiations which have been carried on for some months between the Automobile Board of Trade and the Enterprize Automobile Company, the latter of Hoboken, N. J., the industry is confronted with a situation which bears a close analogy to the famous Selden patent controversy in many respects. The importance of the transaction, which involves the right to manufacture under the so-called Dyer transmission patents, is indicated in the official announcement of the Automobile Board of Trade under date of Aug. 13, as follows:

Showing Location of Dyer Patent Device, Looking Down upon a Motor Vehicle Chassis.

"After negotiations, extending over a period of more than six months, the Automobile Board of Trade has perfected an arrangement with the Enterprize Automobile Company, owner of the Dyer transmission patents, granting its members licenses to operate under them. The patent numbers are as follows: 643,595, 657,650, 662,400, 662,401, 676,223, 886,986 and 921,963. These patents cover practically all forms of sliding gear transmission in use on motor cars at the present time. The patents committee of the Automobile Board of Trade which successfully conducted the negotiations, is composed of the following: C. C. Hanch, W. H. VanDervoort, L. H. Kittredge, Alvan Macauley and L. E. Latta."

In response to a request for further information and to a suggestion that possibly other developments were contemplated in connection with the matter, General Manager H. A. Bonnell of the Automobile Board of Trade states the position of that body as follows:

"The only transmission patents owned or controlled by the Enterprize Automobile Company (which company owns and controls all of the Dyer patents) are those mentioned in our announcement of the 13th inst. The patents seem pretty broad and cover practically all sliding gear-

Digitized by Google

transmissions used on automobiles in this country.

"According to the agreement we have made, the Automobile Board of Trade has and can secure licenses for all its members. While we are not positive, we are under the impression that the Enterprize Automobile Company is also willing to enter into arrangements with other manufacturers to issue licenses."

Willys-Overland Company, Toledo, O., Overland.
Winton Motor Carriage Company, Cleveland, O., Winton.

It should be stated that the patents mentioned above were issued to Leonard H. Dyer, now of Greenwich, Conn., who recently was elected president of the Enterprize Automobile Company, to succeed John R. Taylor, with whom he has been associated in the practise of patent law since 1897. Five of these patents were acquired some six years ago by the Patents Holding Association, then a subsidiary of the old Association of Licensed Automobile Manufacturers, which was succeeded by the Automobile Board of Trade soon after the adverse decision in the so-called Selden patent cases in January, 1911. These were the five first named, and they have been turned over to the Enterprize Automobile Company as a part of the consideration in the present contract.

Patent 643,595 was granted Feb. 13, 1900, and is held to cover two gears and an intermediate epicyclic gearing interposed between one of the gears and the driven axle. Antedating this a trifle in the matter of application is patent 657,650, which was granted Sept. 11, 1900, and is held to cover a fixed guide plate with recesses and notches to hold the gear shifting lever. Patent 662,400, granted Nov. 27, 1900, relates to the subject of two shafts with spur gearing and means for intermeshing the gear wheels so as to transmit power from the driving to the driven shaft. Patent 662,401 is for a multiple speed transmission gearing, and is similar to the main patent, described below except that the gears cannot be shifted as an entirety and the principle of direct drive with all gearing quiescent is not covered. Patent 676,223 is held to cover a removable rigid bridge to carry the motor and operating parts.

What is termed the main patent is that numbered 885,986, for which application was made Jan. 22, 1900, and which was issued April 28, 1908. This is claimed to extend backward in its effect to Feb. 3, 1900, inasmuch as it is declared to be a division of an application for a patent filed that date, which was later granted as patent 921,963 under date of May 19, 1909. This last patent is claimed to underly the so-called main patent as a sort of foundation for it, and is held to cover improvements in the frame, driving gear, and changing and reversing mechanism of a motor vehicle.

It will be noted that the so-called main patent has very nearly 13 years to run. The effect of the entire transaction upon the industry can only be conjectured. While the official statement of the Automobile Board of Trade, and the subsequent explanation by Mr. Bonnell makes mention of the sliding gear transmission, it will be seen that at least one of the patents at issue is held to cover the planetary transmission. This would seem to indicate that the ultimate result would involve a much larger percentage of manufacturers than were the patents confined to the sliding gear transmission.

It is understood that the contract provides that the Automobile Board of Trade shall pay a lump sum to Enterprize Automobile Company, and that

Digitized by Google

the Patents Holding Association shall convey all right, title and interest held by it in the five Dyer patents mentioned above to the Enterprize Automobile Company, this company to issue licenses to the present and future members of the Automobile Board of Trade under all of the patents involved in the transaction and any further automobile patents that may be taken out by Leonard H. Dyer. While the rights of the Patents Holding Association consisted of the exclusive right to issue licenses under the five patents held by it, it is stated that the new contract leaves the Enterprize Automobile Company free to grant licenses to other manufacturers than members of the Automobile Board of Trade on a royalty basis.

In this connection it is interesting to note that William A. Redding, patent counsel, associated with Frederick P. Fisk in representing the Automobile Board of Trade, was asked to investigate the claims of the Dyer patents some time previous to six months ago, since his report was ready at that time. Suits were instituted by the Enterprize Automobile Company, as assignee of the patent rights of Leonard H. Dyer, against certain manufacturers and several individuals about a year ago. It was before this that the investigation of the Automobile Board of Trade was begun, and Mr. Redding is said to have made a very exhaustive search for prior art, not only examining the patent records in the United States, but those of Germany, France, Belgium, Italy and Great Britain, as well.

During the progress of his investigation the suits against the manufacturers, at least those who were members of the Automobile Board of Trade, were continued from time to time, the Enterprize Automobile Company consenting to these delays. Other suits were settled, particularly some of those brought against individual owners.

Something like six months ago action was taken by the National Association of Automobile Manufacturers looking toward a merger with the Automobile Board of Trade. There is a suggestion that those responsible for this action were not wholly ignorant concerning the negotiations under way with the Enterprize Automobile Company, and this supposition is increased by the fact that the charter of the National association does not permit it to hold patent rights as such. It will be noted by a comparison of the membership lists of the two organizations, presented elsewhere, that nearly all of those connected with the Automobile Board of Trade are represented in the larger body. If the proposed merger becomes an accomplished fact, it must be assumed that the entire membership of the combined bodies will enjoy the privilege of securing licenses under the Dyer patents. What arrangement will be made with reference to the cost of such licenses to future members of the organization has not been announced.

Dyer Patent as Applied to Low Speed and Reversing Gears.

Returning to the patents, themselves, or rather to the main patent and that upon which it is claimed to be based, Mr. Redding is quoted as follows: "The patent is imposing in its breadth and has been a threatening element in the industry up to this time. Our search discloses a mass of data, but the industry can draw its own conclusions from the fact that my clients were strongly advised by me, as early as last winter, to take out licenses and avoid the possible danger and expense which must have followed a complete and favorable adjudication of the patents in question."

Mr. Dyer has issued the following statement:

"There has been a widely circulated opinion that the Dyer patents were allowed to rest in the Patent Office and were issued after the industry had grown up around them. This is not true. The exact fact is that through interference proceedings with the Renault patent, application for which was pending coincidentally with mine, the dates and claims of my patent were revealed and the industry appropriated my idea and incorporated it into the modern automobile.

"As to prior art, there is none. Of course there can be found a vast amount of ineffectual endeavor, but there is a difference between ineffectual endeavor and the actual accomplishment of such a result. The American situation is embodied in the Dyer patents 1900, Renault patent 1901, Law, Leonard and Riker 1903. These records are available to searchers and if any of them antedated my patents, Mr. Redding surely would have discovered it. In the foreign art there is nothing effective, despite the large quantity of abortive and ineffectual material revealed by a careful search."

While the main patent embodies 57 separate claims, and that upon which it is based, three more, it is assumed that the public will be interested in learning just what these claims may be. The sketches herewith are taken from the original patent drawings and set forth, in connection with the claims, the entire situation with respect to patents 885,986 and 921,963. The latter reads as follows:

Claims of Patent 921,963.

1—The combination in a vehicle of a spring-supported frame, driving and steering wheels, a motor mounted upon the front of the frame, a shaft driven by such motor and in line with the shaft of the motor, the said shaft being longitudinally arranged substantially at an equal distance between the wheels and substantially parallel with the ground, a friction clutch connecting the shaft to the motor, a second shaft in line with the first shaft, means for directly connecting the two shafts for driving the second shaft without reduction in speed, means for breaking the connection between the two shafts and for connecting them together through power transmitting mechanism, affording a reduced speed, a differential gear between the second shaft and the wheels of the vehicle, and a reversing gear for reversing the direction of travel of the vehicle.

2—The combination in a vehicle of a spring-supported frame, driving and steering wheels, a motor mounted upon the front of the frame, a shaft driven by such motor and in line with the shaft of such motor, the said shaft being longitudinally arranged between the wheels, a friction clutch connecting the shaft to the motor, a second shaft in line with the first shaft, means for directly connecting the two shafts for driving the second shaft without reduction in speed, and means for breaking the connecting between the two shafts and for connecting them together through power-transmitting mechanism, affording a reduced speed.

3—The combination in a vehicle, of a spring-supported frame, driving and steering wheels, a motor mounted upon the front of the frame, a shaft driven by such motor and in line with the shaft of the motor, the said shaft being longitudinally arranged between the wheels, a friction clutch connecting the shaft with the motor, a second shaft in line with the first shaft, means for directly connecting the two shafts for driving the second shaft without reduction of speed, means for breaking the connection between the two shafts and for connecting them together through power-transmitting mechanism, affording a reduced speed, and a reversing gear for reversing the direction of travel of the vehicle.

Claims of Patent 885,986.

1—In a transmission for motor vehicles, the combination of a driving member, a driven member, a driving gear for the former, a plurality of intermediate gears, including a reversing gear and means, including mechanism shiftable as an entirety, for driving said driven member through any one of said intermediate gears.

2—In a transmission gear for motor cars, the combination of a driving member, a driven member, a driving gear for the former, a plurality of intermediate gears including a reversing gear and means, including mechanism shiftable as an entirety, for coupling said driving member to said driven member and for also driving said driven member through any one of the said intermediate gears.

3—Transmission mechanism for motor vehicles, the same comprising a driving member, a driven member, means to couple said driven member to said driving member to be driven by the latter and means comprising mechanism shiftable as an entirety to drive said driven member at a different speed for said driving member and to drive said driven member in reverse direction from said driving member.

4—Transmission mechanism for motor vehicles, the same comprising a driving member, a driven shaft axially aligned therewith, means to couple said member and shaft, one to the other for direct drive of the latter by the former, a plurality of gears arranged out of line with the axis of said shaft and driven by said member, and a shiftable transmission device on said shaft and adapted to engage the said plurality of gears to drive said shaft in the same, and also in a reverse direction.

5—In a transmission gear for a motor vehicle, the combination of driving member, a driven member, and means comprising mechanism shiftable as an entirety coupling said driving member to said driven member to drive the latter from the former and for varying the speed and direction of movement transmitted from said driving member to said driven member.

6—Transmission mechanism for motor vehicles, the same comprising a driving shaft, a plurality of fixed intermediate gears, including a reversing gear, means for supporting said gears, a driven shaft and means comprising a longitudinal, shiftable transmission device to rotate the latter from the driving shaft to any one of said intermediate gears.

7—Transmission mechanism for motor cars, same comprising a driving shaft, gear supporting means driven therefrom at a reduced speed, a plurality of fixed intermediate gears, including a reversing gear, a driven shaft and means comprising a longitudinal, shiftable transmission device to rotate the latter from the driving shaft through any one of said intermediate gears.

8—Transmission mechanism for motor vehicles, comprising a driving member, a driven member, a shiftable transmission member, means co-ordinate therewith to couple said driven member to said driving member, one or more stationary intermediate gears driven by said driving member and means to bring said transmission member into separate engagement and disengagement with said one or more intermediate gears.

9—Transmission mechanism comprising a driving member and a driven member adapted to be driven one by the other at the same speed, at different speeds, or in a reverse direction and mechanism longitudinally shiftable as an entirety for obtaining such changes in speed and direction.

10—Transmission mechanism for motor vehicle comprising a driving member, a driven intermediate gear, a jack-shaft arranged at transmission device on said shaft, means for coupling said driving member and said driven shaft one to the other for the direct drive of the latter by the former, one or more stationary gears arranged at one side of the axis of said shaft and driven by said driving member and means to shift such transmission device into engagement with the said one or more gears.

11—In a motor vehicle, a motor, clutch, driving gear and driven shaft, all axially aligned, intermediate gears between said driven shaft and driving gear, mechansim shiftable as an entirety to couple said driven shaft to said driving gear and to drive said shaft from said driving gear through any one of said intermediate gears, a jack-shaft arranged at an angle with said driven shaft and driven therefrom and vehicle driving wheels connected with and driven from said jack-shaft.

12—In a motor vehicle, a motor, clutch, driving shaft and driven shaft, all axially aligned, means comprising mechanism shiftable as an entirety for varying the speed and direction of movement transmitted from said driving shaft to said driven shaft, a jack-shaft arranged at an angle with said driven shaft and driven therefrom and vehicle driving wheels connected with and driven from said jack-shaft.

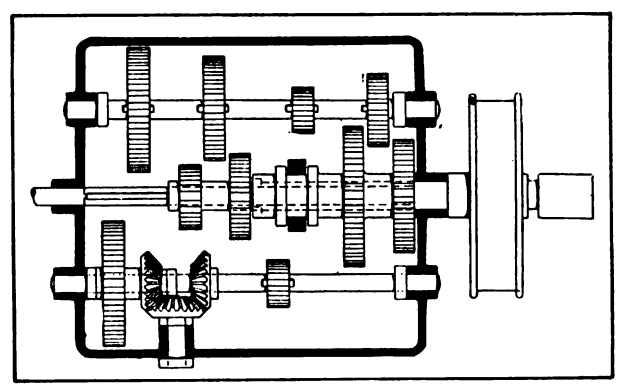
13—In a transmission gear for motor vehicles the combination of a driving member, a driven member, axially aligned therewith and means comprising mechanism shiftable as an entirely to couple said driving and driven members together and to vary the speed and direction of movements transmitted from said driving member to said driven member.

14—In a speed changing gear for motor vehicles, the combination with a motor shaft, a driven shaft, means for connecting the two together to secure high speed, a low speed gearing consisting of a plurality of gear wheels caused to engage by longitudinal shifting movements and means for producing reverse rotation of the driven shaft.

15—In a motor vehicle the combination with the motor and driving wheels, of a gearing connecting the driving wheels and motors, the said gearing comprising a longitudinal shaft and a clutch connecting the shaft to the motor, and by means of which it will be driven, of means for rotating the wheels and a portion of the shaft at a different speed ratio, the said means including a jaw-clutch and longitudinally sliding gears, a single lever for sliding the gears and engaging and disengaging the jaw-clutch and a reverse gearing, and means operated by the said lever for engaging the reverse gearing.

16—In a motor vehicle the combination with a driving motor and driving wheels, of a gearing connecting the two, the said gearing comprising longitudinally aligned driving and driven shafts and a clutch connecting the driving shaft to the motor, and by means of which it will be driven, connections between the driven shaft and the driving wheels, gearing connecting the longitudinal shaft to positively drive the driven shaft at low or high speed, and comprising longitudinally sliding gears and a second clutch, and a single manually operated sliding device for sliding the gears, and for engaging the second clutch.

17—In a motor vehicle, the combination with a driving motor and driving wheels, of a gearing connecting the two, said gearing comprising longitudinally aligned driving and driven shafts and a clutch connecting the driving shaft to the motor and by means of which it will be driven, connections between the driven shaft and the driving wheels, gearing connecting the longitudinal shafts to positively drive the driven shaft at low or high speeds, and comprising longitudinally sliding gears and a second clutch, and a single actuating lever for sliding the gears and for engaging and disengaging the second clutch.



18—In a motor vehicle, the combination with the motor and driving wheels, of a gearing connecting the two, the said gearing comprising longitudinally aligned driving and driven shafts and a clutch for connecting the two, for driving the driven shaft at high speed, and reduced speed gearing for positively driving the driven shaft at a reduced speed and means for engaging the said reduced speed gearing, the said reduced speed gearing being entirely disconnected when not in use, and being introduced and disengaged by a longitudinally sliding movement.

19—In a motor vehicle the combination with the motor and driving wheels of a gearing connecting the two, the said gearing comprising longitudinally aligned driving and driven shafts and a clutch for connecting the two for driving the driven shaft at high speed, and reduced speed gearing and reverse gearing for positively driving the shaft at a reduced speed, or in the reverse direction, and means for engaging the said reduced gearing and reverse gearing, the said reduced speed gearing and reverse gearing being entirely disconnected when not in use, and being introduced and disengaged by a longitudinally sliding movement.

20—In a motor vehicle the combination with the motor and driving wheels, of a gearing connecting the two, the said gearing comprising a longitudinal shaft, a clutch connecting the shaft to the motor and by means of which it is driven, connections between the shaft and the driving wheels, and a change speed device for rotating a portion of the shaft at a less speed than the motor, the said change speed device comprising an auxiliary shaft and gears on the longitudinal shaft, and means for intermeshing the gears by a sliding movement.

21—In a motor vehicle, the combination with the motor and driving wheels of a gearing connecting the two, the said gearing comprising a longitudinal shaft, a clutch connecting the shaft to the motor, and by means of which it is driven, connections between the shaft and the driving wheels and a change speed device for rotating a portion of the shaft at a less speed than the motor, the said change speed device comprising an auxiliary shaft, and gears on the longitudinal shaft and means for intermeshing the gears by a sliding movement, the said means comprising a single manually operated lever.

22—In a motor vehicle the combination with the motor and driving wheels, of a gearing connecting the two, the said gearing compris-

Additional Forward Speeds Obtained by Addition of Extra Secondary Gears on One of the Auxiliary Shafts, Together with Others on Main Driving Shaft.

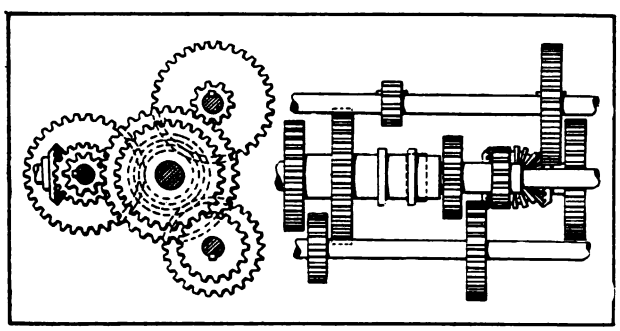
ing a longitudinal shaft, a clutch connecting the shaft to the motor, and by means of which it is driven, connections between the shaft and the driving wheels and a change speed device for rotating a portion of the shaft at a less speed than the motor, the said change speed device comprising an auxiliary shaft, mounted in rigid bearings, gears rigidly mounted on the auxiliary shaft and gears on the longitudinal shaft, and means for intermeshing the gears by a sliding movement.

23—In a motor vehicle the combination with a driving shaft made in two parts, of a clutch made in two parts and connecting the shaft parts, one of the clutch parts sliding upon its supporting shaft part, a gear connected to the sliding clutch part and sliding with it, an auxiliary shaft, gears thereon and means for sliding the moving clutch part and its companion gear to disengage the two shaft parts and engage the gear with a gear on the auxiliary shaft, to cause the two shaft parts to rotate at a different speed relation.

24—In a motor vehicle the combination with a driving shaft in two parts, of a clutch made in two parts and connecting the shaft parts, one of the clutch parts sliding upon its supporting shaft part, a gear connected to the sliding clutch part and sliding with it, a gear on the other shaft part and rotating with it, an auxiliary shaft gear thereon, the said shaft being mounted on rigid bearings and means for sliding the moving clutch part and its companion gear to disengage the two shaft parts and engage the gear with a gear on the auxiliary shaft, to cause the two shaft parts to rotate in a different relation.

25—In a motor vehicle, the combination with a driving shaft made in two parts, of a clutch made in two parts and connecting the two shaft parts, one of the clutch parts sliding upon its supporting shaft part, a gear connected to the sliding clutch part and sliding with it, a gear on the other shaft part and rotating with it, and auxiliary shaft, gears thereon, the gears being rigidly mounted on the shaft and means for sliding the moving clutch part and its companion gear to disengage the two shaft parts and engage the gear with a gear on the auxiliary shaft to cause the two shaft parts to rotate in a different speed relation.

26—In a motor vehicle the combination with a driving shaft made in two parts, of a gear case, a clutch made in two parts and connecting the two shaft parts, one of the clutch parts sliding upon its supporting shaft part, a gear connected to the sliding clutch part and slid-



Digitized by Google

ing with it, a gear on the other shaft part and rotating with it, an auxiliary shaft, mounted in rigid bearings, carried by the gear case, gears movable in a fixed plane with respect to said shaft, on the auxiliary shaft and means for longitudinally sliding the moving clutch part and its companion gear to disengage the two shaft parts and engage the gear with a gear on the auxiliary shaft to cause the two shaft parts to rotate in a different speed relation.

27—In a motor vehicle, the combination with a driving shaft made in two parts, of a gear case, bearing on the gear case for the shaft parts, a clutch made in two parts and connecting the two shaft parts, one of the clutch parts sliding upon its supporting shaft part, a gear connected to the sliding clutch part and sliding with it, a gear on the other shaft part and rotating with it, an auxiliary shaft, mounted in rigid bearings, carried by the gear case, gears on the auxiliary shaft, the said gears being rigidly mounted on the shaft and means for sliding the moving clutch part and its companion gear to disengage the two shaft parts and engage the gear with a gear on the auxiliary shaft to cause the two shaft parts to rotate in a different speed relation.

28—In a motor vehicle, the combination with a shaft made in two parts of a gear case, bearings on the gear case for the shaft parts, a clutch made in two parts and connecting the two shaft parts, one of the clutch parts sliding upon its supporting shaft part, a gear connected to the sliding clutch part and sliding with it, a gear upon the other shaft part and rotating with it, and auxiliary shaft, mounted in rigid bearings carried by the gear case, gears on the auxiliary shaft, and means carried within the gear case for sliding the moving clutch part and its companion gear to disengage the two shaft parts and engage the gear with a gear on the auxiliary shaft to cause the two shaft parts to rotate in a different speed relation.

29—In a motor vehicle the combination with a driving shaft made in two parts, of a gear case, bearings on the gear case for the shaft parts, a clutch made in two parts and connecting the two shaft parts, one of the clutch parts sliding upon its supporting shaft part, a gear connected to the sliding clutch part and sliding with it, a gear on the other shaft part and rotating with it, an auxiliary shaft mounted in rigid bearings carried by the gear case, gears on the auxiliary shaft, the said gears being rigidly mounted on the shaft, and means carried within the gear case for sliding the moving clutch part and its companion to disengage the two shaft parts and engage the gear with a gear on the auxiliary shaft to cause the two shaft parts to rotate in a different speed relation.

Views of the Device as Seen from Above and from One End.

30—A motor vehicle having driving wheels, a motor, a shaft in line with the motor shaft, a clutch connecting the two to cause the shaft to rotate at the same speed as the motor, the shaft being longitudinally arranged between the driving wheels and divided into two sections, a device for connecting and disconnecting the two sections for causing them to rotate as an entirety or to permit independent rotation, means for rotating the rear section of the shaft at a lesser speed than the motor or in a reverse direction, said means including sliding gears, longitudinally movable in a fixed plane with respect to said shaft and mechanism for so moving said gears.

31—In a motor vehicle, the combination with a shaft formed of two parts, a connecting clutch and a gear on each shaft part, of a second shaft and gears thereon, and a single lever for shifting the gears on the first shaft and actuating the clutch.

32—Transmission for a motor vehicle, having a shaft formed of two parts, one telescoping within the other, connecting a clutch, a gear carried by one clutch member, a second gear connected to the first gear but freely rotatable with respect thereto, a second shaft, and gears thereon and a single lever for shifting said first gears, and actuating the clutch.

33—In a motor vehicle, the combination with a shaft formed of two parts, of a clutch connecting the two parts, a sleeve surrounding the abutting ends of the two parts, a gear formed integral with the clutch, and engaging with one part, a second gear formed integral with the sleeve and engaging with the other part, an auxiliary shaft, gears thereon disengaged at the high speed, intermediate gears interposed between the gears on the second shaft, and means for moving the sleeve, clutch and gears to disengage the two shaft parts and intermesh the gears whereby the two parts of the shaft may be caused to rotate in different speed relation.

34—Transmission gearing for a motor vehicle, having a shaft formed of two parts, one telescoping within the other, a connecting clutch, a gear integrally formed upon one clutch member, a second gear, a sleeve thereon, connecting with, but freely rotatable with respect to the first gear, a second shaft with gears thereon and a single shifting lever for sliding first gears and disengaging the clutch.

35—In a motor vehicle, a gear case therefor, having a cover and supporting brackets, with a set of common securing bolts.

36—In a motor vehicle, a combination of a shaft therefor, formed in two parts, a fixed clutch member on one part, a movable clutch member on the other, gears connected to said movable member, a plurality of auxiliary shafts, gears thereon, and means for sliding said movable clutch member and connected gears along the shaft to disengage the clutch and intermesh the gears seriatim.

37—In a motor vehicle, the combination with the shaft, formed in two parts of a clutch for connecting parts together to cause the shaft to rotate as an entirety, slidable gears on the shaft's parts, connecting to and working with one clutch member, auxiliary shafts with gears thereon, and means, which being moved, will first disengage the clutch and move the gears to a position to engage with the gears on one auxiliary shaft to cause the shaft's parts to partake of the different speed relations, and the continuation of the movement will cause the gears to engage with the gears on the other auxiliary shaft and cause the shaft's parts to rotate in opposite directions.

38—In a motor vehicle, the combination with an operating motor, of connections between the motor and the driving wheels, comprising a two-piece shaft connected thereto, connections to said shaft and driving wheels, a clutch connecting the two parts of the shaft, a gear carried by one part of the shaft, a second gear carried by the other part, connections between the gears and the clutch for moving altogether, an auxiliary shaft, two gears secured thereto, out of mesh with the other two gears at the high speed, a second auxiliary shaft, two gears secured thereto, normally out of mesh with the first two gears, intermediate gearing interposed between the two gears on the second auxiliary shaft, and means for disengaging the clutch and intermeshing the different gears, whereby the two parts of the shaft may be caused to rotate in different speed relations.

39—In a motor vehicle, the combination with the driving shaft made in two parts, of the clutch connecting the two parts, a sleeve surrounding the abutting ends of the two parts, a gear formed integral with the clutch, a second gear formed integral with the sleeve and engaging with the other part, and an auxiliary shaft, gears thereon, disengaged at the high speed, and means for moving the sleeve, clutch and gears to disengage the two shaft parts and intermesh the gears, whereby the two parts of the shaft may be caused to rotate in different speed relations.

40—In a motor vehicle, the combination with the driving shaft made in two parts, of a clutch connecting the two parts, a sleeve surrounding the abutting ends of the two parts, a gear formed integral with the clutch, a second gear formed integral with the sleeve and engaging with the other part, an auxiliary shaft, gears thereon, disengaged at the high speed, a second auxiliary shaft gears thereon disengage at the high speed and means for moving the sleeve, gears and clutch to disengage the two shaft parts and intermesh the gears, whereby the two parts of the shaft may be caused to rotate at different speeds.

41—In a motor vehicle, the combination with the driving shaft made in two parts, of a clutch connecting the two parts, a sleeve surrounding the abutting ends of the two parts, a gear formed integral with the clutch and engaging with one part, a second gear formed integral with the sleeve and engaging with the other part, and an auxiliary shaft, gears thereon, disengaged at the high speed, intermediate gearing interposed between the gears, means for moving the sleeve, clutch and gears to disengage the two shaft parts and intermesh the gears.

42—In a motor vehicle, the combination with a motor and driving wheels, of connections between said motor and the driving wheels, including a two-piece shaft, a clutch connecting the two shaft pieces, gears upon the shaft pieces and auxiliary shaft with gears thereon, said gears being so arranged as to be out of mesh when the clutch is engaged, an element longitudinally shiftable as an entirety for actuating said clutch and intermeshing said gears, substantially as set forth.

43—In a motor vehicle, the combination with the shaft formed in two parts, one telescoping within the other, of a connecting clutch, a gear integrally formed upon one clutch member, a second gear connected to the first gear but freely rotatable with respect thereto, a second shaft, and gears thereon, and a single lever for shifting said first gears and actuating the clutch, substantially as described.

44—In a motor vehicle, the combination with the driving shaft formed in two parts, of a fixed clutch member on one part, a sliding clutch member on the other part, a gear rigidly connected to said slidable member, a gear rotatably connected to said slidable member, and auxiliary shaft, gears thereon and means for moving said slidable clutch member and connected gears along the shaft to disengage the clutch and intermesh the gears.

45—In a motor vehicle, the combination with an operating motor, of connections between the motor and the driving wheels, comprising a two-piece shaft connected thereto, the connections between said shaft and driving wheels, a clutch connecting the two parts of the shaft, a gear carried by one part of the shaft, a second gear carried by the other part, connections between the gears and clutch for moving all together, an auxiliary shaft, two gears secured together, out of mesh with the other two gears at high speed, a second auxiliary shaft, two gears secured thereto out of mesh with the first two gears at the high speed, and means for disengaging the clutch and intermeshing the gears, whereby the two parts of the shaft may be caused to rotate in different speed relations.

46—In a motor vehicle, the combination of the driving wheels, the motor, the driving shaft between the motor and driving wheels, made of two longitudinally aligned sections, a clutch arranged to couple the sections so that the driving shaft may turn as an entirety and longitudinally sliding speed reducing gearing arranged to connect the shaft sections, and so co-ordinated with said clutch that the engagement of said gearing will effect the prior disengagement of said clutch and vice versa.

47—In combination in a change-speed mechanism, a driving shaft, a driven shaft, gears mounted upon said driving shaft and driven shaft, intermediate gears on an axis in fixed relation with the axis of said driving and driven shafts, means for transmitting power from said driving shaft to said driven shaft through said intermediate gears, and means movable on the driven shaft for directly connecting the driving and driven shafts with all intermediate gears at rest.

48—In combination in a change-speed mechanism, a driving and a driven shaft arranged in the same axial line and adapted to have independent movement, change gears carried upon the driving and driven shafts, means for varying the position of said gears, power transmitting means adopted to connect a gear on said driving shaft and on said driven shaft and a clutch mechanism for directly connecting said driving and driven shafts.

49—In combination in a change-speed mechanism, a driving shaft,

Digitized by Google

a gear borne upon said shaft, a countershaft, a gear borne upon the counter shaft and meshing with the gear upon the driving shaft, a driven shaft operatively arranged with relation to the driving shaft and provided with a clutch mechanism adapted to clutch it directly to said shaft, and intermediate gears borne upon the driven shaft and counter shaft, whereby the speed of the former may be varied with relation to the speed of the latter.

50—In combination in a change-speed mechanism, a driving shaft and driven shaft, a driving gear for the former, a plurality of intermediate gears including a reversing gear and means for driving said driven shaft through any one of said intermediate gears.

51—In combination in a change-speed mechanism, a driving shaft, a driven shaft, a plurality of transmission gears mounted to slide thereon, a plurality of intermediate gears arranged to engage and drive respectively, but singly, the said transmission gears, and means to couple said driven shaft directly to said driving shaft.

52—In a motor vehicle, the motor, clutch, driving gear and driven shaft, all axially aligned, means to drive said driven shaft from said driving gear at the same and also at different speeds, a jack-shaft arranged at an angle with said driven shaft and driven therefrom, and vehicle driving wheels connected with and driven from said jack-shaft.

53—In combination in a change-speed mechanism, a driving shaft, a driven shaft, a counter shaft in fixed relation to said driving and driven shafts, and operative gearing on said shafts, and inclosing casing, a bearing in said casing for one end of the driven shaft, the other bearing for said driven shaft being in the driving shaft.

54—In combination in a change-speed mechanism, a driving shaft and a driven shaft, operatively arranged, an inclosing casing, a bearing in said casing for one end of one of said shafts, the other end of said shaft having a bearing in the other shaft, a counter shaft in fixed relation to said driving and driven shafts and a plurality of gears connecting said counter, driving and driven shafts.

55—In combination in a change-speed mechanism, a driving shaft and a driven shaft, the driven shaft having a bearing in the driving shaft, and means movable on the driven shaft to engage the surrounding end of the driving shaft to rotate the two shafts at the same speed, a counter shaft in operative fixed relation to said driving and driven shafts and a plurality of gears connecting said counter, driving and driven shafts.

56—In combination in a change-speed mechanism, a driving shaft and a driven shaft axially aligned, a counter shaft in fixed relation to said driving and driven shafts, a plurality of gears connecting said counter, driving and driven shafts, and inclosing casing, a bearing in said casing for one end of the driven shaft.

57—In a transmission mechanism for motor vehicles, a casing, a driving shaft or shaft section projecting into said casing at one side, a bearing therefor in the wall of said casing, a gear and clutch part fixedly secured on or integral with said shaft section, and entirely on one side of said bearing within said casing, a driven shaft in said casing having a movable complementary clutch part, a counter shaft in fixed relation to said driving and driven shaft, and a plurality of gears on said shaft whereby varying speeds are transmitted to a shaft projecting from said casing.

TRAIL OF THE "BULL DOG."

That America is richer in ruins and historic points of interest by a thousandfold than all of the European countries combined, is the decision reached upon reading "The Trail of the Bull Dog," by Dr. Charles G. Percival. In this book, the author deals in a most interesting manner with his 50,000-mile journey, lasting two years, during which he penetrated every part of the United States, Mexico and Canada in the Abbott-Detroit "Bull Dog."

Dr. Percival takes his readers into parts of the country not usually visited by the tourist and gives a large amount of new and interesting information concerning a civilization compared to which the oldest of Europe's monuments belong to but yesterday. That this section of the great Southwest, where the most enlightened race in the world lived, departed and left no history within the knowledge of today, is accessible to the automobile, is not generally known. Dr. Percival makes it perfectly plain that the motoring tourist may have his dream of romantic speculation fully realized.

SIMPLEX ALUMINUM SOLDER.

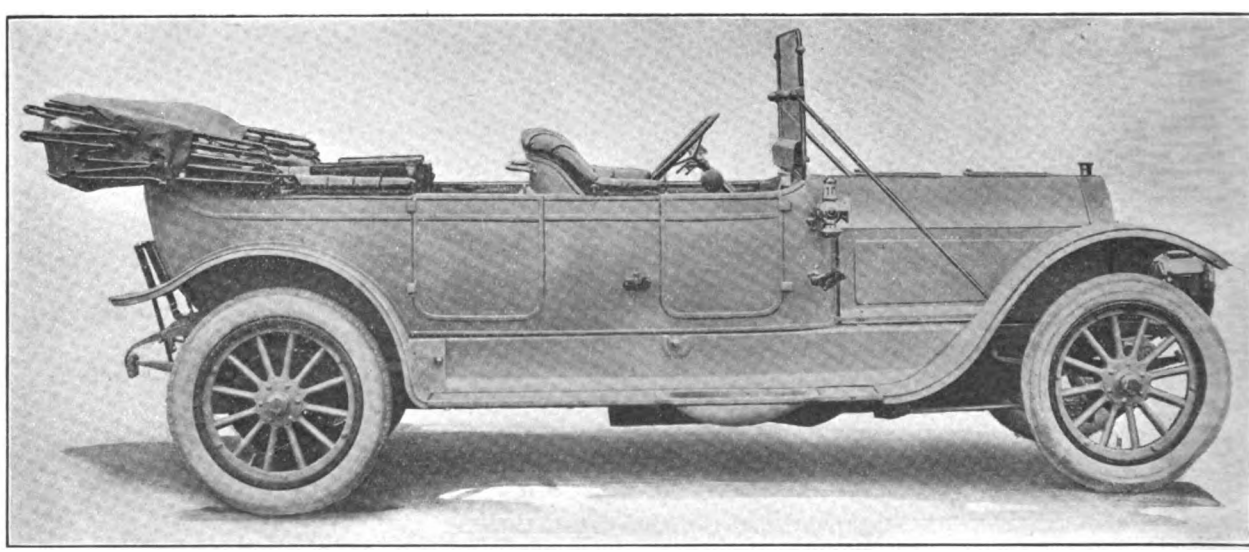
One of the difficulties with which repairmen must contend is that of soldering aluminum. This metal differs from ordinary materials, but it may be successfully handled if the right solder is employed. The Simplex Aluminum Solder Company, 108 Broadway, Astoria, Long Island, N. Y., is marketing Simplex aluminum solder which is designed for soldering aluminum parts as well as for joining brass or copper to aluminum.

According to the maker it requires no other tools than an ordinary copper soldering iron, and no acid, rosin or other similar substance is necessary in its application. All that is needed is that the work shall be free from dirt, grease, etc., and bright and clean. The parts to be repaired may be cleansed with gasoline and if very dirty or greasy, the foreign elements may be removed with nitric acid.

The simplicity of the operation will appeal to workmen who have struggled to secure good results. All parts are first tinned in the usual manner, taking care to have the iron clean, after which the solder is applied. When large castings or pieces are to be joined, which is held to be practical with Simplex solder, the parts should be heated to nearly the same degree as the solder. Brass or copper can be tinned with ordinary solder then joined to aluminum with the Simplex material, providing the work is free from acids. Simplex aluminum solder is inexpensive and is guaranteed by the maker.

ANOTHER OAKLAND BRANCH.

Following its policy of establishing branch houses in leading distributing centres, so as to improve the service end of the business and to facilitate the selling end, the Oakland Motor Car Company, Pontiac, Mich., maker of Oakland cars, will take over the business of the Oakland Company of Pennsylvania, in Philadelphia, Sept. 1. The new branch will be in charge of Edward K. Leach, for some time past general manager of the Commercial Car Journal in that city.



MONTREAL SHOW DATES.

The fourth annual Montreal show, under the auspices of the Automobile Club of Canada and the management of E. M. Wilcox, will be held in the Drill Shed, Jan. 4-11, just preceding the exhibition in New York City. The Toronto display will be held a month later.

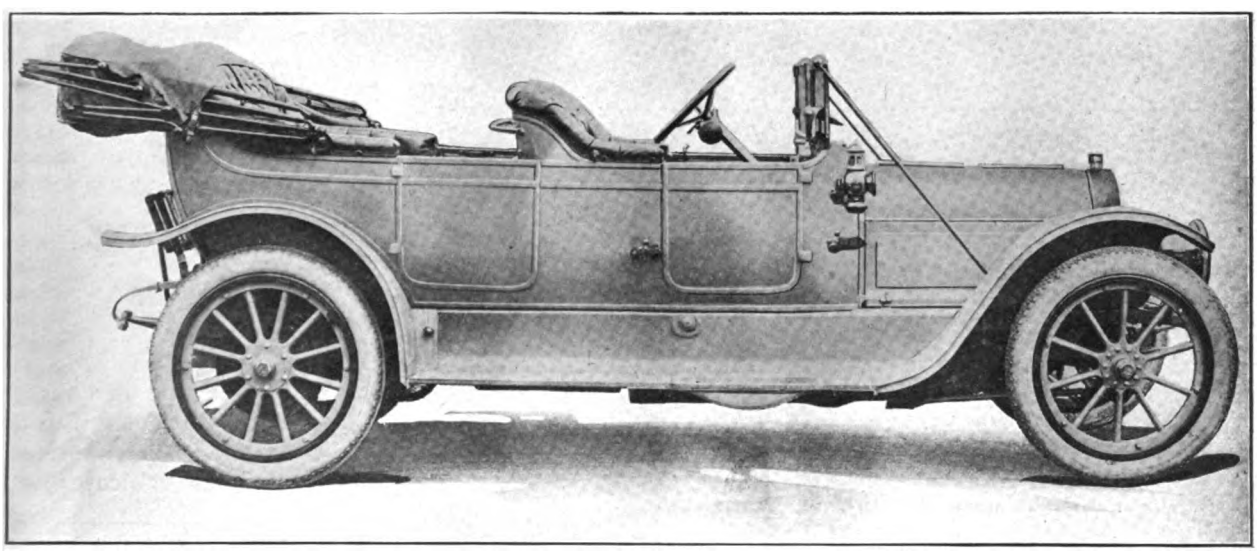
Digitized by Google

FOUR PIERCE-ARROW CHASSIS FOR 1913.

ANNOUNCEMENT is made by the Pierce-Arrow Motor Car Company, Buffalo, N. Y., maker of Pierce-Arrow cars, that for the coming season it will produce four chassis, this being one more than it has previously built in any one year. It is stated that with the delivery of these machines the sizes will be indicated by the first four letters of the alphabet, each letter being coupled with figures stating the horsepower rating of the motor, so that the chassis will be specified as 66-A, 48-B, 38-C and 48-D for convenience in reference and factory listing. The chassis to which reference is directly made will, following the policy of the company inaugurated in 1909, be six-cylinder only. It is hardly necessary to rehearse the development of the six-cylinder automobile since the company brought out its first vehicle of that type in 1906, but reference can be made to the consistent development of the vehicles and the high state of refinement that has been attained. Today the Pierce-Arrow cars may be regarded as the standard of the American industry and in every respect they are efficient, dependable and reliable.

Pierce-Arrow Model 66-A, a Seven-Passenger Touring Car with Wheelbase of 147.5 Inches and Motor of 66 Horsepower.

These chassis types have been referred to as new, but as a matter of fact they are new only in the sense of being productions of the present, for while they have been perfected as a result of experience they represent the basic principles found in the original six-cylinder machines built for the season of 1906. This does not mean that progress has not been made, but it does mean that the first six-cylinder engines were so well designed and constructed that the hard test of actual service did not develop a fault or reason for failure.



As to the fourth chassis, which will be produced for the first time, it might be well to describe it as being another Pierce-Arrow machine, which is probably as much information as the well informed motorist might care to have.

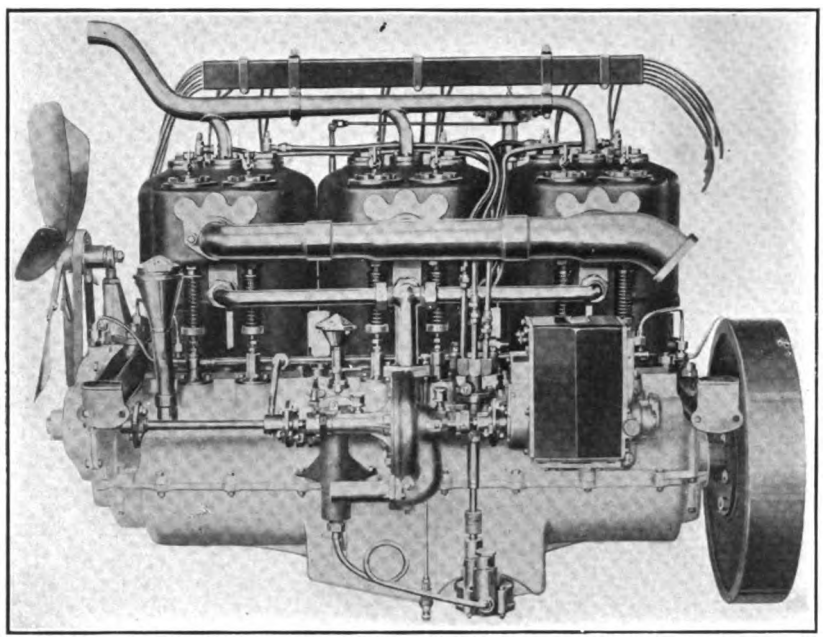
In considering the chassis separately it might be well to say that the company will produce three sizes of motor, the first of which is the 66-A, with bore of five inches and stroke of seven inches; the second is the 48-B and 48-D with bore of 4.5 inches and stroke of 5.5 inches, and the third is the 38-C with bore of four inches and stroke of 5.5 inches. The only change as compared with the engines previously built is the lengthening of the stroke of the 38-C from 5.125 inches to 5.5, this somewhat increasing the power. In other respects the motors are identical. By this is meant that the engines are, in general design and construction, the same as those built for the previous manufacturing year. Aside from the 38-C motor, the proportions are exactly the same and the power production ought to be unchanged. Of course it is known that with three different sizes of motors the parts vary with the differences in the machines.

In considering the engines, however, it is expected that there will be perhaps a higher ef-

Digitized by Google

ficiency from the refinement of the system of lubrication. Not that there was dissatisfaction with that used for a number of years, but it was believed that there was a demand for positive mechanical feed. The former method was to store the oil in a reservoir carried above the engine cylinders and to feed this by gravity through a system of tube enclosed in the engine case. This system consisted of a main lead from the reservoir with leads to all the bearings and another to the compartment enclosing the timing gears. The flow of oil was to the seven main bearings with an outlet from each lead which registered with a hole drilled in the crankshaft and connected with channels through the crankshaft, webs and crankpins with outlets registering with the connecting rod bearings. The oil was carried through the seven oil leads there are three to the end and centre bearings. The oil is carried in a reservoir or sump in the base of the crankcase and it is drawn from this by a gear driven pump and carried through a filtering screen that is easily detached and cleaned, to a main lead with leads to the three bearings, and to the timing gearcase. The pump forces the oil through the system and floods the bearings and the impulses of the pump and the centrifugal action distribute the oil thoroughly within the engine, effectively lubricating it. The excess oil is drained to the reservoir and it is filtered before being drawn into the pump, this insuring against the presence of metal particles. The volume of oil supplied to the bearings is dependent upon the speed of the motor. A pressure gauge on the dash indicates the force that is

Pierce-Arrow Model 38-C, a Five-Passenger Touring Car with Wheelbase of 134 Inches and Motor of 38 Horsepower.



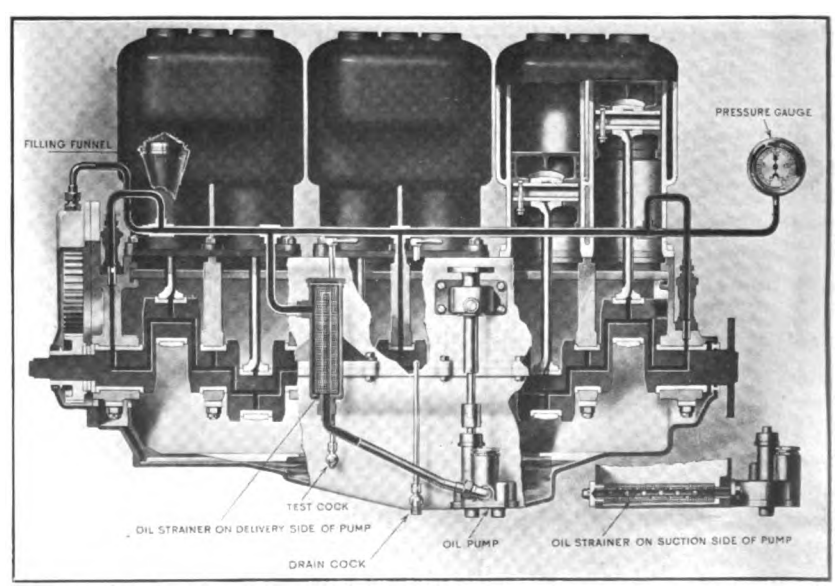
connecting rod outlets to tubes carried on the rods, which in turn had outlets at the wristpins. With this the gravity flow of the oil was sufficient to lubricate the bearings and the centrifugal action of the shaft carried the oil to the connecting rod big and small ends, while this same action distributed the excess lubricant all over the interior of the engine, lubricating the camshaft bearings, the valve tappets, the tappet guides, the piston and cylinder walls. The excess oil collected in the base of the motor case where baffle plates prevented it from flooding the combustion chambers, while a pump driven by a spiral gear on the exhaust camshaft returned the oil, after filtration, to the reservoir.

With the new or modified system the overhead oil reservoir is dispensed with and instead of exerted upon the oil supply for the pump. The 48-D motor has the gravity feed lubrication that has been described.

As may have been assumed from the statement made above the engines each have seven main bearings, there being a web between each of the connecting rods, so that under any condition of operation the crankshaft is perfectly rigid and there is no possibility of side pressure leverage. The bearings are liberal in diameter and length for the crankshaft, camshafts and wristpins. Extreme care is taken in the finishing of the pistons and cylinders and the highest grade materials are used throughout the motors.

The Pierce-Arrow carburetor is built to a design that has been found to yield entirely satisfactory results with these motors. The instrument

Digitized by Google



The Exhaust Side of the Pierce-Arrow Six-Cylinder Motor.

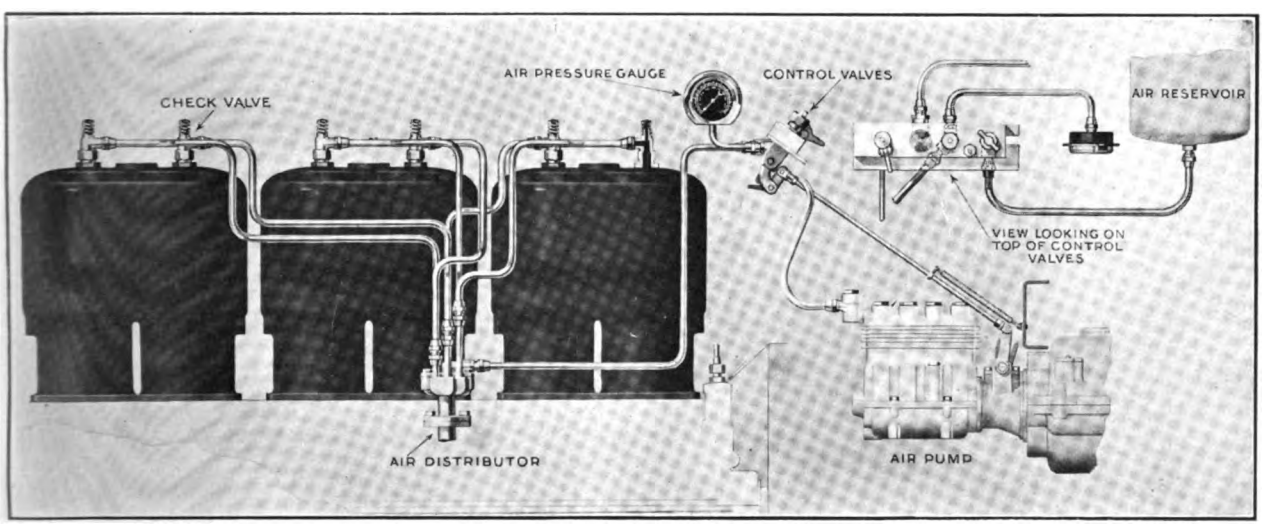
is an automatic double-jet type conceived to afford a uniform mixture of fuel at all speeds and at differing temperatures, and to insure against extreme variance of air temperature and the effect upon the engine the carburetor is water jacketed. The volume of air supplied is varied by reed valves that become operative consecutively as the motor speed is increased and more fuel is necessary. The construction has been to meet the different requirements and has been found extremely economical and dependable.

The ignition is by two systems for each motor, these being in every way independent. The one has a Bosch high-tension magneto as a source of current, the magneto being mounted on a bracket at the rear of the exhaust or left side and it is driven by the outside shaft that operates the water pump. The wiring leads are carried across the top of the motor to the spark plugs located above the inlet valves. The other is a storage battery as a current source which is operated in connection with a series of six coils and a master vibrator. The coil box is placed on the dash under the hood, where it is out of sight. There is a kick switch placed on the dash through which either of the systems may be controlled.

The motor is cooled by water circulated by a centrifugal pump driven by the outside shaft from the timing gears at the exhaust side of the motor, that is carried through a generous inlet manifold to the base of the exhaust valves of the cylinders and after circulating about the cylinder heads is carried by a large outlet manifold to the cellular radiator of liberal proportions. All of the connections are short and with wide curves, and the brass tube is of a size that should there be failure of the pump the water will continue its circulation by thermo-syphon influence.

The engine is started by compressed air from a system of Pierce-Arrow design. The installation includes a four-cylinder pump, by which air is stored under pressure in a tank, and a distributor which has a lead to each of the six cylinders. The pump is mounted on the forward end of the transmission gearset case and is driven by a clutch which will connect the countershaft of the gearset. This clutch may be engaged by the pressure of one's foot on a pedal located in the air control panel, which is installed at the base of the dash and within easy reach of the driver's left foot. A pressure gauge on the dash panel indicates the

The Lubrication System of the Motors of the Pierce-Arrow Models 66-A, 48-B and 38-C Chassis.



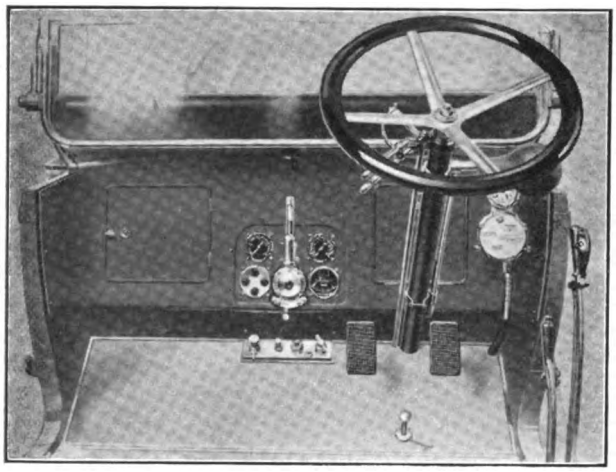
Digitized by Google

pressure of air in the seamless steel tank, which guides the driver in his use of the compressor. When it is desired to start the machine pressure on a button on the air control panel releases the air under pressure to the distributor on the motor and then to the cylinders in the order of firing, the motor being turned until the first explosive charge is fired. It is possible to use this compressed air for charging tires and there is a nozzle controlled from the air control panel at which connection of the tire hose may be made. The air system on the Pierce-Arrow cars is the result of several years' experiment by the company's engineering experts, during which tests were exhaustively conducted. The motor of the 48-D chassis is started by an acetylene system.

The clutch is a cone type with the cast aluminum spider carrying cork inserts, the inserts insuring positive and easy engagement. The clutch is mounted on brackets supported by the drop forged steel support for the motor and its constant alignment is positively insured. The transmission gearset is a selective sliding gear type, with four forward speeds and reverse, that is operated by a lever at the right side of the car. The gears are constructed of a special formula steel, heat treated, hardened and fitted at the factory. After numerous inspections they are tested by a master gear to insure quietness, and further tried by the scleroscope to be of consistent hardness throughout. The shafts are mounted on annular ball bearings and the shifting rods are held in position by a roller that insures against two sets of gears meshing at the same time.

The main driving shaft is of tubular form, which is not only lighter than a solid shaft, but has the advantage of forming an oil reservoir at the rear end, preventing binding and wear. The rear axle is a semi-floating type with a steel housing, in which is the differential gear and the chrome nickel driving axles. The brakes act on steel drums bolted to the rear wheels, the shoes of the internal expanding brake being lined with German bronze, and the external contracting brake band being faced with woven asbestos. Both brakes are equalized.

The road wheels are all fitted with demountable rims, both wheels and rims being of the company's own manufacture. The wheels are constructed of carefully selected second growth hickory and are extremely well made. The rims were perfected after more than two years' experiments and the design was adopted by the company with a very high standard to satisfy. The rim is secured to the felloe by six bolts, four of which fit holes in the rim. The rim is slotted to fit the other two bolts, so that the rim may be dropped into its proper position, rather than fitted, whenever a change is made. In removing the rim it is not necessary to remove the tire valve dust cap. The design is such that the rim has three bearing surfaces for practically the entire circumference of the wheel. The demountable rims are fitted with quick detachable channels.

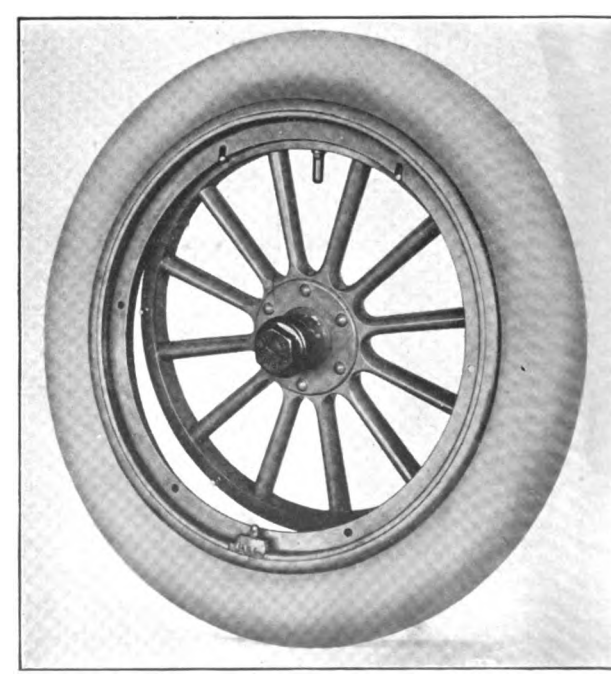


The Pierce-Arrow Compressed Air Engine Starter, with Compressor Driven Off an Extension of the Transmission Gearset Countershaft.

The electric horn installed outside the dash, the trunk rack at the rear, and the extra demountable rims and tires are the only equipment to be seen outside of the car, and the running boards are practically clear.

Considering the bodies, they are in every sense

Digitized by Google



The Dash and Control Members of the Pierce-Arrow Chassis, Showing the Convenience of Arrangement.

Pierce-Arrow in design, construction, and finish. They are in every way complete and satisfying. With the different bodies that may be fitted it may be said that there are 25 Pierce-Arrow cars. For the 38-C the bodies available are the runabout with rumble seat, four-passenger touring, five-passenger touring, brougham and landaulet; for the 48-D, the touring body only is fitted; for the other two chassis the runabout with rumble seat, four-passenger touring, five-passenger touring, seven-passenger touring, brougham, landaulet, suburban, landau, vestibule suburban and vestibule landau are offered.

The claim is made by the manufacturer that the Pierce-Arrow cars produced from now on will include more equipment than was ever before provided with a standard machine. The regular fittings consist of a top with a dust cover, windshield, an engine starter, an electric generator that supplies current for all lamps and charges the storage battery, a full complement of eight lamps (including two electric head lamps, two combination electric and oil dash lamps, one combination electric and oil tail lamp, one electric number illuminator, one dash lamp for gauges and switches, one clock and auto-meter lamp, and in enclosed cars a dome lamp), electric horn and bulb horn, demountable rims with two extra rims, four-cylinder power air pump, auto-meter and clock, gasoline gauge, shock absorbers, extra tire and rim carrier with a lock, trunk rack, coat and robe rail, foot rest, gasoline primer, locks with a master key for the hood, dash cabinets, and tool and supply compartments, jack, and a full set of tools.

There are other qualities as well that appeal to the discriminating motorist. The gearset lever at the right hand is shorter than the brake lever, that there may be nothing to prevent easy operation of either; the brake and clutch pedals are made adjustable to meet the personal requirements of the operator, and between the clutch and the brake pedals is the accelerator. On a panel on the dash is mounted the gasoline gauge, the voltmeter for the storage battery, the switches for the electric lamps and the gauges for the oiling and air pressure system. The gauges are lighted at night by an electric lamp and the horn is just below the steering wheel on the steering column, a solid tube replacing the usual flexible tube. Close to the driver's left hand is the electric horn button and in front of him are the auto-meter and clock. The operation of the air system is controlled by the foot. The spark and throttle levers are at the left side of the steering column and are held by notched quadrants, located where they may be easily operated without removing the hands from the wheel.

While there are differing sizes of chassis as regards power, the chassis also differ as regards wheelbase. For instance, the 38-C chassis is 119 inches for the runabout, 127.5 inches for four-passenger touring car, and 132 inches for the other body installations; for the 48-B the runabout wheelbase is 128, for the four and five-passenger touring bodies 134.5 inches, and 142 inches for the other models; for the 66-A chassis the runabout wheelbase is 133.5 inches, for the four and five-passenger touring bodies 140 inches, and for

The New Pierce-Arrow Demountable Rim, with Which All Cars Are Equipped.

Digitized by Google

the other models 147.5 inches. The 48-D model is built in but one wheelbase length, this being 134.5 inches.

The 36 inch wheels of the 38-C chassis are shod with tires 4.5 inches diameter for all purposes; the wheels of the 48-B chassis are fitted with 36 by 4.5-inch tires as a runabout, and 37 by five for all other body installations; the wheels of the 66-A chassis are fitted with 37 by five-inch tires as a runabout and with all other models 37 by five-inch tires forward and 38 by 5.5-inch rear with all other body equipment. The gasoline tank capacity of all runabout chassis is 22.5 gallons; with four and five-passenger bodies the capacity is 24 gallons for all bodies save the 48-D, which is 28 gallons, and for other body equipment the capacity is 25.5 gallons.

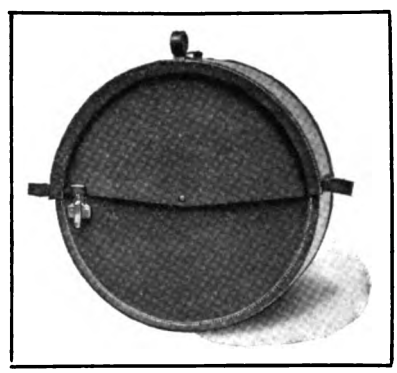
UNITED STATES MOTOR COMPANY.

According to the Wall Street Journal, a member of the bankers' committee which is actively engaged in straightening out the financial difficulties of the United States Motor Company, says that the condition has improved materially since the committee took charge and that the betterment should continue. It is pointed out that United States Motor preferred sold up to 21 on the curb recently, showing a gain of four points over the previous day. The Wall Street Journal is authority for the statement that all the company needs is working capital; it has the business.

MOTZ TIRE BRANCH.

Because of the large increase in the use of Motz double tread cushion tires, made by the Motz Tire & Rubber Company, Akron, O., in Pittsburg, Penn., and vicinity, it has been deemed necessary to establish a factory branch at 300 North Craig street, in that city. In keeping with the policy of the company this action carries with it the operation of a thoroughly equipped service station, with a full corps of workmen and tire experts. S. H. Frensdorf is in charge as manager. He was associated for some time with the Diamond Rubber Company's branch in Boston, before joining the Motz interests.

ANOTHER REO DIVIDEND.



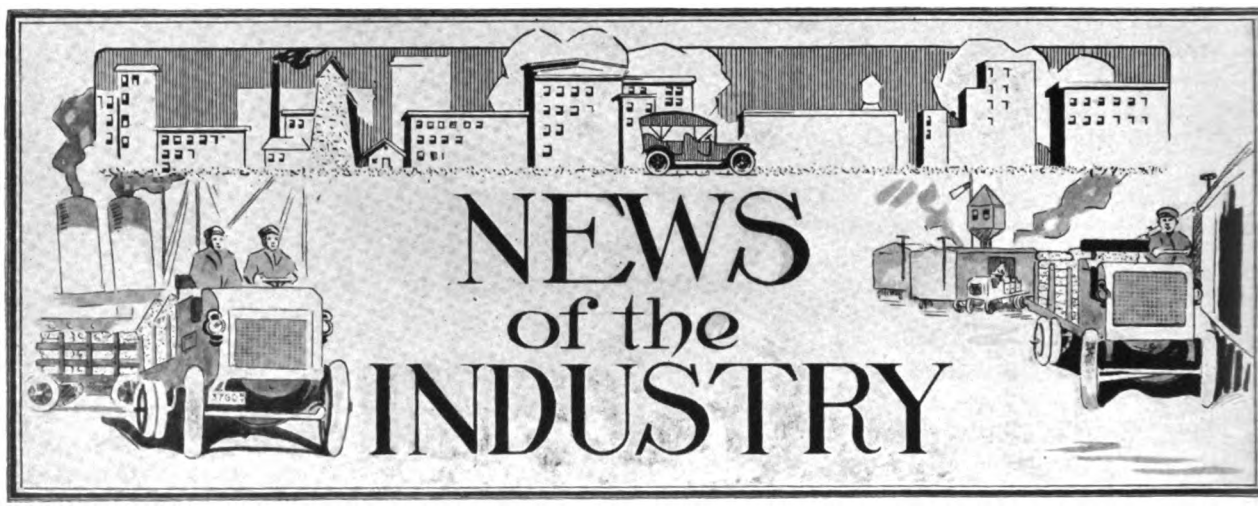
According to a dispatch from Lansing, Mich., the Reo Motor Car Company, maker of Reo pleasure and commercial cars, will declare a 10 per cent. dividend in the near future. This is understood to be the third dividend of this character which the stockholders have received during the present year, and the condition of the treasury is such that the plan will be continued at intervals of two months during the remainder of the year.

RACE MEET FOR NASHUA.

Steps are being taken to hold an automobile race meet at Nashua, N. H., in connection with the state fair during the first week in September. It is understood that $1000 will be offered in prizes and it is anticipated that several well known drivers will be seen.

S. C. S. TIRE TRUNK.

The advantages of a tire trunk are many. It serves to protect the inner tubes from the weather or foreign elements, makes for accessibility when the tubes are needed, and being equipped with locks prevents theft of the tubes as well as other material which may be carried in the trunk. The S. C. Simon & Co., 1020 Race street, Philadelphia, is marketing the S. C. S. revolving door tire trunk which is constructed of high grade material and guaranteed in every respect. The solid basswood rim is .1875-inch thick and is covered with a high grade material, water and dustproof, and the maker points out that it is practically indestructible. The truck is equipped with a revolving door, as will be noted by the accompanying illustration, an arrangement making for convenience.



The S. C. S. All Wood Body Tire Trunk.

LABOR DAY AT BRIGHTON BEACH.

Arrangements have been perfected for a programme of automobile racing on the new motordrome at Brighton Beach, Long Island, Labor Day. The list of events follows: Five miles, 161-230 inches; five miles, 231-300 inches; five miles, 301-450 inches; five miles, under 600 inches; 50 miles, free-for-all for W. B. trophy; five miles, free-for-all handicap; 10 miles, under 600 inches, and three heats of five miles each for the Remy grand brassard.

JONES SPEEDOMETER EXPANDS.

Manufacturing Facilities Almost Trebled by Additional Factory in Brooklyn.

In order to meet the greatly increased demand for its product, the Jones speedometer, recorder and other like devices, and to fill large speedometer contracts with various car manufacturers for the 1913 season, the Jones Speedometer Company, New Rochelle, N. Y., has secured additional factory facilities in the Bush Terminal, Brooklyn, N. Y. This new plant is much larger than the one in New Rochelle, and it is estimated that the production facilities will be trebled by the move.

Although it is not the intention of the company to abandon its present plant, the general offices and shipping department will be removed to the new location, Oct. 1. On that date the commercial vehicle department, now at Canal place, New York City, where recorders, hub odometers and truck speedometers are manufactured, will be moved to and consolidated with the speedometer service station in the Speedometer building, Broadway and 76th street, New York.

TO MAKE WIRE WHEELS.

Philadelphia Concern Will Engage in Their Production Under British Patents.

The Standard Roller Bearing Company of Philadelphia is said to have acquired the American rights for the manufacture of the Rudge-Whitworth detachable wire wheels, a British invention. The concern is installing the necessary machinery and it is anticipated that active production will begin within the near future.

Rudge-Whitworth wheels are utilized abroad on a number of well known pleasure vehicles, and it is understood that several American manufacturers of cars have become interested in them during the past few months. It is stated that blue prints showing specifications and requirements for particular models have been filed with the Standard Roller Bearing Company for sufficient wheels to warrant production in quantities.

GOOD ROADS DELEGATES.

Prominent Men Who Will Represent America at the Convention in London Next Year.

Inasmuch as the United States is the only government which has no official right to appoint delegates to the international good roads congress in London, in 1913, the American Association for Highway Improvement is to act as the American branch of the international association. The following are the delegates from this body:

Powell Evans, Philadelphia; A. W. Dean, chief engineer, Massachusetts state highway commission; A. G. Batchelder, chairman, executive board, American Automobile Association; A. N. Johnson, state highway commissioner, Springfield, Ill.; Prof. Arthur H. Blanchard, Columbia University; Austin B. Fletcher, state highway commissioner, California; Horace M. Sweetland, New York City; George W. Tilson, consulting engineer to borough of Brooklyn, N. Y.; John R. Rablin, chief engineer, Metropolitan park commission, Boston; Harold Parker, Massachusetts; Dr. Joseph Hyde Pratt, state geologist, North Carolina; William Phelps Eno, Washington, D. C.; Clifford Richardson, New York City; Dr. L. I. Hewes, United States office of public roads; Morris R. Sherrerd,

Digitized by Google

New Jersey; Henry B. Drowne, Columbia University; William H. Connell, Philadelphia; Prevost Hubbard, Institute of Industrial Research, Washington, D. C.; Maj. W. W. Crosby, Maryland Geological Survey, and Dr. Clayton H. Sharp, New York City.

BAKER ELECTRIC POLICY.

Follows Example of Many Gasoline Car Producers in Abandoning Yearly Model.

While a number of makers of gasoline pleasure vehicles have announced their intention of abandoning the yearly model within the past two years, the Baker Motor Vehicle Company, Cleveland, O., is believed to be the first producer of electrics to adopt this policy. Concerning this step, O. B. Henderson, sales manager of the concern, says:

"Continuity of development is our watchword. Instead of once a year giving the purchaser the benefit of added refinements, we have found it more satisfactory to all concerned to continuously incorporate in the manufacture of the Baker electric all the improvements created up to date, so that each car we produce is the best possible car we can make, embodying everything of merit which we can put into it."

NEW FACTORY BUILDINGS.

Demand for New Departure Ball Bearings Makes Necessary Additional Facilities.

Because of the largely increased orders for New Departure ball bearings, the New Departure Manufacturing Company, Bristol, Conn., finds it necessary to work all of its departments 127 hours a week and some of them 152 hours. It is stated by the company that this condition is assured for months to come, but the situation is to be relieved in a measure by the erection of additional factory buildings.

These additions will give nearly 75,000 square feet of floor space, but this will not be available until late in the fall. Three outside machine building plants, and the company's own extensive manufacturing machine shop are busy on special machine equipment for the new buildings.

DeWitt Page, secretary of the company, states that during the past year numerous leading automobile manufacturers gave the product of this concern a very exhaustive test, and as a result contracts were signed whcih will triple the output of the last 12 months. Naturally, the company is very much gratified, and Mr. Page is of the opinion that the entire industry should be more than ordinarily interested in the supremacy of this American product in the home market.

FOSDICK WITH HUPMOBILE.

Pioneer Boston Salesman Wins Deserved Recognition with Detroit Concern.

Harry Fosdick, one of the best known automobile salesmen in the country, has been appointed assistant general manager of the Hupp Motor Car Company, Detroit, maker of the Hupmobile. This news will meet with general approval in the industry, particularly as Mr. Fosdick's connection therewith dates from 1899, when he began his business career in charge of one of the first motor car salesrooms in Boston.

Harry Fosdick, Assistant General Manager, Hupp Motor Car Company.

It was under his direction that the Winton first made its appearance in New England, and later he was identified with a number of foreign importations. At one time he was vice president of the Hol-Tan Company of New York, handling the American sales of the Fiat, and afterwards he was associated with Vincenzo Lancia in introducing the Lancia car in this country. He went to the Hupp concern from the Stevens-Duryea Company, where he was sales manager for some time.

RESPONSIBLE FOR CARTERCAR.

Success of Well Known Friction Driven Line Now Devolves Upon H. R. Radford.

At a recent meeting of the board of directors for the General Motors Company, Harry R. Radford was elected vice president and general manager of the Cartercar Company, Pontiac, Mich.,

Digitized by Google

maker of the well known friction driven Cartercar line. In the future he will have complete charge of the factories of this concern, bringing the engineering, purchasing, manufacturing, advertising and selling organizations, with all of the branches in New York City, Philadelphia, Detroit, Chicago, Kansas City, Omaha and San Francisco directly under Mr. Radford's direction, and making him solely responsible for their success.

That he is eminently well qualified for this position is evidenced by the remarkable ability displayed while he held the position of sales manager during the past several years. Because of his record along this line he was made general sales manager about a year ago, and since that time his personality and energy have enthused the other members of that organization.

Harry R. Radford, General Manager, Cartercar Company.

Vice President Radford announces that during the coming season the company will construct and market about 5000 Cartercars. The total production this year was in the vicinity of 3500. He points to this increase as ample justification for continuing the friction transmission, which has been a feature of this line for the past eight years.

NEW TRUCK CONCERN.

Well Known Men Interested in Standard Company Now Being Organized in Detroit.

The list of commercial vehicle manufacturers in Detroit is to be increased by the addition of the Standard Motor Truck Company, which has been incorporated for $50,000. Among those who are active in the new concern are Howard Wilcox, for some time past connected with the Kelsey Wheel Company, and W. K. Ackerman, formerly assistant manager and purchasing agent for the Reliance Motor Truck Company of Owosso, Mich.

A factory at 975 Bellevue avenue, 35 by 140 feet in dimensions, has been secured, and the work of producing trucks will be begun in the near future. The vehicle is to have a capacity of three tons, and will be of standard construction throughout. The motor will be a Continental.

WITH INTERNATIONAL MOTOR.

Vice President Lloyd of General Vehicle Company Enters the Gasoline Field.

R. M. Lloyd, who has been connected with the General Vehicle Company, Long Island City, N. Y., maker of G. V. electric trucks, as vice president for several years, has resigned to become assistant to President Coleman of the International Motor Company, New York City, maker of Mack, Saurer and Hewitt gasoline commercial vehicles. He already has assumed his new duties.

Following the announcement of his retirement many of his old associates were entertained by him at a dinner at his home in Oyster Bay, N. Y., at the conclusion of which he was presented with a handsome silver smoking set. The full significance of the move has not been made public, although it has been suggested for some time that the International Motor Company was anxious to enter the electric field.

LEAVES STUDEBAKER COMPANY.

Walter E. Flanders Said to Have Severed His Connection with E-M-F Plants.

According to information from Detroit, Walter E. Flanders, formerly president of the E-M-F Company of that city, and later vice president and general manager of the E-M-F plants of the Studebaker Corporation, has severed his connection with that concern, and in the future will devote his entire attention to the Everitt Motor Car Company of Detroit and the Flanders Manufacturing Company of Pontiac. From the same source it is learned that a movement is on foot to change the name of the Everitt concern to the Flanders Motor Company.

In connection with this statement, it is said that the Everitt company will devote its entire attention to the production of six-cylinder cars in two models, manufacturing in its present plant in Detroit and in a new four-story addition which is nearing completion. It is understood that many of the parts will be made in the Pontiac factory of the Flanders Manufacturing Company.

DEATH OF H. F. DONALDSON.

President of Society of Automobile Engineers and Prominent Consulting Expert.

In the death of Henry F. Donaldson, in New York City early in the month, the industry loses one of its most prominent figures. He was president of the Society of Automobile Engineers, and a member of the firm of Tracy & Donaldson, consulting experts. He leaves a host of personal friends among the motor car manufacturers and engineers of this country and Europe.

Mr. Donaldson was born 45 years ago and began business life as a mechanic. His active mind was able to grasp the complicated details of automobile engineering at a time when many were dependent upon the research of such men, and his advice was much sought after. He always was a prominent worker in the interests of the Society of Automobile Engineers, and last year was chairman of the committee in charge of the foreign tour taken by this organization. He was elected president at the annual meeting in New York last January, and a few months ago became associated with Joseph Tracy in the firm of consulting experts.

The council of the Society of Automobile Engineers has passed the following resolutions:

Resolved, That the Society of Automobile Engineers, through its council, greatly deplores the death of its president, Henry F. Donaldson, whose capable and energetic work for the society during the past year is widely recognized and who was respected and beloved by all of his associates for those brilliant attainments of mind and sterling qualities of manhood that raised him above the ordinary level of mankind, making him a natural leader and an unwavering advocate of that which was right and noble and generous; and be it further

Resolved, That the society extends its deepest sympathy to his immediate family and other relatives in their grief over their great and irreparable loss.

MARMON TRUCK NOW.

Indianapolis Maker of Pleasure Cars Springs Decided Surprise upon Industry.

The Nordyke & Marmon Company, Indianapolis, Ind., maker of the well known Marmon line of pleasure vehicles, has announced the production of a Marmon light delivery wagon. The information that the concern would add a commercial car to its line came as a distinct surprise to the industry, but it is stated that the question has been under advisement for some time, and that a few of these wagons were built for use about the factory some months since. The design may be regarded as thoroughly tested and not as an experiment in any sense of the word.

The Marmon truck is a light delivery car with capacity of 1200-1500 pounds. The motor is the same as employed on the 32 horsepower Marmon pleasure car, with the exception that the bore has been reduced from 4.5 inches to four. An additional mechanical feature is the automatic governor, which is held to limit the speed to a maximum of 20 miles an hour. Another new idea in truck construction is the use of dual pneumatic tires on the rear wheels.

GOES WITH GRAMM.

Another Official Follows His Old Chief into the New Business Venture.

W. H. Moore, for some time manager of the sales department with the Gramm Motor Truck Company, Lima, O., control of which was purchased recently by John N. Willys of the Willys-Overland Company, Toledo, O., has resigned to accept a similar position with the Gramm-Bernstein Company of Lima, although his new title will be general sales manager. Mr. Moore has grown up in the sales end of the motor truck business, and is well known as a salesman of ability.

W. H. Moore, General Sales Manager, Gramm-Bernstein Company.

Since the retirement of B. A. Gramm, and his association with M. Bernstein, formerly a director of the Gramm company, in the establishment of a new manufacturing enterprise along similar lines, several of the members of the old organization have joined him. Among the others is Fred Biszantz, designer and general superintendent.

Recently John N. Willys brought suit at Toledo against A. L. White and W. T. Agerter of the Gramm Motor Truck Company, asking for a cancellation of a contract involving the purchase of this concern, alleging fraud, in that the financial condition was not as represented to him.

OHIO TAKES OVER JEWEL.

Former Carriage Concern in Cincinnati Loses Its Identity in Motor Company.

The secretary of state in Ohio has authorized the merger of the Jewel Carriage Company and the Ohio Motor Car Company, both of Cincinnati, O. In the past the Jewel company, which formerly was a well known maker of horse vehicles, has been in charge of the sales of the Ohio gasoline car, made by the Ohio company. The carriage end of the business was sold to the American Carriage Company of Cincinnati some months ago.

The Ohio Motor Car Company is constructing an additional plant at Colborne, Ont., which will be operated by the Canadian branch. The officers of the concern are: President and general manager, Charles F. Pratt; vice president and factory manager, A. E. Schafer; secretary, Charles M. Anderson; treasurer, O. M. Blake; sales manager, H. F. Boulden; engineer, R. E. Northway.

Herman Hendricks of Brownstown, Ind., Stealing a Ride on a Pathfinder Touring Car.

NEW DISCO STARTER.

Maker of Well Known Gas Device Brings Out Combination Electric Equipment.

The success of the Ignition Starter Company, Detroit, Mich., in connection with the production of an acetylene gas starting device for automobile engines, has been such as to warrant it in increasing its capitalization to $500,000. Coincident with this announcement comes the information that an addition to the line has been perfected in the Disco electric lighting, starting and ignition equipment.

In order to manufacture this latest product the plant of the Gray Motor Company in Detroit has been taken over, giving the Ignition Starter Company 20,000 square feet of additional floor space. The officers of the company are: President, J. Watson Fitzgerald; vice president, H. N. Sanger; treasurer, A. B. Porter; secretary, George P. Sweet.

NEW RECORD FOR PIERCE-ARROW.

Driving a Pierce-Arrow car, made by the Pierce-Arrow Motor Car Company, Buffalo, N. Y., Frank Botterill of the Tom Botterill Automobile Company of Salt Lake City, Utah, recently established a new road record between that city and Denver. The total distance covered was 591 miles and the driving time, 32 hours.

STEALING MOTOR CAR RIDE.

An accompanying illustration indicates a new and novel method of securing an automobile ride without going to the trouble of calling the attention of the owner to the desire for assistance in this regard. The photograph is that of a 40 horsepower Pathfinder touring car, made by the Motor Car Manufacturing Company, Indianapolis, Ind., during the recent Four-States tour of the Indiana Automobile Manufacturers' Association. The boy curled up inside the tire case is Herman Hendricks of Brownstown, Ind., and he declares that he rode the entire distance between Seymour and Brownstown in this position.

ENTRIES FOR AVIATION MEET.

The Aero Club of Illinois announces entries from the following aviators, who will take part in the meet held in Chicago, in connection with the fourth annual international race for the Gordon-Bennett cup, Sept. 9: Max Lillie, Andrew Drew, De Lord Thompson, Eugene Heth, Louis Mitchell, Otto W. Brodie, Howard Gill, Chauncey Vought, Glenn Martin, Paul Peck and Miss Katherine Stinson of America; Peter Colevon of Greece; George Metach and Marcel Tournier of France, and Paul Studency of Russia. These aviators will be seen in the other events than the international race, although some of them may be nominated to represent their countries therein.

BUY ABBOTT-DETROIT CARS.

The Centaur Motor Company of Chicago recently made a rather unique record when it succeeded in selling four Abbott-Detroit cars in one afternoon, all to the members of one family. The four parties consisted of a father, son and two sons-in-law. The sales were made after a competitive test on a 22 per cent. grade with other cars.

KISSELKAR FOR CAMPING TRIP.

Mrs. A. J. Payson of San Mateo, Cal., long an ardent motorist, is trying a new idea in vacation touring, at least for that section of the country. When she decided to spend the summer in taking cross country trips, she was anxious to overcome the incidental discomforts of the rural hotel, and ordered a KisselKar of special design from the local agent of the Kissel Motor Car Company, Hartford, Wis. An accompanying illustration shows the car, which was constructed to meet Mrs. Payson's desires in every respect.

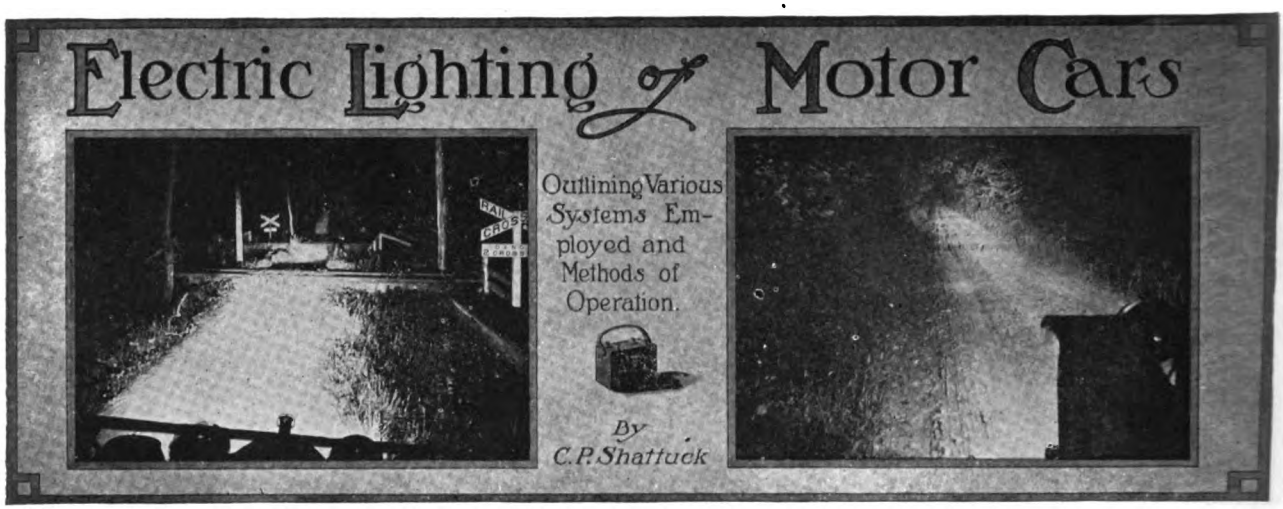
The machine is planned to carry every possible requisite of camp life. Back of the tonneau, which is of the standard KisselKar semi-touring type, there is a steel box, nine feet long by four wide. This is divided into various compartments, where a tent, portable flooring and poles, cots, bedding, camp stools and provisions are stored. Besides these necessities, there is room provided for fishing, hunting and prospecting outfits, as well as clothing. The box is covered with heavily padded water proofing.

Special KisselKar Utilized by Mrs. A. J. Payson, San Mateo, Cal., on Her Summer Vacation Tour.

TAKES NEW QUARTERS.

The United States Tire Company has moved its general offices to the United States Rubber Company's building, Broadway and 58th street, New York City. The structure is the tallest north of 42d street, and will be utilized in the future as the home of the United States Rubber Company and its subsidiaries. The building is 20 stories high. The basement and sub-basement will be occupied by the United States Tire Company as a stock room, and the 15th, 16th and 17th floors will be utilized as general offices.

COLE EXPERTS NAMED.



In line with the policy of the Cole Motor Car Company to maintain the highest possible service for Cole owners, four valuable additions have been made to its travelling field force, which will add much strength to the service organization. C. J. Corkhill, an automobile man of much experience, has been appointed assistant sales manager with headquarters at Omaha, Neb. His territory, over which he will have complete control, is bounded on the east by the Missisippi river, on the south by the Gulf of Mexico, on the west by the Rockies and on the north by Canada. J. R. Moler is to hold a similar position in the territory west of the Rockies, and will continually travel among the Cole agents.

J. R. Hamilton, a thorough mechanic, will be associated with Mr. Moler. W. B. Lacer, who has had considerable experience in automobile manufacturing, is also a Cole service expert. In adding these men to the field service department, President Cole of the company continues his staff of experts at the factory, whose duty will be to travel from place to place, as circumstances warrant.

STUDEBAKER NAME PLATE.

In future, all cars built at the mammoth plant of the Studebaker Corporation in Detroit, will be known as Studebaker machines, and the Flanders "20" and E-M-F "30" designations will be dropped. The product of the Studebaker plant is valued at $50,000,000 a year and the change of name in this manner is considered as decidedly new to the automobile industry.

Part XIII—Hartford Combination System.

IN ANALYZING the electrical lighting equipment it should be borne in mind that dynamo-electric machines are divided into three classes, these consisting of: Generators, for the conversion of mechanical into electrical energy; motors for converting electrical into mechanical energy, and transformers. The last are utilized for the conversion of one character or voltage of current into another, as direct into alternating or vice versa, or from one voltage into a higher or lower.

The first named type is utilized in connection with motor car lighting and is a generator, developing a direct current which is necessary to charge a storage battery, as with an alternating current a rectifier must be employed. The electric motor is energized by electricity and as pointed out, converts the current into useful energy which may be employed for divers purposes, among them being that of rotating the crankshaft of an internal combustion motor, an operation familiarly known to motorists as spinning the motor. To operate the electric motor current must be supplied and starters of this type employ a storage battery usually of higher voltage than ordinary, or with cells connected by a switch to secure the desired voltage.

It is possible to combine the essential features of the lighting and starting members and a motor-generator of this type was described in a previous installment. The fields of this instrument have two windings, a series and a shunt. When the device operates as a motor the series winding is in series with the armature, but when running as a generator both windings are in use.

The Hartford lighting and starting system, made by the Hartford Suspension Company, Jersey City, N. J., differs from the above mentioned in that the generator and motor are separate and distinct, although energy for the motor is supplied by the same battery charged by the generator. Although the wiring diagram presented herein depicts the lighting and starting devices as a combination system, either may be fitted and operated without the other, an arrangement making for simplicity and convenience. It may be pointed out that there are some models of cars which do not lend themselves as readily to the installation of a motor-generator or the motor, although the dynamo may be fitted, because of the fact

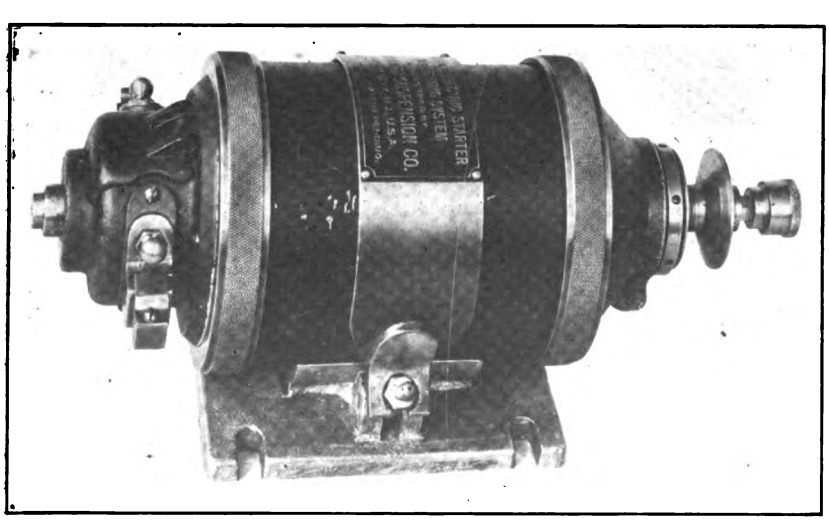

Fig. 87—The Hartford Lighting Generator, a Compact Machine Delivering a Steady Voltage Irrespective of Motor Car Speeds.

Digitized by Google

that it may be driven by belt or chain, if gear or shaft drive is not applicable.

The Hartford lighting generator is a very

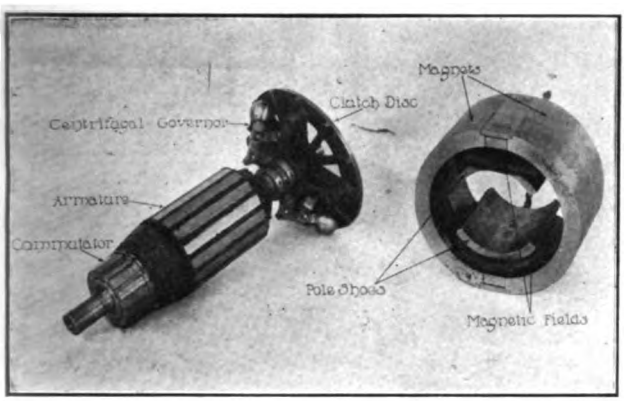

Fig. 88—Outlining the Governing Device, Construction of Pole Shoes, Electro-Magnetic Fields and Magnets.

neat, compact machine, as will be noted by Figs. 87 and 93, which depict the instrument, the latter illustration showing it installed on a car. The battery is floated on the line and the generator is provided with a governor which operates at a car speed of approximately 14 miles an hour. The system also includes a cut-out which disconnects the generator from the battery when the amperage falls below a certain car speed, and cuts in the generator when it develops the proper amperage. The system makes for simplicity, including as it does, a generator, battery, switch, fuse box and cut-out. The latter with voltmeter and ammeter are mounted upon a neat base for attachment to the dash. The starting device is even simpler, it comprising besides the battery, a push button and a motor.

Type of Generator.

The generator is of the permanent magnet type having auxiliary electro-magnetic fields. The latter are new in one respect; that is, their location with regard to the permanent magnetic field. Instead of being wound around this part they are wound around the pole shoe extension, as will be noted at Fig. 88, which depicts the magnets, pole shoes and fields. The company states that owing to the greater permeability of the pole shoe a better magnetic circuit is obtained, more so than if the coils were mounted on the magnet proper. One of the advantages claimed for the permanent magnetic type generators lies in the fact that the battery cannot reverse the polarity of the generator, if it should accidentally be connected with it.

The pole shoes are of a high grade malleable iron and to their construction and location of fields is due the successful results of the generator. They are fitted carefully to a cylindrical housing provided with threaded ends to which are attached the end covers, illustrated at Fig. 89. These covers are provided with knurled edges, making it an easy matter to remove the parts if desired.

Armature and Commutator.

The armature is shown at Fig. 88 and is of the drum wound type, of liberal size. The wires are treated with a special material which is baked to render them impervious to heat or moisture. The commutator is carefully designed, highly sub-divided and the segments are divided by a high grade insulating material. The armature shaft is of chrome nickel steel, carefully ground to size and being of liberal diameter will withstand all stresses. It rotates in ample sized ball bearings, these taking care of all radial and thrust loads.

Governor.

The battery is protected from high voltages which would be created if the generator were driven at excessive speeds or those corresponding to high car speeds. A centrifugally operated friction governor is employed, operating at 14 miles an hour car speed. Its design is simple as will be noted at Fig. 88, and comprises two ball members which move in or out pivotally mounted arms connected to the clutch disc. When the speed of the generator rises above a certain number of revolutions, the weights move out by centrifugal force, gradually breaking the contact between the driving and driven disc. The driven pulley continues to revolve at speed, but that of the armature is held practically steady. When the speed of the automobile falls again, contact is again made by the discs. These parts are so nice-

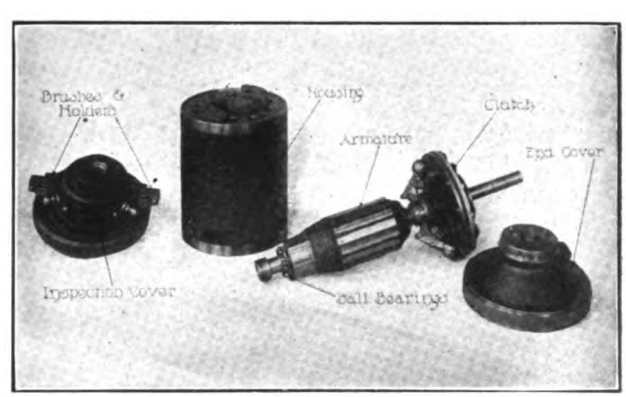

Fig. 89—Simplicity and Accessibility Are Features of the Generator, as Will Be Noted by Its Components.

ly adjusted and balanced that the action of the governor is positive and at the speed desired. It is pointed out by the maker that exhaustive tests

Digitized by Google

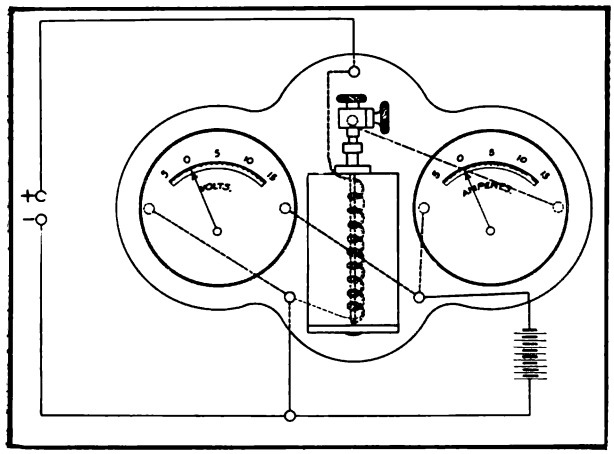

Fig. 90—Illustrating the Automatic Cut-Out, an Iron Clad Lifting Coil with Series Neutralizing Coil to Cut Out Battery.

have demonstrated there is little if any wear, due to the material employed and the fact that the device is not in constant service.

Brushes and Holders.

Current is collected from the commutator by carbon metallic brushes which are mounted in the end cover and fully protected from foreign elements. They may be removed and replaced easily if desired, but it is pointed out by the company that they are carefully fitted and will not require any attention, their tension being automatically cared for by the design. Inspection of the commutator and brushes is obtained by a hinged cover, spring retained, on the top of the end cover. A feature of the brush arrangement is that the holder and brush may be removed as a unit.

In systems where the battery is floated on the line it is essential that the generator be cut out when the voltage developed falls below that of the battery else the battery will discharge through the generator. The Hartford system includes a magnetic cut-out, comprising an iron clad coil with series neutralizing the coil. The principle of operation is depicted at Fig. 90 and drawing also shows the circuits with the voltmeter and ammeter, these members being mounted upon the same base as the cut-out, which is enclosed in a cylindrical housing. The components assembled for mounting upon the dash are illustrated at Fig. 92.

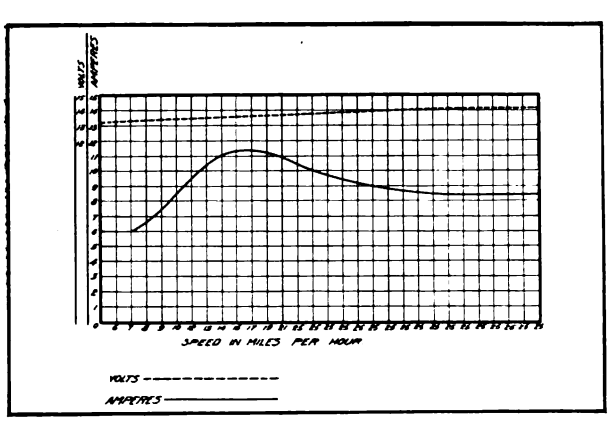

Fig. 91—Chart Depicting General Characteristics of Generator Which Is Cut in at a Car Speed of Eight Miles an Hour.

The generator is cut in, or connected to the battery, when the automobile is travelling at eight miles an hour and is not cut out until the speed of the car falls to approximately six miles an hour. The cut-out device is entirely automatic in its action and requires no attention whatsoever, being carefully tested at the factory. The voltmeter and ammeter, mounted upon the dash and in full view of the driver, enable him to note at a glance the operation of the system.

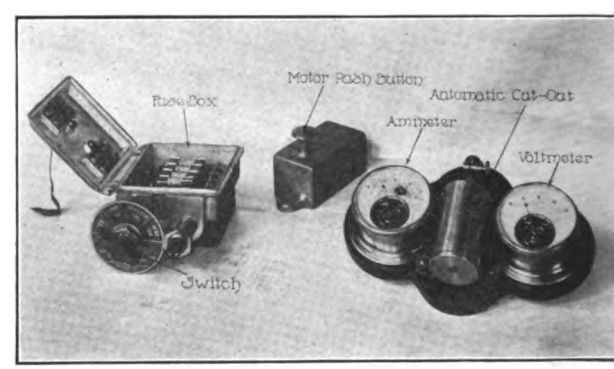

Fig. 92—Illustrating Fuse Box, Motor Push Button, Automatic Cut-Out and Current Indicators.

At Fig. 91 is presented a chart showing the general characteristics of the Hartford generator. It will be noted that at a car speed of eight miles an hour the machine is developing nearly seven amperes and that the rise is gradual until slightly over 11 amperes are developed, at which time the car speed is 15 miles an hour. From this point the curve shows a gradual decline to 8.5 amperes, being held at this amperage at 25 miles and over.

The volt curve is very steady, showing slightly over 13 at a car speed of seven miles an hour and the rise is gradual to 14 volts, demonstrating the close regulation of the generator. In the chart the volts are indicated by dotted lines and the amperes by a straight line.

Silent Chain Drive.

A silent chain drive is recommended by the company, and the ratio is three to one, although a gear drive may be employed. The generator is mounted upon a metal base which is slotted to

Digitized by Google

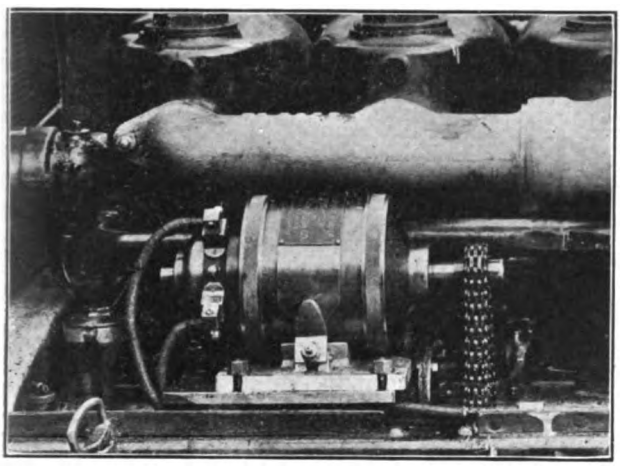

Fig. 93—Showing Generator Mounted on Car, Its Compactness and Practical Base Facilitating Installation.

facilitate installation and the machine is secured to the base by a strap, making for easy removal as well as permitting the moving of the generator in either direction when lining up the driving and driven pulleys or sprockets.

The equipment includes a selective type switch, allowing the use of any group of lights such as tail and side; head, side and tail or head and tail. The lamps are protected from any possible excessive voltages through short circuits by fuses, these being installed in a neat box and the arrangement makes it a simple matter to locate faulty connections, etc.

A 12-volt, 60 ampere-hour battery is utilized, its dimensions being 7.5 by nine inches. Although six-volt Tungsten lamps are employed and operated on a 12-volt battery reference to the wiring diagram depicted at Fig. 94 will indicate how the voltage is distributed. The headlights are connected on one-half of the battery and the tail, dash and side lamps to the other half to balance the load. The lamp loads of the generator are approximately 85 watts.

The generator and components of the lighting system are manufactured in the factory of the Hartford Suspension Company and throughout the best of material and workmanship is incorporated. All parts are interchangeable and the system was subjected to severe tests on cars before being placed upon the market. Its simplicity is such that it will appeal to motorists not familiar with electricity, for aside from lubrication the generator requires no attention whatsoever.

The Hartford Motor Starter.

The electric motor starter produced by this concern is the result of careful study of the internal combustion engine by Edward V. Hartford, president of the company, who believed from the outset that the practical and efficient starter should be similar in its application of power to that obtained by rotating the starting handle by hand. After exhaustive tests electricity was decided upon because of its simplicity, cleanliness, durability and safety. The ease with which energy may be applied, the operation involving the pushing of a button, makes for convenience, a factor appealing to the discriminating motorist.

Few automobilists realize the energy developed by a small, light motor operated by electricity and that when the energy is transmitted through a reduction of gears, a considerable impulse is obtained. The Hartford motor is an example of the compactness with which these members may be constructed, it being but 4.5 inches in diameter and 7.5 long. Some idea is obtained of the size of the motor by the illustration at Fig. 95, which shows the machine held in the hand, it being suspended by wires while the photograph was taken to obtain a clear picture. Its weight, including the gears, etc., is but 35 pounds.

The motor itself weighs but 20 pounds and is rated at one-third of a horsepower. It is designed to operate at high speed, about 7000 revolutions

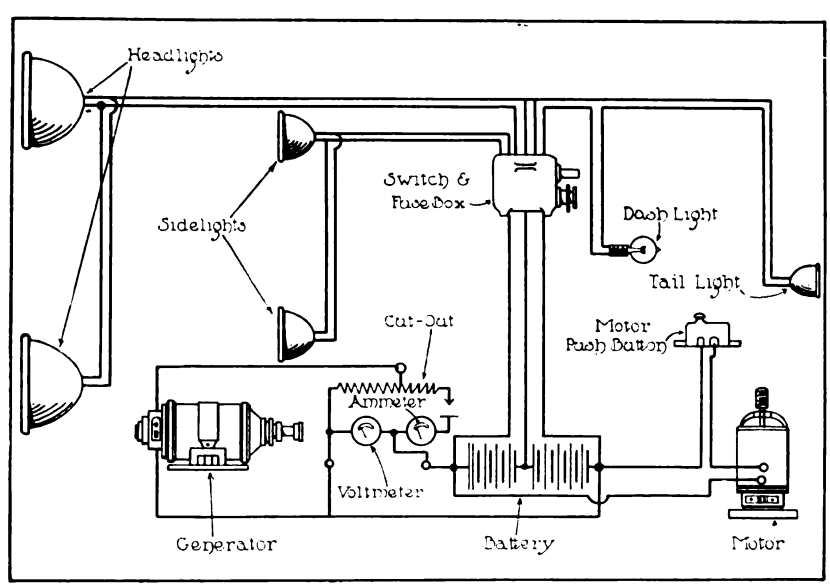

Fig. 94—Wiring Plan of Hartford Lighting and Starting System, Depicting How Lamp Load Is Balanced, Also Simplicity of Motor Starter.

Digitized by Google

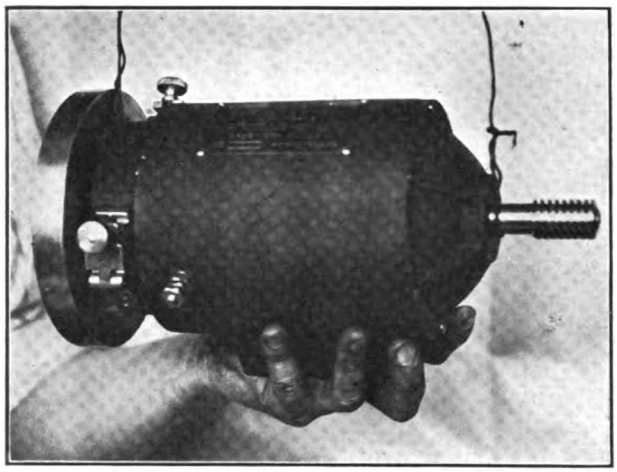

Fig. 95—The Hartford Electric Motor Starter, Weighing but 20 Pounds, Which Will Spin the Largest Gasoline Engine with a Small Consumption of Current—Note the Diminutive Size of the Motor.

a minute. This does not mean that the flywheel of the explosive engine is rotated at this high ratio; in fact, it is revolved very much slower, varying from 40 to 70 turns a minute, this depending upon the design of the gasoline engine. This reduction of speed is obtained by a combination worm and spur gear, 85 per cent. efficient.

These members are depicted at Fig. 96 and it will be noted that the extension of the armature shaft is provided with a worm which meshes with a similar and larger member, the reduction being 25 to one. Mounted upon the same shaft is a spur pinion which is in mesh with the large spur gear shown at the right of the illustration and the latter gear is secured to the main shaft of the motor car, usually between the flywheel of the engine and gearbox. The spur gear reduction is five to one, making a total of 125 to one.

The efficiency of the motor is augmented by the utilization of a small flywheel of about 2.25 pounds, this member being mounted at the end of the motor shaft, the power of which is increased as the square of the velocity and the momentum of this flywheel, when revolving at a very high speed, adds the stored up energy to the torque of the motor when the intermittent resistance of rotation is offered by compression. In other words, the function of the flywheel is to assist the motor when the compression point of the gasoline engine is reached, it being stated by the maker that at this critical period the speed of the electric motor is steady, and that economy of battery current is effected.

Gears in Constant Mesh.

The gears are always in mesh, eliminating any possibility of stripping. In the large gear is fitted a positive roller clutch, which engages in starting and automatically disengages when the explosive motor starts. It is equipped with ball bearings upon which it rotates, but the gears which are always in mesh become stationary. The worm gear is not keyed to the shaft of the motor, but is secured by a friction disc and spider spring, similar to the member used on the Truffault-Hartford shock absorber. The function of the device is to dissipate the force of a back kick of the gasoline motor without undue strain or injury to the starter. Should a back fire result, through improper advance of the spark, etc., the starter's shaft would simply slip around.

Battery Consumption.

The 12-volt storage battery employed with the lighting system and maintained in a fully charged condition by the generator, supplies current to the starter, which consumes between 200 and 225

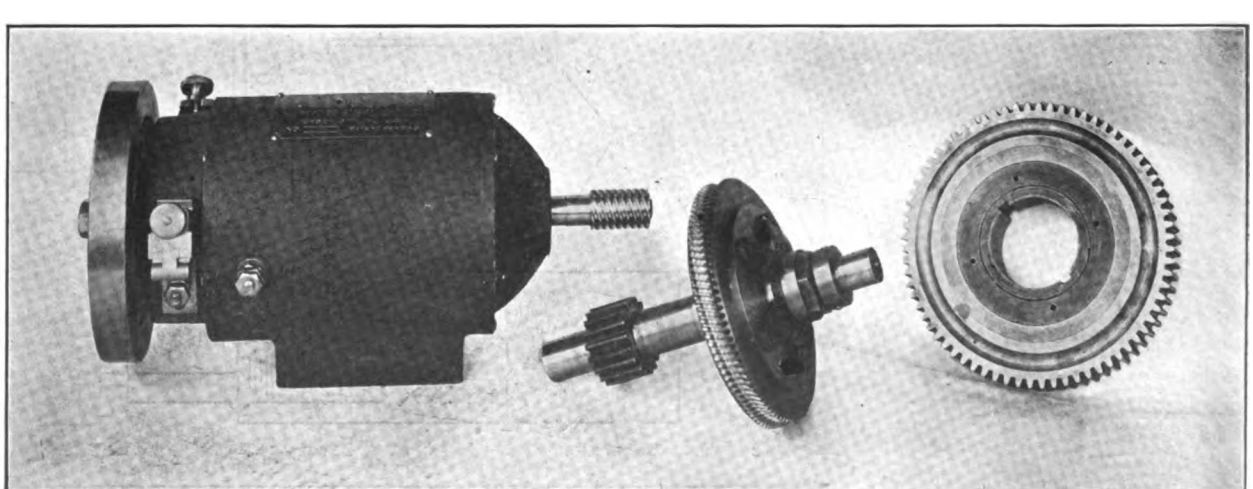

Fig. 96—Outlining the Worm and Spur Gears of Starter Having a Total Reduction of 125 to One.

Digitized by Google

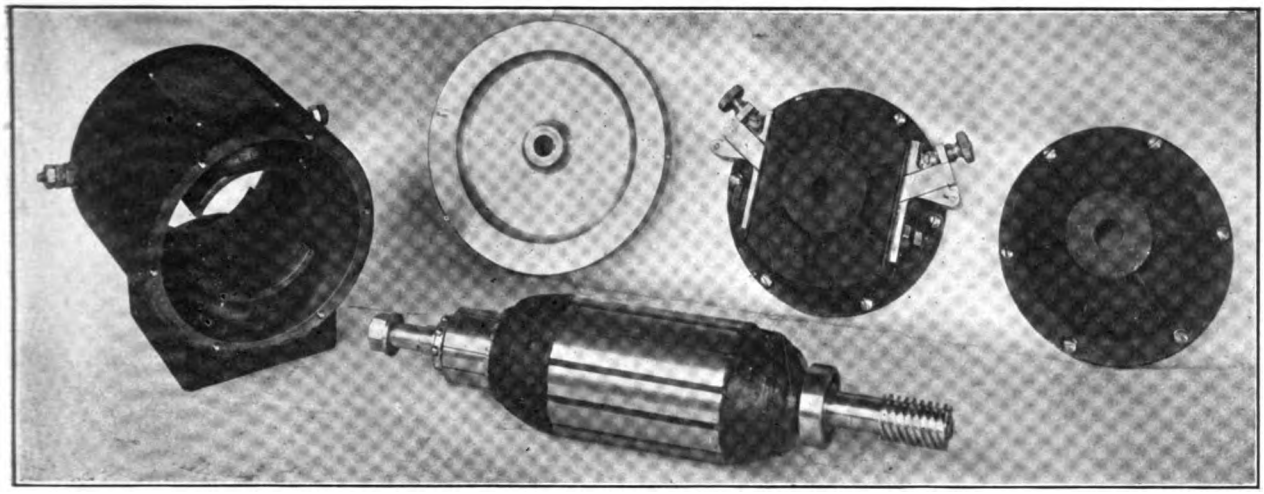

Fig. 97—The Components of Motor Which Is of the Series Mould Type—All Parts Are Fully Enclosed, Readily Accessible and Protected from Moisture and Foreign Elements.

watts, this depending upon the design of the car. The mere pressing of a button located upon the dash or other convenient place, connects the battery to the motor which spins the flywheel of the gasoline engine. When the latter starts the clutch automatically releases as previously pointed out.

The current consumption is slight after the initial impulse and the battery contains enough energy to make possible a large number of starts. Some idea of the power of the little motor may be obtained when it is considered that a watt is equivalent to lifting .7373 foot-pound a second and that 746 watts is equal to one horsepower.

The motor is of the series mould type, the torque increasing with its load. All parts are constructed of high grade material and are accurately machined. The armature shaft is of chrome nickel steel, carefully ground to size and rotates in high grade ball bearings. The armature, which is depicted at Fig. 97 with other components of the motor, is laminated with very thin Russian iron, which eliminates heating, and reduces core losses to a minimum. It is wound with enameled double silk covered magnet wire, and perfectly balanced. The commutator is well designed and of liberal size.

All gears are cut carefully of a high grade material and throughout attention has been paid to minor details. The brushes and holders are readily accessible, as is the commutator, and accurately machined and fitted end covers or plates prevent the entrance of moisture or foreign elements. The wiring plan is simple, as will be noted by the diagram presented at Fig. 94, and as previously pointed out may be installed as a separate equipment or in combination with the lighting system.

Before being placed upon the market the Hartford motor starter was subjected to practical tests, being fitted to a number of different types of automobiles, these ranging from low to high powered machines. On a 72 horsepower six-cylinder automobile, the engine of which required a pull of 250 pounds with the compression cocks closed and with a starting crank with a 10-inch radius, the Hartford motor rotated the flywheel of the gas engine at a rate of 70 turns a minute.

The tests were not confined to warm weather alone, but during cold weather when the motor car was exposed to temperatures well below zero. Even after the car had stood for hours the starter proved efficient, a feature which will appeal to motorists who have experienced the difficulties of starting a cold engine and with a low grade of gasoline. In fact, the entire equipment has proven decidedly satisfactory in service.

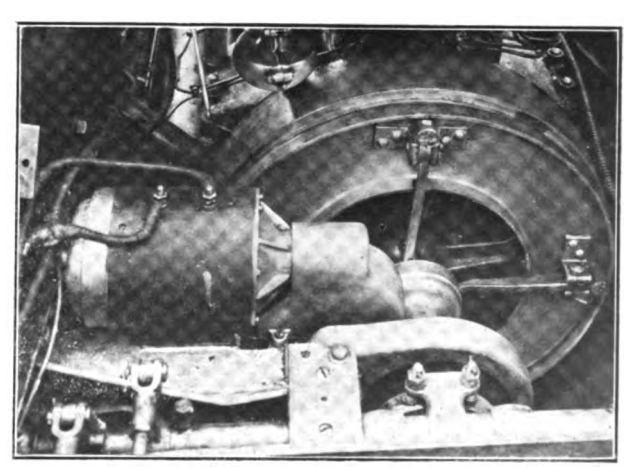

Fig. 98—Depicting the Motor Starter Located Between Flywheel of Engine and Gearbox—The Gears Are Always in Mesh.

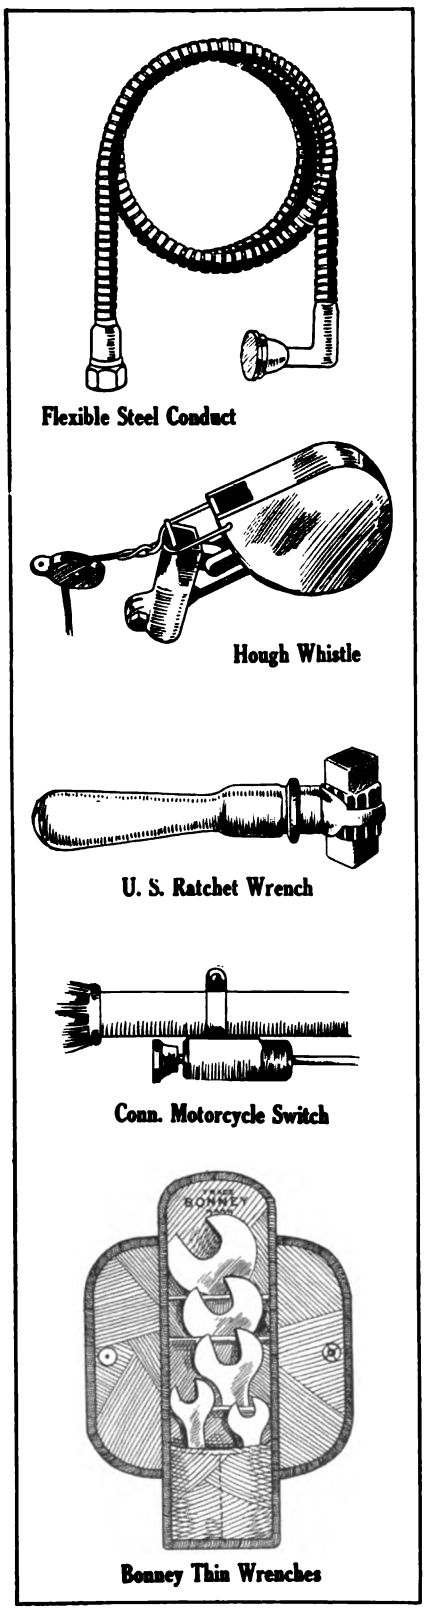
NEW AND NOVEL ACCESSORIES THAT APPEAL TO MOTORISTS



American Flexible Tubing, produced by the American Metal Hose Company, Waterbury, Conn., is as the name implies a flexible conduit designed for installing electric wiring or carrying tubing, and among other purposes is that of replacing rubber hose on tire pumps. The pump tubing is furnished in any length with a swivel pipe thread coupling to connect with the air line on one end and an Acorn fitting elbow on the other. It is claimed by the maker that the material will withstand high pressures as well as severe service.

—— ★ ——

The Hough Whistle, which was designed primarily for model T Ford motor cars, although the signal may be fitted to the exhaust pipe of the muffler of other makes, has been changed. The improvement made is to the sounding chamber, which formerly was circular in construction. That portion having the aperture into which the gases flow is now made flat, the maker holding that the tone of the signal is made more musical, and that the design is more compact as well as neater. In other respects the device is the same, the drum being drawn into action by a pedal operated cable and held in normal position by a spring. The Hough whistle is marketed by the Flint Oil Company, Providence, R. I.

—— ★ ——

The U. S. Ratchet Wrench is the product of the U. S. Ratchet Wrench Company, 215 North Adams street, Peoria, Ill., and is designed for the repair shop and garage. It is equipped with 16 ratchets and the vanadium steel dog grips every 16th of a circle, facilitating the removal of nuts inaccessible with ordinary tools. The device is fitted with a cam mechanism, permitting a reverse action without removing the tool from the work. A universal joint extension, 18 sockets and 10 hexagonal sockets come with the tool, also one spark plug and seven combination square and hexagonal sockets.

Flexible Steel Conduct

Hough Whistle

U. S. Ratchet Wrench

Conn. Motorcycle Switch

Bonney Thin Wrenches

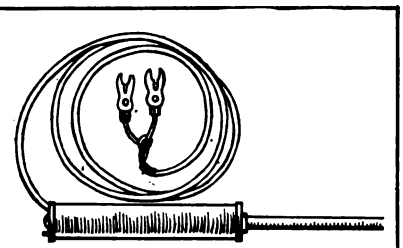
—— ★ ——

A Motorcycle Ignition Switch which is clamped to the handle bars of the mount in proximity to the grip is manufactured by the Connecticut Telephone & Electric Company, Meriden, Conn. A slight pressure of the thumb on a button cuts out the ignition, and by turning the button a trifle, it may be removed and the ignition locked, preventing the starting of the motor. It is attached easily and requires but a single wire, the lead being from the magneto. One of the advantages emphasized in the device is that it facilitates control of the mount in crowded city traffic.

—— ★ ——

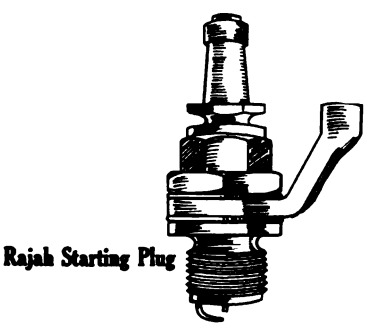
The Bonney Thin Wrench outfit is being manufactured by the Bonney Vise, Tool & Wrench Works, Allentown, Penn., and comprises a set of five members having openings from .25 to one inch. A feature of the wrenches is that being thin they may be utilized in tightening check nuts and in working in places where the ordinary drop forged or monkey wrench would be too thick. The tool is made of a high grade material, carefully hardened, polished and nickel plated, and the outfit is moderately priced. The case is equipped with snap buttons and each wrench has an individual pocket.

Digitized by Google



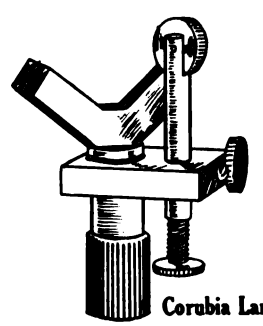
The Magnetic Lifting Tool, marketed by the Sypher Tool Manufacturing Company, 2208 Warren street, Toledo, O., is a useful device for the repair shop or garage as by it bolts, nuts, cotter pins, tools or small parts, which have been accidentally dropped in inaccessible places and are not reached easily with the hands, may be taken out. The instrument weighs 2.5 pounds, is 12 inches in length and the magnets are operated by electricity supplied by dry cells or a storage battery. It is actuated by a press button on the end of the handle, thus closing the circuit, and as the tool is in service but a short time but little current is consumed. The device is provided with several feet of flexible cord, has a polished brass case surrounding the windings and is inexpensive.

★

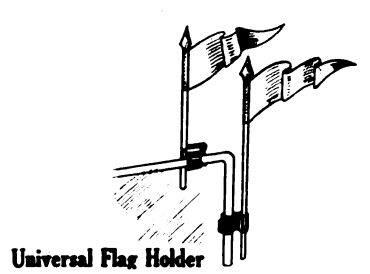


The Rajah Starting Plug was brought out recently by the Rajah Supply Company, Bloomfield, N. J., and the plug proper does not differ from those made by this company except that a device has been added, whereby the cylinder may be charged with gas. The mixture is introduced into the combustion chamber through a hollow yoke which is secured to the shell of the plug by a jam nut. Above and below the yoke are copper asbestos gaskets, which prevent the escape of the gas, which is conducted to the centre of the plug. It is stated that the plug may be taken apart and cleaned without interfering with the gas piping.

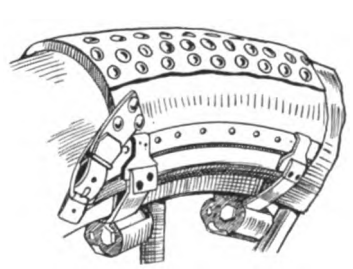
★



The Corubia Lamp Lighter, produced by the Corubia Manufacturing Company, 71 Third avenue, New York City, is a lighting device for attachment to acetylene lamps. It comprises the burner to which is clamped a brass pillar mounting a highly tempered file wheel held in contact with a piece of sparking metal by a spiral spring, the tension of which may be regulated by a thumb screw. The wheel is actuated by finger pressure and the operation results in a shower of sparks which ignite the acetylene. The spark metal is said to be very enduring and the lighter is moderate in price.



Magnetic Lifting Tool



Rajah Starting Plug

Corubia Lamp Lighter

Universal Flag Holder

Universal Tire Protector

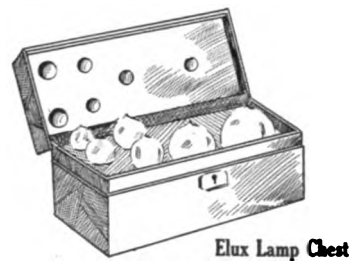
★

The Universal Flag Holder, made by the J. & J. Manufacturing Company, 192 Piquette avenue, Detroit, will appeal to touring motorists as it is designed for attachment to the metal moulding of the windshield and will accommodate two pennants. The device is small, neat and strong, and constructed of a high grade spring steel nicely enameled. The maker states that it will not mar the metal as the holding part is lined with felt. It is attached easily and quickly and is inexpensive. The company also manufactures a holder for attachment to the fenders.

★

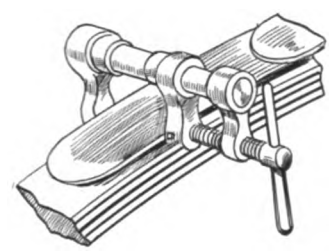
The Universal Tire Protector, manufactured by the Universal Tire Protector Company, Angola, Ind., differs from those of usual form inasmuch as the device is mechanically anchored to the shoe. It is designed for attachment to a tire which presents symptoms of weakness or a shoe which has blown out. The tread is provided with metal studs, making for durability and traction, and the boot also is provided with a rim arrangement to which is secured straps, these being tightened by a locking device. It is pointed out by the maker that the protector may be applied and locked in a very few seconds, as well as drawn tightly over the casing.

Digitized by Google



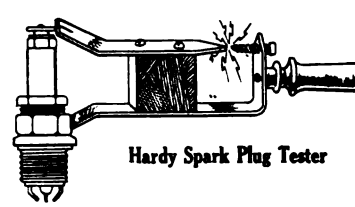
The Elux Automobile Lamp Chest will appeal to motorists whose cars are equipped with electric lights as the container is so constructed that the fragile bulbs are retained securely. The box is provided with a tray with apertures for the sockets, and the cover is also equipped with holes into which the bulbs fit. The chest will contain six lamps, two head and side and a similar number of bulbs for the tail light. The box is fitted with a snap lock and is very compact and neat. It is marketed by the Elux Miniature Lamp Works of the General Electric Company, 324 Lafayette street, New York City.

—— ★ ——

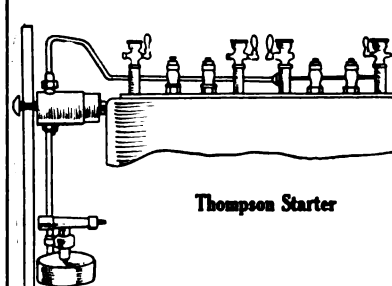


The Auto Spring Lubricating Tool, marketed by Chas. E. Miller, 97-103 Reade street, New York City, is a useful and inexpensive device which will be appreciated by those who have attempted to lubricate the leaves of the spring. The tool is clamped to the spring and the leaves are opened easily and without damaging the members, by the simple turning of a handle. The device is drop forged, nickel plated, and adapted to any size spring.

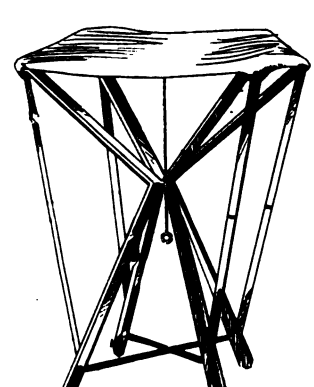
—— ★ ——



The Hardy Spark Plug Tester is the product of the R. E. Hardy Company, Austin avenue and May street, Chicago. It is designed to make easy the location of a faulty plug and in testing the members the operator is protected from possible shocks as the handle is of insulated material. Two metal strips, attached to the device, are placed in contact with the terminal and shell of the plug, and the current passes to and across the adjustable gap. By it the strength of the current may be determined and it also assists the plug gap to remove deposits.



Elux Lamp Chest



Auto Spring Lubricating Tool

Hardy Spark Plug Tester

Thompson Starter

Glendale Folding Chair

The Thompson Starter and Lighter, is manufactured by the Andrew C. Thompson Auto Company, 421 Park avenue, Plainfield, N. J., and utilizes acetylene which is exploded in the cylinder in the usual manner. Gas is led from the tank through a regulator, thence to a storage chamber integral with the starting push button which is mounted on the dash. From the starting device proper, the mixture, which may be adjusted, is led to the cylinder or cylinders by tubing. When the design of motor does not permit of the use of priming cups for attachment, the starter may be employed by piping it to the intake manifold, this requiring an air valve. The company manufactures a spark plug with ball check attachment for use with the starter where priming cups cannot be employed. In addition to the starter the system includes a lighting device for the headlights which is operated by a lever on the dash. The burners are of the jump spark type.

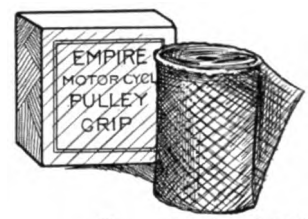
—— ★ ——

The Glendale Folding Chair is marketed by the Glendale Folding Chair Manufacturing Company, 152 West 34th street, New York City, and is made of pressed steel. Its construction is such that when folded it is scarcely as long or wide as an ordinary music roll. Its weight is less than two pounds and it is stated that it will support 400. It is opened and folded easily, and being free from complications, will make a valuable addition to the equipment of the motor car.

—— ★ ——

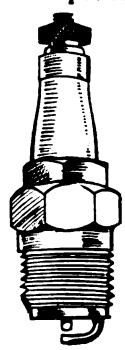
The Empire Motorcycle Pulley Grip is manufactured by the Empire Tire Company, Trenton, N. J., and is utilized to dress the driving pulley face. It is claimed by the maker that

Digitized by Google

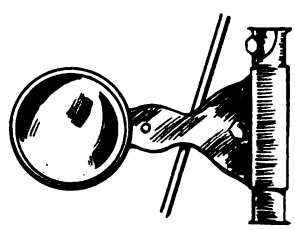


operating with a slack belt is permitted and that the material will eliminate glazing and slipping, as well as increase the life of the belt. By it the diameter of the pulley may be enlarged, increasing the speed of the mount. The material is thin and comes in rolls packed in a neat box.

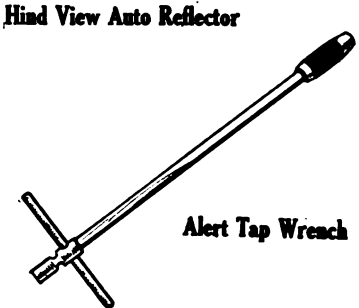
★



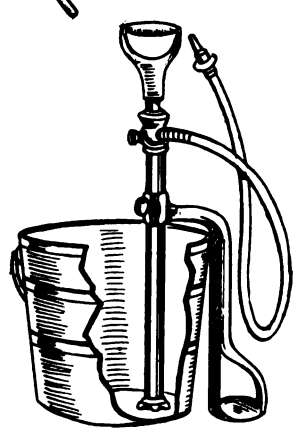
The J-M Spark Plug is a new product of the H. W. Johns-Manville Company, Madison avenue and 41st street, New York City, and it presents interesting features inasmuch as it is a combination porcelain and mica plug. The steel electrode is surrounded with nine layers of tightly wrapped high grade sheet mica, and extra insulation is provided by covering the mica tube with a substantial porcelain housing, thoroughly kilned and glazed. The terminal end of the electrode is equipped with a metal cap, protecting the part as well as making for security of the binding nut. Ample asbestos washer packings are utilized at both ends of the electrode, assuring a gas tight plug. The firing points are composed of an alloy of platinum, iridium and nickel, and the maker points out that they will not pit excessively or carbonize, also that they are adapted for service with a magneto and may be adjusted readily and utilized either with a battery or magneto.



★



The Hind View Auto Reflector is manufactured by the Kales-Haskel Company, 445 Lafayette boulevard, Detroit, and is designed for attachment to the windshield or dash for the purpose of enabling the operator of the automobile to note approaching vehicles in the rear without turning in the seat. It is constructed of solid brass and the mirror is five inches in diameter. The reflectors are made in different styles and sizes.



Empire Motorcycle Pulley Grip

J. M. Spark Plug

Hind View Auto Reflector

Alert Tap Wrench

Fowler Pump

★

Alert Tap Wrenches are the product of the Alert Tool & Wrench Company, 221 North 23rd street, Philadelphia, and are designed for the repair shop as well as owners caring for their own machines. The wrenches are longer than those of usual construction, being 13 inches, and are provided with expanding jaws with a capacity of from .0625 to .4375 inch. They are made especially for tapping, drilling and reaming parts difficult of access and are constructed of high grade material, finished in gun metal blue and are guaranteed by the maker.

★

The Fowler Fire & Spray Pump is the product of the Fowler Lamp & Manufacturing Company, 61 East 24th street, Chicago. It is a pump device for attachment to a pail or other suitable vessel, and is provided with a foot rest which is adjustable to any height. The rubber tubing is of suitable length and is equipped with a spray or solid stream nozzle. The maker points out that the pump may be utilized for washing a car where city service is not obtainable and in addition the pail may be filled with a chemical fluid and utilized as a fire extinguisher.

★

Multibestos is the product of the Standard Woven Fabric Company, Worcester, Mass., and is utilized for relining brakes. It is a heat proof material, very durable and possesses unusual gripping properties. It is maintained that it does not disintegrate during its wearing life and has an unusual high co-efficiency of friction.

LONG DISTANCE CAMPING TOUR.

CARRYING his own camping impedimenta and accompanied by his wife, son and daughter, William L. Finley of Janesville, Wis., started July 11 on a tour that has had Boston as its eastern destination, and which will be concluded, if present plans fructify, about Sept. 1. The vehicle used is a 1910 model T Ford touring car that has been driven constantly for three seasons and which has been given all kinds of hard service on the western roads.

The tourists were 13 days reaching Boston, making in that time a total of 1362 miles, and while rain compelled their finding shelter at hotels five of the nights, the remainder of the time the Finleys camped where night overtook them and slept with intense satisfaction in the tent that they erected in a few minutes at the conclusion of the day's run.

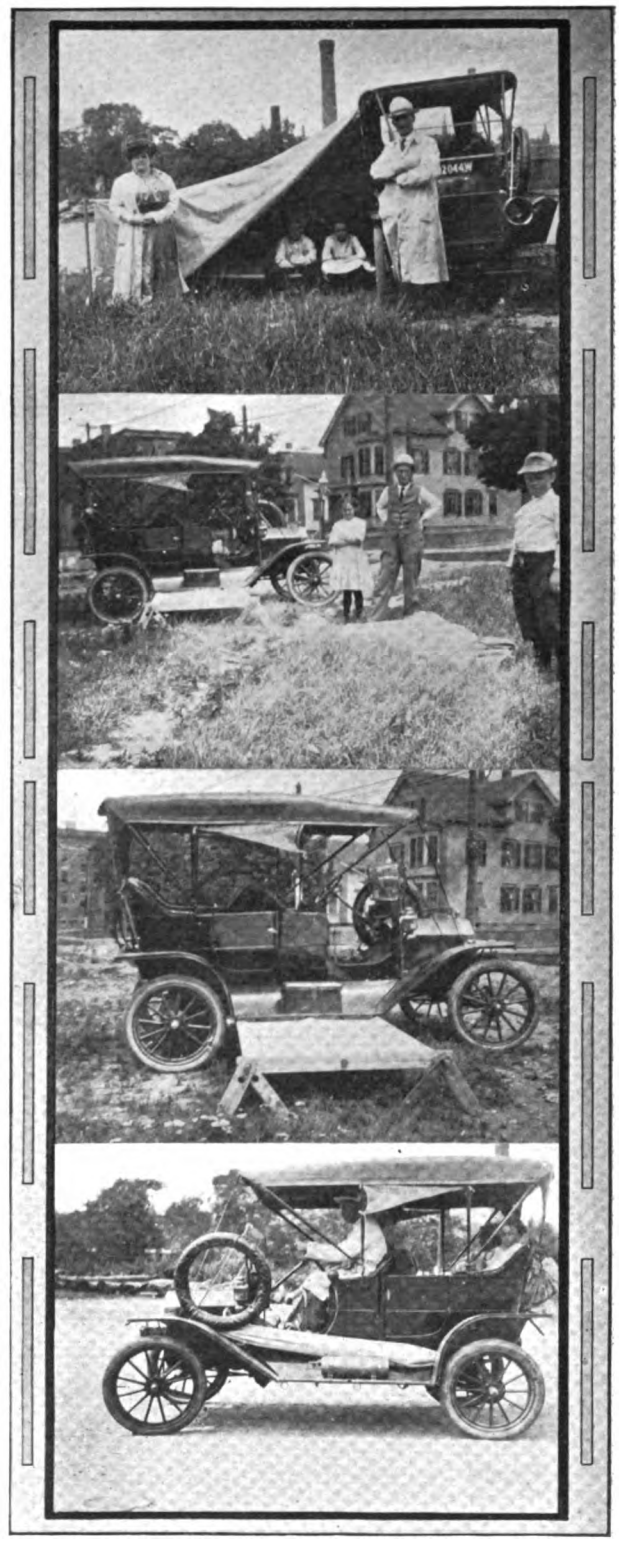
Mr. Finley was for years engaged in farming in the vicinity of Janesville, and for the last year or two has been agent for a well known car in that city. He had himself enjoyed innumerable hunting and fishing trips and felt perfectly at home in the open. He proposed to Mrs. Finley and the children that they drive to Boston and camp en route, which all enthusiastically approved, and so a route was discussed and decided which will call for about 3500 miles driving when covered. Mr. Finley had a tent made that was 10 feet wide and 12 feet long, with a height of seven feet at one end and four feet at the other, with walls on the two sides and low end, this leaving the high end open, with the roof of the tent so arranged that it could be made fast to the side of the top of the car, as illustrated. With this the car always formed one end of the tent and this arrangement left the car, protected by its top and side curtains on the side furthest from the tent, for the use of the tourists.

Nothing exactly like this outfit was observed by Mr. Finley and he conceived the idea of utilizing the car and the tent and having the two together in the event of storm. The tent was made of substantial duck and it was roped with two end guys that are carried to stakes at sufficient angle to the sides to afford a desirable tautness. The side walls are staked down when desired and then with two stakes to support the low end wall at the full height the tent affords its full area. Twelve stakes and the two guy stakes are all that is required, the car top carrying the greater part of the strain. To prevent excessive stress upon the rear tire of the side of the car on which the tent is made fast the axle is jacked on that side whenever camp is pitched. The tent is folded and carried in a canvas bag.

End and Side Views of the Tent Made for and Used by William L. Finley and His Family in Their Motor Camping Trip from Janesville, Wis., to Boston and Return, Showing Proportions and Manner of "Raising."

Three eyes of iron are bolted to the under side of the running boards near the outer edge to form the supports of the head of the cot or couch. The cot is 6.5 feet length and 43 inches width and at the centre and at either side of the canvas forming it are pockets into which are placed oak curtain poles 1.25 inches diameter and seven feet length. At the foot of the cot is a spreader of wood three inches width and one inch thickness bored to receive the ends of the three poles when fully spread. Two legs of similar materials as the spreader, with sharpened ends, and bored with

Digitized by Google



holes to give two heights, are fitted for each of the outside poles, and when set up the cot is firmly erected and will remain as long as desired, with sufficient ventilation and always perfectly dry. This cot, with the poles and spreaders, is rolled and placed in a long canvas bag and is packed on the left running board, as shown in the illustration.

The cot was intended for the use of Mr. and Mrs. Finley and for the children it was found the seat cushions made an excellent bed. Two carriage robes, four blankets and four pillows were found to be all the bed clothing required, and the bedding and the tent were carried strapped on the back of the tonneau. Two suit cases were allowed for clothing for the party and beside these the equipment included a single burner oil stove, boxes containing tea, sugar, pepper, salt, etc. Of course it was necessary to travel as light as possible, because of the limited space and the need of protecting the luggage, but a surprising amount of clothing was stored in the cases and the car seemed well laden when the start was made. It was necessary to strap a spare tire to the left side of the windshield as may be noted in the illustrations. The suit cases were strapped on the other side of the car on the tool box.

Prior to the start the car was overhauled and made ready for a long journey and the morning of July 11 the start was made. None of the tourists had ever had like experience and there was some uncertainty as to just what conditions would be most satisfactory, but it was decided to have breakfast and supper in camp and to take dinner whenever this was convenient. It was believed that it would be best to pitch camp in a farm yard or in a schoolhouse yard, and this idea was followed out through the eastern run, there never being refusal of the request to drive the machine off the road and camp.

Mr. Finley, speaking of his experience with the residents with whom he came in contact when camping, said that there was always more or less interest manifested in his camping outfit and that he was always made welcome. This was a distinct convenience because of the need for water, and he said that he soon mastered the work of handling the tent. In a very short time it was raised and the cot set up, and then the work of preparing the meals was minimized to making tea, there being very few dishes used.

It was found advisable to purchase in any town that was passed through late in the afternoon whatever was desired for supper and breakfast, and purchases were made in small quantities, because there were no conveniences for carrying

Reading from Top to Bottom: Tent Side Raised and the Children Sitting on the Couch or Bed; Tent Folded for Packing, Showing the Couch; the Couch Assembly and the Means of Supporting the Foot; the Camping Outfit Packed, the Tent in a Bag at the Back of the Tonneau and the Couch in a Bag on the Running Board.

Digitized by Google

food. Usually whatever was bought was ready to serve, and with fruit and butter very satisfying meals were prepared. Two of the four did not use milk and sugar with their tea and before long all were drinking it without "trimmings." This was from choice and not from necessity.

The tent space was sufficient so that the children could place their bed wherever they desired in it and of course any degree of ventilation could be had. The tent itself was satisfactory and though they occupied it during several severe falls of rain no leaks were developed and it was always dry and habitable.

The speedometer registered 6271 miles when the start was made from Janesville and the first day the run was through Beloit, Rockford, Cherry Valley, Belvedere, Meringo, Pingree and Elgin to Chicago, where the night was spent with friends at Washington park. The total run for the day was 121 miles and this was completed at 3 in the afternoon.

July 12 the route was through South Chicago, Hammond, Ind., Highland, Hobart, Wheeler, Valparaiso, Laporte and South Bend, camp being pitched east of South Bend late in the afternoon, the day's run being 110 miles. July 13 the start was made with rain threatening and at Goshen rain fell and the tourists remained there until noon. When the rain ceased the drive was resumed and the Ohio line was crossed, but at Bryan, as rain again fell, the tourists went to a hotel for the night.

July 14 the tourists left Bryan and drove to Toledo, and later passed through Freemont and Huron, camping east of Huron. The following day rain began to fall when near Lorain, and after a delay in this village they continued on to Cleveland and to Geneva, where rain again caused them to seek the shelter of a hotel. July 16 they drove to Conneaut, thence to Erie, Penn., Westfield, and went into camp about 10 miles east of that town. July 17 the route was through Dunkirk to Buffalo, to Niagara Falls, and the tourists camped near the falls. July 18 the greater part of the day was spent on the Canadian side of the St. Lawrence river and late in the afternoon they drove to Albion, N. Y., where the temperature was so cold they put up at a hotel.

Starting at 9 in the morning of July 19 the tourists drove through Rochester, Newark, Lyons and Spring Lake, camping near that town. The next day the way was through Syracuse, there being some bad road between Spring Lake and Syracuse, then to Utica, Herkimer and to Little Falls, where camp was made for the night. Rain fell July 20 until 5 in the afternoon, when the drive was resumed to Fonda, where the Finleys were the guests of friends for the night. July 22 the drive was resumed, going by way of Hoffman's Ferry to avoid bad roads, to Schenectady, Albany and thence to Lebanon, Mass., camp being pitched near the Shaker village in that town.

July 23 the tourists drove to Pittsfield, where a stop was made to clean the engine of carbon, and when this had been done the drive was continued by way of Huntington, Westfield, Springfield to Palmer, near the last named town camp being made. The morning of July 24 the last stage of the eastward journey was begun and Boston was reached by way of Worcester at 3 in the afternoon. There the Finleys were the guests of friends. During the run east the tourists covered 1362 miles, and used 78 gallons of gasoline and 24 quarts of oil, the cost being $14.50 for fuel and $4 for lubricant.

The homeward trip was begun July 29 at 3 in the afternoon when the campers drove to Lonsdale, R. I., where they were the guests of relatives until Sunday, Aug. 4, when they again took up the journey and left by the way of Worcester to reach the main road through to Albany. On reaching that city the itinerary was to be laid out and it was intended to make the trip by easy stages and get back to Janesville just prior to the opening of the school term.

Mr. and Mrs. Finley decided on the camping journey because it was a novelty, and they were delighted with their experience. Clark, aged 13, and Catherine, aged 10, had benefited materially by their life in the open air and the lad had gained seven pounds in three weeks, which was a sufficient indication of the success of the tour. Mr. Finley, by the way, is a motor car dealer in Janesville, and of course kept his machine in excellent condition. He says that were he to make the drive again there is nothing that he would need in his outfit, though it would be possible to add conveniences.

LENOX TO INCREASE OUTPUT.

The Lenox Motor Car Company, Boston, Mass., has made plans for a largely increased product for the coming season, and with this object in view it has secured the services of one of the best known automobile men in the United States, W. K. Hadley, who has gone to Boston as general sales manager and purchasing agent of the company. Mr. Hadley has just resigned as special factory representative of the Marion Sales Company and prior to that time was for five years with the Maxwell-Briscoe Motor Company.

TAKES OVER SALES END.

Aug. 1 the Hood Rubber Company, Watertown, Mass., took over the entire business of the Shawmut Tire Company, which had up to that time acted as its selling agent for automobile tires, tubes and accessories. In the future the Hood Rubber Company will not only manufacture, but will also sell, bill and collect all accounts and carry on the business in its own name.

LONG TRIP IN CARTERCAR.

An accompanying illustration shows Miss Goodsell of Rock Island, Ill., in a Cartercar, made by the Cartercar Company, Pontiac, Mich., alongside the famous Rock Island train California, of which her father, Charles Goodsell, is the driver. Incidentally it may be remarked that Mr. Goodsell holds the record for the fastest time made on that railroad.

Miss Goodsell of Rock Island, Ill., and Her Cartercar, with Which She Is Enjoying a Long Distance Tour Accompanied Only by Women.

Miss Goodsell is at present enjoying a 1200-mile trip in her Cartercar, accompanied only by a party of women. This machine was selected by Mr. Goodsell for this purpose, because of his implicit belief in the friction transmission, with which all Cartercars are equipped.

WITH OLDS MOTOR WORKS.

L. Clyde Smith has been appointed advertising manager of the Olds Motor Works, Lansing, Mich. Mr. Smith has had long and exceptional training in preparing literature relative to the automobile business, on both the commercial and pleasure car ends. Recently he has been assistant to the director of advertising for the General Motors Company, Detroit. He was chosen for his new position by O. C. Hutchinson, general manager of the Olds Motor Works, who, in making his selection, followed a policy he has always observed, that of securing the services of men of broadest experience in their particular line.

SECURES CONTROL OF THOMAS.

The entire control of the E. R. Thomas Motor Car Company, Buffalo, N. Y., was recently secured by interests closely allied with the United States Motor Company, New York City. President F. R. Humpage of the Thomas concern, it is stated, has secured an option of purchase of all the stock, and is now seeking the necessary capital to consummate the deal.

Although it has been known for a considerable length of time that the largest stockholders in the one company were the largest in the other, there has been no official confirmation of this. In addition to producing the regular Thomas line of cars, it is planned, also, to place a small six-cylinder machine on the market.

SLATER GOES WITH MICHIGAN.

William J. Slater, former advertising manager of the Firestone Tire & Rubber Company, has been added to the forces of the Michigan Buggy Company at Kalamazoo, Mich., maker of Michigan cars, as assistant sales manager. Mr. Slater is best known to the automobile industry and trade through his connection with the Firestone company, where his ideas, both in manufacturing and selling, have been adopted by a number of tire makers.

THE REMY MODEL R D MAGNETO.

The model R D Remy magneto of the inductor type, made by the Remy Electric Company, Anderson, Ind., many of which are being fitted as standard equipment on 1912 automobiles, provides dual ignition with one set of spark plugs, current being supplied by the magneto and by dry cells or a storage battery. It is a simple ignition system in that it is installed easily and aside from lubrication every 1000 miles, does not require any attention. The magneto has but one adjustment, that of the contact screw, which regulates the break of the contact points, and this may be changed without disturbing any of the components and may be set by the novice.

The current generated by the magneto is a low-tension and the electricity is converted or built up into a secondary current by a transformer coil placed outside of the magneto, returned to the latter and distributed to the proper spark plug by a distributor which also serves to direct the battery current when cells are employed for starting or for operation.

How Current Is Generated.

The magneto differs from those of the armature type in that current is produced by induction; that is, the shaft of the magneto is equipped with two steel, fan shaped inductor wings, within a stationary winding, in the magnetic field. This single winding is of coarse magnet wire, is held stationary, and the inductor members rotate around it, one on either side. At each half-turn of the inductor shaft, the direction of the flow of the lines of magnetic force through the winding is alternately reversed, inducing in the winding two electrical waves or impulses for each complete revolution.

The stationary winding is directly connected through the magneto circuit breaker with the primary of the coil. The circuit is mechanically broken during the current wave, which is of considerable duration, the maker stating it is more than 35 degrees of the inductor's revolution. It is also pointed out that the nature of the wave is such that the same heat of spark is obtained, irrespective of the advance or retard of the cam housing which, when shifted, causes the spark to occur earlier or later at the gaps of the plugs as desired.

Function of Distributor.

The distributor is utilized for distributing the current after it has been transformed by the coil to a high voltage which is necessary for it to bridge the gap at the spark plug. It will be noted by the wiring diagram presented at Fig. 1 A that one high-tension cable leads from the coil to the distributor. For each revolution of the magneto inductor, the wire conveys two high voltage impulses to the distributor, which makes one revolution to two of the inductor, by means of a gear, this arrangement being necessary to furnish a spark to each of the four plugs in proper order.

The inductor, therefore, must be driven at crankshaft speed for a four-cylinder, four-cycle motor, and 1.5 times crankshaft speed with a six-cylinder engine of the same type. With the two-cylinder, four-cycle, opposed motor, the distributor is eliminated, a single cam being employed, causing but one impulse for each revolution of the inductor and the magneto is driven at crankshaft speed.

Switch Connections.

The switch is of the kick type and the lever provides two positions in addition to neutral, these comprising a connection for the battery and magneto circuits, either of which may be employed separately. A push button is incorporated and when this is depressed with the lever at "battery," current flows from the dry cells through the coil, thence to the distributor and to the plug in circuit with the blade of the distributor. The arrangement permits of the installation of a motor starter of the acetylene type. The

Digitized by Google

service of dry cells or a battery is not absolutely necessary as the motor may be started upon the magneto if desired.

Timing Magneto.

The magneto is timed by the break of the contact points and the piston of the motor should be at exact dead centre of the firing stroke. The cam housing, which is depicted at B, should be set in a fully retarded position and the platinum points should just be separating. The high-tension wire from the cylinder should be connected to the distributor terminal corresponding to which the distributor segment is opposite. The remaining terminals are then connected in the proper firing order of the motor.

It should be borne in mind that when the firing order of the motor is 1, 2, 4, 3, the cables from

Wiring Connections.

The wiring connections must be made according to the diagram presented at A and to facilitate installation, either when new or during service, the Remy Electric Company utilizes different colored wires as denoted in the drawing.

The adjustment of the magneto is an easy matter. By referring to the diagram at B it will be noted that there are two platinum points, one stationary, and the other movable and attached to a lever or arm. The points are held in contact by a spring on the arm and are separated when the cam on the shaft revolves, the periphery of the cam performing the function. The adjustment of the points should be so made that the maximum break is between .025 and .03 inch. The sketch shows the cam in a position of the maxi-

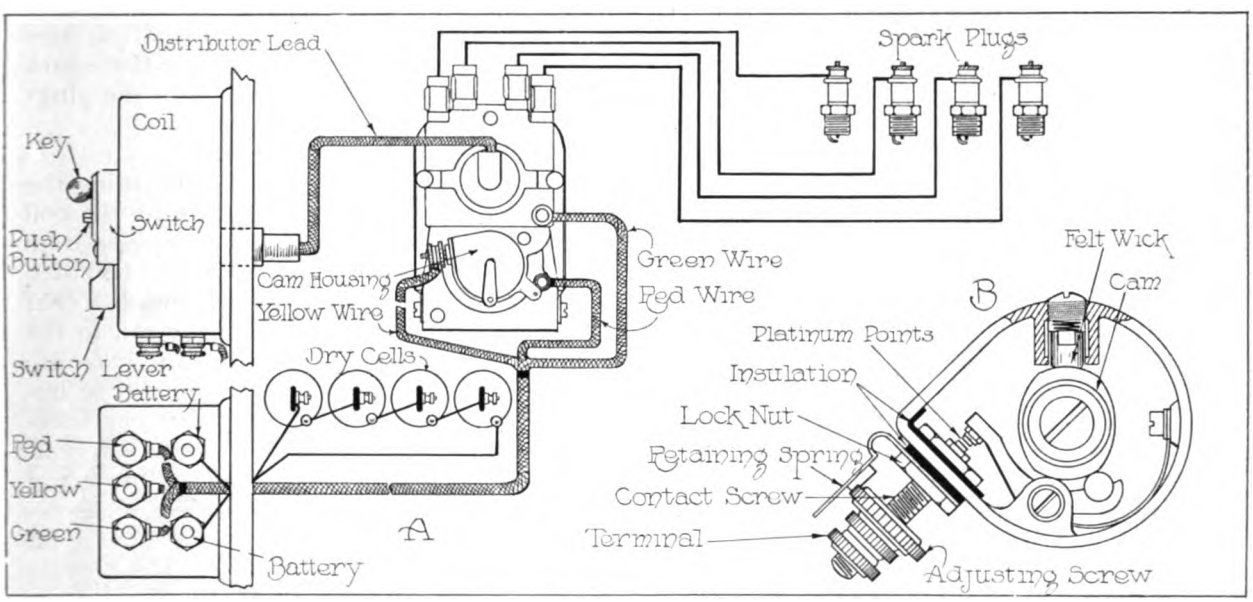

Fig. 1—Outlining Wiring Diagram of Model R D Remy Magneto: A, Depicting the Various Leads and Components of System; B, Showing Cam Housing and Only Adjustment of Magneto.

cylinders 1 and 2 must be attached to terminals 1 and 2 of the distributor, but the wire from the No. 4 cylinder is attached to the No. 3 member of the distributor as the No. 4 cylinder fires ahead of the No. 3. When the order of firing is 1, 3, 4, 2, the lead from cylinder 3 is connected to terminal 2 of the distributor, the No. 4 to the No. 3, and the No. 2 to the No. 4. In the event of an overhaul of the motor or the secondary wires becoming mixed, the above suggestion and following table will be of service:

Firing Order, 1, 2, 4, 3.		
Cylinder.		Distributor.
No. 1.	to	No. 1
No. 2.	to	No. 2
No. 4.	to	No. 3
No. 3.	to	No. 4

Firing Order, 1, 3, 4, 2.		
Cylinder.		Distributor.
No. 1.	to	No. 1
No. 3.	to	No. 2
No. 4.	to	No. 3
No. 2.	to	No. 4

mum break of the platinum points.

If the motor misses with the spark retarded and the skipping is more pronounced at low rather than high speeds, the contact screw should be screwed out a notch at a time until the trouble is overcome. If the engine misses with the spark advanced, and it is more noticeable at high speeds than low, the contact screw should be screwed in a notch at a time until the motor operates smoothly. The adjustment is made easily as the screw member is slotted with a plurality of cuts and a spring having a knife blade edge engages with the opening, also holds the screw firmly in position.

Gaps of Spark Plugs.

Although different motors require different

Digitized by Google

gaps at the spark plugs, about .025 or .03 inch is best for most engines. If the motor misses when running idle or pulling light, the gaps should be

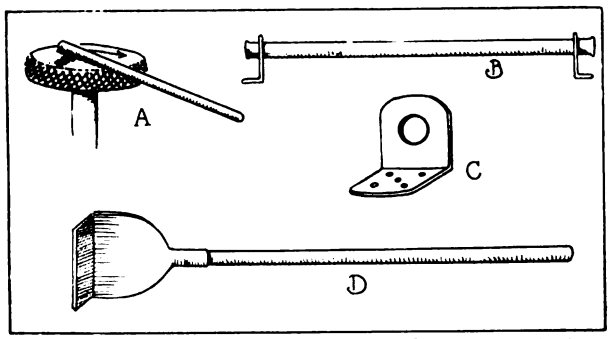

Fig. 2—Some Devices Made Easily by the Owner: A, Auxiliary Lever for Dash Adjustment of Carburetor; B, Foot Rail Constructed of Brass Tubing; C, Support for Device; D, Scraper for Removing Deposits from Garage Floor.

increased. If the trouble is noted when the engine is pulling heavy at slow speed, the gaps should be made shorter.

The magneto is provided with three oilers and each of these should receive a few drops of lubricant about every 1000 miles. The cam is lubricated by means of a felt wick and this should be inspected often enough to prevent the material from becoming dry and when such is the case it should receive attention. The cam house is removable, permitting of easy access to the circuit breaker parts.

FUEL ADJUSTING LEVER.

There is a growing tendency to fit a dash adjustment of the carburetor and the advantages are numerous, especially when operating in constantly changing altitudes such as in the mountains. Some of the devices permit regulation of the air while others act directly upon the needle valve. One of the features of the attachment is that the proper mixture may be obtained without leaving the seat and with the motor carrying a load and under different operating conditions.

The experienced driver appreciates the device which he seldom utilizes, but the novice is prone to tamper with the adjustment, even after it has been set accurately by the expert. It is a common occurrence for the amateur driver to change the adjustment whenever he fancies his motor is not developing its maximum power.

The suggestion outlined at Fig. 2 A was noted by the writer recently on a model T Ford roadster, the owner of which is an experienced motorist. The knurled screw member is equipped with an arrow for aiding the operator to determine the best opening of the needle valve, but if the screw is rotated beyond a complete turn, the driver is at a loss to know where the original setting was.

In the instance referred to the motorist after considerable experimentation discovered that the motor gave the best results with the arrow in a certain position. The binding nut was then locked and a small round metal rod was soldered to the head of the screw member as depicted in the drawing. The lever would not permit of the screw being rotated a full turn, but it did allow sufficient range of movement to increase or diminish the opening of the needle valve.

The lever fitted was about three inches long, making it an easy matter to alter slightly the mixture if desired and because of the leverage obtained, the binding nut could be set up more snugly than would be possible if the adjusting screw were to be moved by the fingers. Another advantage of the device is that it prevents tampering with the adjustment as the lever can be moved only about three-quarters of a turn.

It does not interfere with removing the needle valve of the carburetor as the universal joint may be disconnected easily and the valve screwed out with the fingers. As the screw member is of brass, it is a simple matter to solder the rod to it.

SCRAPER FOR GARAGE FLOOR.

More or less dirt and mud are deposited on the floor of the garage and where it becomes impregnated with oil or grease, the combination is hard to remove. At Fig. 2 D is outlined a metal

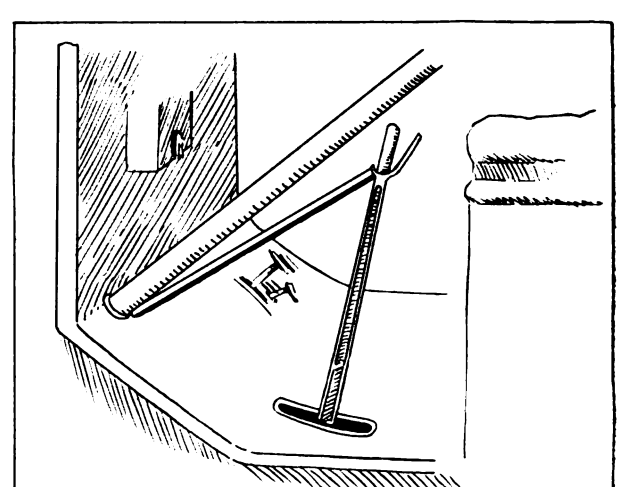

Fig. 3—Method of Holding Clutch Lever of Ford Car When Retaining Mechanism Fails to Operate Properly.

scraper which may be made easily by any blacksmith and is not expensive. It is very similar to the tool utilized to remove snow and ice from

Digitized by Google

the sidewalk with the exception that the scraper proper is bent to an angle. A wooden handle is fitted with which deposits are removed easily from cement, concrete or wood floors.

HOME MADE FOOT RAIL.

Many motorists fit a foot rail in the tonneau, also one for the benefit of the passengers in the front seat. These devices are of service when operating over rough roads as they provide a brace for the feet and make riding more comfortable. While the rails are not expensive and are to be procured ready made, one may be made easily and at a slight cost.

At Fig. 2 B is shown a foot rail made by an owner and fitted to a roadster. A suitable length of heavy gauge brass tubing, about one inch in diameter, was purchased at a brass supply house, also two strips of heavy brass plate. The plates were drilled to the same diameter as the tubing, and for a drive fit, and were next bent to the shape depicted at C. Holes were also drilled and countersunk for screws after which the tube was slipped through the large apertures and the extending ends of the pipe enlarged as shown in the sketch. The rail was then screwed to the floorboards in the desired position. In attaching the holders to the floorboards, care should be exercised to note that the tubing is held securely, and this result may be obtained by attaching one holder and moving the other until it binds, before fastening.

FORD HAND LEVER KINK.

It is surprising what ingenuity is displayed by some motorists in extricating themselves from predicaments brought about by the breakage of some part of the machine. An instance was noted by the writer of a driver of a model T Ford car. With this type of machine the clutch is thrown out of engagement by a pedal, and is held in a neutral position by a hand lever which also actuates the emergency brake. Before starting the motor and in stopping, this lever is drawn backward toward the driver until the clutch is released and the brakes set.

It is retained in a manner similar to all emergency brakes and in the case referred to the mechanism became broken through misuse. Failing to hold the clutch out, it was impossible to start the car as, with the clutch in, the high speed is engaged.

The problem was solved easily by the driver who secured a stick of wood and placed it between the dash and the lever as depicted at Fig. 3. The stick was broken to the desired length to hold the lever so that the clutch was neutral. The driver, who employed the car for business purposes, utilized the kink the entire day, and at the completion of his work had the lever repaired.

A NEW BODY POLISH.

Probably nothing so appeals to the eye of the pedestrian and the occupants of other cars as a trim, well kept automobile, that looks as if it had just come from the manufacturer's hands. In an effort to produce a body polish which would accomplish this result under all conditions, the Hendricks Hardware Company, Philadelphia, has placed in the market a preparation known as Tun A waT.

It is claimed for this that it will remove the cloudy, gray effect produced by damp; eliminate rain spots and cover scratches. It is applied easily, and its quick drying qualities and absence from greasiness or stickiness, are expected to be points which will appeal strongly to motorists.

The Hendricks company holds that its long experience with paints and varnishes of all kinds places it in a position to guarantee that the new polish will not injure the finest varnished surfaces, and that it contains no acid, alkali or other harmful substance. It also claims that it is suitable for bodies of any color, including the clearest white.

ATLANTA'S FALL DISPLAY.

The Atlanta Automobile Association is making arrangements for another fall show in that city, the dates selected being Nov. 16-23. It will be remembered that some years ago a so-called national display was held in this city in November. Last February the second organized exhibition of motor cars in Atlanta proved a decided success. The third display will be held in the Auditorium and will be the first showing of 1913 models in the South.

BOSCH PRIZES OFFERED.

Following its usual custom of recent years, the Bosch Magneto Company, New York City, announces two sets of prizes for cars equipped with Bosch ignition in the races at Milwaukee, Wis., in September. The winner of the Grand Prize will receive $500, the second place driver $200, and third place $100. For the Vanderbilt cup the awards will be $200, $100 and $50.

THE GOOD ROADS CONGRESS.

With the nearer approach of the international good roads congress in London in 1913, it is being brought home more forcibly than ever that the United States is the only civilized nation which is not entitled to official representation. Of course, American delegates will be seated, but they will be appointed by an association of civilians and any action that they may take will not be recognized as binding upon the United States government.

That foreign nations, upon the representatives of which has devolved the matter of selecting the speakers, have chosen some of America's best known road engineers is significant. It is evident that, no matter in what disrespect these countries hold the road conditions in America, they feel that some effort has been made to solve the highway problem.

It is a matter of deep regret that the United States is not in a position to benefit to the greatest possible extent from the results of this congress, but it is significant that men upon whom will depend in a large measure the carrying out of such plans as shall be decided upon, will be present and take part in the consideration of the problem. The unfortunate part of the situation lies in the fact that these men will be expected to pay their own expenses or be reimbursed by individual states, whereas the entire country needs the benefits of their findings.

UNIVERSAL LIGHTING IN JERSEY.

The recent decision of the courts in Camden county, New Jersey, with reference to the liability for damage to vehicles operating on the public ways during the night season, will prove of decided interest to motorists and others. The law in New Jersey provides that all classes of vehicles shall display lights. The crew of a trolley car which ran down a wagon not thus equipped was acquitted on a charge of manslaughter, and the court appears to have held that this is good law. There is every reason why the New Jersey idea should become the rule for the whole country. Concerning this point, the Carriage Monthly, devoted largely to horse vehicle interests, has the following to say, editorially:

> Vehicle lighting laws are made for the safety of every user of the public highways, and with all the common sense and sanity in their favor it is a matter of wonder that such regulations were not enforced long ago in all the states. One would suppose that legal enactments were almost unnecessary to compel the lighting of vehicles, but that drivers, for their own protection, if not for the safety of others, would carry lights voluntarily and not as a matter of compulsion.

CALIFORNIA'S REGISTRATION FEES.

At the last election the people of California voted to expend $18,000,000 in constructing good roads. Already there is a movement on foot to increase the automobile registration fees to raise the money. The same old argument is being revived; namely, the motorists derive benefit from better highways, therefore they will not object to paying for them.

As compared with the fees exacted in many of the states, the flat rate of $2 a machine is somewhat low. Undoubtedly, the automobile owners in California could afford to pay a little more, but it manifestly is unfair to assume that they should bear the entire expense of permanent road work.

Digitized by Google

Every interest in the commonwealth will benefit either directly or indirectly, and there should be a just proportionment of the expense.

The trouble in other sections of the country has been that inasmuch as the motorists always have shown a disposition to pay liberally for better ways, the legislators have found it a simple matter to increase the fees whenever more money was needed. The automobile owners of California should be forewarned and take a lively interest in the proposition which is to be submitted to the legislature next winter.

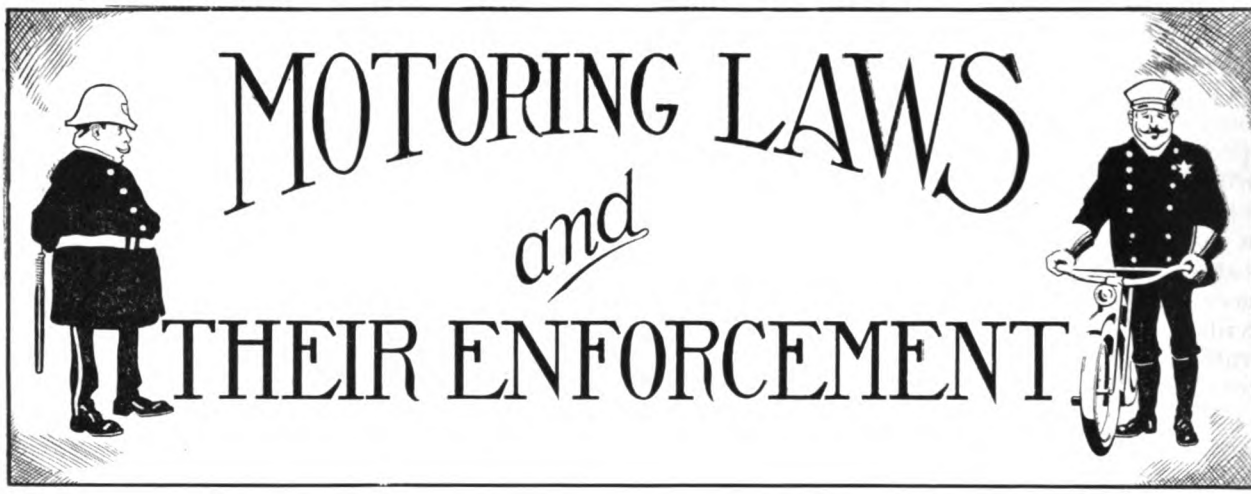
BRITISH STANDARD CAR RACES.

When so-called stock chassis races were quite the order of the day in America the British motoring prints were inclined to view with apprehension the announcement that cars taking part in such events were strictly stock in every particular. Now that American manufacturers are disinclined to support this type of contest, it is somewhat surprising to note that those of Great Britain are taking unusual interest in the so-called standard chassis events. Judging from the regulations governing these meetings, the terms "standard" and "stock" are decidedly synonymous.

STUDYING INSURANCE METHODS.

That there is a growing demand for a revision of the methods under which automobile insurance is written is evident from the fact that the Automobile Underwriters' Conference is taking up the matter of securing a complete policy which shall give the proper protection to cover every form of hazard in connection with the ownership and operation of a motor car. The traffic committee of the National Association of Automobile Manufacturers appears to be in a position to aid the general body of motorists along this line.

As is more or less well known the Royal Automobile Club of Great Britain took up this matter recently, with the result that it is now possible for a British motor car owner to secure all the protection he desires under one policy. It is understood that several companies in America stand ready to duplicate the policies issued in Great Britain, were they not restricted by the insurance laws of the several states.



The whole problem is one which needs extended study. Those not familiar with insurance methods may not be in a position to indicate what is best, but there seems no reason why the manufacturers, or some other organized body understanding the desires of individual owners, should not be able to lend valuable aid in formulating plans. When a satisfactory solution is settled upon it will devolve upon the motorists themselves to seek the proper legislative action, in much the same manner as the automobile owners of Great Britain expressed themselves before their desires were gratified.

"A CRAZY SUGGESTION."

A petition has been handed to President Taft urging him to allow automobiles in the Yellowstone park. Of all the amazing demands this comes among the first. * * * The roads are so narrow that passing in the park, where all vehicles are compelled to go in the same direction, is difficult and as a rule forbidden. Automobiles rushing past would upset the whole prevailing order. On grounds of safety alone there is no sound reason for thus increasing the perils of the park trip. This trip, it should be said for those who have not yet taken it, is the finest that can be had today—the most marvelous, most interesting and most instructive. * * * Think of having automobiles to rush through with. * * * The man who wants to "do it" in the shortest possible time should not be allowed in at all. Better save those other two or three days.

The Hartford Courant, Hartford, Conn., thus expresses itself under the above heading with respect to the proposition of opening Yellowstone national park to motorists. Not every citizen of the United States is endowed with the aesthetic temperament, but it is conceivable that even those not so endowed would be able to appreciate, perhaps in a lesser degree, the marvelous, interesting and instructive in this preserve. That they may desire to devote such time as opportunity will permit in the study of the beautiful in nature is an attribute that can be applied to at least some small portion of the rapidly increasing body of motorists. That these should prefer to take their own time and utilize their own means of conveyance does not seem in itself a fair assumption that they are crazy.

LIGHTS IN NEW JERSEY.

The statutes of New Jersey provide that "every vehicle drawn by horse, horses or other beasts shall carry during the period of 30 minutes after sunset and 30 minutes before sunrise, and whenever fog renders it impossible to see a long distance, at least one lighted lamp, which said light shall be of such nature and so displayed that it may be seen both from a point at least 250 feet in the direction towards which the vehicle is proceeding and from a point at least 250 feet in the direction from which the vehicle is proceeding." Of course, every automobile is required to carry at least two lighted lamps, similarly visible, during the same period.

A recent decision in the courts of Camden county will prove of interest to motorists and others. The night of March 29, 1912, a motorman of a trolley car ran into a truck wagon, completely demolishing it, killing one of the occupants and injuring the other. In the trial for manslaughter, the motorman and conductor set up that no light was displayed on the rear of the wagon. This defense proved sufficient for the jury, and the car crew was acquitted. Whether or not this interpretation of the law would apply in the case of an automobile which accidentally ran down an unlighted vehicle in New Jersey may be open to question, but the decision is bound to have its effect upon future legal actions in that commonwealth.

UNIFORM SPEED LAWS.

The legislative board of the American Automobile Association has been active during the past two years in an effort to secure uniform speed regulations in the various states. As a result, 34 of the 37 commonwealths which have enacted laws covering this subject have inserted the words "reasonable and proper" or "reasonable, safe and proper" in the sections relative to speed limitation. Undoubtedly this is a step toward uniform legislation, but with the exception of Florida and Georgia, the laws immediately proceed to define what shall be termed prima facie evidence of a speed greater than is reasonable, safe and proper. The following tabulation shows the lack of uniformity in this respect:

Speed Limit in Miles an Hour.

	Open Country.	Resident Section.	Business Section.	Crossings, Curves, etc.	Penalty.
Alabama	30 (max)	..	..	..	$25
Arkansas	20	15	15	6	100
California	20	15	10	4	100

*No "reasonable and proper" provision; †defined by local ordinance; ‡general code; §not less than $10.

Digitized by Google

It will be noted that while practically all of the states provide that the rate of speed shall be such as is reasonable and proper, the interstate tourist is compelled to inform himself with respect to the speed limitations which are held to be prima facie evidence of violation, and the result is not unlike that which would follow a statute in which these terms were not used. In some states, Massachusetts for instance, the courts have so interpreted the law that the prima facie evidence does not apply when the condition of traffic is such life and property are not endangered by a greater speed.

Most motorists are anxious to comply with the law in this respect, but when the limitations in the residential district, for example, vary from eight miles an hour in Texas to 18 in Maryland, with the additional possibility of local ordinances in several commonwealths, it is bound to be difficult for the visitor from another state to comply with all the provisions. If it be necessary to define the terms "reasonable and proper," it would seem entirely possible to make the definition uniform, and until such conditions prevail there can be no uniformity of speed regulation in the accepted sense of the word.

CALIFORNIA WANTS MORE MONEY.

Assemblyman Milton Schmitt of San Francisco proposes to resubmit to the next session of the legislature his bill increasing the tax on automobiles. The present fee in that state is $2, yielding a revenue of $38,136 during 1911. At a recent election the people voted to expend $18.000,000 on state highway work, and as has been true in many other commonwealths, it is proposed to make the motorists shoulder a large proportion of this expense.

The taxing clause of the Schmitt bill provides the following fees: Twenty-five horsepower and less, $5; 25-30, $10; 30-50, $15; over 50, $25. It also provides that a machine utilized for other than commercial purposes shall pay half-fees after paying full fees for four years and that commercial cars shall pay but $5 annually.

TEST MISSISSIPPI LAW.

The first test case under the new automobile registration law in Mississippi, which became effective Aug. 1, developed in Jackson, Aug. 4, when H. C. Lawrence, a garage manager, was arrested for not displaying a license tag. The violation was deliberate, the object being to have the law brought to the attention of the supreme court. Lawrence was fined $25 in the local court and an appeal was filed immediately.

AN AMENDMENT IN NEW YORK.

Secretary of State Lazansky of New York announces that he will introduce a bill in the next legislature which will provide that no license shall be granted to a chauffeur in cities of the first class unless the applicant is recommended by a special officer of the police force in that city.

WATER BREAKS IN PENNSYLVANIA.

Following closely upon the decision of the Massachusetts supreme court holding towns and cities liable for damages done to vehicles by reason of contact with water breaks in the road, the supreme court of Pennsylvania has handed down a similar decision. Test cases will be begun in the near future in several other states.

ARIZONA NOW HAS LAW.

The legislature in Arizona has passed a motoring law which will go into effect Sept. 1. Under its terms the registration fee becomes $5 for each machine, and in case the car has once been registered separately the second fee is but $3. The secretary of state is required to furnish an aluminum seal, not less than two inches in diameter, which must be displayed on the registered vehicle and no other. Non-residents are exempt for six months, providing they have complied with the laws of their own states. The license fee for a chauffeur also is $5. The speed clause contains the words "reasonable and proper" and fixes the maximum at 30 miles an hour in open country, 15 in residential sections and 10 in the business portions. Local ordinances are permitted, if they do not conflict with the state law.

TRAPS IN VARIOUS STATES.

Police have established traps in an effort to eliminate violations of the automobile laws as follows:

Chelsea, Mass., local ordinances concerning direction of travel; Winthrop, speed traps on Washington avenue and Bennington street; Hingham, speed trap at top of Old Colony hill; Quincy, must not use muffler cut-out; Abington, speed trap in centre of town and motorists should sound warning signal outside of town.

Providence, R. I., frequent change of speed traps in thickly settled sections.

Accompanying illustrations present the new Boulant surgical automobile brought out in France, as an adjunct to the military equipment of the republic. As the name implies the car is in every way a modern operating room, fitted with all the accessories and supplies to make it the last word in scientific perfection.

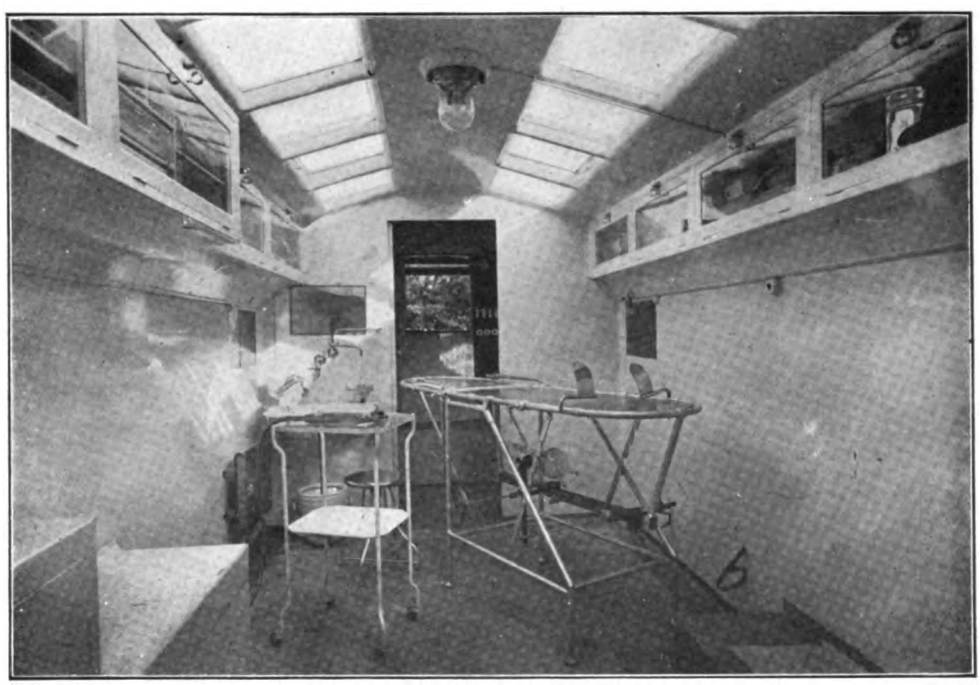
The chassis is a Schneider, redesigned to accommodate the width and length of body which has been deemed necessary to fulfill the demands of a vehicle of this character. The motor is a 40 horsepower Schneider, and is guaranteed to propell the car to the scene of activities in the time of war at a speed of 30 kilometers (about 18 miles) an hour.

While it is contemplated that the vehicle may be utilized to accompany the troops into engagement, it has provision for establishing a permanent camp within easy access of the conflict, a tent being folded against either side. One of the photographs presents the car thus stationed with the tent set up, and it is anticipated that this would be utilized as a reception room for patients, either before or after treatment.

The car itself is divided into three compartments, the main portion being the operating room. This is fitted with all necessary appliances, and is quite as complete in its appointments as any hospital. One of the views shows this room, with its operating table, washstand, etc., this being that looking toward the front of the machine, and the electrical apparatus in the forward compartment may be seen through the doorway leading to this part of the car.

Boulant Travelling Surgical Laboratory, Mounted on Schneider Chassis for Use in Times of War.

Here also is located the sterilizing plant, by means of which sterilized water is obtained for use in the operating room, and in addition it is possible to supply the troops with 15,000 liters of such water every 24 hours. An electric pump is provided for the purpose of taking the water from a well, pond or stream, the energy being supplied by the motor of the automobile. The sterilizing process is by means of ultra-violet rays.



The rear compartment houses the

radium apparatus, and a special device, invented by M. Boulant, permits the use of the radioscope at the operating table. There also are cupboards and drawers for the reserve surgical materials.

★

One of the extra strong, 15 horsepower Colonial Napier cars, made by S. F. Edge, Ltd., London, England, recently was subjected to a strenuous test on the so-called South Downs of England, occupying three days. During this time it was driven 263.2 miles, up and down hills, across country, and at all times over ways that were extremely rough. At the completion of this test the car was driven a measured half-mile on the Brooklands track at a speed of 43.14 miles an hour. The Royal Automobile Club certified the results, which indicate that the machine performed the task without mechanical failure of any nature. The gasoline consumption figured out at 15.82 miles an hour. As the cross country trials were accomplished in a blazing hot sun, the thermometer showing better than 100 degrees, Fahrenheit, the effect upon the cooling system was worthy of note, and in this respect the car proved decidedly efficient. The test was in every way the most strenuous yet conducted in Great Britain.

Interior of Boulant Vehicle, Showing Operating Table, and a Glimpse of the Electrical Apparatus in Forward Compartment.

★

Sydney Allan Friede of St. Petersburg, Russia, who is associated with his father as agent for Ford cars, made by the Ford Motor Company, is spending some time at the factory in Detroit. He declares that although there are by no means as many automobiles in St. Petersburg as in American cities of corresponding size, the number is increasing rapidly and those of American manufacture appear to be gaining steadily over competitors.

★

The Standard Electric Car Company, Jackson, Mich., has received an initial order for 50 Standard electrics to be shipped to Europe. Vice President C. F. Krueger is directly in charge of the exportation through A. A. Swingley of New York City. Fifteen of these will go to England, while the remainder will be divided between Germany, Russia, France and Italy.

★

The automobile industry in Italy has had a prosperous year. The exports increased and the demand has shown a steady growth. American manufacturers have succeeded in selling a number of inexpensive touring cars and runabouts, and such machines are said to be the only ones which can successfully compete with those of Italian make. During the year the Italian imports of automobiles numbered 686, valued at $1,298,512, as compared with 398, valued at $883,967 the year previous. Exports in 1911 numbered 2918, valued at $5,621,679, as compared with 2120, valued at $4,015,571 in 1910.

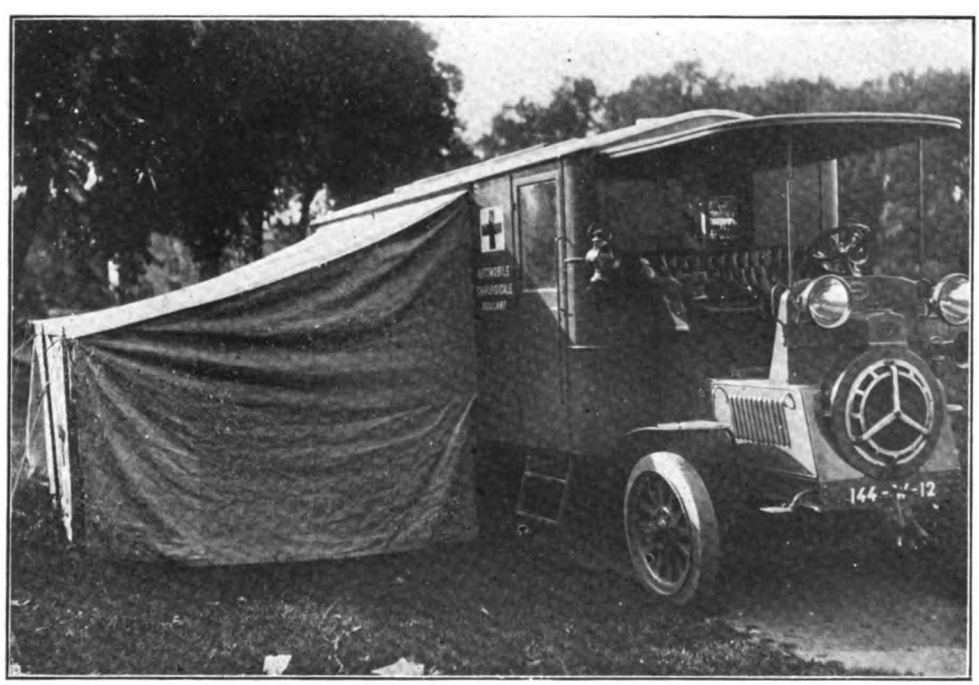
★

The second standard chassis race of the year, and the third held in Great Britain on the Brooklands track, last month, brought out an entry list of 15 machines, although but eight started. The speed was by no means as fast as that made on speedways in America, but exceeded that of previous events, being 57.49 miles an hour, as against 56.25. The total distance covered was 277 miles, a Singer, driven by Haywood, finishing in first place in 4:48:46.2. A Gladiator was second in 4:48:46.6, while third place went to a Turcay-

Digitized by Google

Mery in 6:18:17. It would appear from this result that but three cars were able to complete the entire distance.

—— * ——



Owing to the controversy existing between agents for American and foreign made cars doing business in Canada, tourists entering that country should be careful to arrange customs bonds and report at the frontier posts whenever they cross the border. Charges of smuggling have been made to the customs officials and a close surveillance has been undertaken.

—— * ——

The R-C-H Corporation, Detroit, has enjoyed a splendid foreign business during the past six months. Of the 2208 automobiles shipped abroad from Detroit in that period, 502, or 22 per cent, were R-C-H machines, going to all parts of the world. This is considered a remarkable showing, particularly as the concern has been doing business but little over nine months.

—— * ——

There has been rapid increase in the number of automobiles used in Spain during the past year. At Seville, for instance, about 150 machines are registered. Those utilized are chiefly of French, Italian, Belgian or Spanish manufacture, although recently a number of cars imported from the United States have found favor. Three American automobile companies have established agencies in Seville during the past year.

Boulant Car with Tent Set, Providing Temporary Hospital Within Easy Access of Troops.

In the recent flying kilometer race at Warsaw, Russia, in connection with the Russian trials, a 20 horsepower Vauxhall car, made in England, won on formula, the distance being covered in 0:36.4. The highest speed was made by a Benz, its time being 0:26.4.

—— * ——

John A. Corry of Leeds, Yorkshire, England, has patented a motor car for polar exploration. The machine is intended for use in climbing cliffs of ice, and will be propelled by corrugated steel treads fixed on an endless chain, which will give a firm grip on the ice surface. It is proposed to cross crevices by a system of expanding trellises and telescopic rods of tough steel operated from the motor of the car.

—— * ——

E. G. Eager, resident representative of the Hupp Motor Car Company, Detroit, in Australia and New Zealand, is paying his annual visit to this country. He declares that competition in his field is keen. When he first went to Australia, but one or two American firms were represented, while today almost every machine selling at less than $2000 is sold there.

—— * ——

In 1911 the registration of pleasure cars in London aggregated 48,701, while 3379 trucks were licensed. The number is surprising at first glance, but it must be remembered that many owners in England do not register their cars in London. If they possess several they keep half in service at their country homes and the remainder for city use. This in a measure accounts for the comparatively small registration when the figures are compared with those of New York, for instance.

—— * ——

C. E. Starratt of the United States Tire Company, New York City, says the demand for jinriksha tires in Japan is excellent. This concern recently began sending such tires to Japan and the shipments are now being made almost weekly. With the last shipment went 2000 pairs of bi-

Digitized by Google

cycle tires. Motorcycles are not much in use at present in that country. In Manila and Honolulu the demand for automobile tires is good.

—— ★ ——

According to the consulate in Vancouver, B. C., American automobiles are popular. Over 90 per cent. of the cars in use there are from the United States and they give more general satisfaction than the machines of Canadian make. The best field for the future in Vancouver is stated to be for motor trucks.

—— ★ ——

The programme for the coming season of the Institution of Automobile Engineers at London has been completed and will form an exceptionally interesting and instructive course for automobile engineers. The first session will be held Oct. 9, when T. B. Browne will deliver the president's address. The dates of other meetings will be Nov. 13, Dec. 11, Jan. 8, Feb. 12, March 12, April 9 and May 21. It is probable that meetings other than the ordinary monthly ones will be held, owing to the pretentious programme mapped out, as several topics will be especially treated from time to time by eminent automobile authorities.

Among the papers to be read at the first meeting in October will be the following: "Springs," G. H. Baillie; "Carbon Deposits," G. W. A. Brown; "Aeronautical Engines," A. Graham Clark; "Two-Cycle Engines," Dugald Clerk, F. R. S.; "Roads," Col. R. E. Crompton, C. B.; "Calculations," L. H. Hounsfield; "Motorcycles," W. Chater Lea; "Surging Flow," Prof. W. Morgan; "Tests of Valveless Engine," Dr. W. Watson, F. R. S.; "Heavy Vehicles," G. W. Watson. M. A. Adam and H. G. Burford also will be on the list of speakers and "The Training of Automobile Engineers," will probably form the subject for discussion at one meeting.

NEW CAPITAL FOR ATLAS.

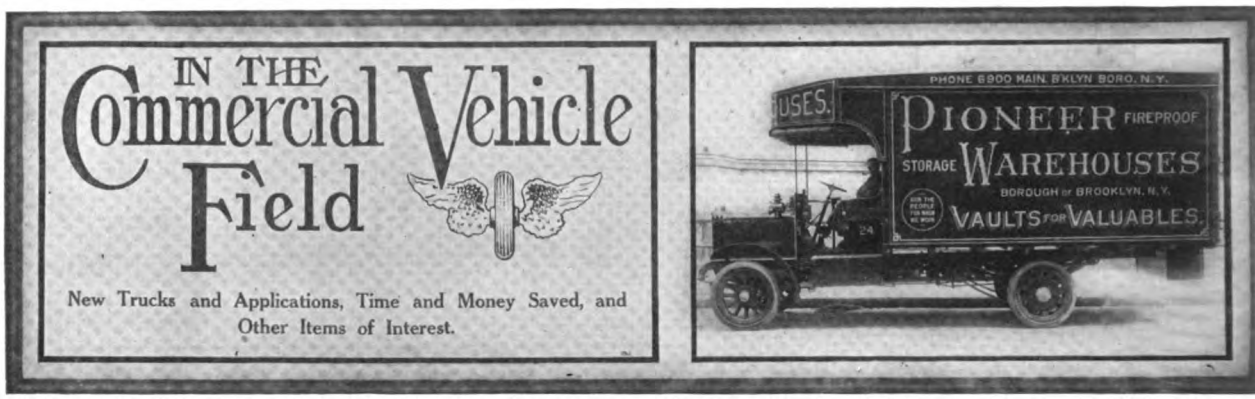
According to information from Springfield, Mass., the Atlas Motor Car Company of that city anticipates that business men of Springfield, New York City and Dayton, O., are to subscribe $100,000 additional stock, and the concern is to increase its capital to $250,000. The plan is said to include an issue of $100,000 in preferred stock and $50,000 in common. The company has been handicapped somewhat of late because of its inability to secure Knight engines from the maker, and active operations are said to have been held in abeyance until September, at which time it is expected that the new proposition will be carried out.

COL. FRANK M. JOYCE DEAD.

Col. Frank M. Joyce, first vice president of the American Automobile Association, and head of the association committee which was making arrangements for the annual Glidden tour, died at his home in Minneapolis, Minn., the latter part of last month. He was instrumental in having the southern terminus of the Glidden event at New Orleans, where he spent the winter. Always interested in automobile affairs, he had been president of the Minneapolis' Automobile Club and the Minnesota State Automobile Association. He was in line for the presidency of the A. A. A. at its next annual meeting.

FRANK BRISCOE RESIGNS.

Announcement is made that Frank Briscoe, one of the vice presidents of the United States Motor Company, New York City, has resigned. He will sail for Europe later in the month, his object being to study motor car engineering abroad. He contemplates remaining in England and on the Continent about a year. Mr. Briscoe will continue as president of the Briscoe Manufacturing Company, Detroit, one of the subsidiaries of the United States Motor Company.



BEAUDET IS SUPERINTENDENT.

T. J. Beaudet recently retired from the driving end of the automobile industry to become superintendent of the San Francisco agency of the Cadillac Motor Car Company, Detroit. Having been in connection with the automobile business practically since its inception in this country, he is credited with being one of the best mechanics in the United States. He is perhaps best known as the man who drove a car down the west coast of Mexico through a territory never before reached by a motor car and who holds many western road records. He has always driven a Cadillac.

SUCCESS WITH TIRE FILLER.

Meeting with a big demand for its product, The Resilient Auto Tire Filler Company of 41 Columbus avenue, Boston, which is producing a puncture proof tire filler claimed to eliminate 90 per cent. of tire difficulties, is offering a 30-day guarantee from the time of installation. During this time the full price of the tire filler will be refunded if the purchaser is not entirely satisfied with the service.

COUPLE-GEAR WHEELS ON WEBB.

An accompanying illustration shows a Webb aerial ladder wagon, made by the Webb Company, formerly of St. Louis, Mo., but now of Allentown, Penn., on which the Couple-Gear wheel and motor equipment, made by the Couple-Gear Freight-Wheel Company, Grand Rapids, Mich., has been utilized. The chassis is the regulation 3.5-ton Webb construction, with the exception stated. Whether or not this is one of the new lines which is to be added with the advent of John M. Mack, formerly of the Mack Bros. Motor Car Company, Allentown, is not made clear. The details of the change in management have not been made public, although the reorganization of the Webb Company was announced early in the month.

The Couple-Gear wheel and motor construction is of interest, the wheel being of hollow metal and carrying the driving electric motor inside. In this particular wagon the gasoline-electric system is employed, by which is meant that a gasoline motor is utilized to develop current which is distributed to the individual electric motors within the wheels proper. It ought also to be said that another electric motor and gears are so disposed as to be utilized in raising and lowering the ladders.

The driving force is applied to each of the four wheels at two opposite points, with a balanced division of the work accomplished by the two driving pinions, one on either side, this being effected by a simple rocker device called an evener. These two driving shafts constitute an extension of the motor armature in opposite directions, and carry small bevel pinions, which mesh with very large bevel gears attached to the exterior metal casings of the wheels. One meshes with the inside gear and the other with the outside, the armature shaft being set at a slight angle to permit such action. This gives the same direction of rotation to both parts of the wheel, while the same sized pinions and gears and like prolongations of the armature

Webb Aerial Ladder, Fitted to 3.5-Ton Gasoline-Electric Chassis, Utilizing Couple-Gear Wheels and Motors.

Digitized by Google

result in producing exactly similar speeds. This is necessary, as otherwise the two sides of the wheels, attached together at some points, would be driven at differing speeds, resulting in breakage as soon as power was applied to them.

A further peculiarity is to be noted in the method of attaching the axle stub on which the wheels turns, this being made integral with the motor casings within, so that an elongation of the inside stub, keyed to the taper sleeve in the steering knuckle holds the motor in position. This insures that this member shall be held horizontal while the wheel revolves around it. The construction allows of the wheel being turned around the knuckle pivot without interfering with the motor action or the transfer of the electrical current to the motor. Inasmuch as this construction is the same for all four wheels, it permits four-wheel steering and driving. The advantage of this method lies in the superior traction obtained.

This construction has given decided satisfaction in numerous installations, both with fire department vehicles and mechanical transports. In fact Couple-Gear wheels are utilized to advantage in all classes of work. The employment of the combined gasoline-electric system is held to increase the mileage radius very materially.

Baker Electric Two-Ton Wagon Built for American Express Company, Washington, D. C.

KNOX IN ROAD BUILDING.

Contractors in Sioux City, Ia., have demonstrated that the mechanical transport can be utilized with splendid results in the construction of the modern roadway. During the past year two six-ton Knox trucks, made by the Knox Automobile Company, Springfield, Mass., have been operated as tractors, hauling two trailers of three yards capacity each besides the load on its own body. The average daily delivery of material has been 44.5 yards, the average distance being 3.5 miles.

Both truck and trailers are fitted with special quick dumping bodies, which facilitate delivery. The contractors estimate that it would have required at least 10 two-horse teams to have done the same amount of work, and that the cost of such equipment would have been more than twice as much as that of the Knox outfit.

WINNIPEG AGRICULTURAL TRIALS.

American machines were decidedly successful in the fifth annual international contest for agricultural motors, tractors and plows held in Winnipeg, Manitoba, in connection with the Canadian industrial exhibition last month. The contests were decided upon economy brake and maximum brake test, plowing, design and construction, and an added feature of interest this year was the engine gang plow competition, in which the various developments in the large plow outfits were tested to show the farmer what could be accomplished with a thoroughly modern equipment. The points upon which the judges made their awards were: Draft, evenness of furrow depth, lay of furrow slices, evenness of cut of inside plow, ease of adjustment and manipulation of the plow in and out at ends, straightness of furrows and stops attributable to plow.

The gasoline machines were divided into two classes: B, cubic piston displacement of 300 cubic feet a minute, being won by the product of the J. I. Case Threshing Machine Company, 411.7 points; and C, gasoline, piston displacement of 500 cubic feet a minute, by the Aultmann-Taylor machine, 447.7 points. The heavy fuel machines

Digitized by Google

also were divided into two classes, D and E, for motors of 500 cubic feet and over 500 feet, respectively. The International Harvester machine was first in class D with 398.15 points, while the Rumely oil pull tractor took class E with the highest number of points scored in the contest, 449.75. The Case steam machines won all three events for vehicles of this type, the highest number of points made being 442.85. The grand prize for best all around performance went to the Rumely tractor of class E, rating over 500 cubic feet of piston displacement a minute. Gold medals were awarded the winners.

BAKER ELECTRIC SUCCESSFUL.

As further evidence that the two-ton electric wagons, made by the Baker Motor Vehicle Company, Cleveland, O., are giving ample demonstration of efficiency and economy, may be cited the fact that 12 machines of this type recently were consigned to the American Express Company, Washington, D. C., for delivery service in that city. The company also states that it now has orders for installations equal to that at Washington for 17 different cities. These are in addition to the campaign which brought about the employment of 100 vehicles in New York, Boston and other large commercial centres. That 70 per cent. of the year's business of the Baker company was in the form of repeat orders from satisfied users of Baker machines would appear to be indication of the character and quality of the electric wagons it manufactures.

Five-Ton Pierce-Arrow in Service with Towar's Wayne County Creamery, Detroit.

NEW FACTORY IN PITTSBURG.

The Pitt Motor Truck Company was organized recently in Pittsburg, Penn., with a capital stock of $200,000. Members of the firm include J. E. Douglas, E. P. Douglas, W. S. Phillips, F. R. Brandt and J. McCalmont. It is the intention of the concern to manufacture commercial cars exclusively, and it is expected that the factory will be completed sufficiently early to permit of placing the first product on the market this fall.

PIERCE-ARROW MILK DELIVERY.

Some interesting figures concerning the use of a five-ton Pierce-Arrow worm driven truck, made by the Pierce-Arrow Motor Car Company, Buffalo, N. Y., in the delivery of milk are made public by Towar's Wayne County Creamery in Detroit. Two shifts of men are employed, and the car is operated day in and day out, an average of 21 hours throughout the week and 12 on Sunday.

The machine leaves the Towar plant every morning with a load of wholesale bottled milk and cream, which it distributes to the grocery stores and factory dining rooms on the east side of Detroit. It takes from 3 in the morning until 1 in the afternoon to peddle this load and make collections. The weight of the return load of empty bottles and crates is about three tons. It formerly took three teams and one single wagon to do this work.

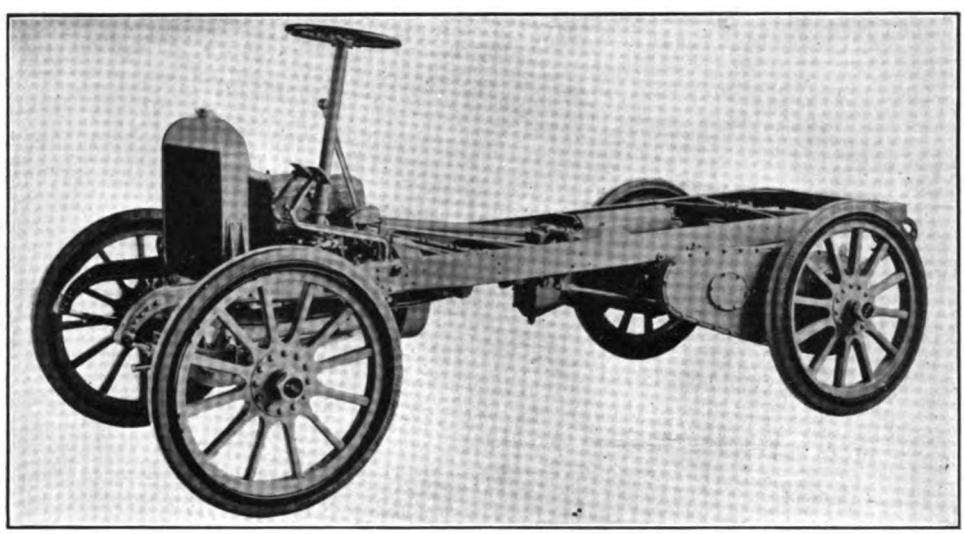
At 1 in the afternoon it makes two trips to the railroad stations for milk, being loaded with five tons each trip. The second driver takes the truck at 2, and a journey to the north end branch, four miles away, is made, with a full load of bottled goods to be delivered the following day by the wagons stationed at this branch. On the return trip it has a full load of empty bottles weighing four tons.

A second round trip to this branch is taken before lunch at 6. Two more trips to the railroad

Digitized by Google

depots for supplies follow lunch, then one trip to the east side branch, a total distance of 10 miles. Upon its return from the east side, there usually is another trip to the railroad station. These afternoon and evening trips are all five-ton loads with an occasional overload of half a ton. Mr. Towar estimates it would takes at least five large teams to handle this afternoon and evening work, while now it is done with two men and the Pierce-Arrow truck.

NATCO ONE-TON TRUCK.



Believing that specific service requirements must determine the general as well as the detailed design of a mechanical transport, the National Motor Truck Company, Bay City, Mich., has brought out the Natco one-ton chassis, shown in an accompanying illustration. A number of standard body types are produced by the company, and those constructed to suit the requirements of the purchaser will be undertaken upon order.

The motor, which is placed under the deck, is of the short, compact, long-stroke type, its bore being 3.5 inches and the stroke five, and the rating 20 horsepower under the S. A. E. formula. The four cylinders are cast en bloc, with the inlet and exhaust manifolds on the right. Ignition is by high-tension magneto. Cooling is by water, the vertical tube radiator being in front of the dash.

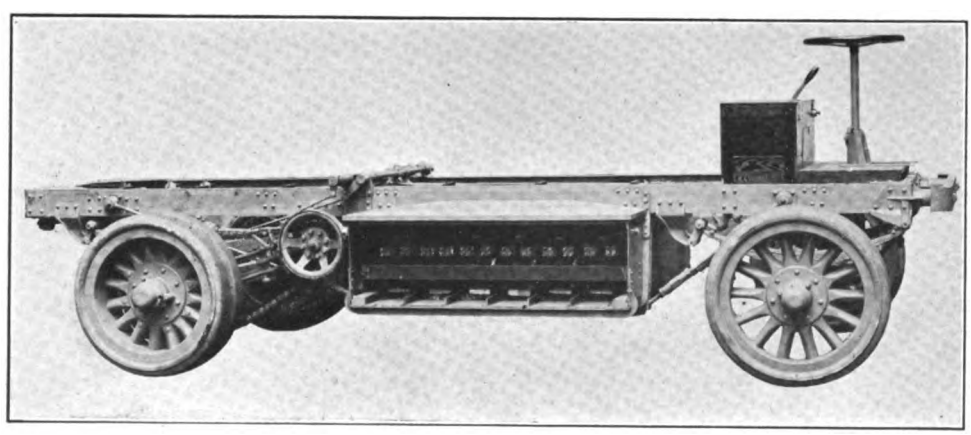
In the matter of lubrication, the Natco system is decidedly distinctive. A positive, mechanically operated system is claimed for the method employed. The main reservoir is located at the bottom of the crankcase and has a capacity of six quarts. The pumps, which are gear driven from the camshaft, are in a forward compartment from which lead pipes, these supplying the lubricant to the end bearings of the crankshaft and to a sight feed device in full view of the operator. After being led to the various components the oil returns to the main supply tank through a stand pipe, which extends to within .375 inch of the bottom of a compartment filled with water. Owing to the difference in specific gravity between oil and water, the former rises to the top and overflows into the main reservoir. It will be noted that the lubricant is not only filtered, but cooled by this process.

The clutch is a leather faced cone member, equipped with compression springs to permit easy engagement, and a straight line drive is provided to the transmission. The latter is selective, giving three speeds forward and reverse. Final drive is by side chains. Two sets of brakes are utilized, both acting on the rear wheels. Springs are semi-elliptic front and rear. Tires are solid rubber, 36 by 3.5 inches, all around. The wheelbase is 104 inches, tread 56, and the weight of the chassis 2400 pounds.

The company is under the same management as the National Cycle & Manufacturing Company, which has engaged in the production of automobile parts for the past seven years.

Chassis of Natco Truck, Notable for Simplicity and Accessibility of Parts.

DAILY HORSE COSTS.



In an address before the Team Owners' Association in Boston recently, W. H. Jarvis of Jarvis, Crawford & Co., certified public accountant, gave some interesting figures on the cost of keeping horses, the data being taken from his experience in checking up the books of concerns operating fleets of horse drawn vehicles. According to this information it costs $5.02 a day to maintain a single team and $8.54 for a double team in Boston. The expense accounts are made up of the following items:

Digitized by Google

	Single Team.	Double Team.
Driver's pay	$2.00	$2.50
Feed	.90	1.80
Rent and stable	.31	.62
Shoeing and small repairs	.19	.38
Claims, accidents, tolls, etc.	.18	.36
Foremen and helpers, pro rata	.18	.36
Other helpers	.20	.40
Repairs, harness, painting	.13	.26
Manager or superintendent, salary	.10	.20
Office rent, telephone, clerks	.31	.62
Miscellaneous, veterinary, etc.	.24	.48
Fire and accident insurance	.08	.16
Depreciation	.20	.40
Totals	$5.02	$8.54

HEADS MORGAN COMPANY.

Charles B. Foster, for the past 10 years president of the Foster & Richardson Bedstead Company, Westboro, Mass., recently withdrew from that concern to become president of the Morgan Motor Truck Company, Worcester, Mass., maker of Morgan trucks. Charles H. Derby, an attorney in Worcester, had been at the head of the concern, since the resignation of Harry Unwin some eight months ago, pending the time when the right party could be secured to take the position permanently.

Five-Ton Waverley Chassis, Largest Machine Produced by This Concern.

TAKES G. M. C. AGENCY.

The Texas Wagon Works, Houston, Tex., one of the largest builders of horse drawn vehicles in the Southwest, recently took the agency for the General Motors Truck Company, Detroit. This company, recognizing the growing importance of the motor truck, has perfected a plan which will enable it to extend its wagon business, and at the same time take advantage of the new demand for power driven business vehicles. As agent for the General Motors Truck Company, the Texas concern will be able to supply both gasoline and electric chassis in all standard sizes, and, in addition, furnish from its own shops bodies that will exactly meet the requirements of each customer. This plan, it is believed, has many advantages from the standpoint of the local purchaser.

WAVERLEY FIVE-TON MODEL.

The Waverley Company, Indianapolis, Ind., one of the oldest concerns in the industry devoting its attention exclusively to the production of electric vehicles, announces a new model, a five-ton chassis. This is the largest car yet produced by this company, and is regarded by it as presenting every feature that long experience and sound engineering could suggest. The new chassis weighs 8660 pounds and the battery 2540, to which must be added the weight of the body installation.

The machine is driven by a single motor, 85 volts, 60 amperes, which is suspended from hangers at the extreme rear of the chassis frame, being protected from contact with anything that might cause damage by the heavy frame and the rear axle. The drive from the motor is by shaft to a jackshaft in which is incorporated a differential gearing, and thence by side chains to the rear wheels. The current is drawn from a battery of 42 cells of 25 plates each, having a capacity of 324 ampere-hours. The chassis is 212 inches length and the loading space is 168 inches length and 78 inches width. The wheels are shod with 36 by seven-inch tires forward and 36 by five-inch double rear tires.

One of the features of the design is the truss construction that is incorporated in the suspension of the battery box, which prevents springing and greatly stiffens the frame without the need of extremely heavy material. The entire design is with a view to heavy work, such as brewery service, and the rated mileage is 35 miles on a charge over comparatively level ways.

The Hexoline Lubricating Company, New York City, has been incorporated for the purpose of producing automobile lubricants.

A JIG FOR FILING KEYS.

A jig that is constructed easily and at slight expense, and is adaptable for filing up stepped, parallel or taper keys, is depicted at Fig. 2 C. A piece of thin metal is selected and two radial slots cut as shown in the sketch. Another piece of metal is fitted with studs which are slipped through the apertures and the two parts held together by means of wing nuts. As the device is adjustable keys may be held in any desired position as illustrated in the drawing.

BOXES FOR CASE HARDENING.

Boxes for case hardening are useful and the dimensions of these members will depend upon the size of the parts to be hardened. The boxes may be constructed from .125-inch sheet metal as required, and at Fig. 2 B is presented a plan for making the members. The plate is bent round and riveted along one side, projecting pins being fitted on the inside to provide a support for the covers to rest upon.

SHACKLE BOLT-SHOCK ABSORBER.

A unique and simple device combining the functions of a shackle bolt and shock absorber, which is stated to be inexpensive, has been brought out abroad. A novel feature of the invention is the utilization of friction cones as depicted at Fig. 1 A, the action of which members opposes the movements of the vehicle springs to which the device is applied. By referring to the drawing, which presents a side and end elevation view, it will be noted that the friction cones are screwed to the ends of the bolts B and C, to which are attached the frame member and rear end of the laminated spring of the vehicle.

It is stated that the device may be applied similarly when three-quarter or full elliptic springs are employed. The links D are constructed in halves, as indicated, being secured together by bolts fitted with short helical springs, and are turned with internal V grooves to correspond with the friction cones on the bolts. The function of the small springs on the bolts holding the two halves of the links together is to automatically take up any wear that may take place in

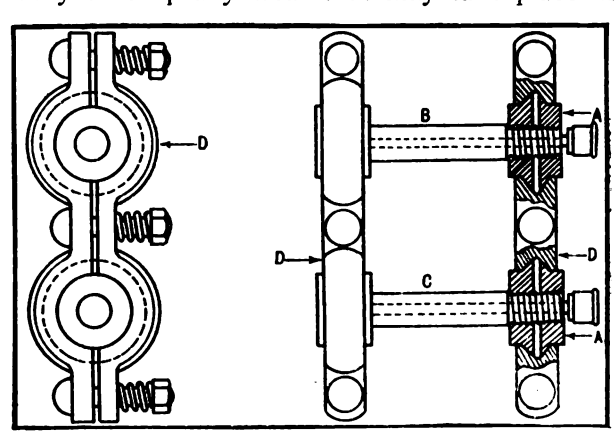

Fig. 1—Combined Shackle Bolt and Shock Absorber Having Friction Cones and Helical Springs.

the V grooves or on the friction members.

The object of the cones is to absorb by friction stresses set up when the car is operating at high speeds over rough roads. It is claimed that the cones tend to absorb the action of the suspension springs and slow down the vertical movements of the chassis frame. Another feature claimed by the maker is that as the shackle member is dust proof and self-lubricating it will endure indefinitely, as well as increase the life of the shoes. The device is also applicable to the front springs of the motor car.

Digitized by Google

VALVE LIFTER OF TUBING.

Valve lifters may be purchased or made and at Fig. 2 A is presented a sketch of a tool made by a workman from a piece of iron tubing. The piping was cut down with a hacksaw, as depicted in the drawing, and the centre piece drilled with a fine drill and removed. The remaining ends were sprung outwardly and filed smooth. In constructing the lifter it is advisable to remove a trifle more material from the bottom than at the top, as this provides more room when removing cotter pins or retaining keys.

CARVER ELECTRIC DRILL.

In fitting special appliances and in making repairs, there are many places about the chassis and body of the motor car which must be drilled.

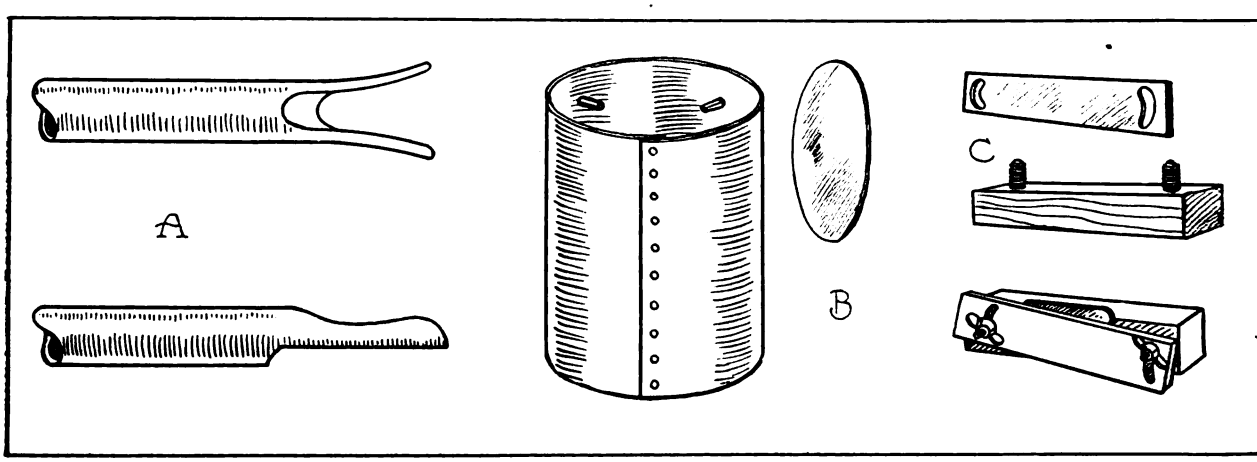

Fig. 2—Suggestions for the Repair Shop: A, Valve Lifter Constructed of Iron Piping; B, Sheet Metal Box for Case Hardening; C, Jig for Filing Keys.

It is not always practical to detach the parts and carry them to the bench or drill press and it is often difficult to drill the holes with the ordinary breast or hand drill, owing to a lack of room in which to rotate the handle. The portable electric drill overcomes these difficulties and in addition much valuable time is saved for the customer as well as the shop.

At Fig. 4 is presented the Carver electric portable drill manufactured by the American Electric Tool Company, West Newton, Mass., and it is known as the type 3-A. C. to distinguish it from similar tools made by this concern. It is provided with two speeds, 350 or 650 revolutions a minute as desired, and is capable of drilling steel up to and including .5 inch. The machine is very compact, weighs but 23 pounds and included in the equipment is 20 feet of the best flexible water proof cable, 16 gauge, and separable attachment plug for attachment to any lamp socket.

The motor was specially designed to develop maximum power with least weight and throughout the workmanship and material are the best. The armature revolves on imported ball bearings and a ball thrust bearing, protected by a dust cap, reduces wear and friction to a minimum. The gears are of high grade steel and Parsons bronze. and by means of a thumb nut on the front head the speed of the drill may be changed while running.

The motor is air-cooled by forced circulation and the air apertures are covered with perforated metal to prevent the entrance of chips. The spindle bearings are of the best hard bronze, and it is pointed out by the maker that the drill requires no other attention than lubrication.

Each tool is equipped with a combination breast plate and spade handle, permitting use in any desired position, and a No. 1 Morse taper socket instead of chuck is optional. Instant control is obtained by a quick break switch in one of the side handles. The other member unscrews. The chuck is off centre, allowing the drill to be utilized in a corner, etc.

THE LUTHER TOOL GRINDER.

A small, compact grinder is being made and marketed by the Luther Grinder Manufacturing Company, Milwaukee, Wis., and is adapted to the small repair shop not equipped with power. The mechanism of the machine, which is manually operated, is contained within a hollowed wheel. A series of four driving gears and pinions produce a speed of 20 revolutions to every turn of the handle. All bearings are constructed of one piece and the working parts are fully enclosed and pro-

Digitized by Google

tected from dust. The grinding wheel is a composition known as Dimo-Grit, the new "diamond" sharpening substance, and is 5.5 inches diameter.

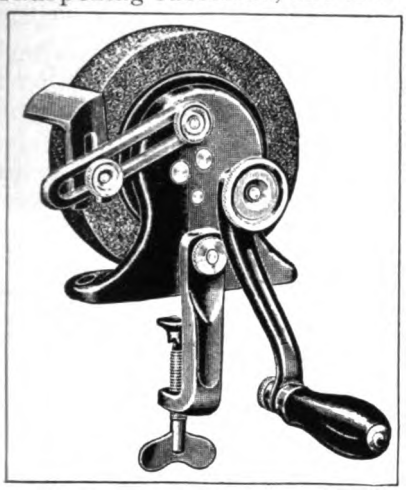

Fig. 3—Luther Grinding Device.

The design is such that it may be disassembled easily and packed in a box 5.75 inches long. It is fitted with an adjustable tool rest, also a clamp for attachment to the bench, etc. The tool is constructed of high grade material and being of compact design, as well as easily carried, could be utilized in repair work where the automobile is overhauled at the owner's garage.

RENEWING ASBESTOS GASKETS.

In overhauling the power plant the workman encounters motors having parts of odd dimensions. An instance of this kind was noted recently in the copper-asbestos gaskets which were fitted to a French motor. The members were hard and apparently unfit for further service, but being odd sized, the repairman attempted to renovate the gaskets. They were held over a flame for a few minutes when the heat removed the old lubricant and the copper was also softened.

VICTOR MOTOR TIRE INFLATOR.

The garage proprietor who keeps abreast of the times and who believes in the installation of labor and time saving devices, employs some method whereby his customers may inflate tires with little or no physical labor. Many garages and service stations utilize tanks of compressed air, but this system has the disadvantage of not being portable; that is, the automobile must be moved in proximity to the hose.

The portable tire inflator brought out by the Victor Electric Company, Chicago, differs from those of usual construction inasmuch as it is an electric motor mounted on wheels and actuates a pump. In addition to being movable the device may be employed for removing dust which lodges in the crevices of tufted cushions and other places difficult of access by other means. Being mounted on wheels it is moved easily about the garage and may be employed at any point convenient to a lamp socket of an electric lighting system.

As will be noted by the illustration presented at Fig. 5, the motor is provided with a pulley which actuates a belt. The latter drives a larger member mounted upon a stand and the pulley wheel operates an eccentric to which is secured the piston rod of the pump. A hose connects the cylinder of the pump to another chamber which is provided with a pressure gauge. All air passes through this reservoir to the tire and a drain cock is fitted to the chamber. It has two functions, one making it possible to reduce the tire pressure or to allow all of the air to escape, the other being to permit the drawing off of any moisture, foreign elements, etc., that may collect.

The deposits are expelled through the drain cock by connecting the outlet hose and pumping up a pressure of approximately 75 pounds before the vent member is opened. As but one-fifth of a horsepower is required to operate the device, and as it is only in service during the inflating process, the maker points out that it is very economical as well as convenient. The pulley reduction is such that only a small amount of current is utilized after starting.

Special attention has been paid to the compressor and its construction embodies high grade material and workmanship. The inlet and outlet

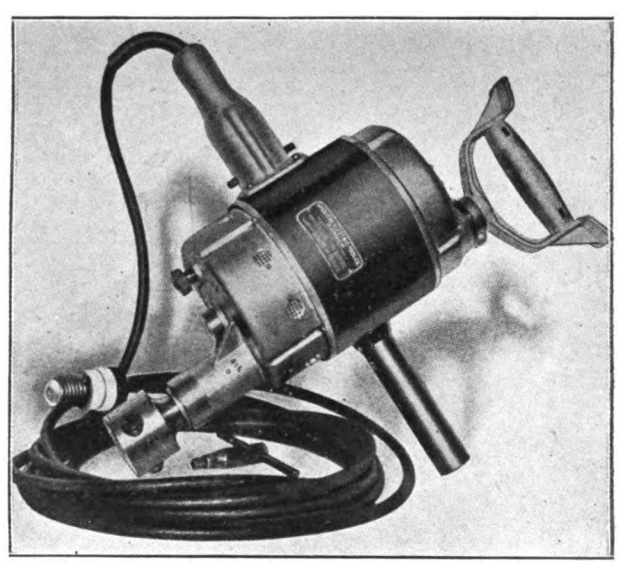

Fig. 4—Carver Electric Portable Drill Having Two Speeds and Offset Chuck.

valves are of the steel ball type, and are readily adjusted. The cylinder is of steel and its piston is equipped with a patented lubricating device con-

Digitized by Google

sisting of a felt ring set in a groove provided near the centre of the piston head, and once being oiled keeps the cylinder well lubricated. The felt member also prevents any surplus oil from collecting and being forced to the inner tube of the tire, which would affect the rubber.

HINTS ON CASE HARDENING.

Reference has been made to a box for case hardening and the device is illustrated at Fig. 2 B. The chamber should be filled with the case hardening compound, the end luted carefully with fire clay and the clips bent over to secure them in their places. There are several excellent com-

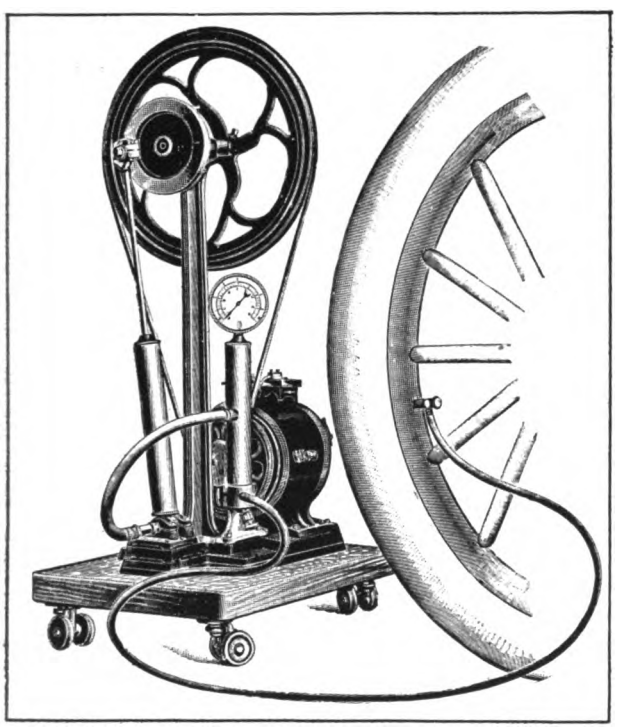

Fig. 5—Victor Air Compressor, Actuated by Electric Motor Mounted on Movable Platform.

pounds sold for this work and if good results are obtained from one of these it is best to utilize it. If, in cases of emergency, none of these is available, charred leather or ground bone mixed with a little salt can be used, but the results obtained from these will differ.

The box should be of such size that a space of at least an inch will be left around the part. A test piece should always be placed in the box with the article and should consist of a piece of the same material as the work and have a sawcut in it. The test piece and the work are both dipped together, and the former is then broken on the anvil. It will break easily. The fractured part may then be examined, and its condition noted.

The two things to be avoided in case hardening are warping and blistering. Warping is mostly caused by unequal heating, and it is as well not to attempt to heat the box in the forge. The following method, although slow, is as efficient as the most elaborate furnace: Lay a circle of bricks on the floor, if it is of earth or brick. The bricks should be laid on their flats with a space of about three inches between their ends, and on this circle lay another similar one, the bricks of which cover the gaps of the first, and continue this until the required height is obtained.

The furnace should not be constructed on a grating with the idea of obtaining a draught, as this is inclined to make the bottom of the box hotter than the top, which is bad for the work. The diameter of the circle must be in proportion to the size of the box.

The quickest way to light a fire in the bottom of the furnace is to make a quantity of coal or coke hot on the forge, and shovel it into the brick furnace. This will start the other fuel put in it. Between the opening of the bricks place some irons to support the box which should be about three bricks from the bottom. Fill the furnace with fuel until the box is covered and let the fire burn slowly and steadily. The advantage of this arrangement is that it will be almost impossible to overheat the work or heat it unequally.

If the fire shows signs of burning more freely on one side than the other, it is easily checked by closing the gaps between the bricks with ashes, earth, etc. The box should be watched to note that it never becomes more than red hot, and it should be kept in this state for a period of four to six hours, according to the nature of the work. Suitable tongs should be kept handy to pick up the work and test it, and they should be dipped as quickly as possible.

Work like spindles should be plunged end down into the water, of which the larger supply the better, a large tank or barrel being suitable. It is best to let the work and test piece get quite cold before they are removed from the water. The test piece should then be examined carefully, as well as the work.

The work, if a spindle or a short shaft, on being run between centres of the lathe should show but a slight amount of distortion or bending, and should be free from scales or blisters. It should then be tested for hardness with a file. The ends of the test piece which have been broken will show how deeply the case hardening has penetrated, and this, for an article such as a wristpin, should be about .03125-inch.

FORD ON LONG TRIP.

Mr. and Mrs. D. S. Wells and daughter, and Minor Johnson of Tampa, Fla., left recently in a specially equipped Ford car, made by the Ford Motor Company, Detroit, on probably one of the longest trips ever attempted by automobile. The trip will occupy eight months, and will take the party through practically every state in the Union. The route will be through the Atlantic States to Canada, thence to Niagara Falls, south and west through Yellowstone park, Colorado, California and old Mexico and back through the Gulf States to Tampa. A full culinary and camping outfit is being carried, and it is the intention of spending practically all the time out of doors.

BIG FUTURE FOR MEXICO.

J. M. Davis, agent general of the Goodyear Tire & Rubber Company in Mexico, who has been spending the past few months in this country, where he has visited practically all of the cities of consequence in the East and Middle West, is very optimistic regarding trade conditions in Mexico as soon as peace is established there. He says there is greater opportunity in that country for American automobile and tire makers than in any other country in the world. Not many years ago, he says, very few cars were imported into the republic, but that now fully 400 to 500 American made cars are received every year, with better opportunities presenting themselves now than ever before.

APPROVES OCEAN-TO-OCEAN PLAN.

President Taft recently welcomed Bert G. Smith, Dell M. Potter and John Zak at the White House, Washington, D. C., after they had completed a 4000-mile trip from the Pacific Coast to Washington. The tourists made the trip by the most direct route, and appeared before the president and members of congress to urge an ocean-to-ocean highway. They had with them a petition, which later will be presented to Congress, bearing at least 1,000,000 signatures in support of such a route. President Taft gave his indorsement.

AMERICAN MOTORS CHANGES.

As a result of the increased growth of the business of the American Motors Company, Indianapolis, Ind., D. S. Menasco, vice president and sales manager, found it necessary recently to relinquish a greater part of his office work to devote his entire time to corporation and organization matters. He has taken charge of the field work, and will devote a great deal of time to acquainting himself with actual conditions in various parts of the country. D. B. Williams, assistant sales and advertising manager, has been appointed advertising and publicity manager, and C. C. Perrin, formerly of the Regal Motor Car Company, Detroit, has been made sales manager.

MARMON WINS IN MINNESOTA.

For the second year in succession a Marmon car, made by the Nordyke & Marmon Company, Indianapolis, Ind., and driven by John Fawkes, has won the annual reliability tour of the Minnesota State Automobile Association. Last year Fawkes was at the wheel of the Marmon which covered the 1461 miles between Minneapolis and Helena, Mont., with a perfect road score, the only machine to finish the tour without penalization.

This year the trip was from Minneapolis to Winnipeg, Can., and return, a distance of 1095 miles. Again the car was the only one making the entire journey without penalization, thereby duplicating its record in the 1911 event. Incidentally, it may be remarked that this year's journey was completed without either puncture or blow-out, as well.

WILL DIRECT NYBERG PUBLICITY.

Oscar R. Ewing, who has been in charge of the advertising and publicity for the Nyberg Automobile Works, Anderson, Ind., maker of the Nyberg line of pleasure and commercial vehicles, has resigned to take up a course in the Harvard Law School. The vacancy has been filled by C. A. Lawrence, who for the past five years has been identified with the Anderson Morning Herald as city editor.

OWNERS' TOUR IN SEPTEMBER.

An owners' tour from New York City to San Francisco has been arranged by the American Automobile Association, and the start will be made Sept. 3. It is the intention to have no regular schedule, but to afford automobile owners the opportunity to travel leisurely. A. L. Westgard, official pathfinder of the A. A. A., will pilot the tour over the so-called midland trail, which will traverse Pennsylvania, Maryland, Ohio, Indiana, Illinois, Missouri, Kansas, Colorado, Utah, Nevada and California.

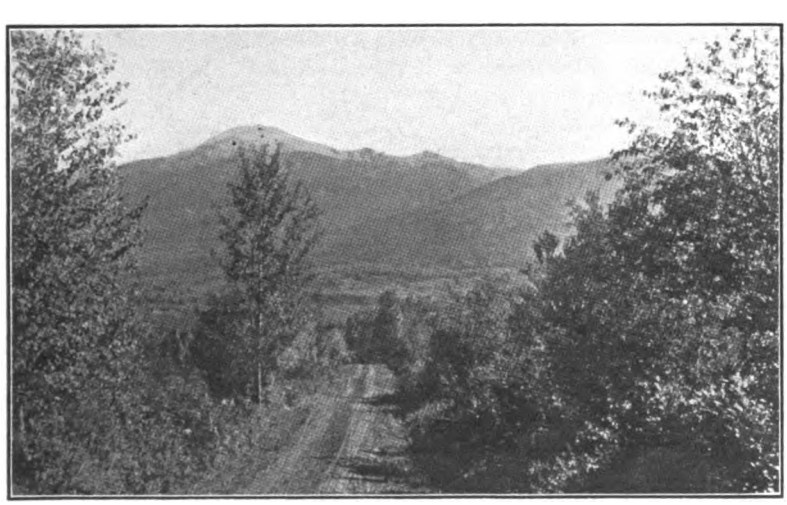
Among the American Alps



FEW people, except those who have spent their vacations for years among the White and Green mountains, realize their marvelous beauty. There is something about their charm which is ever changing, and when they are seen from another angle they present entirely new features, making this section of New England one to which the motorist may turn again and again, always assured of something new and filled with new possibilities.

The itinerary outlined below is designed to start from Boston, visiting the White mountains first and returning to Boston by way of the Green mountains, the route traversing both ranges over most accessible ways. Incidentally, the tourist has opportunity to view the beauties of the Connecticut valley at two of its most interesting points, and some of the prettiest lake scenery in the country is included.

TOUR NO. 30.

Leaving Boston the first day, the way leads through the Merrimac valley into New Hampshire. The towns and cities in this valley are prominent among the manufacturing communities of New England and have contributed their full share toward the industrial wealth of the country. Concord, the capital of New Hampshire, is a handsome city, with its grand old shade trees. A little further along, at Franklin, a foretaste of the White mountains is gained. At the Weirs, a splendid view of Lake Winnepesaukee is obtained, and from this point the lofty ranges begin to make themselves felt as Plymouth is reached for the night stop.

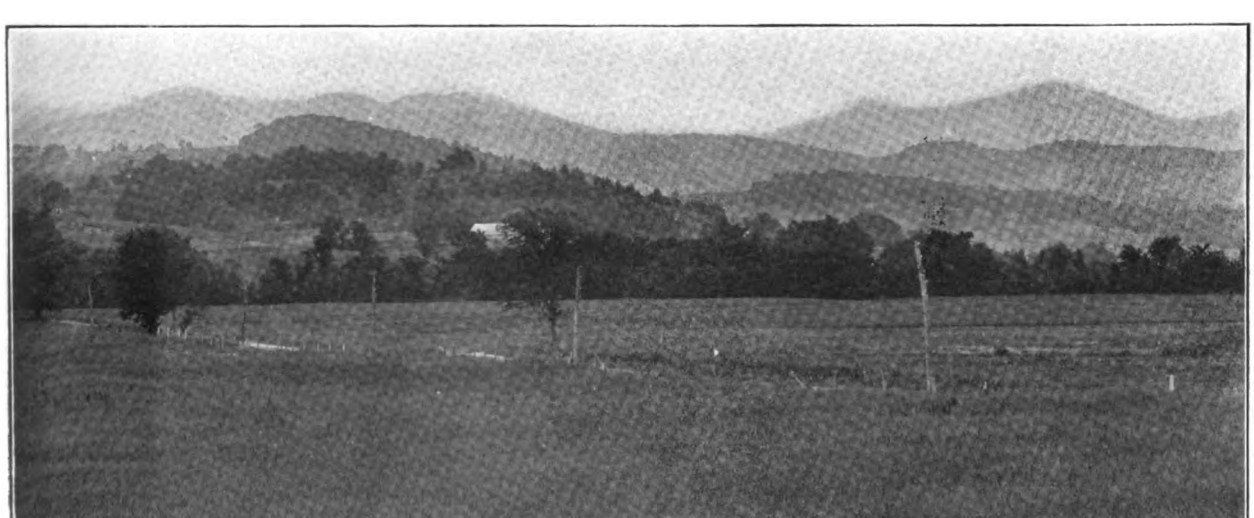
Pleasing View of Mt. Lafayette from Near Franconia Notch.

The morning of the second day the tourist may watch the sun rise over the island dotted Squam lake at the foot of the Squam range to the eastward, while toward the northeast the lofty summits of Mt. Lafayette, Oscola and White Face are visible across the fertile intervales. To the southeast is Lake Winnepesaukee, with Mt. Belknap towering above it, and Mt. Prospect, 2072 feet above the sea, possesses several objects of interest, among which may be mentioned the Miser's Cave, the Avalanche and the cold and boiling springs.

Then begins the drive along the edge of the Franconia range, with splendid views of the more noted peaks greeting the visitor at every turn. From the hills of Bethlehem and Littleton, fine panoramas of the different ranges are to be obtained, before taking the down grade into the Connecticut valley at St. Johnsbury. The way now leads past a number of wonderful lakes, and particular mention should be made of Lake Willoughby at West Burke. The road affords a continual view of the two singular mountains between which the

Digitized by Google

St. Albans Bay, a Picturesque View of Lake Champlain.



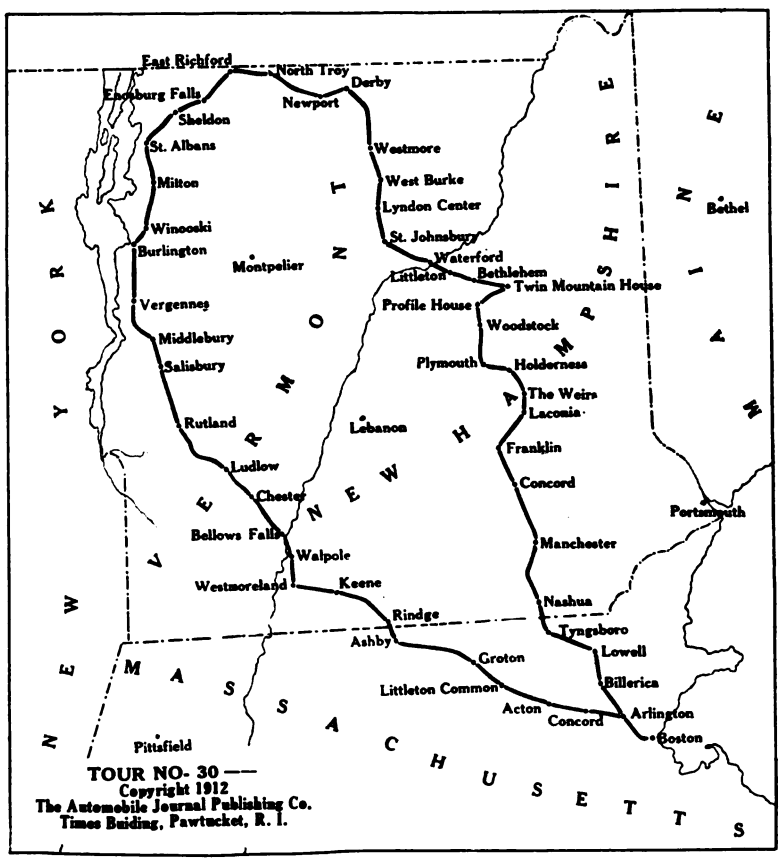
lake is situated, and very rare plants are to be found along the drive beside its shores.

The night stop is at Newport on Lake Memphremagog, an Indian name which means "beautiful water." Two-thirds of it lies in Canada, and many tourists see in it a strange resemblance to Loch Lomond in Scotland, while others call it the Geneva of Canada. The sunsets are particularly worthy of mention, and if possible these should be seen from the sides of Owl's Head.

Frequent glimpses of the Green mountains are obtained to the southward on the way to Richford, the third day. At East Berkshire, not only is Jay peak plainly visible on the south, but isolated peaks across the border in Canada attract and hold the interest. Then comes Enosburgh Falls and Sheldon, the latter with its health giving spring water. The close of the day's drive brings the tourist into St. Albans, on Lake Champlain, with views of the Adirondacks in the distance across its waters.

The fourth day's route is along the shores of this famous lake for many miles, through Burlington, the largest city in the state, to Vergennes, at which point it turns toward the Green mountains, and the remainder of the distance into Rutland provides sufficient climbing for the car. The roads are better than the average in mountainous districts, however, and some opportunity doubtless will be had to view the many little lakes at nearer range. Lake Dunmore with its remarkably clear water and in its environment of hills, is near Salisbury, and of Brandon, Sir Charles Lyell once said: "I have yet to see, either in Europe or America, a spot containing such a variety of unique and valuable substances placed by nature in juxtaposition."

After leaving Rutland, the way is down grade, some of it more or less steep in places, to Bellows Falls, the night stop. Summit is the highest point, and here the road leads over the Hogback to Ludlow, held to have been an island in a primeval lake, long since drained by the breaking down of the serpentine range. Beyond Gassetts, the route enters the Williams valley, which is followed along the foothills



Jay Peak and the Green Mountains as Seen from the Vicinity of East Berkshire in Northern Vermont.

Digitized by Google

of the Green mountains to Bellows Falls.

The fifth day the homeward trip is resumed by crossing the Connecticut river and ascending the winding way in Keene. Westmoreland will be found to be in the midst of fertile farming country, and a vacation resort for many summer people who delight in the quiet and beauty of the vicinity.

Fitzwilliams is a picturesque hill town with many ponds, and the same holds true of Rindge, although in this latter case the ponds have attained the dignity of lakes. The Massachusetts line is crossed before reaching Ashby, and from this point the way leads over historic ground.

PHELPS IS STUDEBAKER MANAGER.

George H. Phelps, recently appointed to the position of manager of the Studebaker Corporation branch in New York City, is but 29 years old. He entered the automobile business in Worcester, handling all sorts of cars, and in 1908 went to Boston as assistant manager of the Buick branch. From the latter place he went to the Studebaker branch as retail manager, bringing that organization up to second place in the list of 35 branches.

NEW ABBOTT-DETROIT FIELD MEN.

The Abbott Motor Company, Detroit, maker of the Abbott-Detroit line of cars, has just appointed four new field men. All are old and reliable men in the industry and will add much to the selling force of the company. E. D. Hand, resigned assistant sales manager of the E. R. Thomas Motor Car Company, has been assigned the states of Ohio, Pennsylvania and West Virginia, in the capacity of district manager; S. T. Henderson, formerly of the Bergdoll Motor Company, will be manager for several southern states with headquarters at Atlanta, Ga.; Frank E. Westcott, formerly representative of the Reo line, is the new manager in Indiana and Kentucky, and Joseph E. Warren, for the past four years with the Chalmers Motor Company, has been sent as special representative on the Pacific Coast.

AJAX TIRE BULLETIN.

The Bulletin for Tire-Users, issued by the Ajax-Grieb Rubber Company, Trenton, N. J., calls attention to the fact that owners and drivers of pleasure cars must pay just as much attention to overloading as must the operators of motor trucks, if they wish to get the best wear and best results. The Bulletin says that loading nine persons into a seven-passenger touring car for a long run isn't what would be termed a good practise, any more than would piling four people into a two-seated roadster be considered as such. The publication also notes that tires should be properly fitted to the rims and properly inflated.

NEW RIM COMPANY.

The Jackson Rim Company, capitalized for $100,000, was recently formed in Jackson, Mich. The officials are Otis W. Mott and C. B. Williams of the Mott Wheel Works of Utica, N. Y., who have joined with Clarence B. Hayes, Winthrop Withington and Mark Merriman of the Hayes Wheel Company of Jackson. Mr. Mott is president, Mr. Hayes vice president, Mr. Withington secretary and Mr. Williams treasurer. A site for the factory is to be secured in Jackson. Although several members of the new company are closely connected with the Mott Wheel Works, the Jackson Rim Company is a distinct corporation, and the two concerns are in no way connected.

FORDS ON PACIFIC COAST.

Of the four cities on the Pacific Coast in which property for the construction of large assembling plants of the Ford Motor Company has been purchased, Seattle, Wash., has been chosen for the first coast assembling station. The plant will turn out 2500 cars for 1913. The property at Portland, San Francisco, Los Angeles, will be held to await developments of the Ford Company's western trade for 1913. The Pacific Coast assembling station will be constructed immediately and will be completed at about the same time as the plant at St. Louis, Mo., where 5000 model T's will be turned out for the 1913 trade.

SPLITDORF COMPANY MOVING.

The Splitdorf Electrical Company recently commenced the removal of its plant from New York City to Newark, N. J., and already one of the large buildings of the concern in the former city is practically vacated. The equipment in the other buildings will be removed at opportune times. Complete removal, it is expected, will not be consummated before Sept. 1. The offices of the company will until that time remain in New York City. The Splitdorf plant will be concentrated in the building in Newark, formerly occupied by the Eagle Company, which is controlled by John F. Alvord, who acquired the controlling interest in the Splitdorf company about two months ago.

OPENS INFORMATION BUREAU.

The Automobile Club of Utah recently opened a free bureau of information at 251 South State street, Salt Lake City, Utah, in order to help tourists who are crossing the country. A register is to be kept of all cars passing through the city and a system of route cards and maps, giving road information in all directions, is to be provided. Tourists are given cards and asked to write back to the club giving road information and conditions. By this method the club is able to give at all times the latest information on roads.

DEVICES THAT DETECT INEFFICIENCY.

Additional Information Relative to Revealing Misuse of Pleasure and Commercial Vehicles—Outlining Particularly the Protection Afforded the Owner.

PREVIOUS consideration of the subject of recording devices for watching the movement of the motor vehicle when not accompanied by the owner, took up certain phases of the situation,

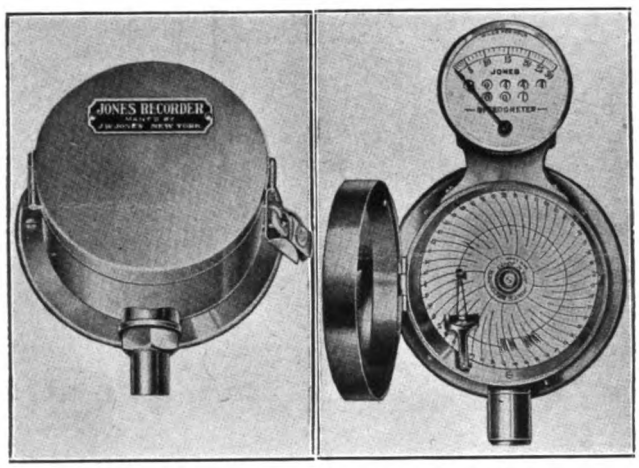

Fig. 5—Front and Rear of Jones Recorder, with and Without Speedometer.

and the illustrations were such as would tend to bring out the application of this factor to the commercial vehicle side. Mention was made of the fact that these instruments were designed for use with the so-called pleasure car, but it so happened that the charts presented laid rather more stress upon the possibility of their use for strictly business purposes.

An effort will be made herein to discuss still other phases of the problem, and if the illustrations and the arguments appear to indicate that the devices selected for description are particularly applicable to the pleasure vehicle side it should not be taken to mean that they are not also of special advantage to the owner of a motor truck. The point which the writer desires to make is that all the instruments illustrated and described during the consideration of this subject are equally applicable to all types of automobiles. It has been deemed best, however, to indicate certain needs of the business man, pleasure car owner and garage man, and the efforts that have been made to solve the difficulties presented.

There is at least one problem in which the garage proprietor is deeply interested. It was touched upon in a previous installment. While it is true that no garage can be held responsible for the improper use of the car, there is bound to be more or less unpleasantness if it so happens that the machine is turned over to the chauffeur without the owner's knowledge, particularly when the result is what has come to be termed a "joy ride." Any device or any method which will tend to eliminate this possibility is bound to receive careful attention from the garage man.

It is not claimed that the recording device will entirely solve this problem, but it may be indicated that by its use the owner is enabled to keep a strict watch upon his chauffeur and his property. If at any time he discovers any suspicious circumstance he is in a position to determine for himself whether or not there is danger of more serious consequences and to take such steps as good judgment would dictate.

The garage proprietor cannot be expected to assume the responsibility for any or all of the machines in his care. He is selling service, not conducting a detective bureau. He tries to protect the owner by arranging to deliver the car only upon order, but further than that he cannot go with reason. It remains for the owner to protect himself, particularly when it is possible to do so by the installation of simple and inexpensive precautions.

To illustrate this point, reference may be had to Fig. 5, which presents the Jones recorder, manufactured by the Jones Speedometer Company, New York City. This is shown both with and without the speedometer attachment and in both front and rear views. The company also produces a hub odometer, which registers the mile-

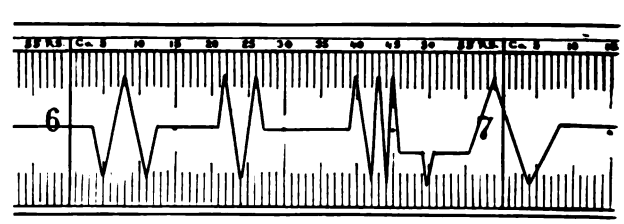

Fig. 6—Portion of Sample Speedograph Chart.

age, either forward or backward. The recorder, however, is designed to supply a complete and accurate history of the vehicle's performance every minute of the 24 hours and is equally ap-

Digitized by Google

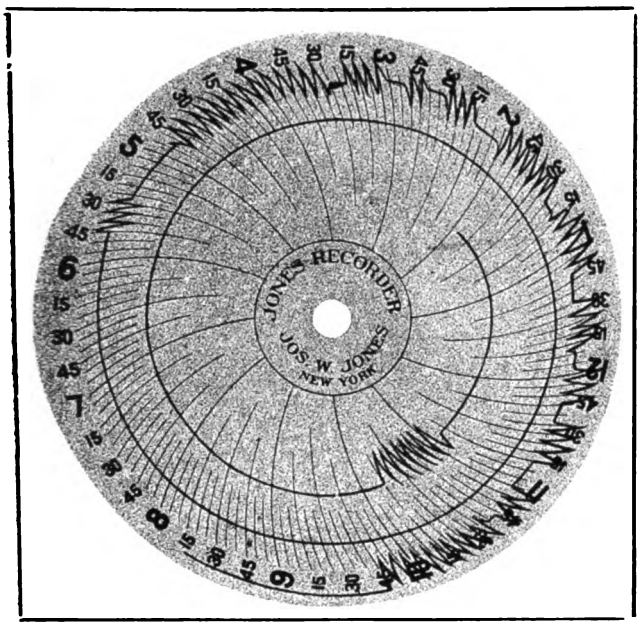

Fig. 7—Sample Jones Recorder Chart, Indicating Character of Permanent Record.

plicable to pleasure and commercial cars.

The instrument is enclosed in a heavy brass case and may be attached to the dash or any other convenient part of the car. It is connected by a flexible shaft and gears to the front wheel, in exactly the same manner as the Jones speedometer is fitted. A marking stylus travels over a chart of sensitized paper, which cannot be tampered with and which gives a permanent record of the vehicle's movements at all times.

One of these charts is shown at Fig. 7, and in explanation it may be said that when the car is standing this chart is constantly travelling under the marking stylus, the record of the stop being shown by the continuous line. The length of this line indicates the duration of the stop. The running time is recorded by cross or zigzag lines, each one of which denotes a half-mile of travel. The speed of the run is calculated by counting the number of zigzag lines in a given period of time.

With one of these recorders attached to the car, the owner always is in a position to tell the start, stops and duration, mileage between stops, speed at all times, and the time of returning to the garage. Inasmuch as the case is locked, and no one can have access to the record except the party who holds the key, the company maintains that the owner is in possession of even more accurate information than would be possible if the car were accompanied by a private detective.

If it should transpire, for instance, that the chauffeur was in the habit of utilizing the machine for his own pleasure without authorization, this fact would be made apparent from study of the chart at the end the day. The owner, therefore, must have knowledge of any lapse of duty, and is able to forestall the possibility of the more serious "joy ride."

This is but one of the many ways in which the recorder may be utilized to advantage. In fact, it may be stated that the objects of this device are the same as may be applied to all of those described heretofore, and any of those may be employed as indicated of the Jones.

Referring again to Fig. 7, this chart was put on at 8:15 and the vehicle was running as follows: 9:45 to 10:37, 9.5 miles; 10:45 to 11, three miles; 11:15 to 11:37, four miles; 11:45 to 12:05, 2.75 miles; 12:15 to 12:35, 4.25 miles; 12:47 to 1:15, five miles; 1:20 to 2, 7.25 miles; 2:15 to 2:35, three miles; 2:45 to 2:55, two miles; 3:05 to 3:22, 3.5 miles; 3:33 to 4:50, 14.5 miles; 5:30 to 5:35, 3.25 miles. There were 12 stops. The car was out of service for 16.5 hours and then ran again from 10:15 to 11:08, 9.25 miles. The chart was removed at 2 with a total run of 71.25 miles. The average speed was 11 miles an hour. The running time was six hours and 25 minutes.

Still another device of this character is the Speedograph, made by the Recording Speedometer Company, 54 Clinton street, Newark, N. J., and illustrated, both opened and closed, at Fig. 8. It will be noted that this is a combination speedometer and service recorder, the former being located in the bottom portion of the case and connected by a set of gears with the actuating mechanism at the top.

When closed all parts of the Speedograph are

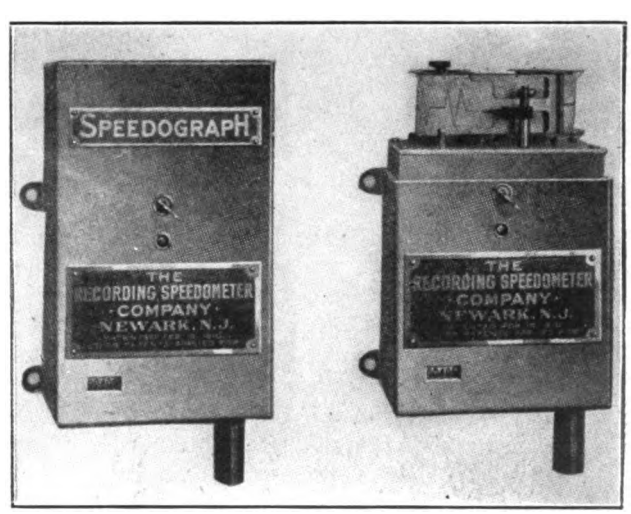

Fig. 8—Speedograph Opened and Closed, Showing Recording Pencil Making Record on Chart.

Digitized by Google

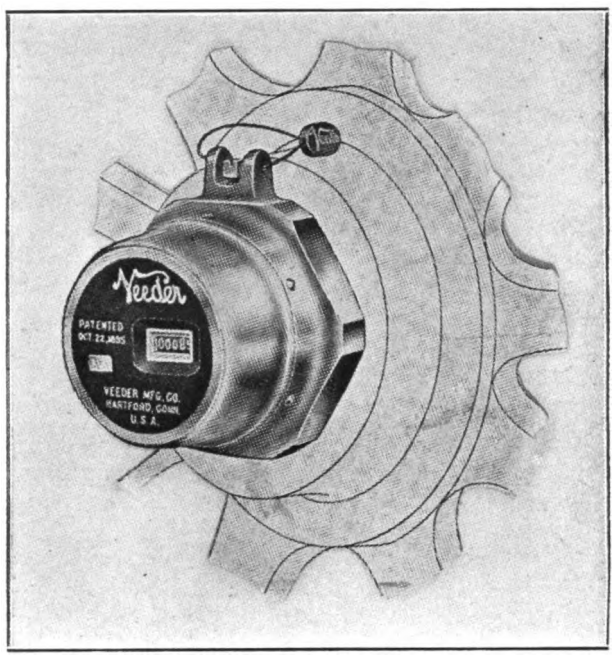

Fig. 9—Veeder Hub Odometer Sealed in Place on Hub.

securely locked against anyone not in possession of the key. It is maintained by the maker that there is absolutely no way in which the actuating needle can be tampered with or the gear be thrown out of engagement. In this manner the owner always is assured of an accurate record of the vehicle's movements. It is designed to check the time the car leaves the garage or any given point, as well as of the return, every stop made and its duration, the total number of miles travelled, the speed and variations in speed during the trip, etc. It readily will be seen that it may be employed in the same manner as the other devices presented.

Fig. 6 depicts a portion of one day's record, and in explanation it should be stated that the vertical lines indicate the vehicle was moving, while horizontal lines show that it was idle. The tape is divided into minutes, and is moved past the pencil point from one spindle to the other at the rate of three inches an hour, this being timed accurately by clock work. The pencil point travels up and down three-quarters of an inch for each half-mile, and is operated by the wheel of the vehicle.

The above record shows that the car started at 6:03 and was run 1.5 miles at the rate of 10 miles an hour, or one mile in six minutes. From 6:12 until 6:21 the vehicle was standing. From 6:21 to 6:27 it ran 1.5 miles at the rate of 15 miles an hour, or one mile in four minutes. From 6:27 to 6:39 it was standing. From 6:39 to 6:42 it moved at the rate of 15 miles an hour for three-quarters of a mile, then at the rate of 30 miles an hour for 1.675 miles. At 6:46 it stopped three minutes, then ran one-quarter of a mile at a 10-mile rate; stopped five minutes; ran 1.75 miles at the rate of six miles an hour, or one mile in 10 minutes, and stopped again at 7:08. Thus the record might go on for the entire day, giving the owner opportunity to follow its movements all of the time.

Another maker of hub odometers is the Veeder Manufacturing Company, Hartford, Conn. These differ from the recorders, in that there is no chart, the main object being to disclose the mileage obtained from the car under all conditions. Additional details are possible of computation, however, and the maker states that a reading of the register will give the owner all the essential information of this nature.

The Veeder hub odometer, which is illustrated at Figs. 9 and 10, the former showing the instrument in place on the hub and the latter the internal mechanism, is of exceptional value to taxicab owners, although, as indicated above, it is equally applicable to all forms of vehicles. It is obvious that with an exact record of the mileage available at all times, the owner is in possession of data which will aid materially in computing

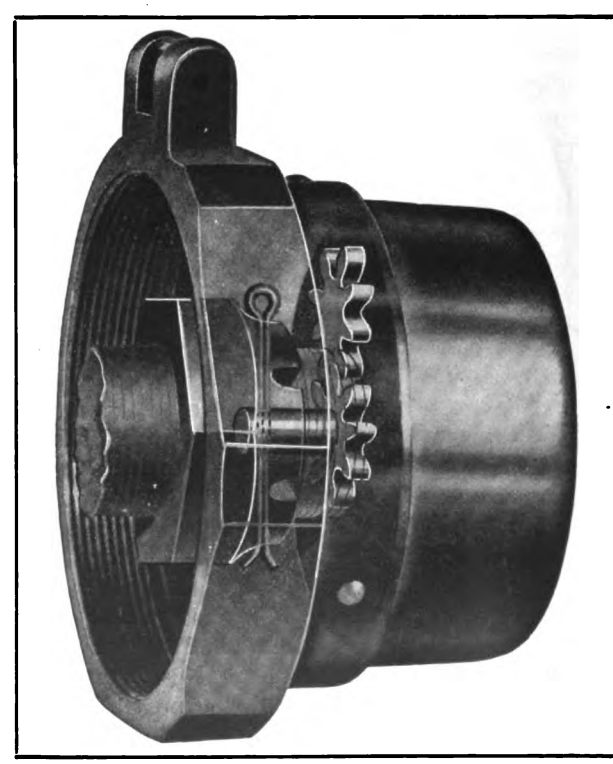

Fig. 10—Shadow View of Hub Odometer, Showing Operating Mechanism.

Digitized by Google

costs of motor haulage, for instance.

A small spur gear is used to drive the odometer. A shank on the side of this gear is inserted in a hole in the end of the axle. The cotter pin which locks the nut passes through this shank and prevents the gear from turning or becoming loose. This gear meshes with a second gear inside the cap as seen in Fig. 10, and suitable mechanism drives the register always in the same direction, so that the entire distance travelled by the car, whether forward or backward, is recorded.

It is maintained that there is no way to take the instrument off except by unscrewing it from the hub. This can be done only after the set screw, shown in Fig. 9, has been withdrawn sufficiently to permit the cap to be turned, an operation that cannot be accomplished without first breaking the seal. This seal is the same in form as that which has been used for many years by railroad people and is held absolutely to prevent tampering with the odometer without detection.

As has been explained the odometer is designed so as to record the distance travelled, no matter whether the car is going forward or backward, so that it is impossible for the driver to subtract mileage by jacking up the wheel and running it backward. It is held that there is no way to disconnect the mechanism by slipping the gears out of mesh.

OAKLAND DETROIT BRANCH.

The Oakland Motor Car Company of Pontiac, has established a factory branch at Detroit, Mich., with headquarters at 1237-41 Woodward avenue. J. F. Montgomery, for the past two years sales manager for the J. H. Brady Company, has resigned from the Bemb-Robinson Company, now representing the Hudson Motor Car Company at Detroit, to take a similar position with the Oakland Detroit branch. W. R. Tracy is the Detroit manager of the company.

FISK COMPANY'S NEW BUILDING.

The new branch building in Pittsburg, Penn., for the Fisk Rubber Company of Chicopee Falls, Mass., is one of the most finely appointed and up-to-date quarters of its kind in the Pennsylvania city. It is located in the heart of the automobile district and is in a new building two stories high, 95 by 20 feet. The ground floor will be devoted entirely to display and salesrooms, while the second floor will be occupied by the repair department, in charge of competent factory men.

COMING EVENTS.

August.

Aug. 25—Track races, Columbus, O.
Aug. 26—Track events, Flint, Mich.
Aug. 30-31—Road races, Elgin, O.

September.

Sept. 2—Track events, Youngstown, O.
Sept. 3-6—Truck trials, Chicago, Ill.
Sept. 7—Track meet, Hamline, Minn.
Sept. 7-9—Road race, Santa Clara, Cal.
Sept. 9—International aviation race, Chicago, Ill.
Sept. 11-14—Reliability run, Buffalo, N. Y.
Sept. 13—Track events, Sandusky, O.
Sept. 17—Grand Prize race, Milwaukee, Wis.
Sept. 20—Pabst Trophy race, Milwaukee, Wis.
Sept. 21—Vanderbilt Cup race, Milwaukee, Wis.
Sept. 21—Track events, Detroit, Mich.
Sept. 29-30—Track events, St. Louis, Mo.

October.

Oct. 7—National tour, Detroit, Mich.
Oct. 7-11—Reliability run, Chicago, Ill.
Oct. 12—Track meet, Salem, N. H.
Oct. 12—Track events, Springfield, Ill.

November.

The Automobile Journal cordially invites the owner, driver, repairman, sales agent and manufacturer to discuss subjects pertinent to the motor car, motorcycle and aeroplane in these columns, believing that the automobile industry and those closely allied with it will be benefited thereby. Complete information dealing with the construction, operation, maintenance and repair of these machines will be published upon the receipt of a communication addressed to the editor of The Automobile Journal. Suggestions or discussions of a mechanical nature, or those facilitating repairs and adjustments, should be accompanied by a rough sketch which will be redrawn for publication. Detailed touring information will be supplied by The Automobile Journal's Touring Bureau upon request. All communications should be accompanied by the full name and address of the sender, but for publication purposes the name will not be used unless desired.

Lighting with Magneto.

(1420)—I am riding a Henderson four-cylinder motorcycle equipped with a Bosch magneto either D U 4 model 2 or D U 4 model 5, and would like to know if it is possible to wire the magneto for lighting tail and headlight. Please advise me if this is possible and if so, how to make connections for same. Thanking you in advance for any information you are able to furnish me, I am,

CARL W. BARTLETT, JR.

Fairbury, Neb., Aug. 12.

The magneto utilized with the mount is designed for ignition purposes and is not applicable for electric lighting. If connected to lamps it would interfere with the ignition system and such an arrangement is not advisable.

Lubrication Losses.

(1421)—I have an Overland and it uses too much oil. Oil sputters out of the poppers all over the left side of the hood and it uses about three quarts every 50 miles. Can you tell me how to remedy it? I have tried putting in but two quarts of oil at a time and it makes no difference whether the crankcase is full or almost empty. I have run the car two years and it began acting this way about six months ago. A. F. HOLT.

Grantsdale, Mont., Aug. 13.

The symptoms indicate leaks between the valve tappets and guides, due to compression in the crankcase. This is brought about by wear. If the proper lubricant has not been employed the rings will become worn, allowing part of the compression to escape past these members into the crankcase. If the latter is not provided with breathers or vents for the escape of this atmosphere, it will seek an exit at the point offering the least resistance. The oil works out between the guide and pushrod, and the latter attracts dirt which combined with the lubricant forms an abrasive.

Manufacturers of motors fit breathers or vents to relieve the crankcase compression and these members may be made and fitted easily if not already installed. In the accompanying illustration at D is shown a method of fitting a breather which comprises brass piping, etc., and the material can be secured at any plumbers' supply house and is inexpensive. The crankcase will have to be drilled and tapped to take the thread of the piping. A fine mesh brass screen is fitted over the cap of the breather, which is removable.

The fitting of breathers will not entirely eliminate the oiling troubles, neither will cutting down the supply of the lubricant effect a cure. The proper method is to replace the worn parts with new. This means eight guides and a like number of pushrods. The old members may be repaired, however, and the illustrations at A, B and C depict the method. That at A consists of cutting vertical grooves in the tappet. The objects of these are to provide a passage for the oil that works up to return to the crankcase. At B is depicted a circumferential groove, this being about .125 inch deep. Connecting with this are two grooves, one on either side, and these lead to the bottom of the tappet as denoted. Any oil working up will gather in the larger recess and find its way back into the crankcase.

At C is shown a method of cutting two grooves in the guide bushing and it will be noted that the top of this member is cup shaped. This gathers the superfluous lubricant which runs back into the crankcase through the two grooves in the bushing. This repair will appeal to the average motorist as the bushing is easier to cut than the tappet which is hardened and will require drawing of the temper and rehardening. Fitting new members is more satisfactory. The joints of the crankcase should be examined to note if they are tight.

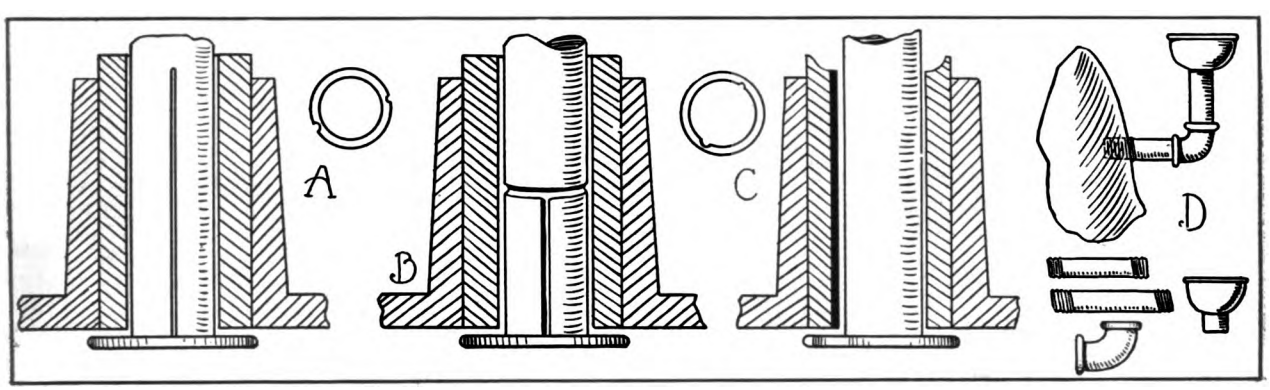
New Rear Axle and Transmission.

(1422)—I have recently purchased a second hand model K Sterling automobile. I understand that it is an assembled car and have been informed that the company has gone out of business, also that the machine has a Beaver motor and a transmission and rear axle the same as the Overland. I would like to get the address of the companies making the motor, transmission, rear axle and other parts, so that I can get repairs made when needed.

J. E. BROWNLEE.

Woodward, Okla., Aug. 18.

The address of the Beaver Manufacturing Company is 787 Chase street, Milwaukee, Wis. Relative to the transmission and rear axle, which are a unit, it may be stated that the Willys-Over-



Digitized by Google

land Company manufactures its own parts. In 1909, unless the writer is mistaken, two different units were used and these were made by the Covert Motor Vehicle Company, Lockport, N. Y., and the Warner Gear Company, Muncie, Ind. These concerns would furnish corrobative information upon request. In writing these companies it is advisable to mention number of car; that is, maker's number.

Electric Lighting of Car.

(1423)—What is the best and cheapest method of lighting my E-M-F Studebaker with electric lights? Where could I obtain the best quotations on storage battery with magneto charge? H. J. WINANS.
Nowata, Okla., Aug. 17.

There are a number of electric lighting equipments of practical and efficient design. The leading systems are being described in The Automobile Journal in the series now in progress. Considering the matter of first cost, the cheapest is the straight storage battery. The prices of the various lighting systems will be furnished upon request by the makers, the addresses of which are given in the Buyers' Guide on page 125, and in the lighting series to which reference has been made.

Remedying Leaky Valve Tappets: A, Cutting Grooves in Tappets to Allow Oil to Return to Crankcase; B, Circumferential Recess and Grooves; C, Cupping Valve Guide Bushing and Grooving Sides; D, Home Made Breather.

Motor Misses When Throttled.

(1424)—What causes my motor to miss fire when just starting out after it has stood about two hours or longer? After that it goes fine if I advance the throttle. It misses only when starting up. A READER.
Bridgeport, Conn., Aug. 20.

The missing referred to is probably due to improper carburetion, caused by too rich a mixture on the low speed. A rich mixture burns more slowly than a lean one and as the engine becomes warm missing caused by a slightly rich mixture disappears. Try cutting down the amount of fuel on the low speed device of the carburetor or give it slightly more air. If the carburetor adjustment is correct and the exhaust shows no symptoms of being rich, look for auxiliary air around the intake manifold connections and those of the carburetor.

Care of Chains.

(1425)—Will you please give me some information as to how to preserve the chains on my double chain drive car? These chains began to wear out before they had been in service one year. I oiled them as often as it seemed necessary, but the oiling does not prevent the wearing. Any information along this line will be appreciated. J. T. PALMER.
Pine Bluff, Ark., Aug. 18.

There are a number of conditions entering into the problem of efficiency with the chain drive for automobiles. Properly proportioned and machined sprockets are essential to successful chain gearing. The important dimensions of a sprocket are the pitch diameter and the bottom and outside diameters.

Too much distance between the driving and driven sprockets or too much sag, causing the chain to whip up or down, is very destructive to the chain. A poor chain will operate on a good sprocket, but when the latter is incorrect it will ruin the chain.

The principal cause of trouble within the chain is elongation. It is the result of stretch of material or natural wear of the rivets and their bearings. To guard against the former manufacturers use special materials of high tensile strength, but a chain subject to jars and jolts beyond the limit of elasticity of the material may be put in a worse condition in a short time than in months of natural wear. If for any reason a link elongates unduly, it should be replaced at once, as one link of this kind will eventually ruin the entire chain. Such elongation frequently results from all the load being thrown on at once.

To minimize natural wear, chains should be well lubricated inside and out, protected from mud and dirt, cleaned often and replaced to run in

Digitized by Google

the same direction and same side up. A new chain should never be applied to a worn sprocket.

In a sprocket with no clearances a new chain fits perfectly, but after natural wear the pitch of the chain and sprocket become unlike. The chain is then elongated and climbs the teeth, which act as wedges, producing enormous strain, and it quickly wrecks itself. With the same chain on a driven sprocket, cut with clearances, all rollers seat against their teeth. After wear the working roller shifts to the top, and all other rollers seat with the same ease as when new.

Theoretically all the rollers share the same load. This does not obtain in practise, however, for infinitesimal wear within the chain causes one, and only one, roller to bear perfectly against the working face of the sprocket tooth at any one time. Clearance along the driver will not provide for elongation. To operate properly the pitch of the driver must be lengthened, which is done by increasing the pitch diameter by the amount dependent upon the clearance allowed.

There is a wrong and right way to lubricate chains and upon the method depends its efficiency. The members cannot be lubricated properly by squirting on oil as the lubricant carries with it to the bearing surfaces the greater part of the dirt and grit, compounding an abrasive which soon destroys the bearings.

The proper method is to remove the chains from the car and immerse them in gasoline or kerosene, washing them thoroughly to remove all dirt. They are then placed in a vessel containing mutton or beef tallow to which is added a small quantity of powdered graphite. The mass is then placed over a slow fire and allowed to remain until the lubricant has penetrated to each bearing, after which the chains are hung up to dry. Where the machine is operated during rainy weather the chains accumulate considerable mud and if this is allowed to work into the bearings, deterioration quickly follows.

Route Through Kansas City.

(1426)—Please give me a routing between Louisiana, Mo., and Wichita, Kan., by way of Kansas City.

G. E. R.

Perry, Ill., Aug. 10.

The following itinerary is outlined to occupy four days, with night stops in Glasgow and Kansas City, Mo., and Emporia, Kan.:

First Day, Louisiana, Mo., to Glasgow, Mo., 130.4 Miles.

Louisiana to	Miles to	Total Miles
Vera	7.3	7.3
Bowling Green	4.0	11.3
Curfyville	7.9	19.2
Vandalia	10.4	29.6
Laddonia	10.3	39.9
Mexico	20.7	60.6
Thompson	6.3	66.9
Clark	24.6	91.5
Renick	7.3	98.8
Higbee	9.0	107.8
Yates	5.7	113.5
Armstrong	7.3	120.8
Glasgow	9.6	130.4

Second Day, Glasgow, Mo., to Kansas City, Mo., 119.1 Miles.

Glasgow to	Miles to	Total Miles
Gilliam	10.2	10.2
Slater	3.6	13.8
Marshall	13.3	27.1
Mt. Leonard	11.4	38.5
Blackburn	6.4	44.9
Corder	8.9	53.8
Higginsville	5.4	59.2
Maynard	8.0	67.2
Odessa	10.0	77.2
Oak Grove	11.7	88.9
Grain Valley	5.1	94.0
Blue Springs	5.0	99.0
Independence	10.9	109.9
Centropolis	4.4	114.3
Kansas City	4.8	119.1

Third Day, Kansas City, Mo., to Emporia, Kan., 125.7 Miles.

Kansas City to	Miles to	Total Miles
Rosedale, Kan.	4.3	4.3
Merriam	4.6	8.9
Shawnee	1.0	9.9
Lenexa	5.3	15.2

MANY OVERLAND CONTRACTS.

That 1913 is to prove the biggest year in the history of the automobile industry is the conclusion reached by G. W. Bennett, vice president of the Willys-Overland Company, Toledo, O., maker of Overland cars. He bases his opinion on the fact that already contracts have been received for 36,850 Overlands. They are going to practically every civilized country and every city in the United States. San Francisco will take 3000; Iowa, 2500; New England, New York City, Minneapolis, Kansas City and Philadelphia, 1500 each. The demand is particularly strong in the middle and extreme West.

In The Aviation Field

With the Manufacturer and Operator in America and Abroad

Although the fourth race for the international cup is scheduled to be held at Chicago, Sept. 9, definite announcement concerning the representatives of the various countries is still lacking, in a measure. The following countries are entered for the contest: France, Belgium, Great Britain, Holland, Switzerland and America. Only one, France, will hold an elimination event, and the other national clubs have until 24 hours before the race in which to name their men.

The French team will be composed of Jules Vedrines, Maurice Prevost and Andre Frey, the first two with Deperdussin monoplanes and the last with an Hanroit monoplane. Two other aviators, Guillaume Busson and Alfred Liger, will accompany them as substitutes.

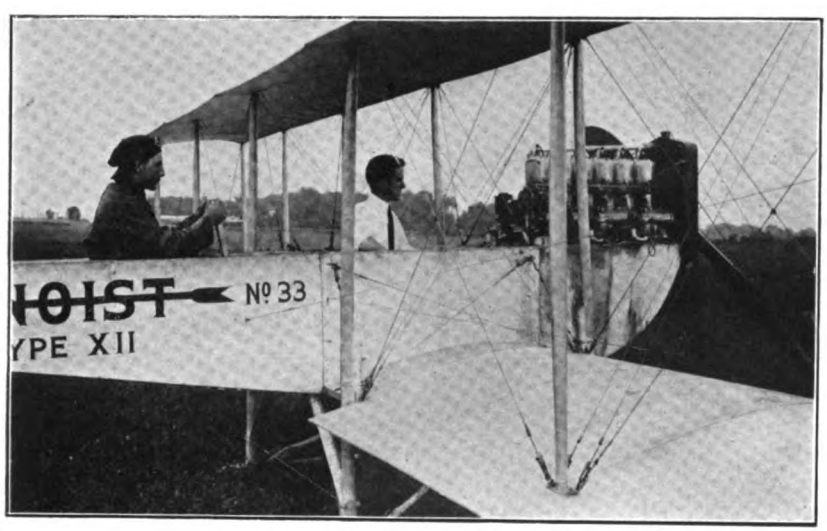
Belgium will be represented by three aviators. Frank Morok will fly a Morok biplane, and the others will operate De Brouckere machines. Their names have not been forwarded to the Aero Club of America as yet.

England was expected to send three machines, but this number has been reduced to two. At one time it was expected that the English representatives would be Claude Grahame-White, in a monoplane of his own construction, built along the lines of the Nieuport, with which the cup was won last year, and Gustav Hamel in a Bleriot monoplane. Subsequent statements would seem to indicate that Grahame-White had given up his original plan, although Hamel appears to be available.

No name has been mentioned in connection with the Holland entry, although this country has a number of pilots who might be considered of sufficient note to warrant their selection. But one machine has been entered.

Switzerland also has one entry, and the names of Eugene Audemars and Roland Garros have been considered in this connection. Both are well known in America, having taken part in numerous events in this country. The latter holds the world's altitude record.

Concerning the American team, the matter is entirely in the hands of the Aero Club of America. Charles Terres Weymann, who won the cup in the third competition in England last summer, has the right to defend it without further ques-



Three International Race Possibilities: From Left to Right, Jules Vedrines of French Team; Charles Terres Weymann of America, Present Holder of Cup; Guillaume Busson of France, Substitute.

Digitized by Google

tion, but he has failed to signify his intention of so doing. Last year he flew a Nieuport monoplane. The only name which has received mention anything like official is that of Marcel Tournier, who is said to have been selected by the Defender Syndicate of Chicago to pilot the monoplane built for this purpose by Burgess Co. & Curtis, Marblehead, Mass., and fitted with a 160 horsepower Gnome engine. The Aero Club of America has asked for tenders of machines for the competition, but no decision has been announced.

As an indication of the importance attached to the science of aviation from a government standpoint it is of interest to compare the amounts being expended this year by various nations. For instance, France has appropriated some $6.500,000 for the development of its so-called fourth arm of the national defence; Russia, $5,000,000; England, a little more than $2,000,000; Germany, about $1,500,000, while the American Congress has set aside $50,000.

Two-Seated Benoist Biplane, a Successful St. Louis Product.

P. W. Page and Lieut. R. C. Kirkland, U. S. A., gave the new Burgess army biplane, made by Burgess Co. & Curtis, Marblehead, Mass., its official tests in Marblehead bay early in the month. The machine was constructed to the designs supplied by the army officials and weighed, with load, 2000 pounds. The contract called for a speed of 45 miles an hour, and the average speed made by it, both with and against the wind, was 56. It climbed 2000 feet in 10 minutes. In every way it exceeded the requirements and was accepted by the government at the conclusion of the tests.

E. Helen of France, who holds the Michelin prize, recently announced his intention of making another attempt to secure the award for 1912 by flying a 100 horsepower Nieuport monoplane over a triangular course from Buc. He intends to start at 3 in the morning and continue flying until 8:30 in the evening.

The British military trials were begun at the Salisbury Plain flying field in England this month, and definite announcement of the results is expected in the near future. Thirty-two machines are competing for five prizes, two of which are open to the world and three for British machines only. The first prize is $20,000 and the second, $10,000, these being the open awards. The others are $7500, $5000 and $2500, respectively. In addition the army officials reserve the right to purchase any machine outright for $5000.

The competition is along lines which were laid down for the government of the military tests in France last year. There will be speed tests over a two-mile course, climbing, altitude and endurance, alighting and arising from plowed ground, etc. The machines and pilots taking part are as follows:

Biplanes—British & Colonial Company, C. H. Pixton and E. C. Gordon-England; Avro, Lieut. Parke and R. Charteris; Coventry Ordnance (two), T. O. M. Sopwith; Cody, S. F. Cody; Breguet, W. B. R. Moorhouse and M. Moineau; Flanders, F. P. Raynham, Lohner, Lieut. von Blacshke; Piggott, Parr; Aircraft Manufacturing Company, P. Verrier.

Monoplanes—British & Colonial Company, H. Busteed and J. Valentine; Deperdussin (England), J. Vedrines and Lieut. J. C. Porte; Cody, S. F. Cody; Hanroit (England), Bielovucie and S. V. Sippe; Bleroit, G. Hamel and Perryon; Deperdussin (France), Maurice Prevost; Vickers, McDonald; Martin-Handasyde, Gordon Bell; Mersey, R. C. Fenwick; Harper, ———; Handley Page, H. Petre; Borel, Chambenois.

Percy Noel of Chicago, editor of Aero and Hydro, has offered a $1500 cup which will be competed for annually in hydraeroplane flights in that city. Only licensed aeroplane pilots may compete, and the contest will include rising from the

Digitized by Google

water, landing and expert handling of the machine.

Nels J. Nelson of New Britain, Conn., who has been flying a biplane of his own construction during the past year, announces that he will give up aviation at the end of the present summer. It is understood that Nelson has made considerable money in exhibition work, and that he has saved most of it, intending to enter into business for himself.

New passenger speed records were created by Legagneux with a Zeus monoplane at Compiegne, France, early in the month. The previous marks were set by Andre Frey in an Hanroit monoplane in June. Both lists follow:

Kilos.	Frey.	Legagneux.
10	4:30.2	4:24.8
20	9:01.0	8:51.0
30	13:30.0	13:18.6
40	18:01.0	17:44.8
50	22:31.2	22:13.0
100	44:56.2	44:36.6
150	1:07:19.0	1:07:10.0

Lincoln Beachey has announced his intention of trying for a world's altitude record in a flight from Governors Island, N. Y., in the near future. He will employ a Curtiss biplane, fitted with 80 horsepower Curtiss motor, and Vacuum Mobiloil, made by the Vacuum Oil Company, Rochester, N. Y., will be utilized for lubrication purposes.

Lieut. John Rodgers, U. S. N., senior member of the naval aviation corps, has been detached from that service and placed in command of the gunboat Yankton. It is understood that this action was taken upon his own request, and that he will be succeeded by Lieut. T. G. Ellyson.

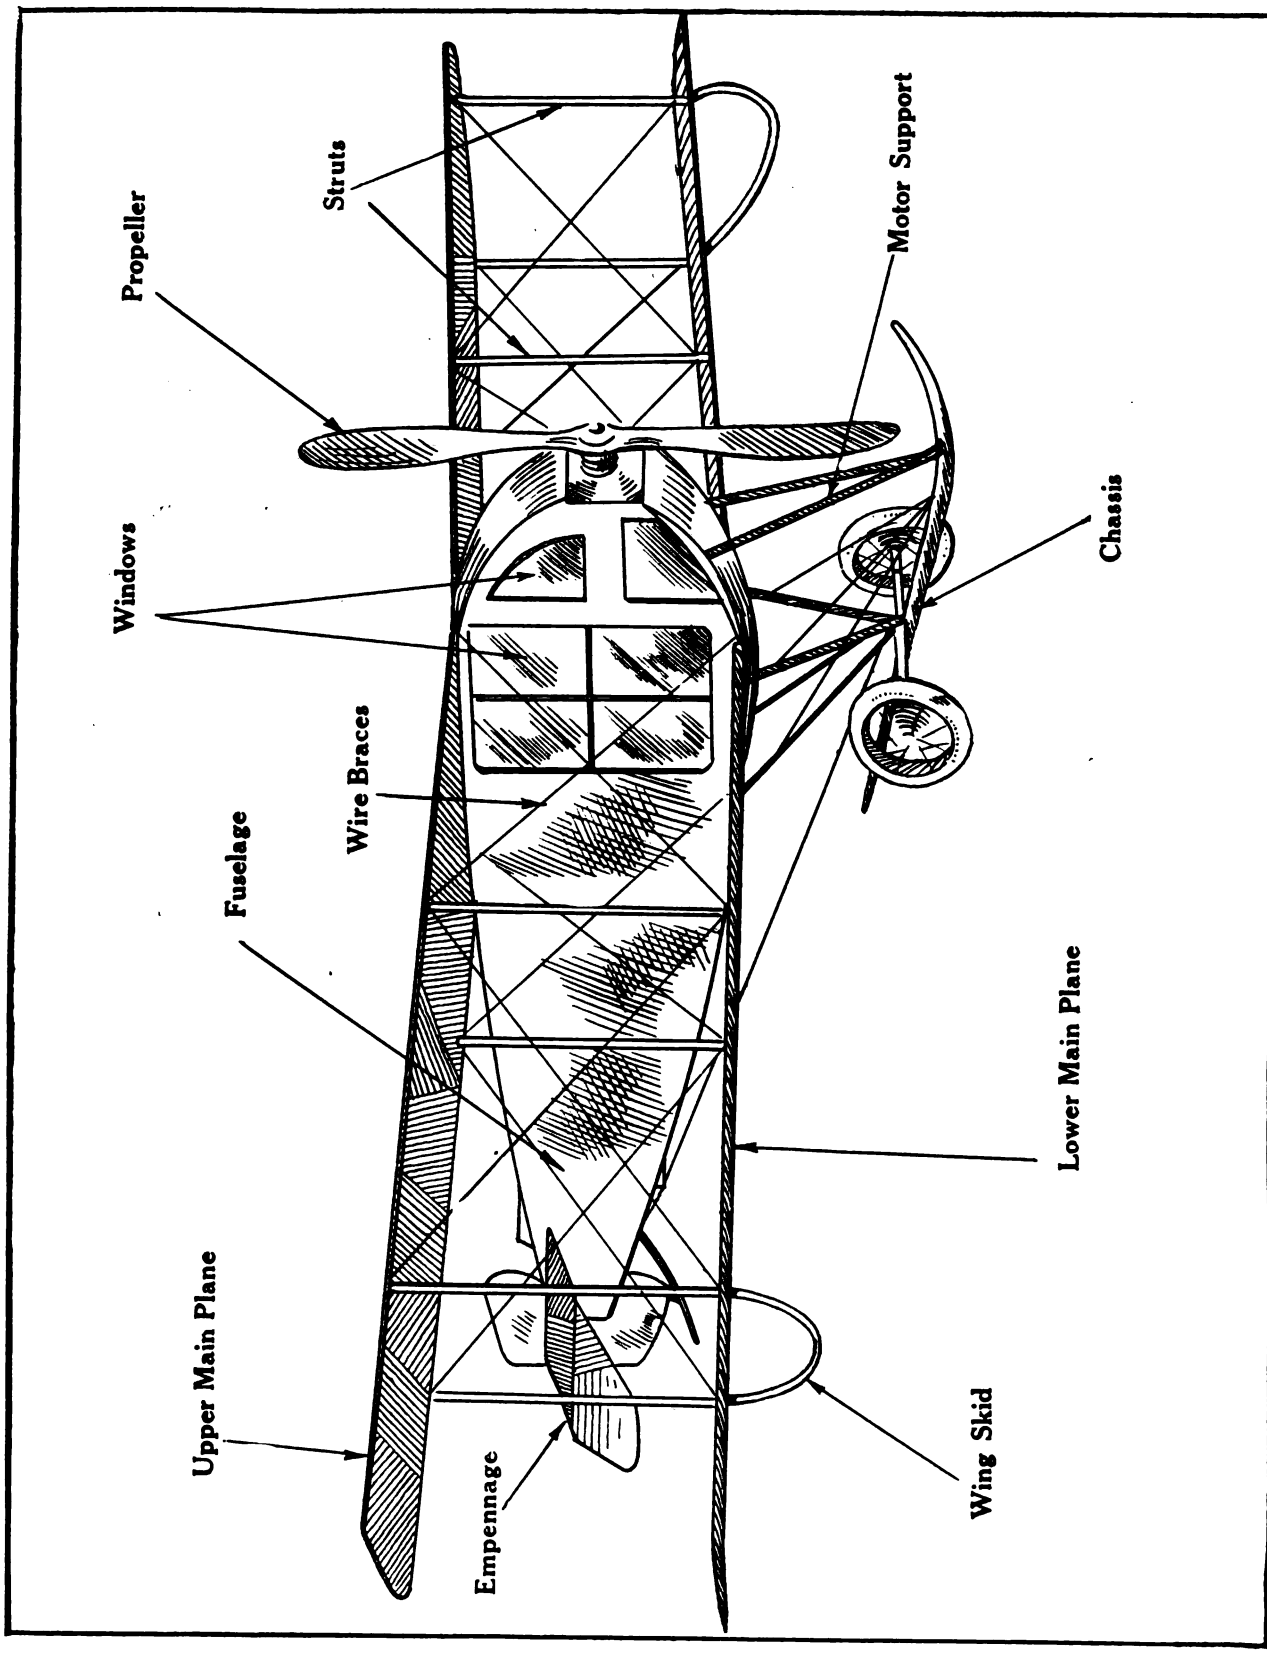
Miss Ruth Law, sister of F. Rodman Law, who has been making parachute jumps from aeroplanes, has taken up the study of aviation, and recently drove a biplane to an altitude of 7800 feet at Saugus, Mass., carrying her instructor, Arch Freeman, as a passenger.

The first attempt of the United States government to utilize aeroplanes in connection with militia manoeuvres, during the mimic war in Connecticut this month, does not appear to have been decidedly successful. Three machines were employed, these being assigned to duty on either side. Two of them were unable to remain in service throughout the week.

They were employed in scout work, and for a time were of undoubted service in locating the position of the "enemy." Adverse weather conditions appear to have made it impractical to send the machines aloft as often as would have been necessary, and the opportunity for selecting landing places was by no means ideal. Probably other results would have been obtained had the pilots been more familiar with their machines.

The tests cannot be looked upon as conclusive in any respect. Little attempt was made to bring about anything more than a beginning. Those in charge of the details had given the problem hardly any study, and the part expected of the aeroplanes was by no means as thoroughly thought out as has been the case in European countries under similar circumstances.

An accompanying illustration shows one of the latest models of the Benoist biplane, made by the Benoist Aircraft Company, St. Louis, Mo. This concern has been engaged in the manufacture of aeroplanes for the past two years and the machines have proven practical under every test. This is termed the cross country model and carries two passengers.



It was from a Benoist biplane that Albert Berry first dropped from an aeroplane in a parachute near St. Louis, March 1. Anthony Jannus was at the wheel and the successful drop was made when the machine was at an altitude of 1500 feet and travelling at the rate of 55 miles an hour. The machine was equipped with a six-cylinder Roberts motor of the vertical type.

The Imperial Aero Club of Russia has decided to hold an international aviation meet at St. Petersburg, sometime in September, the exact dates to be announced later.

The following aviators have entered for the hydraeroplane meet of the Aero Club of France at St. Malo, Aug. 24-26: Barra, Curtiss; Beaumont, Donnet-Leveque; Benoist, Sanchez-Besa; Busson, Deperdussin; Chambenois, Borel; Moilla, R. E. P.; Mollien, Curtiss; Renaux, Maurice Farman; Train, Astra-Train; Weymann, Nieuport. It will be noted that America is represented by two machines and one pilot, although the pilot, Weymann, will fly a French monoplane fitted with pontoons.

Mme. Pallier has qualified as a licensed pilot under the rules of the Aero Club of France, having flown an Astra-Wright biplane at Villacoublay. In addition to the regular tests she drove the machine to Paris and encircled the Eiffel tower, before alighting to receive her certificate.

Progress of Aerial Navigation.

Mechanical Details and Features of Construction.

THE AVRO BIPLANE.

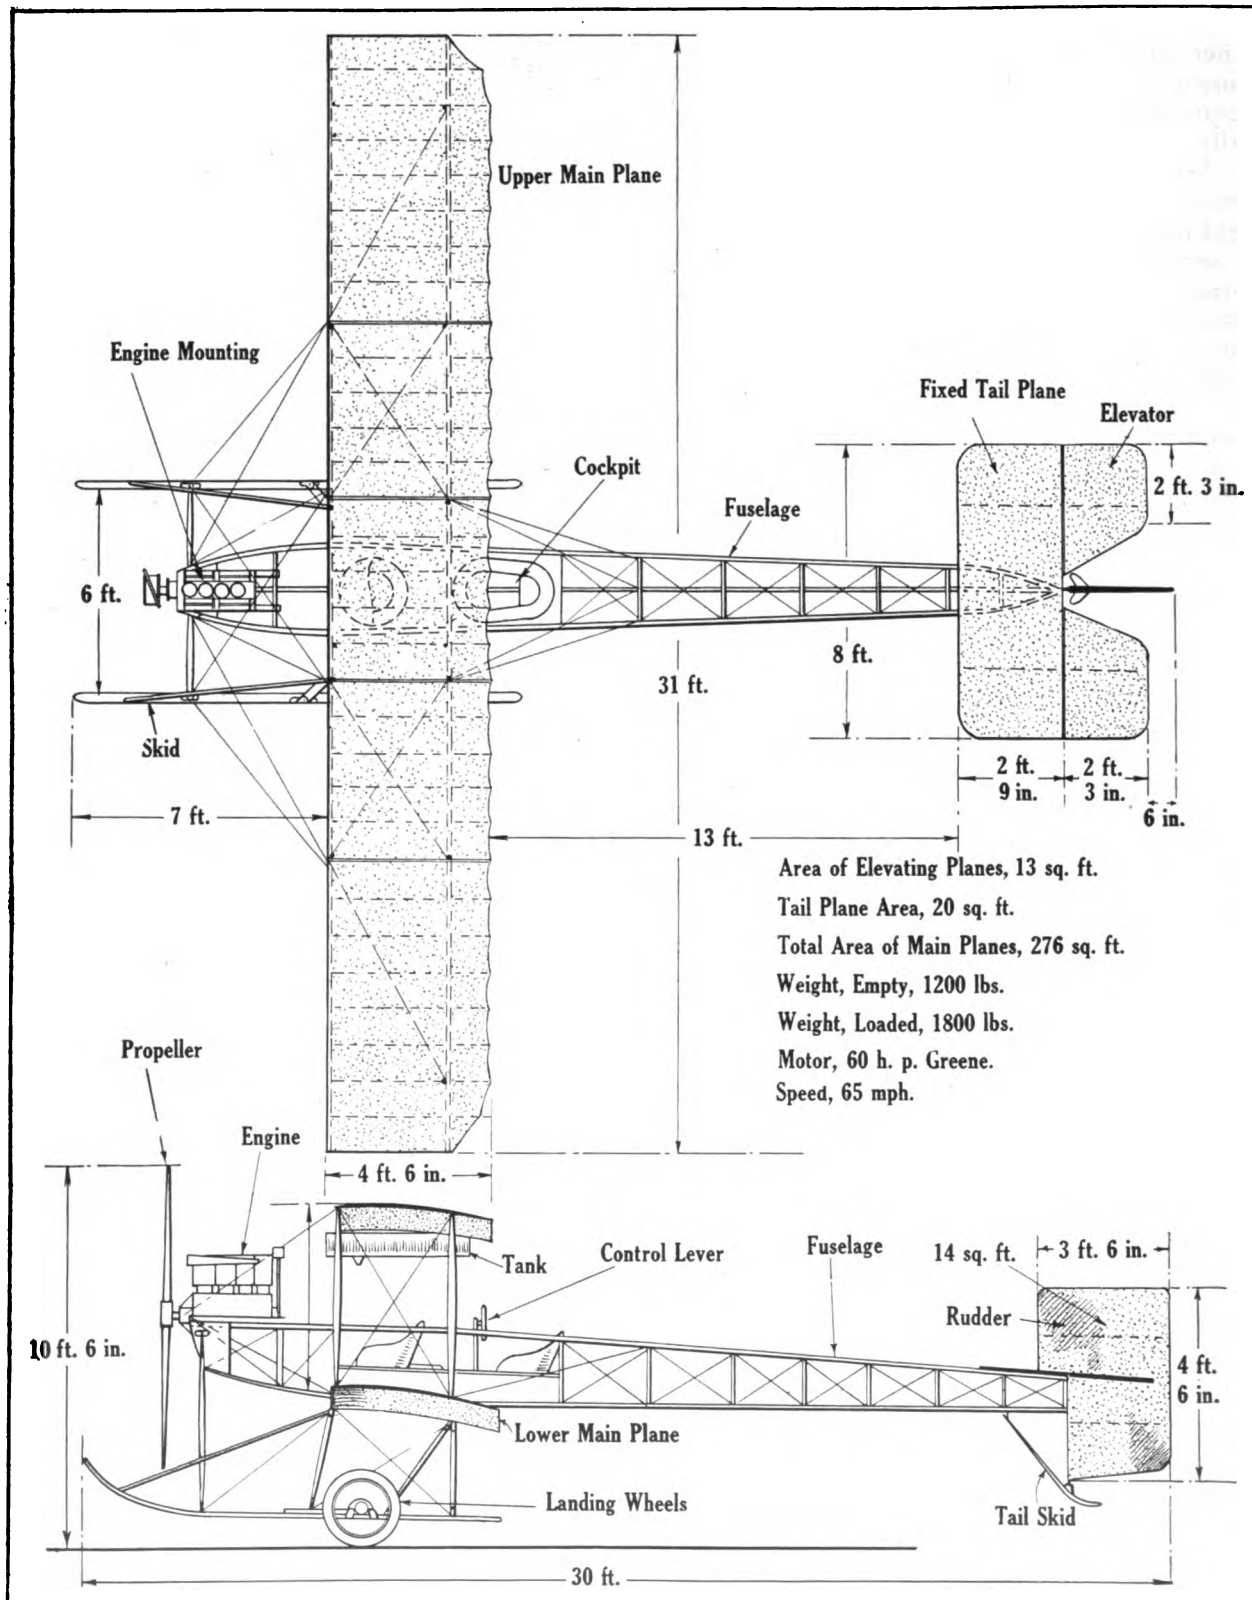
A. V. Roe of England came into prominence early in the history of successful British aviation as the inventor and pilot of the Roe triplane. It will be remembered that he attempted to fly this creation at the first Harvard-Boston meet in this country, but it did little better than make a few hops off the ground. However, the Roe triplane performed very creditably later in Great Britain.

For some reason Roe has turned his attention to other designs during the past year, having produced a monoplane, an hydraeroplane and the biplane, which is now under discussion. It will be noted that the name has undergone a change quite as distinctive as the substitution of one or two main planes for the three of the original craft. Those not familiar with the progress of aerial navigation would fail to recognize in the Avro of these types, any connection with the Roe of former days, but the derivation of the designation is apparent upon a little thought.

While the side elevation and plan view shown herewith present the general characteristics of the Avro biplane, the perspective is that of the enclosed type, bordering somewhat upon the Bleriot limousine, although not carried quite to that extreme. Inasmuch as the main features are the same in both the enclosed and open types, the sketches are by no means inconsistent.

The fuselage of equilateral triangular section, is somewhat boat shaped, and assumes its maximum beam and draught just forward of the pilot's seat. At its front end, mounted on stout bearers which are in reality continuations of the top pair of body longitudinals, is the engine, a 60 horsepower Green, coupled direct to an Avro propeller, of eight feet six inches pitch.

The main body portion is cross braced in a very neat manner. An aluminum socket, in which the transverse struts are assembled, is applied to the longitudinal member by a single bolt, which also retains in position a mild steel wiring lug. In this manner the whole of the longitudinal spar can be removed or replaced by simply withdrawing the several bolts that hold it in position, without disturbing the remainder of the construction in any way.



The forward end is armored with a nose of pressed steel, while for a distance of two feet aft of this, aluminum panelling is applied to serve as a tray for catching oil dripping from the engine and to preserve the approximate stream line formation. From this point to the rear the fuselage is covered with fabric. This describes the so-called open type.

In the enclosed type, the pilot and engine are completely housed in an aluminum structure, the propeller being the only exposed portion in front. Windows are provided on either side and in the forward portion of the housing. The wings are attached in sockets above and below the side windows. Back of the pilot's position the framework is completely covered top and bottom, making a decidedly novel construction, but one which is obtaining favor with other European manufacturers.

The main planes are constructed in sections that are readily attachable and detachable by means of the simple clip arrangement presented in an accompanying sketch. This is held to possess the advantage of permitting easy repairs by simply replacing the damaged section. The planes are covered on both sides with cotton fabric, which is sized and varnished, after being stretched into position over the wooden wing skeleton.

Warping is employed to preserve lateral stability, the end sections of the main planes being flexed in much the same manner as with the Wright biplane. To accommodate the warping

Digitized by Google

movement the rear boom of each end section is hinged to its rigidly braced continuation in the inner wing sections by the simple hinge device shown herewith, so that in the process of wing flexing that portion of the rear boom moves helically.

Mention should be made of the compression struts that brace the main planes, these being held in position by welded steel sockets and ears, to which the bracing wires are attached, and are formed integrally with the base of each socket. It also will be noted that with the enclosed type the ends of the wings are protected by looped skids.

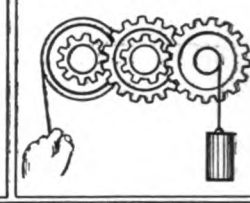
The empennage is unique as regards the shape and area of the flat fixed tail plane, to the rear edge of which are hinged two elevators. The tail plane is rectangular and of fairly high aspect ratio. The rudder and the pair of elevating flaps swing on hinges, having one pin to each series. A wooden skid, anchored by a stout elastic band to the bottom member of the body and loosely attached to the mast which forms the rudder post, and to which the horizontal tail surface is braced, protects the entire assembly.

The landing chassis is not unlike the Henri Farman conception. Two fairly thick struts connect the front of the fuselage with the forward parts of the skids and afford additional protection in case of a rough landing. The wing skids seen in the perspective drawing also are employed on the open type, in which event but one skid is utilized on the landing chassis as indicated therein.

Control is by a central lever, at the upper extremity of which is mounted a rotable wheel, which governs the wing warping. A backward and forward movement of this lever controls elevation and depression. A pivoted foot bar operates the rudder.

Some Interesting Details of Avro Construction: A, Hinged Rear Spar for Wing Warping; B, Attachment of Skid Struts; C, Arrangement of Empennage Components; D and F, Cross Section and Method of Bracing Fuselage; E, Clip for Assembling Wing Sections.

ITS MOST SUCCESSFUL YEAR.



The Willys-Overland Company, Toledo, O., finished the most successful year in its history, Aug. 1, on which date the total product of cars for the 1912 season was 20,845. Under the direction of President John N. Willys the company has risen in the past five years to a position where it ranks second in the number of cars produced by one concern in the United States. The production by months for the fiscal year ending July 31 was as follows: August, 1911, 284; September, 869; October, 1472; November, 1851; December, 1588; January, 1826; February, 2201; March, 2960; April, 3011; May, 2605; June, 1591; July, 539.

THE TRAIL BLAZER.

The fourth issue of the Trail Blazer, a booklet, published in the interests of Findeisen & Kropf Manufacturing Company, Chicago, Ill., maker of the Rayfield carburetor, contains a number of interesting accounts of performances by pleasure and commercial cars, Rayfield equipped. Several cuts depict the scenery in various parts of the country, and there is also an interesting account of the growth of the Findeisen & Kropf company since its organization in 1910.

RECENT MOTOR VEHICLE PATENTS

Wainwright Shock Absorber.

A shock absorber which differs from those of the bumper type in that a spring device is incorporated in the rubber, has been patented by Richard T. Wainwright, Rye, N. Y. It is barrel shaped and means are provided for attachment to the body and axle of a vehicle. The resilient rubber member has a longitudinally disposed opening surrounded by a cylindrical spring imbedded in the rubber which is so shaped as to resist tensional and torsional stresses.

Sims Armored Tread.

Bona Sims, Valley Spring, Tex., has been granted a patent for a flexible armored tread for pneumatic tires. It is applied to the exterior of the casing and comprises a number of metallic plates which are diamond shaped and arranged divergently with respect to the plates of the adjacent row. Other plates are employed, these being similar in shape and both types are linked to one another. Means are provided for securing the outer row of plates to the casing.

Currin Dust Cap.

In pumping additional air into the tube of a pneumatic tire and when the valve stem is protected by a dust cap, it is necessary to remove this member, which operation takes more or less time. Sydney Allen Currin, Bristol, England, has patented a dust cap which presents interesting features as it is made in two sections, one of which may be removed quickly when desired. The part that is attached to the felloe of the wheel is threaded and it also has an annular shoulder and a split portion. The upper section has a similar annular shoulder which registers with that on the lower member, securing the portions.

Desmond Motor Starter.

A large number of patents have been granted of late on devices for starting the explosive motor. Among the more recent patents granted is one to John Desmond, Chicago, Ill., assignor to William S. Potwin of the same city. The device operates on the compressed air principle and includes a chamber for the storage of the atmosphere, and actuating means. The motor shaft is fitted with a ratchet and pawl mechanism which is pivotally mounted and operated by the piston rod of the air cylinder. The latter is fitted with a valve which opens and closes at the two extremes of the movement of the piston rod and the actuating lever is returned to its normal position by means of a spring.

Leclerc-Schmitt Rear End Bumper.

Bumpers are generally fitted to the front of a motor car, but a new application of the protecting device is noted in the patent granted Moise L. Leclerc and William Schmitt, New York City, assignors to said Leclerc and Frederick W. Darnstaedt of the same city. The buffer is attached to the rear of the machine and its hanger rods are secured to the frame. Brace links connect the lower portion of the hangers to the frame and guide sleeves are fitted through which the buffer rods move. The buffer bar proper is secured to the rods and interposed between the members is a cushioning spring, the movement of which is limited by stop collars.

Fortmann Signalling Device.

Gustave Fortmann, Philadelphia, assignor of one-half to George W. Cook of the same city, has been granted a patent for a signalling device which is a box like member and designed for attachment to the rear of a motor car. The member is divided into a number of horizontal partitions and these are fitted with transparent plates inscribed with suitable words which are illuminated at night. Means are provided for operating the signals as desired as well as for lighting each compartment separately.

Cox Magneto-Battery Switch.

Henry G. Cox, Detroit, has been granted a patent for a magneto-battery switch which comprises two sets of independent circuit terminals, a terminal controlling member, also a flexible support for the latter, and permits a tilting movement into three different positions by movement in the same direction but upon different portions. The controlling member is equipped with means for co-operating with the independent circuit terminals for the opening and closing of each circuit.

Digitized by Google

OTHER PATENTS GONE TO ISSUE.

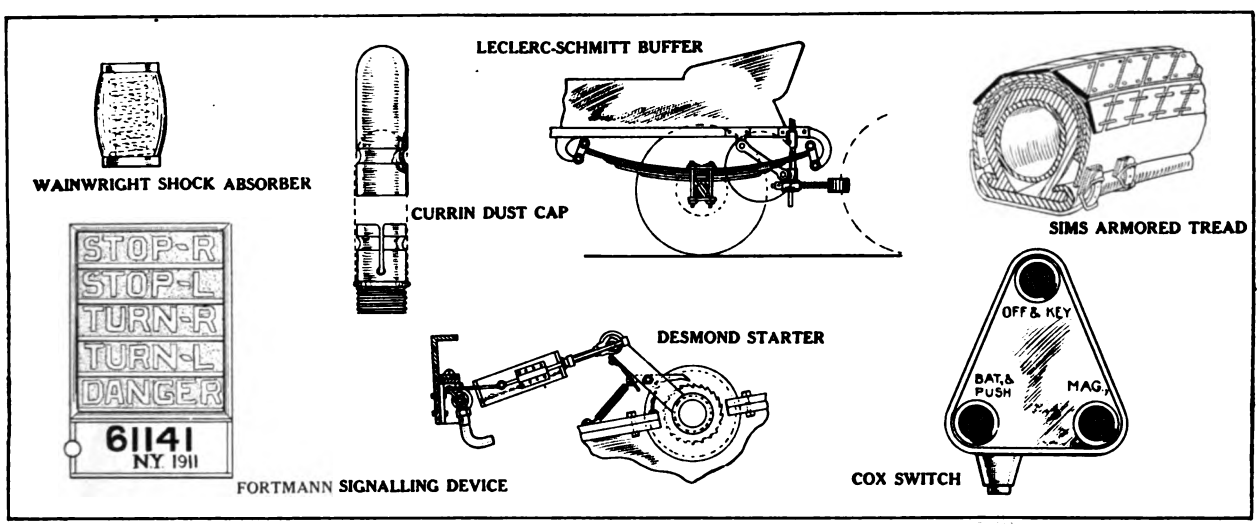
Tire Holder, John Clarence Cole, Chicopee Falls, Mass., assignor to the Fisk Rubber Company of the same place. A tire holder having three supports with adjustable jaws for gripping the inner periphery of the shoe and a locking device to tighten the grip of the members.

Cable Holder, James P. Holloway, Washington, D. C. A device for holding flexible cables, comprising a pair of rigid fingers and a clamp for securing holder.

Explosive Motor, William S. Lee, Detroit. The cylinder is provided with two bores and has a slidable valve sleeve with corresponding external diameters and a bore of a like number of diameters, and means for actuating sleeve.

Brazing Burner, William H. Van Horn, Baltimore, Md. The device includes a fuel chamber and means for conveying same to a jet nozzle and pilot burner. The latter is connected to the jet member by a separate passage and is provided with a number of outlets adapted to maintain the flame of the jet nozzle against extinguishment by the pressure of the gas. Means are also provided to regulate the flame as well as to shut off the supply of fuel to the burner.

Motor Starter, Myron T. Baird, St. Louis, Mo. An explosive mixture is led by tubing to each cylinder of the internal combustion engine. The vapor is distributed by means of a rotating mechanism driven by belt and a push rod is utilized to actuate the rotative member.



Acetylene Purifier, Albert B. Cobb, Waterbury, Conn. A gas purifier consisting of a casing having an outlet for the gas, a funnel in the top of casing, and a vertically arranged pipe closing the bottom of the funnel and opening into the upper end of the same, and a series of blades swivelled on the pipe below the funnel.

Vehicle Wheel, Charles Whitfield Barrett, San Jose, Cal. A vehicle wheel comprising a pneumatic clincher cushion surrounding a hub and means for securing clincher devices.

Insulating Support, George H. Morris, Glencoe, Ill., assignor to the Electric Storage Battery Company, Philadelphia. An insulating support for storage battery tanks comprising an insulating liquid receptacle having a supporting core of rigid material and a cap provided with yielding material adapted to overlie the core and with a flange or skirt depending around the receptacle.

Tire, Heinrich Knoch, Adlershof, near Berlin, Germany. The combination of a felloe and a tire of solid blocks provided with laterally disposed grooves therein, rings sunk in said grooves with their outer faces flush with the outer side faces of said blocks, and means for fitting the flush sides of said blocks and rings for securing the tire to the felloe.

Sheet Metal Cutter, Ephraim L. Schanck, Delaware, O., assignor of one-fourth to M. C. Russell of the same place. A device for cutting holes in sheet metal, comprising a rotary cutting member, a support for same and a handle for actuating the cutter.

Some of the More Recent Ideas of Inventors Working Along Lines Applicable to the Motor Car, Including an Armored Tire, Shock Absorber, Motor Starter, Rear Bumper, Signalling Device, Etc.

Expansion Reamer, Delano H. Dugar, Milwaukee, Wis. An expansion reamer comprising a longitudinally channelled body, a bolt swivelled to one end thereof, a set of blades and means for adjusting and securing the latter.

Battery Cell Container, Thomas A. Edison, Llewellyn Park, N. J., assignor to the Edison Storage Battery Company, Orange, N. J. A container for battery cells, comprising a frame adapted to stand upon a supporting surface, and means for supporting a plurality of cells out of contact with each other, and for preventing lateral movement of same relative to the frame.

Shock Absorber, Thomas J. Mullen and Thomas F. Brennan, New Brighton, N. Y. Comprising an air bag in a reciprocating compression frame with a spring and means for attaching mechanism to the axle and body of vehicle.

Spring Wheel, George L. Webb, Spencer, N. C., assignor of one-half to Michael L. Kiser, of the same city. The spokes of the wheel are fitted to a socket member and a spring is utilized between the spoke and hub of the wheel. The spring section of the spoke is provided with a packing and the space between it and the hub forms a compression chamber.

Recoil Check, William A. Johnson, Chicago. A combination of a cylinder, piston and rod, valve chamber and annular series of springs.

Windshield, Almer B. Thomas, Hardwick, Vt. A flexible windshield supported on the dash by means of rods and a cross bar, also side flaps and means for securing and adjusting same.

Motor Starter, Charles G. Adsit, Detroit, assignor of one-fifth to Sidney B. Winn, one-fifth to George H. Brown, one-fifth to Charles H. Land, Jr., and one-fifth to Nathan H. Jewett, all of the same city. The device comprises a carburetor, a pump and an electric motor to drive the pump. Each cylinder is fitted with tubing having ball check valves, also a solenoid for each valve to lift it from its seat. A rotary selector is connected to the solenoids and means are provided to supply an explosive mixture to each valve casing.

Motor Starter, William J. Foster, New York City. An igniting device for explosive motors having an igniter, a magneto driven by the engine, a condenser and means for charging same from magneto while motor is running and means for discharging condenser when the magneto is at rest.

Starting Crank, Axel M. Walstrom, Minneapolis, Minn. The starting handle is connected to the engine shaft by means of an internally toothed gear having frictional engagement with the starting crankshaft. The starting handle is provided with a gear which meshes with the other pinion and is enclosed in a casing.

NATIONAL CONTEST AND RACING NEWS.

Disbrow in Simplex Is Feature of Galveston Beach Results---Canadian Speedway Opens---Routing for Glidden Tour---Entries for Elgin Meet---Wishart to Drive Mercer---Preparing Course at Milwaukee.

Louis Disbrow in a Simplex special racing machine appears to have been the feature of the three-day beach meet at Galveston, Tex., early in the month. Not only did he take the 50, 75 and 200-mile events, but he created a new mile record for the beach, his time being 0:31.11. The summary follows:

THURSDAY, AUG. 8.

Fifteen Miles, 231-300 Inches.

Car.	Driver.	Time.
Case	J. Nikrent	15:04.62
Case	Disbrow	15:05.00
Mercer	Ferguson	15:09.70

Fifteen Miles, 161-230 Inches.

Mason	H. Endicott	15:27.75

AN ALL-STAR EVENT.

The Metropolitan Motor Speedway Association of New York City is planning a novel contest for the opening event on the Metropolitan speedway at Kearney Meadows, N. J., next spring. A prize of $25,000 is to be offered for competition between winners of the Vanderbilt Cup, Grand Prize and 500-mile races in this country, and of the Grand Prix in France. This will make eligible Boillot, Lautenschlager, Sziz and Nazzaro as Grand Prix winners, and Ralph Mulford, Harry Grant, Louis Wagner, Victor Hemery, George Heath, George Robertson, Joseph Dawson and Ray Harroun.

OPENING MEET AT CALGARY.

The motorists of western Canada have become decidedly interested in automobile racing, and the new Gridiron speedway near Calgary, Alberta, was opened early in the month. The meet signalled Barney Oldfield's return after an enforced absence from racing for nearly two years. Two American cars, made by the American Motors Company, Indianapolis, Ind., were the features of the day, however. The summary follows:

Three Miles.

Car.	Driver.	Time.
Cino	Oldfield	4:06.0
Benz	Heinneman	.....

Three Miles.

Cino	Fritsch	2:48.0
Benz	Heinneman	....

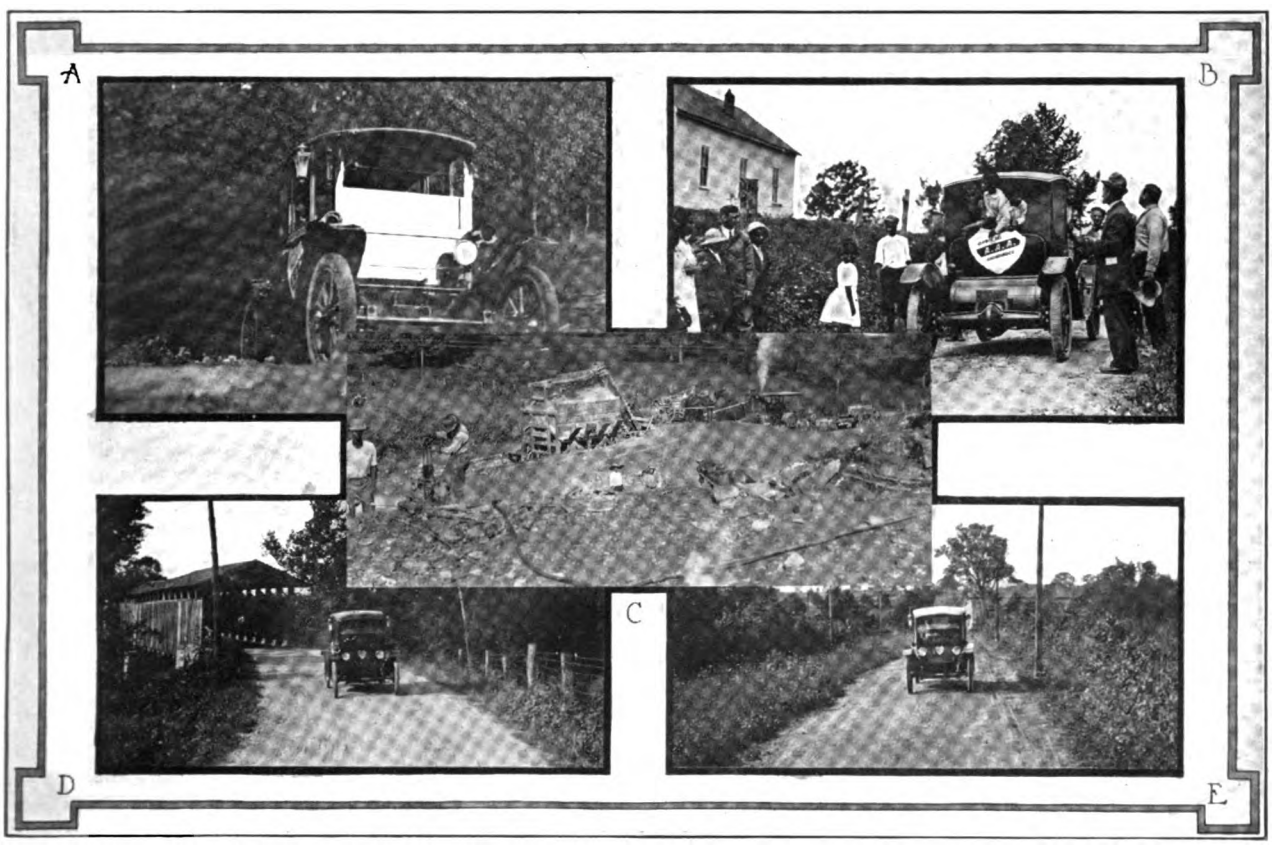
One Mile.

American	Stearns	0:53.8
American	Gresswick	....
Rochet-Schneider	Jullien	....

Five Miles.

American	Stearns	4:08.0
American	Gresswick	....
Rochet-Schneider	Jullien	....

GLIDDEN TOUR ROUTE.



Despite the effort to eliminate all reference to the Glidden tour in connection with the 1912 national reliability tour, the main prize this year being the new A. A. A. trophy, the event is still so termed by those who cherish the memory of the great American motoring classic. The first three cars to enter for the contest are Everitts, made by the Everitt Motor Car Company, Detroit.

The Flanders electric, made by the Flanders Manufacturing Company, Pontiac, Mich., which is pathfinding the route, has completed a large portion of the distance, although it is anticipated

Digitized by Google

that the hardest part of the task lies before it. Accompanying illustrations indicate that road conditions in Kentucky have changed materially since 1910, when the Glidden tour covered some of the same territory.

The tourists will leave Detroit, Oct. 7. The route will lie through Adrian, Mich.; Fort Wayne, Muncie, Anderson and Indianapolis, Ind.; Louisville, Hogdenville and Mammoth Cave, Ky.; Columbia, Tenn.; Florence, Sheffield and Tuscumbia, Ala.; Memphis, Tenn.; Jackson and Vicksburg, Miss.; thence across the Mississippi river to Baton Rouge and New Orleans, La. After reaching New Orleans, the members of the party will have opportunity to visit Panama, although the road conditions in the Canal Zone do not permit of motoring across the isthmus, as was originally planned.

With the Flanders Electric Pathfinder in Kentucky: A, at the Entrance to Mammoth Cave; B, Negro School Near Lincoln Farm in Buffalo; C, Road Building Scene on Line of Tour; D, an Old Covered Bridge on Bardstown Pike; E, Twenty Miles Out of Louisville.

DRIVE A DEAD HEAT.

What is believed to have been the first dead heat race in the history of the automobile industry, at least on a circular track, resulted in the recent meet at Kansas City, when Joseph Nikrent in a Case and William Endicott in a Schacht finished so close together that the officials were unable to determine a winner. The tie was decided by a contest between these two drivers, in which Nikrent finished about two feet ahead of his opponent.

FIVE ELGIN ROAD EVENTS.

Those in charge of the postponed Elgin road races, which will be open to non-stock cars, instead of stock machines as in previous years, have decided upon five events, three of which will be held Aug. 30 and two Aug. 31. The old trophies will be retained, although the nature of the contests is to differ materially from what was originally planned.

Friday, Aug. 30, the event for the Aurora trophy, for cars of 231-300 cubic inches and covering 152 miles, will be run simultaneously with that for the Illinois trophy, for cars of 231-450 inches, and covering 203 miles. The entries for the first award mentioned include Spencer Wis-

Digitized by Google

hart in a Mercer, a Fal-Car and an Ohio, for which drivers have not been named as yet. In the longer race Gilbert Anderson and Charles Merz will appear with Stutz cars, and another Fal-Car completes the list to date.

At the same time the so-called "baby" car race for cars of less than 230 cubic inches will be held for a distance of 92 miles. The prizes are two in number, $300 and $200 in cash, respectively. Already, Harry Endicott in a Mason, Tower and Evans in Studebakers and two Herreshoffs, drivers unnamed, are entered.

The big events will take place Saturday, when the race for the Elgin National trophy for cars of less than 600 inches, and a free-for-all will be run at the same time. The first race will go 254 miles and the other 306. For the Elgin trophy the following are entered: Bruce-Brown, Fiat; Mulford, Knox; Zengel, Stutz; Knipper, Stutz; Hughes, Mercer; Wishart, Mercer; Clark, Mercedes; Tetzlaff, Fiat. Of these, Bruce-Brown, Mulford, Wishart, Hughes, Clark and Tetzlaff will continue in the longer event, while Erwin Bergdoll also will drive his Fairmount Park Benz in the free-for-all.

MEET FOR PITTSBURG.

Evidently Robert Burman is not to be seen in the Vanderbilt Cup race, since he is scheduled to drive the "Blitzen" Benz at a meet in Pittsburg, Penn., Sept. 21. Among the other cars entered for the contests in this city is Camile Janatzy's Mercedes, which will be driven by Hickman of Stuttgart Unterturkheim, Germany. Inasmuch as these two machines have held the world's record for speed, regardless of class, their appearance as competitors in the same race is expected to create a lively interest in the meet.

STOCK OR NON-STOCK RACES.

At the midsummer meeting of the Manufacturers' Contest Association in Detroit, Aug. 15, answers were received from a large number of automobile manufacturers, who do not belong to the association, in response to questions issued by its secretary, in which an effort was made to arrive at some decision with respect to stock car racing in the future. As is well known by those who have followed the racing end of the industry, the list of stock events has decreased materially during the present year. In all the answers received there was but one which was not enthusiastic over the good the association has accomplished during its existence. The sentiment regarding stock and non-stock races was about evenly divided.

Among the other matters taken up was the part that commercial vehicles should play in the future of contests. Those present included: Howard Marmon, Nordyke & Marmon Company; Howard E. Coffin, Hudson Motor Car Company; C. A. Emise, Lozier Motor Company; George M. Dickson, National Motor Vehicle Company; E. W. Curtis, General Vehicle Company; M. C. Meigs, J. I. Case Threshing Machine Company; Paul H. Bruske, Studebaker Corporation; Russell A. Field, assistant secretary-treasurer.

WISHART WITH MERCER.

Probably the most interesting bit of news in connection with the Vanderbilt Cup and Grand Prize races is the announcement that Spencer E. Wishart is to appear at the wheel of a Mercer car, made by the Mercer Automobile Company, Trenton, N. J. Heretofore, Wishart always has placed his faith in the Mercedes, and while he never has been so fortunate as to secure first place, all efforts to prevail upon him to try an American machine have proved unavailing until the present time.

Although it was originally announced that the Milwaukee events would take place over the Greenfield course, the change in plans, resulting in the selection of the Wauwatosa course, has been approved by the contest boards of the American Automobile Association and the Automobile Club of America, the former acting in connection with the Vanderbilt Cup, Pabst Trophy and Wisconsin Trophy events, and the latter for the Grand Prize.

Work is progressing most favorably, something over 5500 loads of stone having been utilized in regrading the surface for the entire 8.2 miles. Oiling began Aug. 20, and it is expected that the first practise will be permitted Sept. 1, at which time work will begin on the grand stands.

Among those who have made conditional entries are Ralph Mulford, winner of last year's Vanderbilt, in a Knox; David Bruce-Brown, winner of the Grand Prize in 1910 and 1911, in a Fiat, with Teddy Tetzlaff and Caleb Bragg as teammates; Spencer Wishart and Hugh Hughes in Mercers, and Erwin Bergdoll in a Benz.

The third annual reliability tour of the Automobile Club of Buffalo will be held Sept. 11-14, covering some 800 miles in New York and Pennsylvania. Orsen E. Yeager is chairman of the committee having the details in charge.

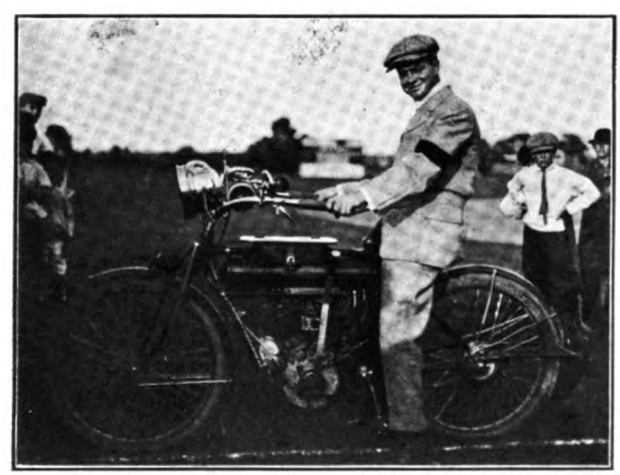
ACTIVITIES OF MOTORCYCLISTS, THE RIDER, THE MANUFACTURER, AND THE DEALER

Patterson Reappoints Committees.

President B. J. Patterson of the Federation of American Motorcyclists has announced his intention of continuing the policies inaugurated by his predecessor and has reappointed the chairmen of the important committees as follows: Competition, Dr. J. P. Thornley, New York City; membership, E. M. Estabrook, Bangor, Me.; legal action, J. Leo Sauer, New York City; press, F. I. Willis, Indianapolis, Ind.

Membership Still Increases.



According to the report of Secretary-Treasurer G. B. Gibson, 936 new members were added to the list of the Federation of American Motorcyclists last month, divided according to states as follows: Ohio, 215; Pennsylvania, 102; Indiana, 88; Kansas, 76; Illinois, 69; New York, 65; California, 43; Michigan, 34; Massachusetts and Wisconsin, 27 each; Canada, 23; Oregon, 18; Washington, 17; New Jersey, 15; Florida, Virginia and Philippine Islands, 10 each; Georgia, eight; District of Columbia and Nebraska, seven each; Maryland and Rhode Island, six each; Alabama, Connecticut, Kentucky, South Carolina and Utah, four each; Colorado, Iowa and Oklahoma, three each; Texas, two; Idaho, Maine, Minnesota, Montana, New Mexico and Panama, one each.

Troubles with Race Promoters.

Dr. J. P. Thornley, chairman of the competition committee, F. A. M., appears to have a decidedly troublesome task upon his hands, judging from the number of communications he has been sending to race promoters throughout the country. These would seem to indicate that there was a movement on foot to adopt tactics that are not conducive to the best interests of the sport.

In one instance Dr. Thornley claims to have discovered evidence which would substantiate the claim that the race was fixed so that a certain rider should win, but only by a wheel length. In another case, it is claimed that a well known rider was to make some kind of a record, but was not to receive first money in the race, while the others were led to believe they were to win as follows: Second, $50; third, $25; fourth, $10. As a matter of fact, it is understood that the second man received $25, and although the fast rider outclassed all others in the event he did not secure first prize. Dr. Thornley has taken up the matter with the promoter, suggesting that it was a clever move as a result of which the management saved the $50 which was offered as first prize.

The tenor of Dr. Thornley's communications is that such practises must cease. The policy of the F. A. M. always has been in favor of clean sport. Apparently, Dr. Thornley is well within his rights in seeking to eliminate all doubt as to the proper handling of the various events.

Paul Peck, Holder of American Duration Record in Aviation, and His Flying Merkel.

Aviator on a Merkel.

Paul Peck, who holds the American duration record for aviation with a Columbia biplane, finds considerable recreation in using a motorcycle when not enjoying a trip into the clouds. The camera has caught him astride a Flying Merkel, made by the Miami Cycle & Manufacturing Company, Middletown, O., which he declares is his favorite mount.

Manufacturers' Annual Meeting.

At the annual meeting of the Motorcycle Manufacturers' Association in Detroit, August 8, the old board of officers was re-elected, with one exception, as follows: President, A. B. Coffman; vice president, Kelly R. Jacoby; secretary, L. D. Harden; treasurer, Frank J. Weschler. Secretary Harden was chosen to fill the vacancy caused by the resignation of J. F. Cox.

Those at the meting were: A. B. Coffman, Yale; Frank J. Weschler, Indian; Kelly R. Jacoby, Merkel; W. G. Schack, Emblem; L. D. Harden, Pope; Staunton, Flanders; W. A. Johnson, Pierce; H. F. Turner, Minneapolis; A. S. Deysher, R-S; Norbert H. Schickel, Schickel; D. J. Hurley, Thor; Ignaz Schwinn, Excelsior; W. T. Marsh, M-M; W. F. Remppis, R-S; R. M. Brown-

Hirah G. Baxter, Providence, R. I., and His New Four-Cylinder Henderson.

son, Triumph; W. B. Colburn, Pierce; George W. Sherman, Triumph; Arthur Davidson, Harley-Davidson; W. T. Henderson, Henderson.

Motorcycles in Forestry Work.

The forest rangers of Porterville, Cal., have been equipped with motorcycles and can now travel between 150 and 200 miles on their reserves, while 50 miles daily was their best average with horses.

Cleveland Restricts Mounts.

Perhaps it was a mistake that Cleveland, O., was not selected as the convention seat, and then again, perhaps it isn't. Councilman Laferty has introduced an ordinance increasing the motorcycle registration fee from $1.50 to $3. His reason is that there already are too many machines in the city and it is about time to increase the taxation. The Cleveland Motorcycle Club has taken up the matter with Mayor Baker.

Kansas Short Grass Club.

Carrying its own camping equipment and accompanied by a brass band of 40 pieces, a motorcycle baseball team and other means of entertainment, the Kansas Short Grass Club is enjoying its annual tour. This is one of the most pretentious journeys in the history of the motorcycle industry and will occupy 15 days. The route lies through Kansas, Nebraska and into Colorado, and return, a distance of more than 1000 miles.

Baxter Adds Henderson.

Hirah G. Baxter, Providence, R. I., who has been state distributor for the Excelsior mounts for the past year, has added the Henderson four-cylinder line, made by the Henderson Motorcycle Company, Detroit. Herewith is presented a photograph of Mr. Baxter trying out his latest demonstration machine.

New Motorcycle Lamp.

An electric bicycle or motorcycle lamp was recently introduced in Amsterdam, Holland, which is bound to prove popular as soon as put into general use. The current for supplying the light is to be generated by the operation of the bicycle or motorcycle. A small wheel attached to the shaft of the dynamo rests on the front or rear wheel of the mount and makes enough speed to operate the lamp. A speed of 10 miles an hour is said to give a powerful light.

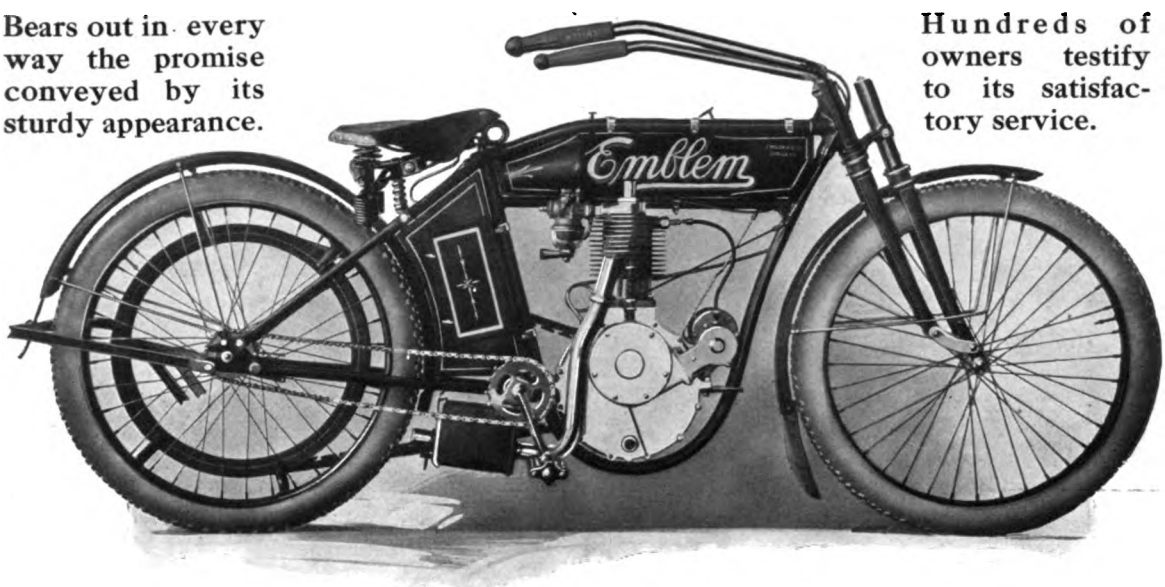
Mesinger's New Factory.

The H. & F. Mesinger Manufacturing Company recently took possession of its new saddle factory at 144th street and Austin place, New York City, said to be the largest plant of its kind in the United States. The new factory is in proximity to the railroad tracks, facilitating shipping; is of mill construction, well lighted and provides 30,000 square feet of floor space. The Mesinger concern is one of the oldest makers of bicycle and motorcycle saddles in the country.

Columbus to Seal Cut-Outs.

Chief of Police Charles Carter of Columbus, O., has decided upon a drastic measure with reference to the cut-out in that city. He has prepared for introduction in the city council an ordinance compelling the sealing of muffler cut-outs on all motorcycles and automobiles.

Emblem Doubles Capacity.



President W. G. Schack of the Emblem Manufacturing Company, Angola, N. Y., maker of Emblem mounts, announces that his concern will almost double its capacity for next year, producing 5000 machines. The new story which has

been added to the factory building is now being roofed over. Work also has been started on an addition to the plant on the rear. This structure will be 105 by 40 feet and will be the same height as the main building, five stories.

High Cost of Living.

In connection with his attempt to solve the problem of the high cost of living Patrolman Richard Tatham of San Francisco has been making an investigation which leads him to believe that from the standpoint of a mounted policeman the odds are in favor of the motorcycle. His table of figures shows that while it costs six cents a mile to travel by horse and buggy on city business, the same distance can be covered in one-third of the time for half a cent a mile on the two-wheeled mount.

In Mail Collection.

After experimenting for 90 days, the United States government has concluded that the motor cycle contributes to an effective system for the collection of mail, with the result that a bill has passed the House of Representatives appropriating $1,000,000 for the purchase of sufficient machines for use in various large cities. The Postoffice Department also has discovered that the motorcycle has proven decidedly economical and efficient on a number of rural carrier routes.

The machines tested by the government were equipped with a specially constructed van providing a chute where mail could be dropped in and a hopper bottom from which it could be delivered at the postoffice. The addition of the motorcycle to the equipment of the Postoffice Department is a decided step for economy and efficiency in the handling of mail.

Club Runs in Philippines.

Ideal conditions are provided in the Philippine Islands for motorcycle runs, and members of the recently formed Luzon Motorcycle Club of Manila, have sent word to this country of many

JOIN THE F. A. M.

which is the National Organization fostering the interests of motorcyclists along legislative and other lines. Cut this out, mail it, and you will get the reasons.

pleasant runs. The riding season lasts the entire year, and while there is no place for racing, much enjoyment is taken in runs into the country. The longest ride from Manila is that to Baguio, 5000 feet elevation, about 200 miles north, where there is a ride of 100 miles to Atimonan, south. The club is active in attempting to secure a betterment of road conditions.

Charles Collins of Danville, N. H., and His Indian.

Troxels for Merkels.

One of the 1913 features recently decided upon for the Flying Merkel, made by the Miami Cycle and Manufacturing Company, Middletown, O., is that the regular saddle equipment will be the Troxel, made in Elyria, O. Several improvements that will add to the comfort and convenience of riders are being planned by the maker of Merkels, it is stated.

Makes Remarkable Trip.

F. W. Baum of Champaign, Ill., recently covered a distance of 1606 miles, by speedometer, in 7.5 days, an average of over 214 miles a day on an M-M, made by the American Motor Company, Brockton, Mass. He rode from Champaign to Chicago and return, thence to Indianapolis, Ind.; Columbus, O.; Wheeling, W. Va.; Uniontown, Penn.; Cumberland, Md.; Martinsburg, W. Va.; Washington, Atlantic City, Baltimore, Philadelphia, New York, Boston and the factory at Brockton, Mass. After stopping there for a few days he planned to return to Boston, from which point he was to sail for the British Isles.

Trials for Passenger Machines.

Such has become the popularity of the passenger carrying motorcycle in England, that trials were recently held by the North West London Motorcycle Club in a run from London to Coventry and back. Out of 33 starters, 22 successfully completed the trip on schedule time. The Woolwich Club was the winner of the team prize, the club being represented by four eight horsepower Matchless machines.

Portland Club Elects.

The Portland Motorcycle Club of Portland, Ore., recently elected the following officers for the ensuing year: President, H. F. Mead; vice president, Harry Brandt; secretary, H. K. Donnegan; treasurer, J. B. Lindsay; assistant treasurer, William Hodeker; captain, Fred Nowatney; lieutenants, William Hodeker and C. J. Ford; sergeant-at-arms, Herbert Zeppenstein; director, E. O. Lucas. Plans are being made for a number of endurance runs and a track meet.

Motorcycles for Police.

The purchase of 22 motorcycles for the police department of San Francisco, Cal., has been recommended by the police commissioners to the city officials. The recommendation calls for 10 seven horsepower Indians, 10 seven horsepower Harley-Davidsons and two Hendersons. Previous to the decision to buy the machines, a series of trials and tests, including races, hill climbs and silence contests between the various makes, were held.

Club Notes, Here and There.

The Worcester Motorcycle Club, Worcester, Mass., recently held a run to Mount Tom, near Holyoke, a distance of 65 miles and return.

The Vancouver Motorcycle Club, Vancouver, B. C., has secured new and attractive quarters, which the members are beautifying.

Mr. and Mrs. Henry Hunter of Providence, R. I., on Their Excelsior Tandem.

The Twin City Motorcycle Club, Norfolk, Va., is planning a race meet for Labor Day, when famen from neighboring states will be present, in-

cluding Thomas Dedge, district champion of Washington, D. C.; Frederick Tiemeyer, champion of Maryland, and Howard French of Baltimore.

The Lowell Motorcycle Club, Lowell, Mass., has elected Mark J. McCann as its new president.

J. J. Reid of San Diego, Cal., recently completed a motorcycle trip of 3500 miles along the Pacific Coast, at an expense of $15 for supplies.

E. F. Starke of Richmond, Va., recently started on a 4000-mile trip, having as his destination, San Francisco.

Annual Triangle Run.

The Providence Motorcycle Club, Providence, R. I., is laying plans for its annual triangle run from that city to Boston, Worcester and return. The date selected is Oct. 6 and B. A. Swenson has been chosen as chairman of the committee of arrangements.

Emblem Mount Stolen.

The Emblem Manufacturing Company, Angola, N. Y., maker of the Emblem, announces that a four horsepower Emblem, carmine finish, No. 4115, was stolen recently from its agent, Jerry Walling, Saddle River, N. J. Motorcycle dealers throughout the country are requested to be on the watch for this machine.

Racing at Brighton Beach.

New York people have been enjoying motorcycle racing at the new board track at Brighton Beach, Long Island, during the past two weeks. Arthur Chapple, riding an Indian, appears to have been the chief attraction. The results in some of the most interesting events were as follows:

Two miles, handicap—First, Lyons, Indian; second, Constant, Indian; third, French, Indian; time, 2:34.2. Second heat—First, Constant; second, French; third, Lyons; time, 1:45.2. Final—First, Constant; second, French; time, 1:41.

Five miles, professionals—First, Wray, Indian; second, Shields, Indian; third, Lockner, Indian; time, 3:49.4. Second heat—First, Lockner; second, Wray; third, Groning, N. S. U.; time, 4:07.4. Final—First, Wray; second, Lockner; third, Groning; time, 3:50.4.

Four miles, match—First, Chapple, Indian; second, Peck, Excelsior; time, 2:47.2. Second heat—First, Chapple; second, Peck; time, 2:43.2.

Ten miles, handicap—First, Albright, Indian; second, Lockner, Indian; third, Groning, N. S. U.; time, 7:17.8.

Three miles, handicap—First, French, Indian; second, Doefler, Merkel; time, 2:25.4. Second heat—First, Wray, Indian; second, French; third, Doefler; time, 2:23.4. Final—First, Wray; second, French; third, Doefler; time, 2:17.2.

Four miles, match—First, Chapple, Indian; second, Fleckstein, Indian; time, 3:00.6. Second heat—First, Chapple; second, Fleckstein; time, 3:00.4.

Paul Brudi, Rural Mail Carrier in Fort Wayne, Ind., and His Emblem Mount.

Six miles—First, Albright, Indian; second, Lockner, Indian; third, Wray, Indian; time, 4:20.6. Second heat—First, Albright; second, Wray; third, Lockner; time, 4:47.2. Final—First, Wray; second, Lockner; third, Mercier, Indian; time, 4:31.8.

Three miles—First, Constant, Indian; second, French, Indian; third, Wray, Indian; time, 2:29.6. Second heat—First, Constant; second, French; time, 2:25.4.

ELEMENTS OF MOTORCYCLE CONSTRUCTION.

Part XVII—Outlining Valve and Ignition Timing and Care of the Magneto—Suggestions for Completing the Overhaul of the Mount.

(By C. P. Shattuck.)

THE removal of pulleys, sprockets, timing gears, cams or other parts of the mount forced on either a round, taper or squared shaft, is a task that will appear difficult to those not versed in mechanics and in attempting the work the novice is liable to damage the parts, especially if metal wedges and force are utilized. Although there are several methods of accomplishing the work, the kink outlined at Fig. 97 A may be adopted with success, and the tools may be made easily and are not expensive.

They consist of two bars of spring steel, about 20 inches long and 1.125 by .25-inch section, with one end of each bent at right angles to a depth of about one inch. The method of using the levers is depicted in the drawing. The short, bent ends are placed between the object to be removed and the engine base, and pressure is applied in opposite directions to the free ends. If the space available at the back end of the part is greater than the width of the lever at the bent end, it may be necessary to insert a piece of packing of suitable thickness.

To avoid crushing the metal of which the crankcase is usually made, it is advisable to insert a piece of strong sheet metal of horseshoe shape so that it will fit over the shaft and remain in position while the ends of the lever are pressed against it. It should be borne in mind that if the part is heated, and the joint liberally covered with kerosene before pressure is applied, it will be more easily removed. Similarly, a tapping of the shaft while pressure is applied under the part will loosen it where a steady pressure fails.

Pulleys and Belts.

If the pulley is worn and of the V type it may be returned to 28 degrees true, but the gear ratio will be slightly reduced in the returning. The care of belts is important and the old member, if serviceable, will require cleaning and dressing. If a new belt is needed make sure that it fits the pulley, and a good test of a belt is to note if it can be looped around a three-inch pulley without undue effort.

Belt slip is due to two principal causes; running the belt under wrong conditions, and when the member does not fit. With the V type the belt should sink into both pulleys so that its top edge is just flush with that of the pulleys, and its bottom edge well away from the bottom of the groove. This gives the sides of the V their full contact area. Some pulleys are turned to 30 and 40 degrees, and a 28-degree belt will not grip properly. A correct pulley wears gradually, whereas one of poor design is poor economy. A rubber belt must be kept clean, and a leather one must be kept dressed with lubricant and free from mud or grit. When these conditions are observed, belt slip is reduced to a minimum.

In the final adjustment of the bearings the

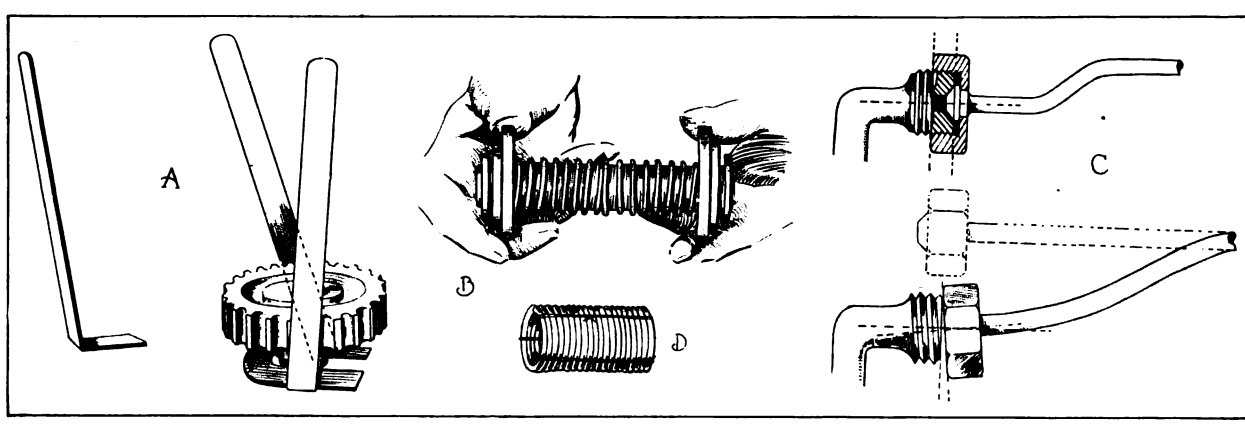

Fig. 97—Hints in the Overhaul: A, Method of Removing Pulley, Gears, Etc.; B, How to Test Tension of Automatic Valve Springs; C, Wrong and Right Way of Making Fuel Connections; D, Depicting How to Tie Valve Spring to Facilitate Replacement.

Digitized by Google

novice will do well to make sure that they are wiped cleaned and well covered with lubricant before finally being locked. The nuts should be set up snugly and where cotter pins or locking devices are employed these must be fastened securely. Smear the piston head and combustion chamber with graphite. This will prevent the accumulation of carbon. It is also advisable before replacing the cylinder on the crankcase to squirt plenty of oil on the cylinder walls, as well as piston rings, and to work the piston up and down a few times to insure that all parts are well lubricated.

The next step is to replace the crankcase and the sections must be carefully cleaned to insure a tight fit. Take up on each nut a little at a time until all are tight. In replacing the cylinder care must be exercised as the rings are fragile and broken easily. In attempting this work for the first time the novice is likely to pinch or cut his fingers. By taking a strip of thin sheet metal or tin and wrapping it around the piston, the rings may be compressed sufficiently to allow the cylinder to slide over easily. Do not attempt to crowd on the cylinder. It will go on easily if the rings are pushed into their grooves. In manipulating the rings do not change the position of the slots, else the compression of the motor will be affected.

If oil has been escaping between the crankcase and cylinder, and the trouble cannot be cured by tightening the nuts, it may be necessary to make a gasket of brown paper and cover it with shellac or oil. The gasket may be cut easily by placing the paper over the cylinder and tapping the edges lightly with a ball pein hammer, taking care not to injure the metal.

Adjusting Valves.

The motor is now ready to be placed in the frame where the work of fitting the valves, etc., will be done more easily. Before replacing the automatic valves, if those be employed, it is an excellent plan to test the members when the mount is a two-cylinder, or a new spring is to be fitted. A method of testing the tension of the spring is outlined at Fig. 97 B and the valve stems should be pressed together evenly. If correct both will open simultaneously. A weak spring will open first. Different tensioned inlet valve springs will affect the running of the motor and lead the rider to blame the ignition.

The automatic valve is assembled easily as it can be compressed by the fingers, but the mechanical members are more difficult and the amateur may struggle for some time before he succeeds in replacing the retaining key. A simple kink for making easy the work is shown at Fig. 97 D, which depicts a spring compressed and tied with string. It is a simple matter to compress the spring in the vise and tie it with string which is cut after the member has been slipped over the valve stem and the collar and locking device secured.

In fitting the valve it should not fit too tightly as when heated the metal will expand and the valve stick. This should be remembered when fitting a new valve. In adjusting mechanical valves it must be borne in mind that expansion takes place when they are hot and all adjustment should be made after the motor has been run. The

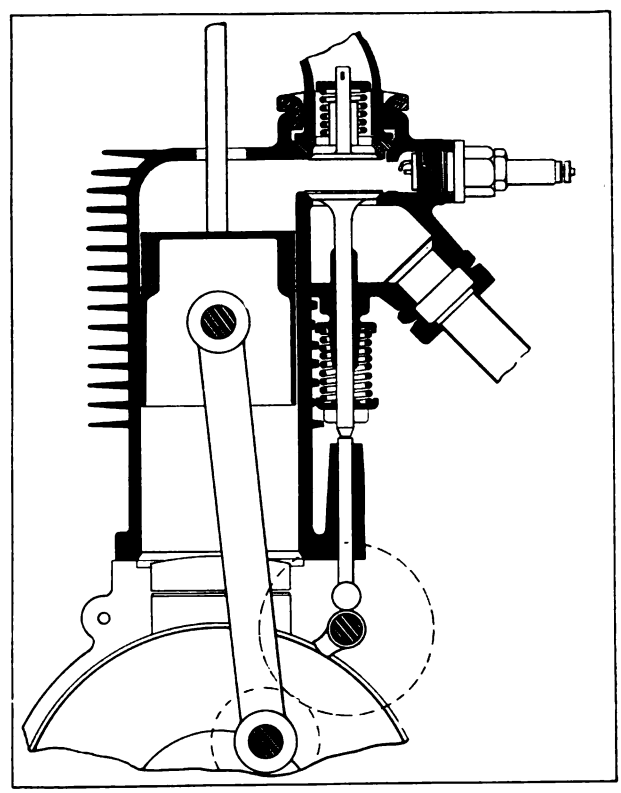

Fig. 98—Depicting Use of Rod to Locate Position of Piston When Timing Valves and Ignition.

proper space between the top of the tappet and foot when the engine is hot is about the thickness of a cigarette paper and an ordinary visiting card when cold. The space cannot be determined by measuring with the valve minus its spring as the former will seat more deeply when the tension is applied. There are various methods of lengthening the stems, such as peining, fitting a cap and drilling and tapping for a screw. It is important that the end be tempered and in attempting repairs the novice should bear this in mind.

If the timing gears are marked or have been

Digitized by Google

in the overhaul, it will be an easy matter to reassemble the motor. On the other hand if the novice has dismantled the motor without marking the gears, the valves will have to be retimed. Assuming that retiming is necessary: It is essential to remember that the small gear on the engine shaft is fixed and invariable—that the exhaust valve must close before the inlet stroke commences, and that the exhaust valve must have a certain amount of lead; that is, it should open a trifle before the firing stroke is completed.

A method of timing by piston lead is depicted at Fig. 98, which shows the components of the motor and method of utilizing a rod or bicycle spoke inserted in the valve cap space. In the drawing the piston is shown at the top of its stroke and a nick should be cut on the rod, after

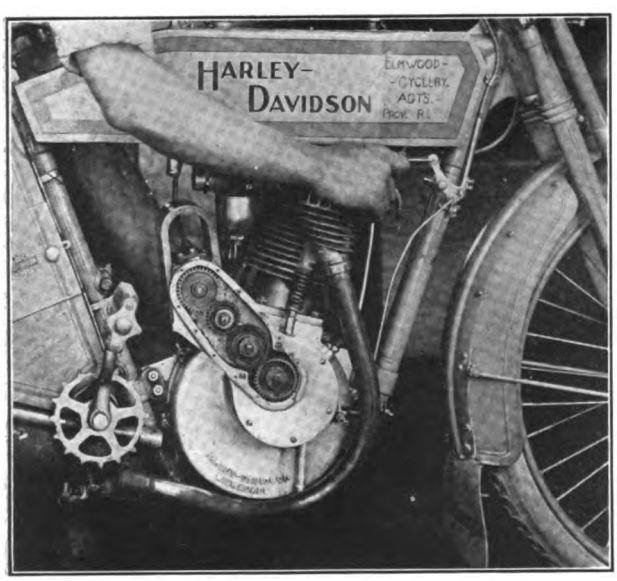

Fig. 99—Showing How Magneto Is Timed by the Expert Repairman.

which the crankshaft is rotated until the piston is at the bottom of its stroke, or dead centre, and the rod again marked. This gives the stroke of the piston. This is next divided into six, eight or 10 equal spaces and the bottom two or three are also marked.

Next, locate the firing stroke; that is, when the piston starts to descend immediately after the spark takes place. When the piston is five-sixths, seven-eighths, or nine-tenths down, mesh the exhaust gear wheel so that its cam just commences to lift the valve, not the tappet, at this point. The valve head is not discernible, but the action of the member may be ascertained by placing a sheet of cigarette paper between the tappet and valve stem which will grip the paper when the valve begins to lift from off its seat.

The amount of lead of the exhaust stroke varies in different motors and the timing may be tested by noting the completion of the exhaust valve action. If the piston has not started on the downward or intake stroke and the paper is released, it may be assumed that the timing is correct. But if the exhaust valve be left open for a fraction of the suction stroke, it is wrong and the valve must be retimed to open a trifle earlier —one tooth of the gears. If the intake valve has an entirely separate cam and pinion, it is set easily. It must open the instant the exhaust valve has closed; that is, as the piston commences its suction stroke, and must close before the piston commences the next upward or compression stroke. If there is separate ignition timing, it should be set with contact maker midway between advance and retard, so that the spark will occur when the piston is at the top of the compression stroke.

Features of Timing.

It should be borne in mind, however, that all valve timing depends largely upon the area of the valve opening, the position of the valves, the speed of the piston and the shape of the combustion chamber. It is customary with most motorcycle engines to close the exhaust about on dead centre. If the valve opening is restricted so that the exhaust is throttled, or if the exhaust pipe is very long and free from obstructions, so that the inertia of the exhaust gases themselves tend to create a suction effect and so tend to pull out of the cylinder more gas than would flow naturally, it sometimes will be necessary to hold open the exhaust valve until the intake opens. The valve timing instructions given herein are general and where possible it is advisable for the novice to obtain the formula from the factory or maker.

Having completed the timing of the valves, the valve caps are next replaced and these should be made gas tight. Before replacing the compression cocks, spark plugs, etc., the ignition must be timed. Where a battery and coil is employed it is an easy matter to time the spark and as this subject was dealt with fully in a previous installment, it will not be considered here. The adjustment of coils, contact breakers, etc., is familiar to the rider through experience.

Cleaning the Magneto.

Regarding the magneto the writer does not believe that there is much that the rider can do to the instrument and that it should be left alone. However, it may be cleaned to a certain extent, provided curiosity does not get the better of the amateur workman. Both the single and twin-cy-

Digitized by Google

linder Bosch models are depicted at Figs. 100 and 101, respectively, and the drawings will be of service in attempting the work.

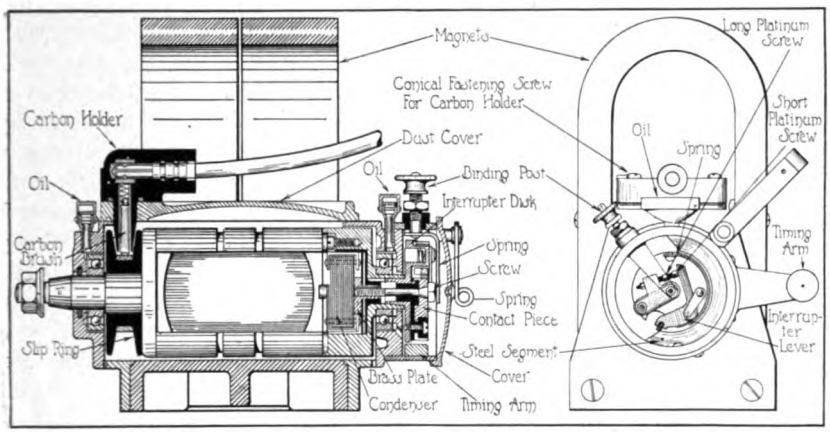

Fig. 100—Components of Magneto Utilized on Single-Cylinder Mount.

The dirt and dust should be removed from the exterior of the magneto with a stiff brush. Next release the outer flat spring holding the cover, pushing the former to one side and exposing the interrupter which is retained by a screw. By removing the latter the interrupter may be taken out and the platinum points cleaned if necessary. They may be pitted or dirty, causing the motor to operate sluggishly. The points should be scraped clean and bright with a knife or smoothed over with a fine jeweller's file. Emery cloth or sandpaper must not be used as the former leaves grit imbedded in the platinum, spoiling the contact, while sandpaper is too rough an abrasive. The parts should be cleaned with gasoline and wiped dry and replaced in order.

The contact brushes or carbon holders are next removed and the carbons cleaned with gasoline. The springs may be lengthened slightly before replacing. In reassembling the holders, care should be exercised not to damage the threads which are delicate and must be handled gingerly.

Timing Magneto.

Timing the magneto is not difficult and the method of procedure is outlined at Fig. 99. Assuming that a single-cylinder instrument is to be timed: The motor is turned until the piston is at top dead centre of the compression stroke and the marked rod or bicycle spoke will again be of service, as in timing the valves. As the contact of platinum points is important in the operation they should be set properly and the maker provides a measuring device in the shape of a fine blade attached to the wrench which comes with the magneto.

To make the adjustment, the lock nut of the long platinum screw is released and the screw moved by the aid of the open end of the wrench applied to the hexagon head immediately adjacent to the platinum point. When adjustment is correct the gauge will just slide between the points. Care should be taken to set up the lock nut firmly.

With the piston at dead centre, retard spark lever fully two-thirds and rotate armature until the platinum points just begin to separate, then mesh gears at this position or lock driving pinion. The armature should be held while doing this work to prevent its moving out of adjustment.

With a V or twin-cylinder motor, set the magneto as above described for the rear cylinder and it should be right for both. It should be remembered that the No. 1 cylinder is that nearest the rear wheel and it will be noted that the segments are marked with the characters I and II and the dust cover of the magneto also bears these figures which refer to the high-tension cables. Lubricate according to the instruction of the maker. Both secondary and primary wires should be replaced with new if the old members are soaked with lubricant or frayed. Terminals must be clean and all wires should be soldered.

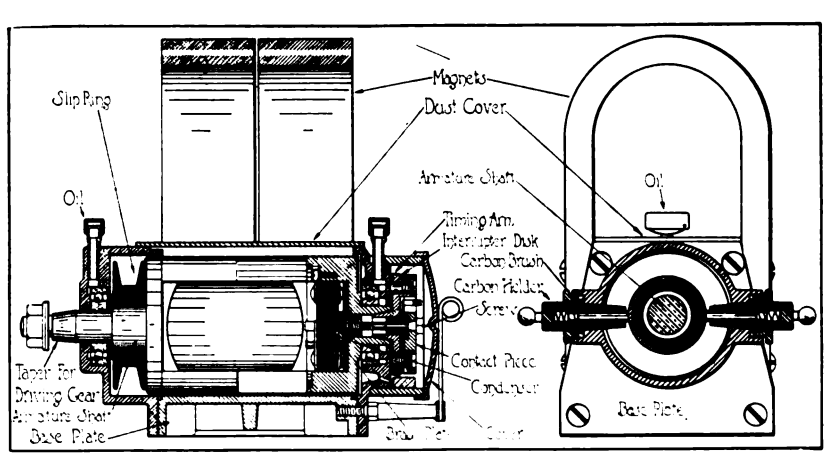

Fig. 101—Outlining Parts of Magneto Fitted to Twin-Cylinder Machines.

Having completed timing the valves and ignition, the valve and spark plugs are fitted and if the threads of these members are slightly coated

Digitized by Google

with graphite removal will be made easy in the future. If the carburetor has been giving satisfactory service, it will require no attention other than cleaning before replacing. In securing the intake pipe, care should be exercised to see that all connections are tight to prevent the entrance of auxiliary air.

It is possible that in removing the fuel pipe the tubing was bent and the novice may experience trouble in replacing and making the connections gasoline tight. In rebending the tubing the feed pipe may be so sprung that the nut cannot be started on the thread without crossthreading. The right and wrong way is depicted at Fig. 97 C, the upper illustration showing the joint properly made, while the lower outlines why the novice fails to make a connection. The nut should screw on easily with the fingers, after which it is tightened with a wrench. If the connection leaks after being made, apply a little laundry soap to the threads, taking care not to fill the orifices of the tubing.

Fig. 102—The Overhaul Completed and Machine Ready for the Road.

It is an excellent plan to empty out the stale gasoline from the fuel tank, and any foreign elements that may be present in the container and the lubricating system will need the same attention. The sight feed glass may be stained, making it difficult to note the flow of the oil. The pump may also require cleaning and repacking, according to its condition.

Muffler and Exhaust Pipe.

Before replacing the exhaust pipe and muffler both members will require cleaning. This work should be thorough as a clogged muffler means a loss in efficiency of the motor. All connections must be tight and in assembling joints subject to heat utilize graphite.

The throttle and gas levers and cables connecting same are next attached, and if any are badly worn, replaced with new. Bowden wire serves a multitude of purposes in connection with the motorcycle and in fitting it should never be cut without first soldering the strands. In soldering into a nipple, run the solder straight through. Thread the wire through the nipple for about .1875-inch, spread out the ends, fill the centre with solder and file down so as to make a neat looking job.

If the pulley has been removed for returning it is replaced and the belt fitted. The starting chain is now replaced and adjusted, as is the belt. It is assumed that the bearings of the front and rear wheels have been cleaned, replaced and lubricated, as well as adjusted previous to this work. If the mudguards have been removed for re-enamelling they are fitted, also the motor stand, and the crankcase filled with oil and gasoline supplied to the tank. The motor is now ready for testing on the stand. It is an excellent plan to feed more oil than usual until the bearings have worked in and the supply in the crankcase should be watched from time to time to make sure the level is at the proper height.

The replacing of the speedometer, generator or gas tank, lamps, luggage rack, etc., may be dispensed with until after the road trial, but the horn or signal and license number should not be forgotten. After the trial spin it is an excellent plan to go all over the mount, trying the nuts and bolts with a wrench as some will be found that will require tightening, although they were formerly set up snugly.

GENERAL MOTORS COMPANY.

The General Motors Company, Detroit, Mich., reports that practically the same number of cars were produced for the 1912 season as in the previous year, and that the production was almost exactly in accordance with the prearranged schedule. The concern ended its fiscal year with all bank loans paid off and with a substantial cash surplus of about $3,000,000 on hand. In other words, all bills have been discounted where there was a discount to be had. Recently $1,000,000 was deposited with the trustee of the sinking fund with which to meet the maturity of Oct. 1 of $1,500,000 on the six per cent. five-year notes. Cancellation of these notes will save the company $90,000 in interest charges, as they are not to be kept alive in the sinking fund.

Digitized by Google

The following companies have been incorporated recently to manufacture or deal in motor cars, accessories, etc.

Overland-Wisconsin Company, Milwaukee, Wis.; $50,000; incorporators, George W. Browne, Mark F. Browne, Thomas C. McMillan.

Sheagren-Hunt Company, Burlington, Ia.; $2500; Chalmers, Reo and Peerless agent; incorporators, W. B. Hunt, J. P. Sheagren, Fred Sheagren.

South Bend Auto Body Company, South Bend, Ind.; $20,000; to manufacture automobile bodies and parts; incorporators, V. E. Paxson, S. W. Nicholson, J. C. Paxson.

Dillman-Helin Motor Company, Richmond Hill, N. Y.; $20,000; directors, William C. Dillman, Richard A. Dillman, Bero W. Holin, W. J. Bissell, Fred G. Hoerlein.

Central Motor Car Company, Canton, O.; to conduct a garage on West Fifth street; incorporators, R. F. Wilson, D. L. Techantz and others.

Medoc Motor Company, Chicago, Ill.; $2500; incorporators, S. Heberling, William A. Curtis and others.

R. L. Bishop Company, New Haven, Conn.; president and treasurer, Raymond L. Bishop; secretary, Frank P. Sargeant.

Consolidated Auto Company, Columbia, S. C.; $5000; to sell motor cars and supplies; incorporators, J. P. Roddey, John J. Cain, J. P. Matthews.

Capitol City Garage Company, Hartford, Conn.; $50,000; incorporators, Conway Hale Brooks, James Leslie Burton.

Vermont Cadillac Company, White River Junction, Vt.; $500; to purchase, repair and sell automobiles; incorporators, G. H. Miller, Richard Hoar, H. G. Bennett, H. R. Miller.

Indianapolis Tire Company, Indianapolis, Ind.; $300,000; to manufacture tires; incorporators, A. A. McKain, E. J. Holliday, A. C. Ayres.

Northwest Auto Company, St. Joseph, Mo.; $5000; incorporators, Ben F. Ellington, Claude C. Tanner, Lena M. Ellington.

Mutual Motor Car Company, Buffalo, N. Y.; $125,000; incorporators, Albert Poppenberg, Fred C. Carter, Orson Yeager.

East Palestine Rubber Company, East Palestine, O.; $50,000; incorporators, E. E. Jones, Ulrich Winter, C. A. Oatsdean, Joseph Hick, O. L. Shumate, A. S. Mauk, Abram Hartley.

Folberth Carburetor Company, Youngstown, O.; $70,000; to make carburetors and automobiles; incorporators, E. A. Hegg, N. A. Emery, E. A. Tobey.

Sutton-Miller Company, Indiana, Penn.; $5000; incorporators, R. S. Sutton, J. Blair Sutton, J. N. Miller, J. W. Clement, Ernest Stewart.

Stocker Rubber Company, Dayton, O.; $50,000; to manufacture automobile tires and accessories; incorporators, A. D. Stocker, Ira J. Cooper, W. H. Brennerm, F. W. Johnston, J. W. Brumbaugh.

D. Henry Bonner Company, Cambridge, Mass.; $20,000; incorporators, David H. Bonner, Edward S. Howland, William E. Furniss.

Studebaker Sales Company, Buffalo, N. Y.; $25,000; incorporators, A. W. Haile, B. H. Phillips, E. C. Schlenker.

Auto Transportation Company, Dixonville, Penn.; $85,000; incorporators, W. C. Carr, G. W. Carr, J. H. Prescott, Thomas E. Boyd, F. Bertolette.

Essenby Sales Company, Fresno, Cal.; $10,000; to deal in automobiles, supplies, etc.; incorporators, H. M. Shaffer, P. W. Cypher, T. R. Becker.

Brown Machine Company, Winchester, Conn.; $5000; to repair motor vehicles, engines, etc.; incorporators, Edward E. Brown, Edward E. Brown, Jr., William A. Brown.

Davies-Bach Manufacturing Company, Cleveland, O.; $300,000; to manufacture motor car accessories; incorporators, George R. Nash, C. H. Davies, O. Nelson, O. Lampus, P. D. Metger.

Fox Spring Tire Company, Spokane, Wash.; $1,000,000; to manufacture motor car tires; incorporators Porter C. Fox, D. D. Woolsley, W. E. Allen.

Sullivan Automobile Company, Newark, N. J.; $25,000; to deal in motor cars; incorporators, J. Sullivan, C. Bagnole, W. N. Frankel.

Central Motor Car Company, Canton, O.; $25,000; to deal in motor cars; incorporators, R. F. Wilson, D. L. Tachants, D. B. Wilson, Anna Herr.

Modern Tread Company, Seattle, Wash.; $20,000; to manufacture motor car tires; incorporators, L. V. Fox, A. H. Shoemaker and others.

Geo. W. Browne, Automobiles, Inc., Milwaukee, Wis.; $5000; agent for Overland, Marmon and Stutz; incorporators, George W. Browne, Mark F. Browne, Thomas C. McMillan.

Automobile Lamp Control Company, Dayton, O.; $15,000; to make automatic lamp controls for automobiles; incorporators, Henry Ehlen, Ernest A. Eastman, William B. Meeker.

Thomas G. Wolverton Company, Jersey City, N. J.; $10,000; general automobile business; incorporators, C. A. Cole, H. T. Letts and others.

Tesla Auto Light Company, Chicago, Ill.; $6000; to manufacture automobile supplies; incorporators, Charles B. Stafford, Harry C. Levinson, Albert Jacobs.

Akron Airless Tire Company, Akron, O.; $50,000; to manufacture tires and rubber goods; incorporators, William S. Brooks, Joseph J. Surbey, Ira N. Thompson, Frank H. Beyea, G. E. Gilmore.

Swing Wheel Company, Cleveland, O.; $50,000; to manufacture automobile wheels; incorporators, A. J. Swing, B. Gross, H. C. Cummings, Harry Pott.

GARAGE AND DEALER.

Keohler & Hanson has purchased two store properties at Odebolt, Ia., and will build a cement block garage.

The Co-Operative Motor Company, Long Beach, Cal., has secured plans for a new two-story garage to be of brick and concrete, representing an investment of $100,000.

The North River Garage, Inc., New York City., is to erect a one-story garage on West 26th street, at an estimated cost of $15,000.

M. H. Perin has secured a permit for a garage of brick and stone two stories in height, at Cincinnati, O. The structure will cost $23,000.

The Autocar Company, Ardmore, Penn., has taken a 10 years' lease of a four-story garage at 418 Washington street, Newark, N. J.

The W. J. Burt Motor Car Company, Los Angeles, Cal., has taken a 10 years' lease of a new garage and salesroom which is to be erected by Dec. 1.

J. B. Pell has leased the garage recently built at Corcoran, Cal., and is installing new machinery.

The Automobile Supply Company, Miami, Fla., has opened a garage on Sullivan street, that city. The concern will deal in supplies.

Digitized by Google

M. G. Van Nice has established a garage at Murray, Ia. In addition to conducting an agency for the Marathon, Moline and Cutting cars, he will do repair work and carry a line of supplies.

The Chicago Electric Motor Car Company, Chicago, has taken a lease for five years of a one-story building on South Morgan street.

W. A. Newby and E. D. Barels have formed the Newby Automobile Company, Wall Lake, Ia., and have purchased the garage formerly owned by H. J. Jensen.

Pierce Bros., South Pasadena, Cal., has moved into a new garage, features of which are a repair shop, vulcanizing department and women's waiting room.

Smith & Furnas, Letts, Ia., engaged in the automobile business, has dissolved partnership and L. J. Turner has joined the firm, which will hereafter be known as Smith & Turner.

G. Dulthuis has purchased the stock of automobile supplies, garage and repair shop formerly conducted by Palmer & Gilley, Parkersburg, Va.

The Winkler Auto and Supply Company has opened a garage and vulcanizing plant at Chanute, Kan.

The Elton Auto & Repair Company, Youngstown, O., is erecting a modern garage in which to locate its business.

F. G. Withrow and G. E. Finch, agents for the Republic tires, have opened a tire repair shop at Grand Rapids, Mich.

P. W. Devendorf, owner of a garage at La Fargeville, N. Y., has taken control of the Arsenal Street Garage at Watertown, N. Y. He will conduct both establishments.

The Corinth Auto Company, Corinth, Miss., will erect a building to be equipped with light machine tools for automobile repair work.

Arthur E. Wheeler has opened a garage and salesroom at Syracuse, N. Y., it being his purpose to handle the Stoddard-Dayton and Haynes pleasure cars and line of trucks.

W. F. Siegmund is at the head of the Detroit Electric Car Company, which has been formed at St. Louis, Mo., to take over the business of the branch, discontinued some time ago.

George Meeley, who maintains a garage at Philadelphia, has established in that city a tire sales office.

Philip Le Page of Methuen, Mass., has opened a new garage on Lowell street.

Fred Crosby, Syracuse, N. Y., owner of the garage formerly occupied by the Kerr-Doane Motor Company and the American Sales Motor Company, is planning a three-story addition to the establishment. He will install an elevator having a capacity of 10 tons.

L. E. Huddle, manager of the Overland garage at Lancaster, O., has leased the building adjoining it for an addition to his present plant.

The Regal & Metz Motor Company has taken over the garage and building formerly occupied by the Acme Garage Company at Worcester, Mass.

The Ohio Auto Repair Company, Cincinnati, O., has taken the agency for the Imperial car, made by the Imperial Automobile Company, Jackson, Mich., which enters Cincinnati for the first time.

Daniel Conway, Jr., and James N. Bussey have formed a partnership at Troy, N. Y., to establish an agency for the R-C-H car, made by the R. C. H. Corporation, Detroit.

Members of the Motorcycle Manufacturers' Association Visiting the Ford Motor Company's Plant During Recent Convention in Detroit.

The Cutting Auto Sales Company, Rochester, N. Y., will build a garage in that city, a feature of which will be a row of stalls with iron grating doors, in which owners may leave their cars and keep the keys.

The Jefferson Garage Company, Inc., Syracuse, N. Y., is reconstructing into a garage the Freeman block, recently partially destroyed by fire. The alterations will cost $10,000.

The Anna Motor Car & Livery Company has opened a garage at Cairo, Ill., which is in charge of R. O. Buford, recently of the Studebaker factory in Detroit.

The Kaukauna Motor Sales Company, organized by T. W. McFarlane, Green Bay, Wis., has opened a garage in that city. The agency for the Marathon cars also has been secured.

F. C. Abrams, who recently acquired the San Diego, Cal., agency for the Rambler cars, has established headquarters in that city.

The Western Auto Company, St. Paul, Minn., has opened a new automobile repair shop at the corner of Rice and Fuller streets in that city.

The Yuba machine shop and garage at Marysville, Cal., has been opened to the public.

J. M. Jones & Sons, Manchester, Mo., is to enlarge and improve its plant this fall. The concern operates the Main Street Garage.

The Co-Operative Motor Company, Los Angeles, Cal., will soon build a two-story brick and concrete garage in that city at a cost of $100,000.

Eugene L. Caton and L. D. Brewster are now the Worcester, Mass., representatives of the Pope Manufacturing Company, Hartford, Conn., maker of the Pope-Hartford car.

The Marathon Motor Sales Company has been formed at Baltimore, Md., to take the agency for the Marathon car, made by the Marathon Motor Works, Nashville, Tenn.

Richard C. Plater has purchased the site at Vauxhall street and Broadway, Nashville, Tenn., embracing 20,000 square feet, upon which he will build the largest garage in the state, to adjoin new stores and a hotel, which also are being planned.

The Painter-Dunn Company is the reorganized name of the Robinson-Painter Company, the Pittsburg, Penn., representative of the Willys-Overland Company, Toledo, O., maker of Overland cars. Thomas F. Dunn, the junior partner, has had a wide experience in handling various lines of automobiles. He was formerly vice president and general manager of the Maxwell-Briscoe Pittsburg company and also of the United States Motor Company. The new firm starts under exceptionally favorable circumstances.

Charles E. Riess, president of the American-Marion Sales Company, New York City, is closing up contracts throughout the New England states with agents for American cars. He will cover every mile of New England territory in order that the company may be adequately represented in that section of the conutry.

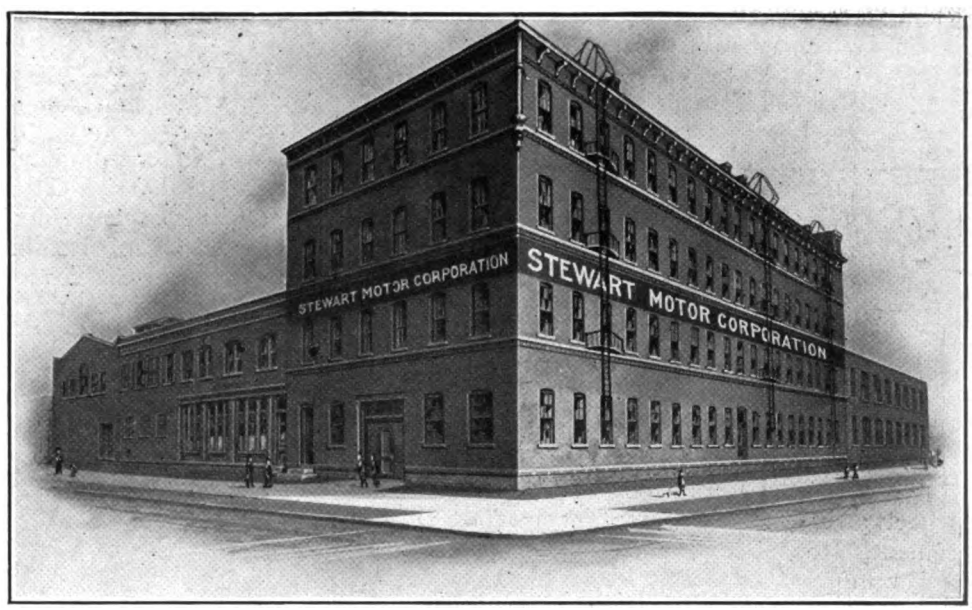
Digitized by Google

WITH THE MANUFACTURERS.

The Hampton Manufacturing Company, Hamilton, O., has removed its factory to Indianapolis, Ind., where it will continue the production of interliners for automobile tires.

The Chevrolet Motor Company, Detroit, has purchased the plant of the Imperial Wheel Works, Flint, Mich. It is understood that a new building will be erected, which will be operated in conjunction with the present plant in Detroit.

The Adamson Manufacturing Company, East Palestine, O., has obtained a patent on its vulcanizer, and the plant is being remodelled for the production of the device in larger quantities.



The American Castings Company, Mishawaka, Ind., has installed new equipment, including molding machines, pneumatic tools and other apparatus, and will increase its force of active workmen.

W. L. Tust, Dubuque, Ia., is president of a new independent oil concern, which is erecting a $25,000 plant in that city.

The Havers Motor Car Company, Port Huron, Mich., has purchased the factory buildings formerly occupied in that city by the E-M-F Company, Detroit. The additional structures will enable the company to increase materially its production of Havers cars for 1913.

The Leech Automobile Company, Lima, O., which has been carrying on experiments with a new motor for the past three years, is erecting a new plant for its production. The officers of the company, which is capitalized for $100,000, are: President, Charles M. Leech; vice president, H. H. Hughes; secretary, Frank Leech; treasurer, A. M. Kelchner; general manager, W. H. Allen.

The R. J. Irvin Manufacturing Company, Indianapolis, Ind., maker of automobile bodies and tops, has awarded the contract for a two-story factory building to cost approximately $50,000. Russe J. Irvin, president of the concern, announces that the company also will occupy two other buildings of large dimensions near the site of the proposed new plant.

Buffalo Factory That Was Acquired by Stewart Motor Corporation of That City.

The Ford Motor Company, Detroit, recently entertained the delegates to the convention of motorcycle manufacturers and dealers in that city, by inviting them to inspect the plant in which Ford cars are produced. An accompanying illustration shows some of the prominent delegates upon this occasion.

The A & M Sales & Service Company has been formed in Indianapolis, Ind., to handle the sales of the American and Marion cars, made by the American Motors Company and the Marion Motor Car Company of that city. The following officers have been named: President, J. I. Handley; vice president and general manager, Thomas L. Marshall; secretary and treasurer, L. R. Wilbur.

The New York Lubricating Oil Company, New York City, has found it necessary to open larger quarters at San Francisco, owing to the increase in the sales of Monogram oil in that territory. An office also has been opened in Spokane, Wash.

The Benz Auto Import Company, New York City, announces a change in management. Paul R. Pelz, representative of the Benz factory in Mannheim, Germany, has become president and treasurer. Paul V. Clodio, for the past two years connected with the company, has taken the position of secretary, succeeding Walter Maas, who has returned to Europe.

The Cole Motor Car Company, Indianapolis, Ind., maker of Cole cars, has appointed the following agencies: King Auto & Repair Company, Charleston, S. C.; Blodgett Bros., Leads, S. D.; John Christensen & Co., Galveston, Tex.; Gasper Machine & Garage Company, Gasper, Wyo.; Boyle & Jeffe, Cheyenne, Wyo.; Cole & Co., Lander, Wyo.

R. C. Anderson, Racine, Wis., for several years vice president of the J. I. Case Plow Works of that city, has taken the position of general manager of the reorganized Simms Magneto Company, New York City.

A. E. Reid of Toledo, O., has taken the agency for the Overland car, made by the Willys-Overland Company, Toledo, with headquarters at Louisville, Ky. Mr. Reid takes charge of the sales in the city and surrounding territory, which includes nearly 40 counties altogether, taking in three in Southern Indiana. The agency has been located in larger and more commodious quarters than was the case when it was held by the Glosebrenner Commercial Car Company.

The American Ignition Company and the Knop Battery Company, both of Detroit, were merged recently under the name of the Electrolamp Company, for the manufacture of the Knop line of spark plugs and storage batteries, as well as a motorcycle electric lamp. The officers are: President, W. J. Sculley; vice president, N. G. Begle; secretary, C. R. Baxter; treasurer, R. L. Aldrich.

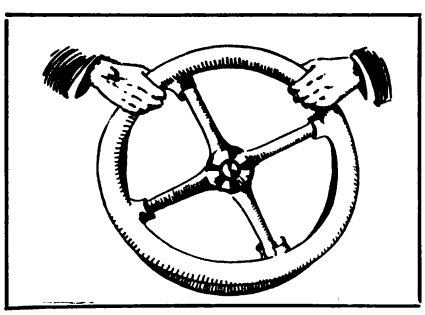
The Morgan Motor Truck Company, Worcester, Mass., has not removed its factory buildings to Buffalo, N. Y., neither has the Stewart Motor Corporation of the latter city acquired the Morgan property, despite the impression conveyed by the last issue of The Automobile Journal. In some manner the illustration of the Morgan factory was printed bearing the following caption: "Factory in Buffalo, N. Y., recently acquired by the new Stewart Motor Corporation." The Stewart concern has acquired a new factory, however, and it is shown herewith.

George Fitzsimons has resigned as sales manager of the E. R. Thomas Motor Car Company, Buffalo, N. Y.

J. M. Ward, who for the past two years has been connected with the Waverley Company, Indianapolis, Ind., maker of Waverley electric cars, has accepted a position as assistant sales manager of the American Motors Company, also of Indianapolis, maker of American cars.

F. S. Rowan, who has been engaged in newspaper work along special lines in various parts of the country, particularly in the Southwest, has become advertising manager of the Clarke-Carter Automobile Company, Jackson, Mich., maker of Cutting cars.

George H. Lloyd announces his retirement from the Velie Motor Vehicle Company, Moline, Ill., maker of Velie cars. He has been in charge of the sales since the incorporation of the company in 1908.



Digitized by Google

AMES COMPANY REORGANIZED.

The Ames Motor Car Company, Owensboro, Ky., has been reorganized with capital of $100,000. Among the new men interested in the concern are George W. Yeoman of Muskegon, Mich., formerly sales manager of the Continental Motor Manufacturing Company, and H. M. Robins of the same city, formerly of the American Electric Fuse Company. The other stockholders include F. A. Ames and Charles T. Smith, both of Owensboro.

STEEREASE MAKES DRIVING EASY.

One of the latest inventions for eliminating the vibration of the steering wheel, as well as providing a secure grip on the member, is Steerease, which is being placed in the market by the Goodyear Rubber Hose & Packing Company, 221 Chestnut street, Philadelphia. A feature of the device, which is inexpensive, is that it is attached easily and without special fittings, such as cords, clamps, etc. The material is a high grade, flexible, corrugated rubber which is slipped over the rim of the wheel after the latter is first treated with a cement. It is made in two colors and requires but a few minutes to attach. The company desires experienced men to take the agency for the device and exclusive territory will be given the right party. Full and interesting particulars will be given by the maker upon application.

Steerease, New Wheel Covering.

GIVE GOOD TIRE MILEAGE.

William H. Todd, official stenographer for the superior court in Boston, Mass., has given the Perfection tire filler, made by the Perfection Filler Company of that city, an exhaustive trial on his car, the four shoes being filled with this material in July, 1910. Since that time, he says, he has driven the machine close to 18,000 miles. Two of the tires are still on the car, the other two having been turned over to the company for exhibition purposes, one after it had been run 7500 miles and the other at the end of 15,000. He declares that his car rides easier on the filler than on air, and that he has found the substitution has not occasioned any greater consumption of fuel, having taken particular pains to test out the matter of gasoline mileage.

COAST-TO-COAST IN KNOX.

Mr. and Mrs. Howard L. Williams of Bristol, R. I., and Harris L. Cooke of Cooperstown, N. Y., completed a most enjoyable cross country trip in San Francisco, Cal., Aug. 10, having driven all the way from Narragansett Bay to the Golden Gate since May 27. The car was a 45 horsepower Knox, made by the Knox Automobile Company, Springfield, Mass.

A northern route was followed from Bristol to Cooperstown, Saratoga Springs and Buffalo to Chicago, where the party remained for three days. Lincoln, Neb., was the next stop of consequence, and Denver was made the headquarters from which several side trips were taken. At Salt Lake City, they were forced to leave the car and visit the Yellowstone national park by train and team.

From Salt Lake City, the party turned almost directly north, entering Idaho and reaching the Pacific Coast in Washington. Thence the journey led down the coast through Oregon to San Francisco. The entire trip was made without mechanical difficulty of a serious nature, although the front axle was bent slightly in a mudhole in the state of Washington. This was remedied at a repair shop in Seattle.

A MISLEADING SIGN.

The following communication may prove of value to tourists who find occasion to visit Quincy, Mass.:

Editor, The Automobile Journal,

Sir:

I observed the other night in the Quincy column of the Boston Herald a little notice that I had been before the police court in Quincy and paid my fine of $5, all of which is true and correct.

I am sorry they did not have an opportunity of relating why I was arrested, and I would look upon it as a favor if you would kindly make some remark upon it in your Journal, calling attention to the fact that the mayor and police of Quincy have had a little sign printed on cardboard which reads:

"Warning Cut-Out." Underneath these two lines of large type they have in very small type: "Must not be used."

The writer, while passing through this beautiful town the other day, was endeavoring to obey the laws to the best of his ability, and when he saw this sign appear in such emblazing style, "Warning Cut-Out," he immediately took his foot off the clutch and put it on the cut-out, only to be arrested forthwith.

I wish you would kindly call attention to this particular sign in your Journal, because it has been the means of causing many a person to break the law, thinking that Quincy wanted him to put on his cut-out.

Yours very truly,

F. W. GIBSON.

10 High street, Boston, Mass., Aug. 15.

MAY CHANGE GLIDDEN DATE.

When the contest board of the American Automobile Association decided upon Oct. 7 as the starting date for the annual tour, consideration was not taken of the possible changes in night stops, made necessary by the road conditions through the territory covered by the tour. Another meeting will be held in the near future to arrange this matter, and it is probable that the start will be changed to Oct. 4, allowing a Sunday stop in Indianapolis, Ind., and another in Memphis, Tenn.

FLANDERS TRUCK COMING.

According to a Detroit rumor, Walter E. Flanders is preparing to enter the motor truck field with a new line of cars, models of which have been undergoing severe tests for some time. The list is expected to include a one-ton machine, fitted with four-cylinder motor and worm drive. This is to be offered with differing body types to meet the various requirements of purchasers.

CUTTING CARS GO ABROAD.

During the past week or more, the Clarke-Carter Automobile Company, Jackson, Mich., maker of Cutting automobiles, has averaged one foreign shipment a day. Three of these went to Australia, three to New Zealand, one to Brazil and one to Italy.

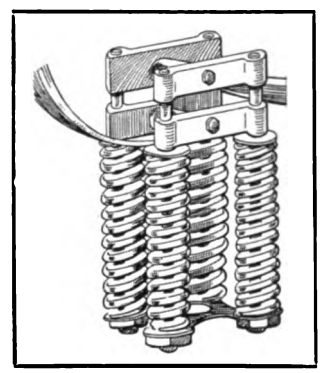
MOTORISTS PAY THE BILLS.

That owners of horse drawn wagons should be compelled to shoulder their share of the expense for constructing and maintaining highways is indicated clearly in the following communication:

Editor, the Automobile Journal,
Sir:

Results have established the fact that rapidly moving automobiles wear out water bound macadam roads, while on tar bound roads they have very little injurious effect. But on tarred roads horses drawing heavy loads do very serious damage to the surface. It is reported by automobilists who go over the Jacob's Ladder road that half a dozen teams, hauling heavy loads of lumber, have dug up the tarred surface by the calks on their shoes so much that the road will soon need expensive repair. In this connection it may be noted that automobilists are taxed $600,000 a year for repairs of the highways, while the owners of horses pay nothing. Ultimately, this manifest unfairness will be corrected, and all those who use and wear out the roads may be called upon to pay their just proportion of the cost of repairs.

Very truly yours,



M. H. R.

Springfield, Mass., Aug. 14.

VELVET AUXILIARY SPRINGS.

The pleasures of motoring are enhanced when the machine rides easily over obstructions and rough roads, and it is essential to equalize the variance in loads. These qualities are secured in the Velvet auxiliary springs, which are so designed that shocks and vibrations are absorbed.

As will be noted in the accompanying illustration these comprise four sensitive adjustable coils or compression members, two of which are secured at the bottom by plates retained by cup washers and nuts. The blocks are bolted to the car spring, when attached to three-quarter elliptic members, and the weight is supported by the four coils. The other portion of the spring is equipped with similar blocks which prevent side sway. The first named set of blocks slides freely up or down upon four studs and a plate is utilize to properly space these members, preventing binding.

Velvet Auxiliary Springs.

A quality of the device is that it may be attached to any spring easily and without altering the parts or employing special fittings. Replacing as they do the stiff, solid link of the rear spring, both downward and upward movements are equalized. The Velvet auxiliary springs are fully guaranteed and moderately priced. George Sumner, Inc., 1843 Broadway, New York City, and 755 Boylston street, Boston, is distributor.

AUTOMOBILE TOURIST'S BOOK.

A work which will prove of decided interest and value to motoring tourists, is published by the Tourist Publishing Company, Boston, Mass., and entitled "Automobile Tourist's Book." It gives desired information concerning hotels and points of interest, on and off the beaten path in the six states of New England.

DINGLEY RETIRES FROM RACING.

Bert Dingley, who is well known from coast to coast as a racing driver, has announced his permanent retirement. In the future he will be the general sales manager of the agency in Los Angeles, Cal., for National cars, made by the National Motor Vehicle Company, Indianapolis, Ind.

Cars from the same factory show wide contrasts in operating behavior.

Not because motor cars vary in workmanship and material, but because motorists vary in

Lubricating Wisdom

The man who uses

TRADE MARK REGISTERED IN

NON-FLUID OIL

UNITED STATES PATENT OFFICE

for his transmission, differential, universal joints, grease cups, etc., eliminates all cause for trouble or inefficiency in these important parts of the car.

He runs a silent car, an economical car, a durable car, a clean car.

His wisdom in lubrication safeguards his motor car investment.

K-ooo Grade NON-FLUID OIL is used in all parts of the car requiring a heavy bodied lubricant. It does not melt like grease, reduces friction better and lasts three or four times as long. Try it in your differential. It will quiet the gears and protect the ball and roller bearings.

K-oo Special Grade NON-FLUID OIL is more widely used for transmissions than any other lubricant. It has exactly the right body to cushion the gear teeth without choking their action and without leaking from the gear case. Varying temperatures do not affect this lubricant in the slightest degree.

Ask your dealer for these lubricants

Be sure you get orange colored cans bearing above trademark.

A NEW VALUE

TO THE PURCHASING POWER OF FIFTY CENTS---A

"BLACK EAGLE" SPARK PLUG.

EFFICIENCY AND QUALITY WITHOUT EXTRAVAGANCE.

From all viewpoints the "BLACK EAGLE" Spark Plug represents the greatest advance in spark plug design and construction in recent years, and has given a new value to the purchasing power of fifty cents.

The base of the "BLACK EAGLE" Spark Plug provides double electrodes so positioned that they present a round surface to the action of the spark, absolutely eliminating pitting of the electrodes which indefinitely prolongs their life, and produces a uniform spark at all times.

When you have discovered that the price you pay for a spark plug has little to do with its service value, you will save 100% to 400% on this item of expense. Try a genuine

"BLACK EAGLE"

The 50c Spark Plug Without an Apology. TRY THEM NOW.

Don't wait until you are 10 miles from a Garage and find you need them.

Most jobbers and dealers sell "BLACK EAGLE" Spark Plugs. All can secure them; if you are unable to have your wants supplied we will forward them free of transportation expense upon receipt of price.

NEWTONE

The Mile Away Electric
MOTOR HORN

Patented Sept. 5, 1911

Torpedo Type

PRICE

$20.00

Including Button and Cable

The Most Perfect Warning Device on the Market

The increased demand for the Newtone Motor Horn is due to its absolute efficiency in warning and economy in operation.

The motor with Hess-Bright Ball Bearings and imported Self-lubricating brushes, eliminate all oiling and cleaning.

The chief engineers of three leading American automobile manufacturers, after a "Break-Down" test, state that, in their opinion, the Newtone Horn is the BEST warning signal made.

The Corbin Screw Corporation Announce

The Manufacture and Sale of the

CORBIN-BROWN SPEEDOMETER

"The Speedometer of *Permanent* Accuracy"

The name "Corbin"—identified with manufacturing for more than 40 years and recognized as a guarantee of quality—will now also be a guide to absolute speedometer satisfaction.

The device, heretofore known as the Brown Speedometer but embodying new and invaluable improvements that overcome a fault common to other speedometers by insuring *permanent* accuracy, will hereafter be manufactured by the Corbin Screw Corporation and sold under the name of the Corbin-Brown Speedometer.

WEED CHAINS PREVENT ACCIDENTS LIKE THIS

What an awful game of chance we sometimes play on the checkerboard of Life!
How narrow is Life's victory over Death at times!
What a contrast is here presented! What an object lesson this scene portrays!

Absolute control and **perfect safety** on the one hand; on the other an "unruly, balky" machine, whose seemingly greatest ambition was to bring its occupants face to face with disaster.

Picture for yourself the story:

Two cars traveling the same country road—a rainstorm overtakes them. Reaching a treacherous, slippery curve—

ONE CAR with scarcely any noticeable slackening of speed rounds the curve and **passes on in perfect safety.**

THE OTHER at the critical moment, **skids,** and in a flash, plants itself in front of the on-rushing trolley.

A mass of wreckage, "nerve-shattered" passengers and a lasting memory of what might have been if the trolley car had not been stopped.

One Car was skid-proofed with Weed anti-skid Chains. The Other was not. Take the lesson home.

Weed Chains

Absolutely Prevent Skidding

Are you still taking your life in your hands by refusing to take the necessary precaution against the dangers of skidding? Are you still unwisely depending on "rubber alone" for the safety of yourself, the occupants of your car and **other road users?**

Make safety yours—take no chances. Fully equip your own car with Weed Chains today and **insist,** for your own protection, that other drivers do the same.

Weed Chains cannot injure tires because "they creep;" are put on in a minute without the use of a jack or other tools. Use **them on all four tires.**

THE NAME WEED ON EVERY HOOK — WEED

At All Reputable Dealers

Weed Chain Tire Grip Co., 28 Moore Street, New York City

"INVADER" GEAR OIL

"Puts Noisy Gears to Sleep"

INVADER GEAR OIL is a heavy, dark fluid lubricant, designed for the lubrication of sliding gear transmissions and differential gears. It can also be used for front gears where a heavy lubricant is required, if the case is tight and separate from the crank case.

This oil possesses peculiar properties which make it invaluable as a lubricant for gears. It contains no foreign matters, such as ground cork, sawdust, etc., but is 100% oil. It is stronger and more serviceable than any other lubricant made. Being free from water and chemicals, it will not foam in the gear case when running or allow the bearings to rust when idle.

Invader Gear Oil being a fluid lubricant it is only necessary to fill the case sufficiently to allow the gears to dip. It is not necessary to pack the case full, as is customary when grease is used. It faces the gears with a coating which is practically indestructible, thereby preventing wear and reducing *noise* and friction to a minimum. A trial will convince the most skeptical that "**Invader**" Gear Oil is the only practical and economical gear lubricant.

Sold in 10 lb. square cans, lithographed; 25 and 50 lb. wooden jacketed cans, special top; barrels and half-barrels

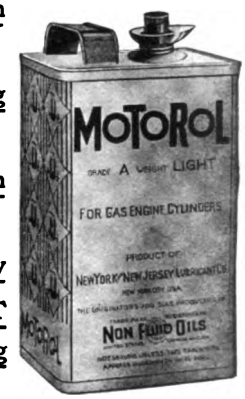
Lubricating your cylinders is a problem which you alone can solve, because you know your engine

YOU need not know oils like an expert; you need not worry through the oil manufacturers' grave advertising talks about finest "Crudes," about gravity, flash, fire test, cold test, viscosity, light colors, low carbon, special refining, special grades, etc., etc.

You just have to bring to a mental focus what you know about your own engine and what you know about the practical results from oils you have used. Then make a simple deduction.

If you find your engine is not doing the work it should, if it knocks in climbing an ordinary hill or when it has warmed up with a moderate run, or demands a wide-open throttle on the least provocation of speed or climb, or stalls when it should keep going on a low throttle—*the oil you are using isn't doing the lubricating work it should;* isn't assisting compression; may be killing your spark with soot and inducing sluggish explosions.

If this oil is a light colored, limpid sort of oil it is lacking in the lubricating function.



It is only good because it "doesn't" carbonize, and you are feeding it so freely to get results that it carbonizes anyway.

If, instead, it is a fairly heavy oil that looks like a rich lubricant, it probably doesn't give results because its richness disappears instantly when it hits the zone of high temperature, and leaves a smudge of carbon behind it.

The oil you would select, if you could have your own way would be *heavier in body* than the pale oils, and *lighter in color* than the heavy oils you have known.

This may be finicky sort of discriminating, but—

MoToRoL

is just that kind of an oil—

Rich in lubricating properties—

Not dark colored with forbidden carbon—

Permanent in body because nature, NOT science, gives it a strong viscosity—

Free flowing, whether it it is a summer or a winter record day.

An oil for new motors and new motorists who want to see the light of economy and long life in their cars.

An oil for old motors and old motorists who have learned and paid dearly for their lubricating lessons.

The oil for you.

We will gladly forward you a sample of **MoToRoL**

Cadillac 1913

Any car at any price which you choose to compare with this new Cadillac will be honored by the comparison.

Long stroke engine. More power.

Silent chain-driven camshaft; enclosed valves; quiet engine. Longer wheelbase; larger tires; Electrical system of automatic cranking, lighting and ignition simplified and improved; automatic spark control. Numerous refinements of essential details.

You will bear witness that the Cadillac case has never been overstated.

Hold to that thought, please, in considering what we shall say of this new car.

Cadillac practice has progressively improved upon itself season after season.

It has now reached a point, which, we believe, warrants us in thinking that comparison of the choicest cars with the Cadillac will hereafter confer a distinction upon those cars, rather than otherwise.

For several years we have calmly observed the rapid rise of the Cadillac in public opinion.

Each year we have seen the little group of its equals in popular esteem narrowed down.

Each year we have seen a higher and higher price named as the basis of comparison with the Cadillac.

And we believe that basis of price comparison is about to vanish altogether.

We believe that the last mental reservation is about to remove itself from the public mind.

We ourselves have felt serenely sure for a long time that in point of real and substantial value the line of demarcation between cars of highest price and the Cadillac was an imaginary line.

We have felt that it was written in water, like the international boundary lines in the ocean---and we feel that this new Cadillac will complete the process of so convincing the public.

The advent of such a car at the Cadillac price is, of course, a matter of genuine moment; and you will be interested, therefore, in this news concerning it.

When Writing to Advertisers, Please Mention The Automobile Journal.

A few of the improvements in the 1913 Cadillac

LONG STROKE ENGINE:---4 1-2" bore by 5 3-4" stroke, increasing the power of the always extraordinarily efficient Cadillac engine. This amplification of power is especially observable at speeds from 12 to 35 miles an hour, dynamometer tests registering an increase of from 18 to 25 per cent.

SILENT CHAIN-DRIVEN cam shaft, also pump and generator shaft, replacing meshed gears, in conjunction with:

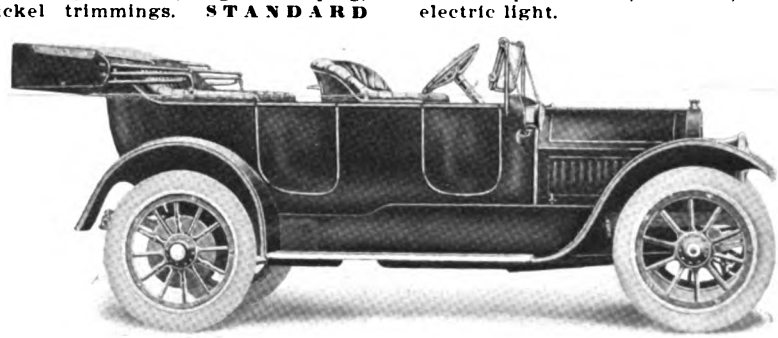
ENCLOSED VALVES, and the superb workmanship throughout in which the Cadillac has always excelled, producing an engine which runs with unusual quietness.

CARBURETOR:---A carburetor of marked efficiency and simplicity has been further simplified, now requiring but a single means of adjustment, removing from it to the greatest possible degree, the necessity of attention.

AUTOMATIC ELECTRIC CRANKING DEVICE, ELECTRIC LIGHTS, IGNITION:---A vastly simplified and improved Delco system developed at the instigation of the Cadillac Company for Cadillac cars, the result of experience with the old system on twelve thousand 1912 models.

While the old system demonstrated itself to be by far the most efficient for its purposes that had ever been developed, the Cadillac Company has evolved means of increasing that efficiency to as near the 100 per cent. point as any mechanical appliance could be. Among the simplifications are, the successful adoption of the single instead of double voltage system, thereby eliminating the controlling switch, the meter, much wiring and other parts. The meter is replaced by a voltage regulator which automatically governs the charging rate of the battery, reducing to an absolute minimum the attention required on the part of the user. The switches for starting, lighting and ignition, the latter equipped with Yale lock, are more conveniently located. Lights are provided with fuses. These and other advantages will be enjoyed by users of the 1913 Cadillac.

AUTOMATIC SPARK CONTROL:---Relieving the driver of the necessity of constant attention in order to secure the maximum results.



LONGER WHEELBASE:---The easy riding qualities of a car which has been regarded as the acme of luxury are accentuated by an increase in the length of the wheelbase from 116 to 120 inches, and a corresponding increase in the length of rear springs.

TIRES:—Increased from 36"x4" to 36"x4 1-2", with the obvious advantages resulting therefrom. Demountable rims.

EQUIPMENT:---Cadillac top and windshield included. See specifications.

SPECIFICATIONS IN BRIEF

ENGINE—Long stroke, 4½-inch bore by 5¾-inch stroke; four-cylinder, silent chain-driven cam shaft, also pump and generator shaft, enclosed valves. Five-bearing crankshaft. **HORSE-POWER** — 40-50. **COOLING**—Water, copper jacketed cylinders. Centrifugal pump; radiator tubular and plate type. **IGNITION**—See "Equipment." **LUBRICATION**—Automatic splash system, oil uniformly distributed. **CARBURETOR**—Special Cadillac design of maximum efficiency, water jacketed. Air adjustable from driver's seat. **CLUTCH**—Cone type, large, leather faced with special spring ring in fly wheel. **TRANSMISSION** — Sliding gear, selective type, three speeds forward and reverse. Chrome nickel steel gears, running on five Hess-Bright ball bearings; bearings oil tight. **CONTROL**—Hand gear-change lever and emergency brake lever at driver's right, inside the car. Service brake, foot lever. Clutch, foot lever. Throttle accelerator, foot lever. Spark and throttle levers at steering wheel. Carburetor air adjustment, hand lever under steering wheel. **DRIVE**—Direct shaft to bevel gears of special cut teeth to afford maximum strength. Drive shaft runs on Timken bearing. **AXLES**—Rear, Timken full floating type; special alloy steel live axle shaft; Timken roller bearing. Front axle, drop forged I beam section with drop forged yokes, spring perches, tie rod ends and roller bearing steering spindles. Front wheels fitted with Timken bearings. **BRAKES**—One internal and one external brake direct on wheels, 17-inch by 2½-inch drums. Exceptionally easy in operation. Both equipped with equalizers. **STEERING GEAR**—Cadillac patented worm and worm gear, sector type, adjustable. 18-inch steering wheel with walnut rim; aluminum spider. **WHEEL BASE**—120 inches. **TIRES**—36-inch by 4½-inch Hartford or Morgan & Wright; demountable rims. **SPRINGS**—Front, semi-elliptical. Rear, three-quarter platform. **FINISH**—Cadillac blue throughout, including wheels; light striping, nickel trimmings. **STANDARD EQUIPMENT**—Cadillac mohair top, wind shield, Delco patented electrical system embodying automatic cranking device, electric lights and ignition. Automatic spark advance. Also Delco distributor ignition system. Gray & Davis lamps especially designed for Cadillac cars, black enamel with nickel trimmings; two headlights; two side lights, tail light. Hans gasoline gauge on dash; horn; full foot rail in tonneau; robe rail; tire irons; set of tools, including pump and tire repair kit; cocoa mat in all tonneaux except closed cars. Speedometer, Warner, with electric light.

The War of 1913

The Fierce Fight Raging Among 40-Horsepower Cars

72 Rivals in It

We are nearing the climax in the fiercest fight that Motordom has ever known.

72 makers of cars around 40 horsepower are contending in a fierce struggle for supremacy.

The chief interest centers around six of these cars. For six leaders, backed by millions of money, are each seeking to dominate this great middle field.

The Michigan "40" is one of these six. The ablest engineers have spent four years to fit it for this fight. And it comes this year to claim first place in all this Forty class.

How the War Began

The trend of the times is toward luxurious Forties.

Owners of small cars come to want more power, more comfort, more room, more appearance. Owners of oversize cars come to want more economy.

So the demand for Forties, in recent years, has become overwhelming.

To meet that demand, 72 makers have taken up Forties. Hundreds of the ablest engineers have centered their genius in them.

Today the finest cars ever built in America belong to the Forty class.

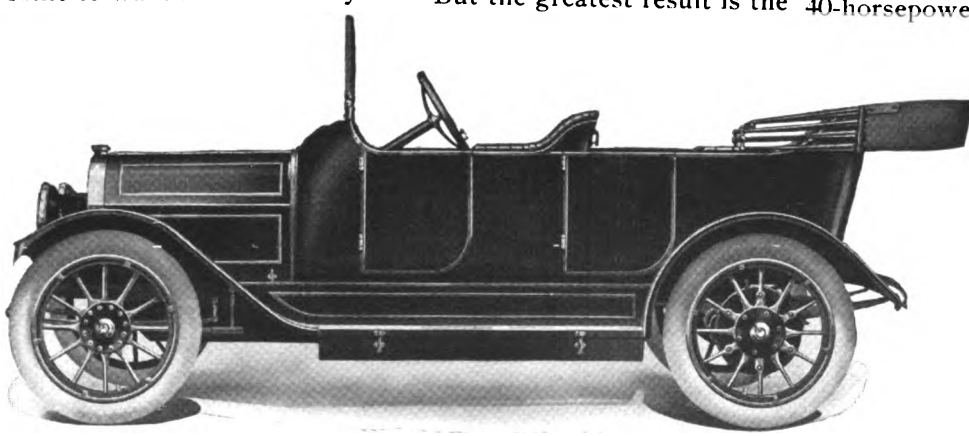
Prices Cut in Two

One result has been to bring out in these cars all the best improvements of the past few years.

Another has been to develop comfort and luxury, beyond anything dreamed of a few years ago.

Another result shows in splendid equipment. Each maker has sought to outrival the others. Some cars at twice the price are not equipped like the modern Forties.

But the greatest result is the cutting of prices. Some makers' prices have been cut in two. Forties are selling, with splendid equipment, for what stripped Thirties used to cost.



The car which gives the greatest value is bound to win this contest. And every maker knows it.

In quality, equipment, comfort and luxury there are limits beyond which none can go. These limits are reached in the Michigan "40."

Then comes the question of factory efficiency. Who can build such cars for the lowest price? Who dares accept the smallest profit?

Big Saving to Buyers

So this war of the Forties means enormous savings to men who watch out and compare. Cars in no other class match the Forties in value. All because there are 72 makers fiercely fighting for favor with 40-horsepower cars.

Michigan "40"—Equipped—$1,585

Digitized by Google

The Michigan "40"

Electric Lighted---Four Forward Speeds Extra-Tired---Price, $1,585 Equipped

Our Offer is This

We enter this fight this year with a value which no maker ever has matched.

You can easily prove this—in one hour's time. Just make fair comparisons.

We have spent four years in perfecting this car. Some of the ablest engineers have worked year after year on it.

We have made since the start over 300 improvements—71 in the past year.

We have sent out in four years about 5,000 cars, and watched every car's performance. Last year this car, in our test cities, outsold every rival.

The Michigan "40" today represents the last word in motor car engineering.

Cameron's Car

Our designer-in-chief is W. H. Cameron, for years the chief engineer of the Overland.

Our body designer is John A. Campbell, famous all the world over. He has been frequently chosen to design equipages for kings.

Every part and detail is in charge of an expert—the ablest man we could find for the purpose.

To these men we have given more than ample time to bring out the utmost of which they are capable.

We have equipped for them a model factory, with 600,000 square feet of room. And we have backed them with all the money and all the experience gained by 30 years of vehicle building.

The result is this wonderful machine, known as Cameron's Car—one of the finest examples in the world today of the modern motor car.

What It Includes

Mark the price of this car—$1,585. Then note what that price includes.

Note the four forward speeds—a feature heretofore confined to the highest-priced cars.

Note the electric lights and dynamo. This feature as an extra on other cars usually costs $125.

Note the oversize tires—35x4½. The usual tire equipment on Forties costs $50 less.

Send for our catalog and make all the comparisons. Measure up the features, one by one, with all our rival cars. Judge for yourself if any Forty car on the market offers what the Michigan gives.

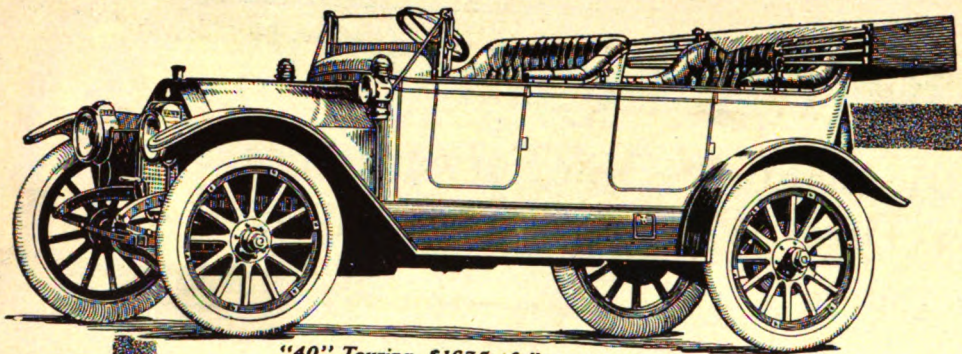
Then let our local dealer show the car. Take care, for your own sake, to get the utmost advantage out of this fight of the Forties.

MICHIGAN MOTOR CAR CO., Kalamazoo, Mich.

Owned by the owners of the Michigan Buggy Company

Some of the Michigan Features

Four forward speeds, instead of the usual three speeds.
Tires 35x4½, instead of the usual 4-inch tires.
Electric lights with dynamo.
Electric horn.
Center control and left-side drive. Both front doors clear.
Motor 40 to 46 horsepower.
Extra effective brakes—16x2 1-4 inches.
Big, comfortable springs.
Adjustable steering post.
Adjustable pedals.
Firestone Demountable rims—extra rim.
14-inch cushions—deeper than any rival.
Rear seat 50 inches inside.
Hand-buffed leather of the finest grade, filled with the best curled hair.
Wheel base 118 inches.
Nickel mountings.
50 per cent. average over-capacity, allowing big margins of safety.
Pressed steel, full-floating rear axle.
Axles sufficient for an 80-horsepower car.
Best mohair top, side curtains and envelope.
Windshield built in as a part of body.
12 1-2-inch electric headlights.
Side lights flush with dash.
Body finished with 22 coats.
Electric horn.
$50 speedometer—4-inch dial.
Special foot rail and robe rail.
Complete tool equipment.
Tool chests under running boards. (106)



Self-Starter

There is such a difference of opinion about the relative merits of the various types of self-starters, that we have not adopted any one type as regular equipment.

We prefer to leave this selection to the buyer.

However, we equip with either the gas starter or a positively efficient electric starter, at a very moderate extra price.

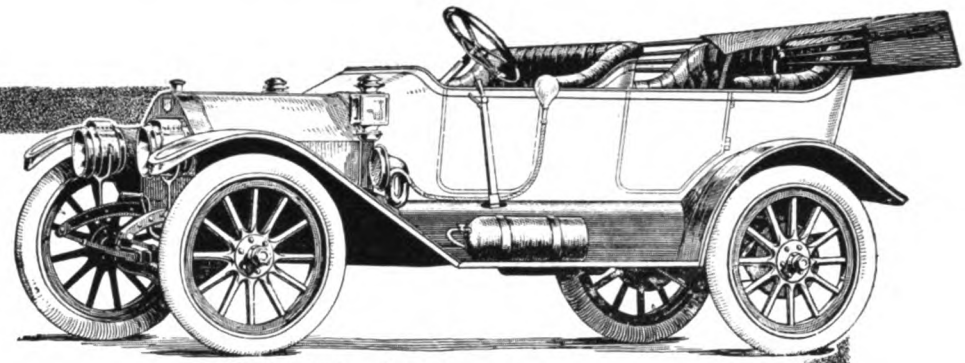
1913's Biggest Value in Three New Models

Beauty, luxury and comfort have been developed to the utmost in the handsome Maxwell "40". Every refinement, every detail, is the very latest. Nothing that would make the Maxwell "40" better has been spared or omitted.

The new 1913 Maxwell is the finest car we have ever built. It is larger, more powerful, finer in every way. But it remains

ECONOMY UNITED STATES MOTOR CO UTILITY



You should buy a Maxwell because—It holds the world's speed record in its class. It is the national touring champion—winner of the Glidden Tour. It lasts longest—proven by actual State registrations. It costs less to maintain—proven by public demonstration.

well

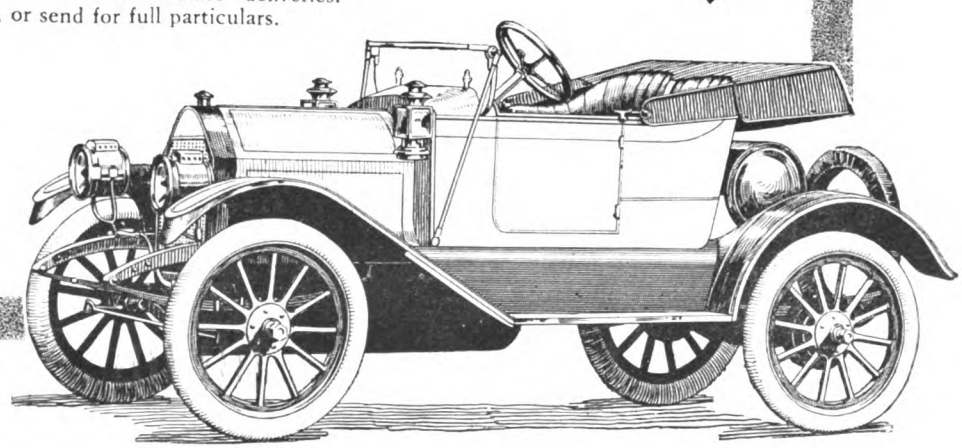
arger, More Power and Refinements

characteristically a Maxwell. That is, it retains the mechanical features responsible for the extraordinary Maxwell durability, endurance, economy of operation and upkeep.

The "40", is made in two body styles—the touring car $1675 and roadster $1625.

Maxwell "30"

We offer also the "30" touring car $1145 and the "30" roadster $1110. Our "30" made a great hit last year, and we were unable to build enough to supply the demand for it. It is improved and enlarged as the leader has been; and we are confident will retain its supremacy in its class.



Maxwell "22"

In the new Maxwell "22" we have the spectacular automobile value for 1913. At $785, fully equipped, including self-starter, the "22" will make an instantaneous hit. If you are interested in this model, we urge you to see the car, get a demonstration and make your selection at once to insure delivery. Our entire output of this model for 1913 is already sold to dealers.

PROTECT YOUR BIG INVESTMENT

You spend much money for a car—a large investment. Why not protect that investment by purchasing QUALITY lubricants?

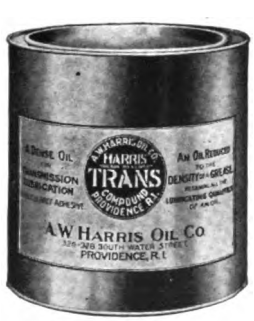
Your engine will work smoother, you will get increased power, no trouble and real efficiency by using

HARRIS

TRADE MARK REG. U.S. PAT. OFF.

OILS

THEY PROTECT YOUR BIG INVESTMENT



For over a quarter of a century, HARRIS OILS have enjoyed an enviable reputation for QUALITY. There is nothing better. All the science, all the experience, all the facilities that go with 25 years of knowledge—of "knowing how" are found in every drop of HARRIS OILS.

A LITTLE GOES A LONG WAY
AND EVERY DROP COUNTS

Ask your dealer for HARRIS OILS!

LUBRICATE YOUR GEARS AND TRANSMISSION WITH

HARRIS TRANS COMPOUND

An oil reduced to the consistency of grease, all lubrication. Send for testimonial letters.

A. W. HARRIS OIL COMPANY,

326 S. Water St., Providence, R. I. 143 No. Wabash Ave., Chicago, Ill.

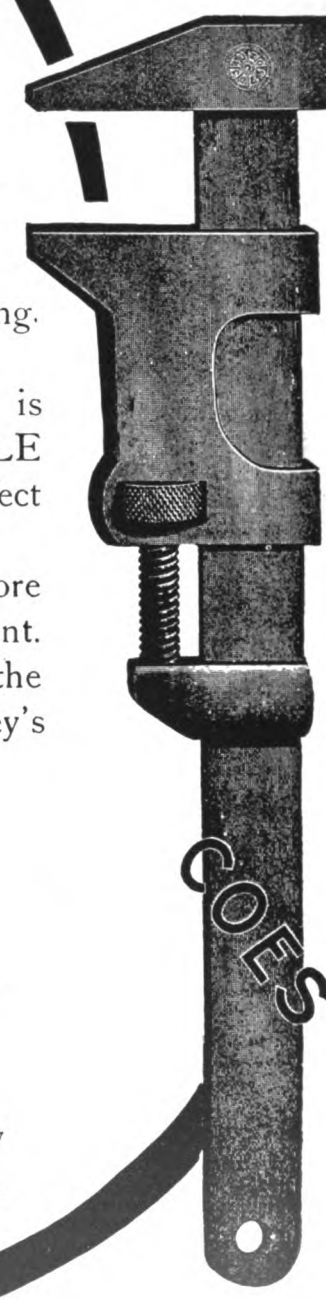
COES



THE
Wrench Supreme

Strength without bulk or clumsiness.
Ease of handling without slipping or bruising.
Perfect balance and right grip

Everything the motorist desires in a wrench is to be found in the "COES" AUTOMOBILE MODEL, and you will never know perfect wrench service until you pin your faith to it.

It stands to reason that the 5 per cent. more you pay for a "COES" wrench goes for 60 per cent. more quality and service—put this wrench in the tool kit and shop. You will get your money's worth.

Send for Literature Now.

"A car which cannot be stopped quickly is a menace to the public."

—*The Automobile.*

In other words, it *all* depends on the brakes. On the hills, in traffic, at the crossing, it isn't a question of speed, horse-power or appearance, but the big thing is—

How quickly can you stop the car?

Brake efficiency depends on design, material, lining. The best brakes are those which will act instantly.

DUPLEX EXTERNAL BRAKES

Will stop the heaviest car with slight pressure. Not only that, but they will stop the car from *sliding backwards*. They possess large surface, correct design and the very best material.

TRADE MARK Raybestos REG. U.S. PAT. OFF.

The Peer Of All Brake Linings

A solid, substantial fabric, presenting a wall of strength. Outwears any other lining, because it is made of genuine long fibre asbestos, specially treated, woven with great care. The sizing and rolling is systematically accomplished so that every inch of the fabric will give highly efficient service and outlast any other lining on the market. The name "RAYBESTOS" is stamped in every foot of the fabric.

Demand and insist upon getting RAYBESTOS—the Quality lining, efficient, economical and almost wear proof.

LBA

The Reinforced

LBA

Storage Battery

Copper reinforcement is one of the vital points in maintaining voltage. See, therefore, that you get a copper reinforced battery which gives you 13 times the conductivity of lead and at no additional cost.

But don't buy a poor substitute. Insist on the original L. B. A. reinforced battery and protect yourself against imitations. No other make of battery is just as good.

When you buy an L. B. A. you know you are getting a battery that embodies 20 years of battery making, plus the highest quality—and at a price no greater than is charged for inefficient substitutes.

The Perfected Tire Filler Proven by Use & Guaranteed

Airless Resiliency That Means Auto Insurance

RUN YOUR TIRES 15,000 MILES

Claims Proven

The Superior Court

Perfection Filler Company,
Old South Building, Boston, Mass.

Boston, August 15, 1912.

Gentlemen:

Noting the various testimonials you are showing at your factory, it occurs to me that my record is an exceptionally good one and that you could use the same possibly to advantage. I had my four tires filled with Perfection fillers in July, 1910, and up to the present time I positively know I have run close to 18,000 miles. My car is still fitted with two of the original shoes and filler, and I have given you at your request, the other two, which I believe you used for exhibition purposes, one having travelled more than 15,000 miles and the other 7,500 miles. I believe my car rides easier with the filler than it did on air, and I find that we have burned no more gasoline than we did on air, having taken particular pains to test out in the matter of gasoline mileage. It is a source of great pleasure to me to be able to start out on a trip knowing that regardless of the roads encountered, I am going to have no tire troubles.

I can earnestly recommend and endorse the Perfection Fillers.

Very truly yours,

William H. Todd
Official Stenographer

MERCER

More Evidence of Mercer-Ability

At Elgin, Ill., Aug. 30, the superior enduring qualities of Mercer cars were again shown. In the 152-mile Aurora Trophy Contest for 300 cubic inch cars, a Mercer, driven by Hughes, took first place in 140 min., 40 sec.—an average of 65.05 miles per hour. Another Mercer, driven by Pullen, was second. The Mercers were never headed from start, and finished about 30 minutes ahead of field.

At Columbus, O., Aug. 25, Spencer Wishart in a 300-inch Mercer Raceabout won a 200-mile race on a mile dirt track, against a field of ten starters. His time was 208 min., 4 1-2 sec. In addition to winning the contest, the Mercer had the honor of establishing new circular dirt track records for 75, 100, 150 and 200 miles.

Correct Designing and Building Methods have made these and other Mercer victories possible. Today Mercer cars are recognized as the highest type of medium-weight automobile construction

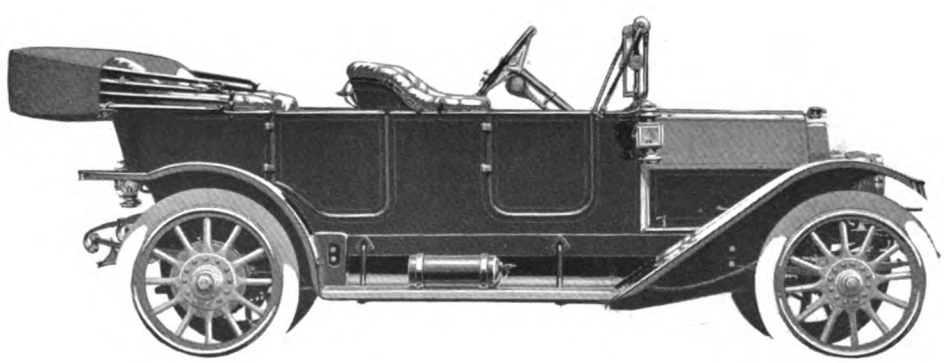
$985

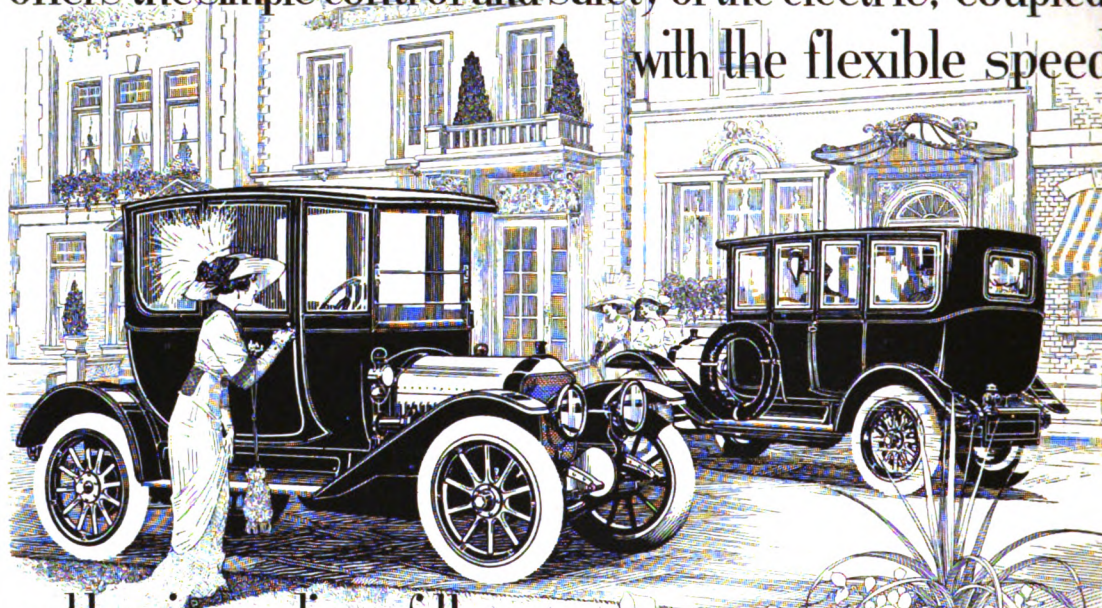
Completely Equipped



This Value Is Self-Evident

Self Starter	*Remy Magneto*
30 Horsepower	*Warner Speedometer*
5 Passenger Touring Car	*Mohair Top and Boot*
110 inch Wheel Base	*Clear Vision Wind Shield*
Timken Bearings	*Prest-O-Lite Tank*
Center Control	

We determined months ago that we would produce a 1913 model which would outstrip all previous efforts in the industry. We have it. The Overland Model 69 T is of such a convincing value that our sales offices are deluged with orders. Since our announcement on August 17th there has been a pouring in of dealers' specifications. We could not build this car at this price were our yearly production any less than 40,000.



Let us mail a 1913 catalogue.

The Willys-Overland Company, Toledo, Ohio

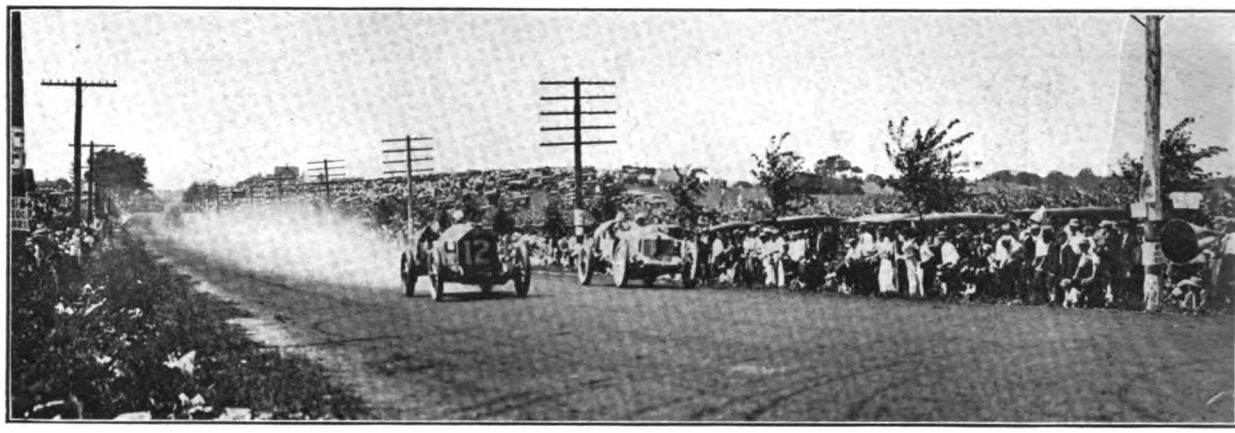
VOL. XXXIV, No. 3 SEPTEMBER 10, 1912 Price, $1.00 the Year

DE PALMA WINS TWO BIG EVENTS.

Drives His Mercedes to Victory in Elgin National and Free-For-All---Merz in Stutz Takes Illinois Trophy---Hughes Wins Aurora Cup with Mercer---Harry Endicott in Mason Finishes First for Jencks Award.

FATE plays strange pranks with automobile drivers. It will be remembered that during the 500-mile race on the Indianapolis speedway, Memorial Day, Ralph DePalma drove his Mercedes to create new records, almost from the beginning of the race, only to have his machine fail him on the next to the last lap. In the double contest for the Elgin National trophy and the free-for-all, over the Elgin road course, Aug. 31, DePalma and his Mercedes took both events. But, this time it was Ralph Mulford in a Knox, who was unfortunate, with this difference—it was the driver and not the car which failed at a critical moment.



Ralph DePalma in Mercedes 4, Finishing a Winner in the Free-for-All—Also First Place Car in Elgin National Event.

In the race for the Elgin National trophy, the contest was between DePalma and Mulford from the start. At the end of the 28th lap, less than 30 seconds separated them, and this was in favor of the Knox. With only two more circuits to make there was every indication that Mulford would finish a winner. It was not known at the time, but undoubtedly his condition was such that he could not maintain the pace, and DePalma took the race. Mulford was second and Charles Merz in a Stutz was third.

The two events were run together, the free-for-all going six additional laps. As the cars came to the pits on the 32nd lap, William Chandler, mechanician for Mulford, half-supporting his chief, who was the victim of a sunstroke, called for another man

Digitized by Google

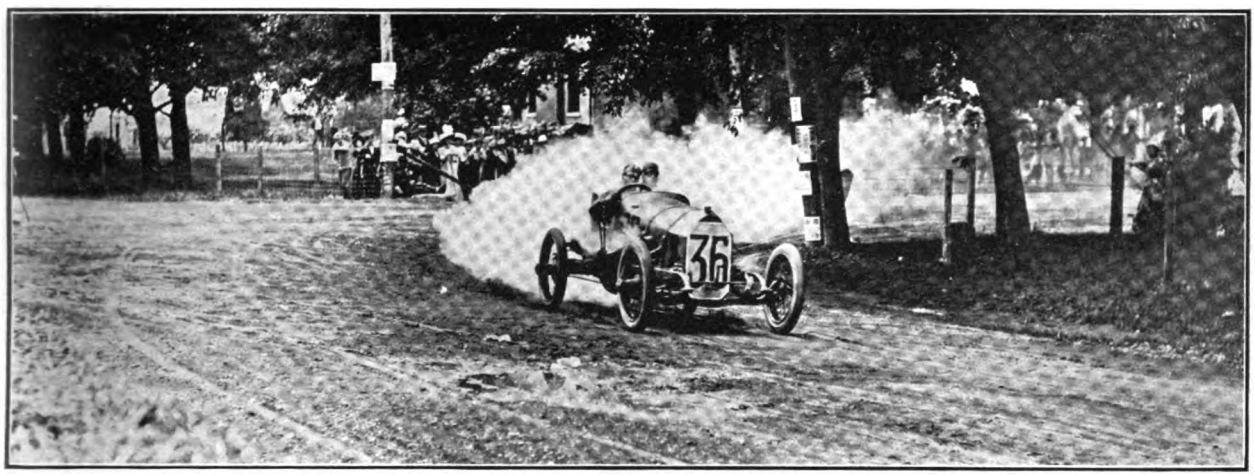
Ralph Mulford in Knox 1 and Charles Merz in Stutz 12, Second and Third Place Cars in the Elgin National.

to continue the contest beside him. Mulford was lifted from the machine; Eugene Steecker, a helper in the pits, was substituted as mechanician, and Chandler continued the big event to finish in third place.

After winning the Elgin, DePalma overtook Erwin Bergdoll in a high power Benz, who had been leading practically since the second lap, and won the second time during the day. Bergdoll lost the race to the Mercedes on the 35th circuit of the course, thereby repeating the failure of DePalma in the 500-mile event, with the exception that he was able to finish in second place.

While it is but natural that the most interest should attach to the big events of the meet, the work of the winning machines in the contests of Aug. 30 should not be forgotten. Charles Merz and Gilbert Anderson, both driving Stutz cars, finished in first and second positions in the race for the Illinois trophy. Hugh Hughes and Edward Pullen, both driving Mercers, occupied similar positions for the Aurora cup, while H. Trussell in a Fal-Car was third. In the small race for the Jencks award but one car finished, this being the Mason, driven by Harry Endicott.

A comparison between the results of this years' events and those of 1911 will prove of value, although the Elgin road races of last year were limited to stock cars, while no such restriction was made for those just held. There was no free-for-all in 1911, this being an added event.



Leonard Zengel in a National completed the 305 miles for the Elgin National trophy in 1911, at an average speed of 66.41 miles an hour. DePalma's average for the free-for-all this year, which also covered 305 miles, was 69. In the Elgin National, his speed was 68.28 for the 254.1 miles. Bergdoll's average for the free-for-all was 67.66, and Mulford's (or Mulford and Chandler), 66.79. Mulford's speed in the Elgin National event was 67.46, and Merz's, 64.41.

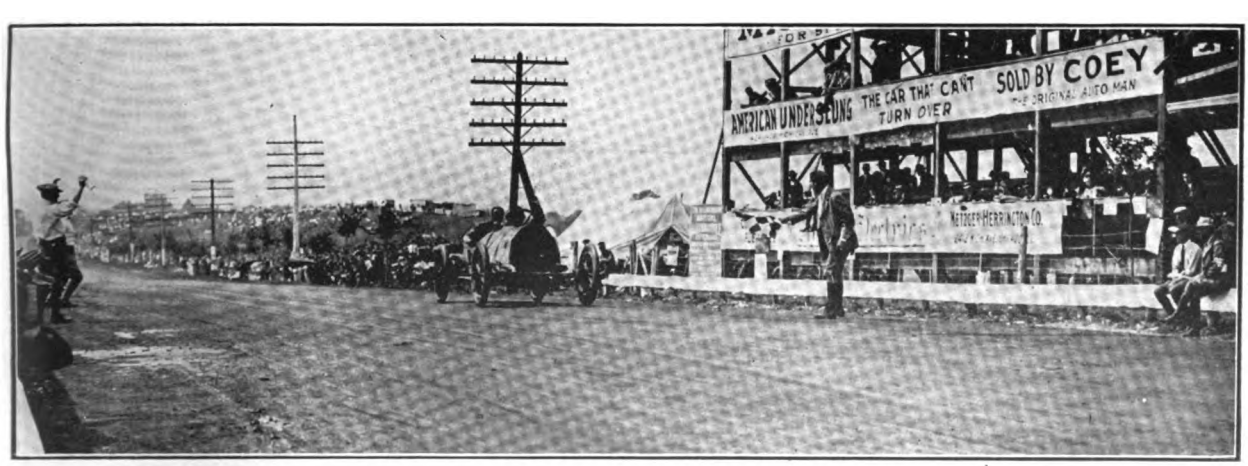
The two races for the Illinois trophy offer a better means for comparison, since both were for 203.5 miles. Donald Herr in a National won the

Charles Merz in Stutz 24, Winner of Illinois Trophy, Passing E. Pullen in Mercer 31, Second Place Car in Aurora Event.

Digitized by Google

Hugh Hughes and the Winning Mercer 36, Rounding a Curve in the Race for the Aurora Trophy.

1911 event at an average speed of 65.81 miles an hour. This year, Merz's speed was 65.96.



Last year the race for the Kane County trophy, covering 169.4 miles, was won by Hugh Hughes in a Mercer, his speed being 64.6 miles an hour. The race for the Aurora cup this year covered 152.5 miles and corresponds more nearly with the Kane County event than with that bearing the same name. Hughes' speed this year was 65.17.

This year the small cars competed for the Jencks award. In 1911 Mortimer Roberts in an Abbott-Detroit finished the 137.5 miles for the Aurora cup at a speed of 54.59 miles an hour. Endicott covered the 101.7 miles for the Jencks award at a speed of 60.89.

The story of the free-for-all is so closely interwoven with that of the Elgin National that it is impossible to tell one without the other, and since the latter race was ended first, it will be best to tell its story first. There were 12 entries, only nine of which actually started. These were: Ralph Mulford, Knox; George Clarke, Mercedes; Mortimer Roberts, Mason; Ralph DePalma, Mercedes; George Hill, Fiat; Gilbert Anderson, Stutz; Charles Merz, Stutz; Spencer Wishart, Mercer and Hugh Hughes, Mercer. The full scores are given in an accompanying table, the results in the Elgin National being indicated under the 30th lap.

DePalma was the first to get away, and the first to complete a lap, his time being seven minutes, flat. However he was not to retain his lead for long, since Mulford made the second lap in 7:06, and the third in 7:05, taking first position at the end of three circuits of the course. Hughes in his Mercer was third. The two Stutz cars were running together well in fourth and fifth places.

Changes came rapidly, however, and DePalma was back in first place again on the fourth lap. Mulford was second, Hughes third and Hill fourth. One more round and the positions of the

Harry Endicott and the Mason 41 with Which He Won th ace for the Jencks Award.

two leaders were unchanged, but the two Stutz machines, Merz ahead and Anderson right behind him, were third and fourth. Clarke was in fifth place, but his car ran into a fence on the sixth lap and both he and his mechanician were injured.

Mulford was in the lead again by this time, although but one second ahead of DePalma. The two Stutz machines were tied for third place, and this is one of the remarkable features of the race, since Mulford and DePalma were tied for first place at the end of the next lap, the seventh. Anderson was 10 seconds ahead of his teammate at this point.

At the end of the eighth lap it was DePalma, Mulford and Anderson, the latter hardly a minute behind the Knox. The following lap Anderson lost his position to Hill. This order remained unchanged until the 14th round, when Anderson's Stutz again replaced Hill's Fiat in third. Less than 30 seconds separated Anderson and Mulford on the 15th lap. The two Mercers were in fourth and fifth positions, but Hughes was destined to stop on the 18th round—the first time he has ever been forced to withdraw during a race while piloting a machine of this manufacture.

It was still DePalma, Mulford and Anderson until the end of the 24th round, with Wishart and his Mercer in fourth place for two laps, and then a spirited contest between Merz and Roberts for this position, these two being tied on the 20th circuit. Merz appeared to have the better of the contest and slowly drew away from the Mason. A little later he passed the other Stutz, arriving in third place at the end of the 25th lap.

Mulford began to lessen the time between him and DePalma at this point. The two Stutz machines and the Mason were having a splendid contest between themselves, while Wishart's Mercer was withdrawn in the 27th. Mulford took the lead in the 28th, but retained it for but one lap. Merz's position in third was secure, and they finished the race in that order—DePalma, Mulford, Merz, Roberts and Anderson.

The behavior of the two Stutz machines, which were competing against cars of much higher power, is worthy of special mention. Their bore and stroke, 4.75 by 5.5 inches, is the same as that of the Knox, but the latter is a six-cylinder car instead of four. The comparative piston dis-

placement is 389.9 for the Stutz and 584.8 for the Knox.

There were eight entrants for the free-for-all, but only five competed, and two of these were out of the running before the free-for-all may be said to have begun. The five were: Mulford, Knox; Clarke, Mercedes; DePalma, Mercedes; Erwin, Bergdoll, Benz and Hughes, Mercer. Inasmuch as Clarke and Hughes withdrew before the completion of the Elgin National event, there remained but three to finish the big race.

Bergdoll, whose machine had piston displacement too large to permit of his competing in the shorter event, took the lead in the big race in the second lap. He retained this lead until the 23rd lap, when DePalma passed him for two rounds of the course. He lost his position again on the 35th lap, and as the event had but one more circuit to go, he lost the race at the same time.

The collapse of Mulford occurred on the 32nd lap. There is every indication that he had been in trouble since the 28th round, which he drove in 5:54, this being the fastest lap in the Elgin National event. His next circuit was covered in 10:33, and while he was hindered slightly on this round by tire trouble, the delay occasioned thereby was by no means sufficient to account for the entire difference in time. It is presumed that the terrific strain combined with the heat to bring about his failure. He grew worse rapidly after being removed from the machine and was taken to the hospital later.

Aug. 30 three races were run simultaneously, these being the contests for the Illinois trophy, Aurora cup and Jencks award. Four cars were entered in the Illinois event, and all started, as follows: Gilbert Anderson, Stutz; W. Hobbs, Rayfield; Neil Whalen, National, and Charles Merz, Stutz. The National and Rayfield were eliminated early, and the remainder of the contest was between the two Stutz machines. It may be stated that it was a contest in every sense of the word, and at times less than a dozen feet separated them. In this respect the performance of the two Stutz cars was similar to that in the Elgin event the next day. At the finish Merz was about two minutes ahead of his teammate.

He completed the distance, 203 miles, in 184:32:25, averaging 66 miles an hour. Anderson's time was 186:14:15.

In the Aurora event, for cars of from 201 to 300 cubic inches piston displacement, there were six entrants, and all but one finished, Wishart in a Mercer withdrawing in the 13th lap. His teammate, Hughes, in a Mercer, although the last sent away, took the lead the first lap and retained that position throughout the entire race of 152 miles. His fastest lap was the third, made in 7:27. Pullen, in another Mercer, passed Wishart, who was second for the first three laps, in the fourth round and finished in second place. Only three cars stopped at the pits during the race and one stop

was unnecessary, Hughes halting in his 12th lap to inform the pit attendants that his teammate, Pullen, had blown a tire on the back stretch.

The small car event, for the Jencks award, had but three contestants: Harry Endicott, Mason; Henning, Ford, and W. G. Wordingham, Herreshoff. Endicott won easily, averaging a speed of 60.7 miles an hour. The Ford was ditched at 50 miles and the Herreshoff withdrew in the second lap. Endicott furnished a little excitement by running into several bales of hay, banked alongside the course, but escaped injury.

In the matter of accessories, a very important factor in the running of any race these days, the Findeisen & Kropf Manufacturing Company, Chicago, appears to have been a consistent winner with the Rayfield carburetor. This make of vaporizer won first and second in the Elgin National, first and third in the free-for-all, first, second and third in the Aurora. The Stutz cars, which finished first and second in the Illinois and third in the Elgin National, were equipped with Schebler carburetors, made by Wheeler & Schebler, Indianapolis.

Bosch magnetos, made by the Bosch Magneto Company, New York City, were fitted to cars taking first, second and third in the free-for-all; first and second in the Elgin, and first and second in the Aurroa. The Stutz cars, first and second in the Illinois, were equipped with Splitdorf magnetos, made by the Splitdorf Electrical Company, Newark, N. J., and the Mason, winner of the Jencks event, also had Splitdorf equipment.

All of the winners used Monogram oil, made by the New York Lubricating Oil Company, 116 Broad street, New York City, and it is stated that 90 per cent. of the cars entered had this lubricant. The Knox used Oilzum, made by the White & Bagley Company, Worcester, Mass.

Michelin tires, made by the Michelin Tire Company, Milltown, N. J., were equipment for the winning cars, save in Aurora event, in which the Mercer was fitted with Firestone shoes, made by the Firestone Tire & Rubber Company, Akron O., forward, and Prowadink tires in the rear. Truffault-Hartford shock absorbers, made by the Hartford Suspension Company, Newark, N. J., were on 11 of the 16 cars using such devices and the winners of the Illinois, Aurora and Jencks events were similarly equipped.

ADOPTS HARTFORD AUTO-JACK.

Announcement is made that the Nordyke & Marmon Company, Indianapolis, maker of the Marmon car, will include the Hartford Auto-Jack made by the Hartford Suspension Company, Jersey City, N. J., as a part of its standard equipment. The Indianapolis concern also includes the Truffault-Hartford shock absorber as regular factory equipment.

DE LISSER RETURNS FROM ABROAD.

Horace de Lisser, chairman of the board of directors of the Ajax-Grieb Rubber Company, Trenton, N. J., recently returned from a trip abroad, on which he established Ajax tire making connections in Europe. His mission was a marked success and details of his plans will be made public in the near future.

MAXWELL CHASSIS FOR 1913.

ADOPTING the horsepower rating instead of names to distinguish its product, the Maxwell-Briscoe Motor Company, Tarrytown, N. Y., a constituent of the United States Motor Company, New York City, announces five new models for the season of 1913. For the first time in several years a two-cylinder machine is not listed, it being replaced by a popular priced, light four-cylinder roadster possessing many attractive qualities and having a very complete equipment, including a motor starter. In addition to the roadster the company produces two other chassis, these being 30 and 40 hosepower, respectively, to which are fitted touring and roadster types of bodies. These four models succeed the Mascotte and the Maxwell Special, the Glidden tour winner of 1912.

New Model Maxwell "22," a Four-Cylinder Light Roadster, Having Multiple Disc Clutch, Sliding Gear Transmission, Motor Starter and a Very Complete Equipment.

Although these models gave universal satisfaction the company has followed its policy of embodying new mechanical features and improving the design. Simplicity and accessibility are noticeable of the chassis components, qualities which will appeal to the motorist caring for his own car, while deep upholstery, lower seats, more tonneau room, improved springs and larger wheels show consideration of the passengers' comfort. The accessory equipment is very complete, including as it does in addition to top, windshield, lamps, tools, etc., a motor starter and electric lights. Throughout attention has been paid to small details which contribute to the convenience of the motorist and among the many refinements are a water proof luggage compartment in the "40" roadster, carriers for spare tires, extra pockets in the upholstering, ventilators, provisions for storing luggage, etc.

With the exception of the "30" model left hand drive is employed, the "22" roadster having left hand control with a progressive sliding gear transmission while the "40" is fitted with centre control and a selective sliding gearset. In keeping with the policy of the company the three point suspension of the power plant unit, including the clutch and transmission, is employed, the design being characteristic of the Maxwell line. An increase in horsepower is noted and many components of the motor have been redesigned in accordance with the best engineering practise. Although many parts have been lightened, weight has not been sacrificed for quality, as the employment of high grade metals and improved machinery has made these changes practical.

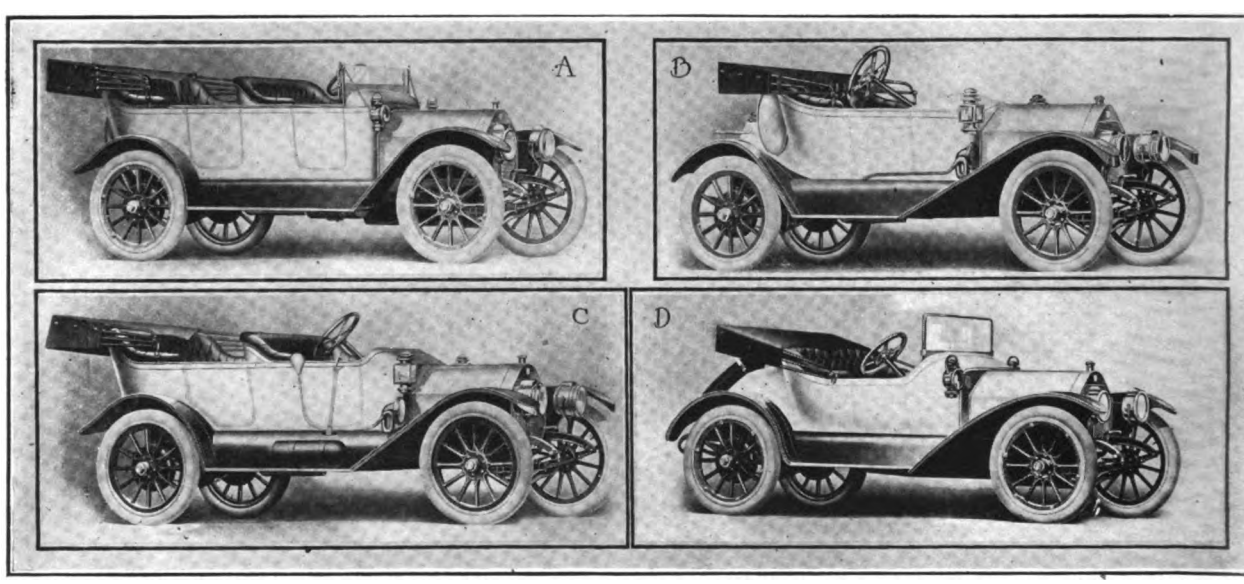
Maxwell "40" Models.

The power plant of the "40" differs from the other models in that the cylinders are cast singly. These are of the T head type having the intake valves located on the right and the exhaust members on the left. Among the new features is the fitting of a specially constructed stuffing box on the valve pushrods and by it leakage of oil is pre-

Digitized by Google

vented, making for a clean motor as well as economy of lubricant. The length of the connecting rods has been increased over that of the Special and the pistons are lighter, making for smoother running qualities. They are fitted with three rings instead of four as formerly, and are provided with new oil returns, eliminating smoking and reducing carbon. The big ends of the connecting rods have been provided with larger oil scoops, insuring proper lubrication by the splash system, this being augmented by a pump which maintains the proper level of lubricant in the crankcase.

The thermo-syphon circulation system has been improved, the intake and discharge pipes having larger diameters and in place of the Y shape manifold a single discharge pipe is employed, this being connected to a water tank behind the peak of the radiator, a new departure and one making for efficiency in cooling.



An innovation is noted in the manner of mounting the adjusting fan support, the bracket being integral with the substantial water manifold. The intake and exhaust manifolds are both polished and copper gaskets are employed. Each cylinder is supplied with mixture from a separate inlet pipe integral with the main induction member and the manner of retention is such that all joints are absolutely gas tight.

The gear driven magneto is mounted on the intake side of the motor, the cooling of which is aided by fan shaped blades in the flywheel and by the belt driven fan. An improvement has been made in the matter of carburetion, the vaporizer being fitted with flexible tubing which extends between the first and second cylinders to a sleeve on the exhaust manifold, providing means for conveying hot, dry air to the air intake of the carburetor, a design making for economy of fuel and a uniform mixture. Adjustments to the connecting rods, etc., are obtained easily by large inspection plates while the clutch and gearbox are accessible by the removal of a few nuts retaining the cover plates, which are provided with ample sized openings for the insertion of lubricant. Relief compression cocks are fitted to all motors.

Improvement in Components.

A larger transmission is employed, it being of the selective type, providing three speeds forward and reverse. The bearings, shaft, clutch bearing cone and gears are of ample size and constructed of high grade material carefully finished. The size of the universal joint has been increased and it is provided with large grease chambers and enclosed in leather. The housing carrying the gear shift and brake lever is at the right with clutch pedal at left of assembly and the clutch-brake design is still retained.

A full-floating rear axle has been adopted, with oil retaining washers. Provision is made for a uniform adjustment of brakes under load and a new style brake turnbuckle is included among the changes. The rear axle struts are of a one-piece forging. The wheelbase is longer than that of the Special and clearance is also greater, which with 36-inch wheels, demountable rims and well de-

Showing Acetylene Motor Starter and Concealed Horn, Standard Equipment with All Maxwell Models.

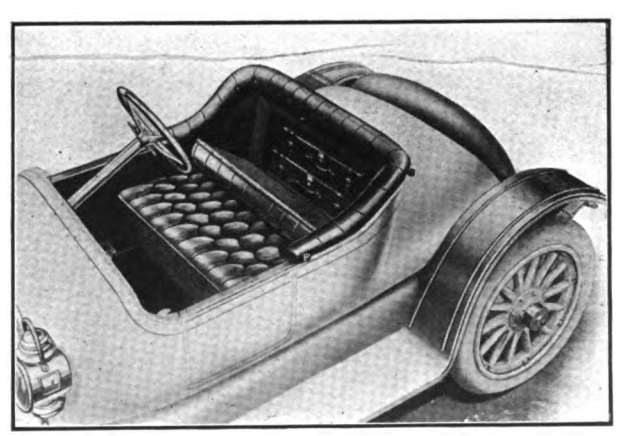
control, the former method having been replaced with members of the sector type. A new design of accelerator is also fitted. The steering wheel is of aluminum and the steering column is set at an angle making for comfort in steering. All components of the steering mechanism have been increased in size. The under pan is now retained by strong springs, eliminating rattle and making it a simple matter to remove the member. Another innovation is the lining of the frame with leather where the body rests, a design making for quietness as well as eliminating vibration.

Refinement in Body Design.

Many refinements are found in the body design. The five-passenger touring car has a larger tonneau, and both seats have been lowered, which with the deep Turkish upholstering make for comfortable riding qualities. Extra upholstery pockets, foot and robe rail are among the appointments.

An innovation of the "40" roadster is the water proof luggage compartment in back of the seat, access being by pulling forward a trap section in the upholstery. Two large suit cases may be carried easily. The roadster is also provided with a turtle deck and is striking in appearance, being designed for those who desire a high powered machine having clean cut lines and liberal and convenient means for carrying spare tires and luggage. Grease cups replace oilers and are fitted to all parts subject to wear.

The equipment is very complete and all accessories are concealed, the gas tank being placed beneath the running board while the horn is located inside the hood. A new type, 60-mile speedometer and the motor starter button are located on the dash. A new design of top is fitted, held by new supports, and the bows fit solidly into rubber faced brackets, making for rigidity. The method of retaining the number plates and spare tires has also been improved. New lamp brackets are utilized as well as new design of lamps and the headlights are so mounted that a greater efficiency is secured. The side and tail lights are combination oil and electric, and a storage battery is utilized to supply current. The color scheme of the "40" is royal blue, black hood and fenders, with reseda gray wheels and running gear.



The Maxwell "30."

Many improvements have been made in the "30," which is the successor of the Mascotte. The bore remains the same, four inches, the stroke has been increased to 4.625.

The diameters of the crankshaft and camshaft have been increased and the cams are now integral instead of being pinned.

Among other improvements is the method of mounting the new type of fan, a bracket being secured to the front cylinder and means provided for adjustment. A refinement is noted in the ignition system, the high-tension cables being carried in a container attached to the cylinders, protecting the wires from possible chafing and short circuits.

Circulation is by the thermo-syphon system as are all the models, but on the "30" a larger size and new design radiator is employed than was on the Mascotte. The bottom of the control levers is now boxed in, thereby protecting them

Concealed Luggage Carrier of the Maxwell "40" Roadster.

from mud and dirt and adding to the appearance of the machine. Additional grease cups are incorporated, replacing oilers, and among the parts

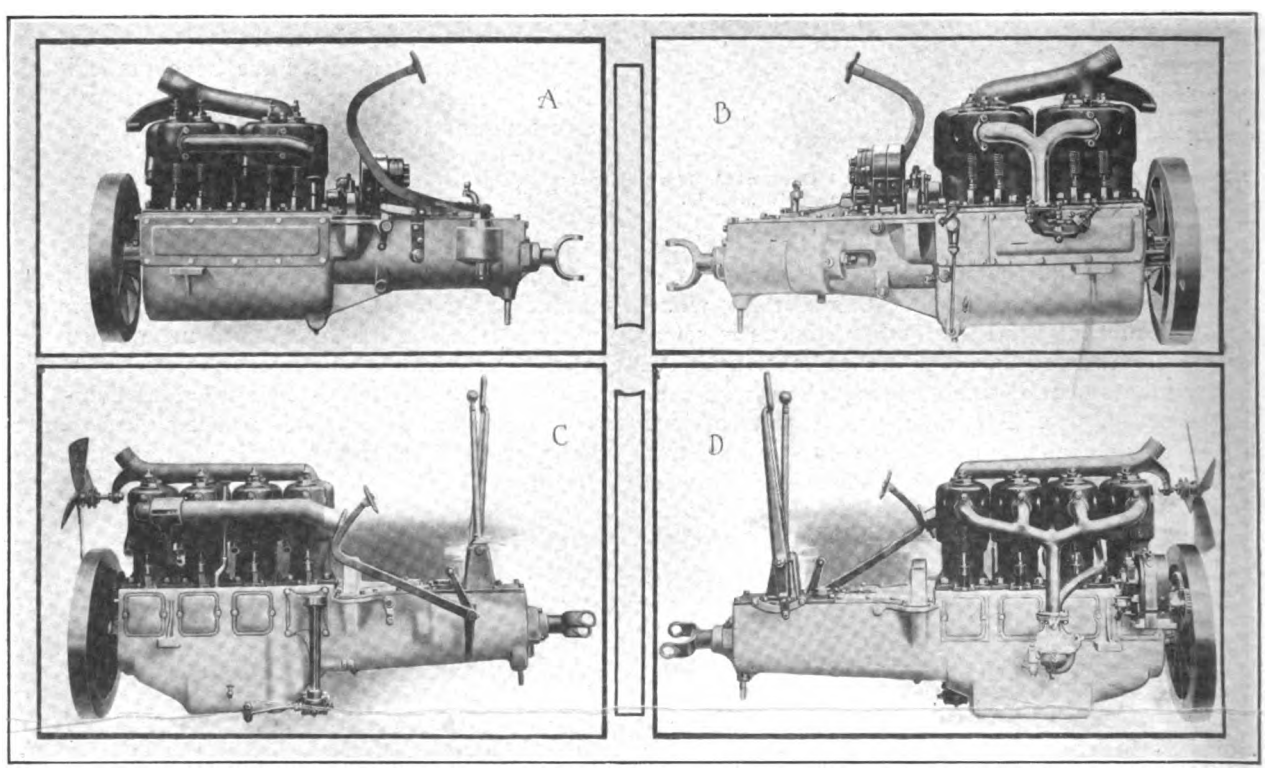
Digitized by Google

lubricated by the new members are the control lever tubing and steering gearcase.

Throughout many parts have been strengthened and the front axle is of the I beam section type and drop forged. New steering knuckles are employed, these permitting of a turning radius of 24 feet, a quality making for convenience when operating on narrow highways.

Longer Wheelbase Employed.

The wheelbase has been increased slightly and a new spring suspension is employed, this consisting of longer, flatter springs of English steel. The design not only makes for more comfortable riding qualities, but with the new rear fenders adds to the appearance of the car and makes it seem hung lower. In the roadster model this effect is further emphasized by the fitting of longer running boards in connection with fenders of new and stronger design.



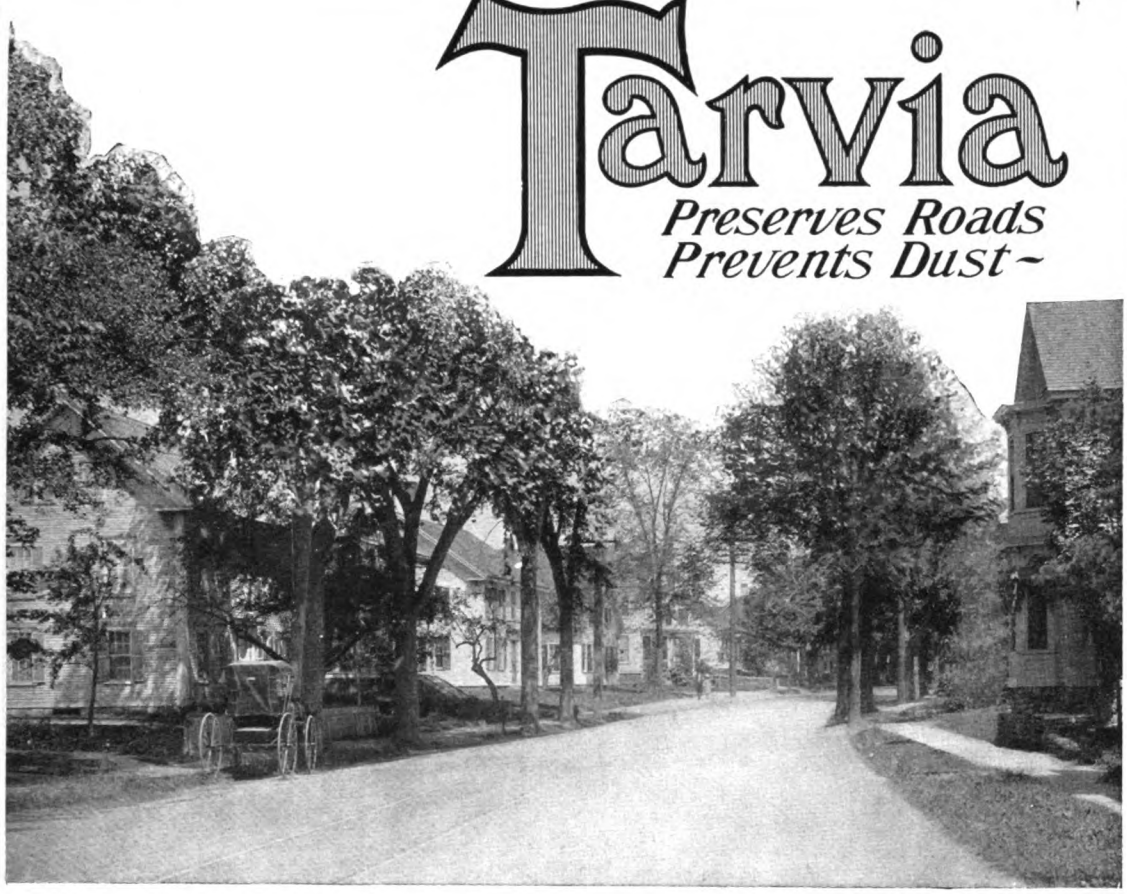
In addition to the resiliency obtained by the new type of springs, new hangers and bumper plates are fitted, permitting of more spring travel before the bumpers are brought into service. The design of the bumpers is such that the impact is softened.

As with the other models the equipment is very complete and among the new accessories are a new design of headlight brackets, these being carried higher than with former models, a method making for greater efficiency as the rays are projected further. The motor starter is of the acetylene type and is included with the equipment. The same refinement in upholstery, etc., is also noticeable in this model.

The Maxwell "22" Roadster.

The Maxwell "22" roadster presents many interesting features and the design will appeal to the motorist desiring a light, well powered machine having qualities found in larger and higher priced cars. The equipment is very complete, comprising motor starter, concealed horn, top and slip cover, windshield, gas tank, five lamps, tools, etc.

The motor is a four-cycle, four-cylinder, water-cooled unit with the cylinders of the T head type and cast in pairs. The bore is 3.75 inches, the stroke four, and the horsepower rating under the S. A. E. formula is 22.25, although in brake tests it is stated that this has been exceeded. The power is ample and there should be plenty in reserve when the lightness of the model is taken into consideration.



Outlining the Power Plants of the 1913 Maxwell Cars: A, Exhaust Side of Maxwell "22" Roadster; B, Intake Side of Same Motor, Depicting New Design of Carburetor; C, Left Hand Side of Maxwell "40" Motor, Depicting New Manner of Mounting Fan and Stuffing Boxes on Valve Pushrods; D, Intake Side of Same Motor Showing Centre Control Levers and Hot Air Device Fitted to Carburetor.

Tarvia

Preserves Roads
Prevents Dust

Union Avenue, Laconia, N. H. Built with Tarvia X.

Laconia's Experience with Tarvia

The Board of Public Works of Laconia, N. H., invited inspection of their tarviated roadways by the United States Office of Public Roads, and the Government report is embodied in Bulletin No. 42, issued in February. It says in part—

"The work was being done in a first-class manner in every way, and it will be gratifying if this type of construction could be extended entirely around the beautiful Lake Winnepesaukee.

"Their method of maintenance as explained has been to apply 1-2 gallon of a tar product after the road has been built about one year, and at the end of two and three years, respectively, to apply about 1-3 to 1-2 gallon of a lighter grade of tar at each application, resanding in each case.

"Some of this class of construction has now been laid for four years in this city and it is in good condition."

The foregoing roads were not only maintained with Tarvia, but were built with Tarvia in the first place by the penetration method.

Laconia used Tarvia first in 1908, 9,816 yards; in 1909 two more sections were laid, amounting to 6,528 yards; in 1910 7,800 yards more of tarviated macadam were laid, and figures for 1911 were 24,400 square yards.

All these pavements are now in excellent condition, and a light coat of "Tarvia B" applied during 1912 will be sufficient to carry them through the season. The cost for this "Tarvia B" treatment will not exceed 2c. per yard for the whole area.

These roads are dustless, mudless, do not ravel under automobile traffic, and are being maintained in the best of condition despite the low annual upkeep.

Thanks to Tarvia, Laconia has, all told, several miles of beautiful macadam roadways without any dust nuisance or extravagant cost.

Every town and city can solve its road problems by gradually changing from plain macadam to the more scientific and modern tarviated macadam, as Laconia has done.

Booklets on request.

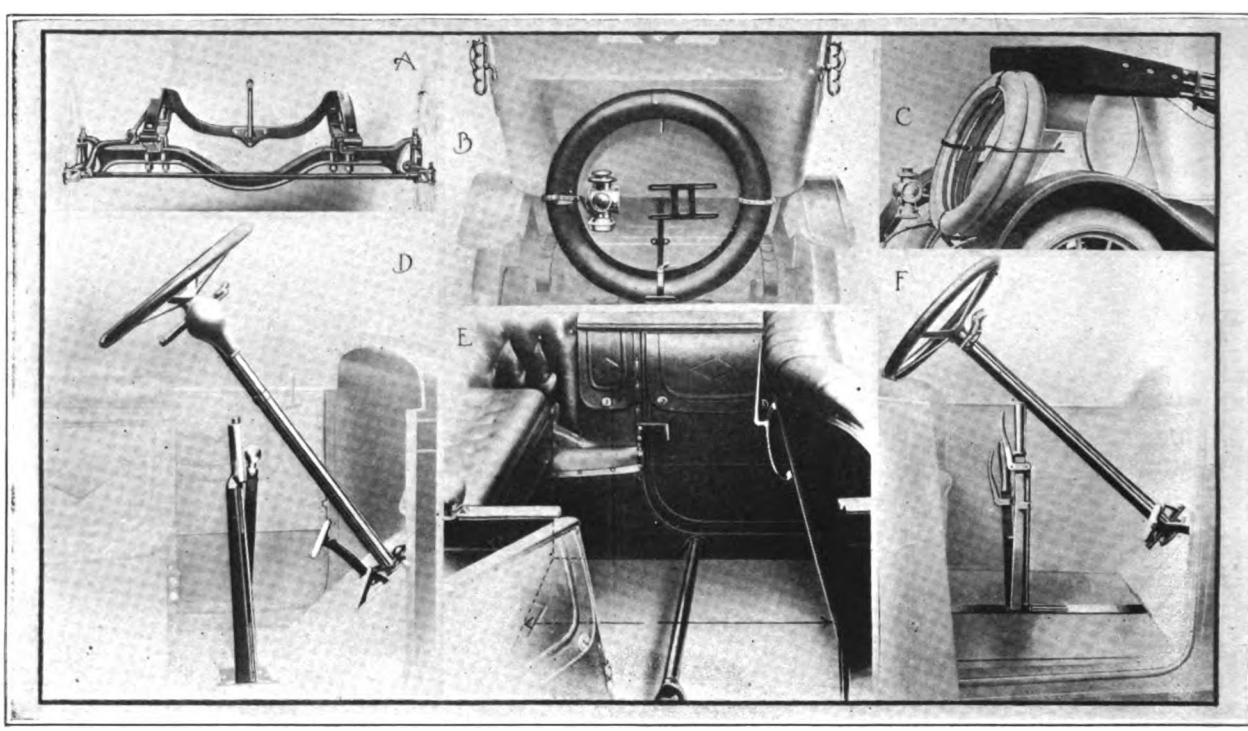
The intake valves are located on the right with exhaust on the left of the motor which is fitted with large inspection plates, making it an easy matter to reach connecting rods, main bearings, etc., when desired. As with the "40" model, the fan bracket is integral with the discharge water manifold. The crankshaft is of liberal dimensions, of heat treated, high carbon steel, ground to size and is carried in three large babbitt bearings. The carburetor is of a new design, constructed of bronze and is said to be very efficient as well as economical of fuel. Dual ignition is provided by a magneto and batteries and the former is mounted back of the motor, being gear driven and so located as to be easily accessible.

Lubrication is by splash and the level of the oil is maintained by a plunger pump. The connecting rods are provided with large sized scoops insuring the thorough lubrication of all working parts and in designing the lubrication system attention has been paid to eliminating unnecessary smoke, a factor making for reduction in carbonization.

Multiple Disc Clutch.



The clutch is of the multiple disc type, composed of 15 discs of crucible saw steel, and operates in an oil bath, making for easy engagement. The motor, clutch and transmission are a unit and the three point suspension, characteristic of the Maxwell models, is employed. The universal joint is of ample size, is provided with grease chambers and is enclosed in a leather cover.

The transmission is of the progressive sliding gear type, providing three speeds forward and reverse. The operating lever works back and forth in a straight line slot in the floorboard and the emergency brake lever is mounted beside the gear shift member at the right of the driver and in the centre. Left hand drive is utilized as with the "40" model.

The radiator is of the honeycomb type. The wheelbase is 93 inches and tread is 56 inches.

The front axle is tubular, of seamless steel and the rear axle is of the semi-floating type with ball and roller bearings of ample size. Two sets of brakes are fitted, the service being operated by the clutch pedal and the emergency by lever.

The dash is free from accessories save for the starter button, oil sight feed and coil. The equipment is as fully complete as with the other models and includes acetylene motor starter and concealed horn. The color scheme is Brewster green with cream wheels.

Some Features of the New Maxwell Models: A, Drop Forged I Beam Axle Utilized with Successor to Mascotte; B, Number Plate Hangers and Tire Carriers of Maxwell "40"; C, Tire Suspension of Maxwell "30"; D, Showing Location of Control Levers of the Same Model; E, Enlarged Tonneau and Extra Pockets of Maxwell "40"; F, Centre Control and Left Hand Drive of "22" Roadster.

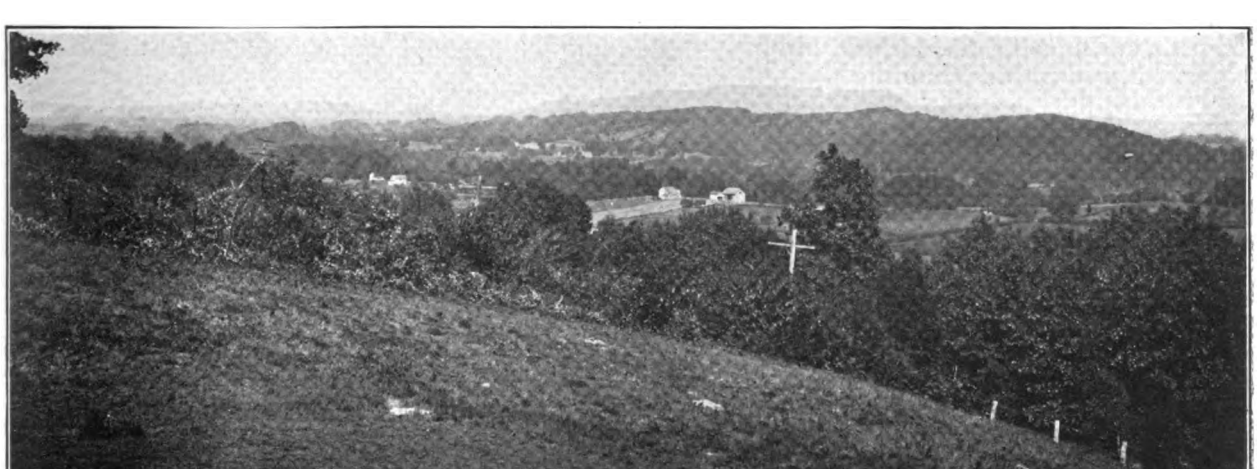
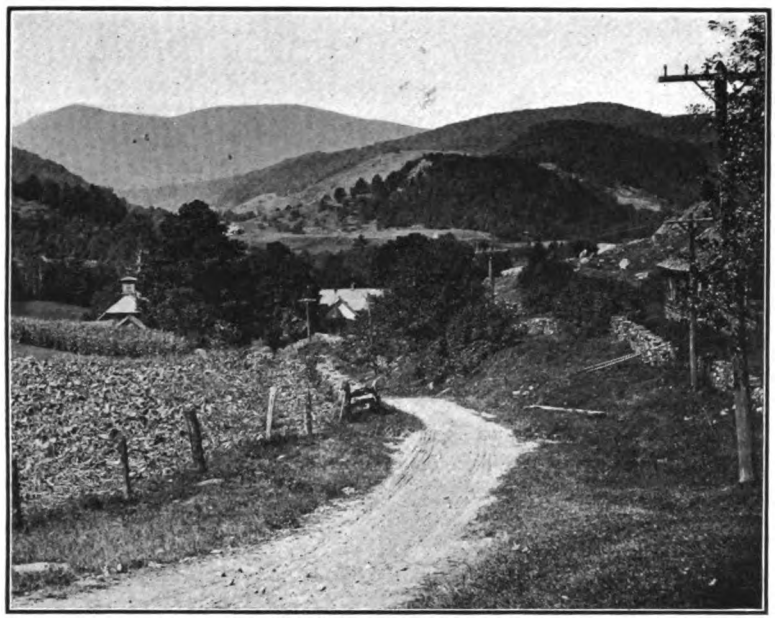
In the Green Mountains of Vermont



FOR those who love the beautiful in nature the Green mountains hold a particular charm. The roads leading through this region are not quite as ideal as those over which motorists have been wont to visit the White mountains of New Hampshire, but they offer little difficulty for the modern car. In some respects this adds to the delight of the tour, since it gives opportunity to get into more intimate touch with the mountainous districts.

TOUR NO. 30.

Leaving New York City the first day, the way leads along the shores of Long Island sound, through many of the residential suburbs of the metropolis, both in New York and Connecticut. Stamford, Norwalk and Bridgeport offer plenty of inducements to tarry by the way, and the intermediate shore resorts are equally inviting.



After passing Stratford, the valley of the Housatonic is followed to the confluence of the Naugatuck at Shelton. This latter city is so interwoven with those of Derby and Ansonia as to make them practically one large centre. Seymour is a prosperous manufacturing town, although it suffered recently by reason of a flood, resulting from the breakage in the dam which held back the Naugatuck at this point. The borough of Naugatuck is a thriving rubber centre. Waterbury, the Brass City, is the night stop, and it will be found that the day's mileage has not been such as to preclude the possibility of taking advantage of some of the numerous pretty drives in this vicinity.

The second day takes the tourist over the new road to Southington mountain, through Southington, Plainville and Farmington to Hartford, the capital of the state and noted for its beautiful parks. The Massachusetts line is crossed at Southwick, that little "neck of land" which extends down into the state of Connecticut. The road from this point to Northampton, the seat of Smith College for girls, lies along the base of several

View of Southington Mountain, Near Waterbury, Conn., with Hanging Hills of Meriden in the Distance.

Pleasing Mountain Scenery in the Vicinity of Jamaica, Vt.

mountains of the minor class, chief among which is Mt. Tom. Still others of the same character are passed on the way through South Deerfield and Deerfield to Greenfield, and the Vermont line is crossed soon after leaving the latter town. The night stop is at Brattleboro.

The mountains of the second day virtually are the foot hills of the Green mountains, and the more imposing peaks come into view early on the third day. Good roads lead into Newfane, near which is Putney mountain and Sunset lake. Splendid fishing and hunting are offered in season. Jamaica is another comfortable country town surrounded by beautiful green hills, almost in the West river valley.

Innumerable lakes and streams dot the landscape in the vicinity of South Londonderry, and there are several attractive scenes within easy reach. Among these may be mentioned Hamilton falls, Flat rock on top of Glebe mountain, and Devil's den. Manchester Center is admirably located between three mountains and is one of the highest points in this section. Manchester is at the base of Mt. Equinox, and at Stratton mountain, toward the southeast, is the romantic pass known as Stratton gap.

The state seal of Vermont had its origin in Arlington, in which town are the West and Red mountains. The way leads down the valley of the Battenkill to Cambridge, N. Y. This river is crossed at Greenwich, and then the country becomes more flat and uninteresting on the way to Saratoga, the night stop.

Good roads are offered for the trip between Saratoga and Albany by way of Mechanicville and Waterford. Below Albany is Kinderhook, where may be seen a number of ancient buildings, among them being the Van Alen mansion built in 1721 and the Van Schaack mansion erected in 1774. Two miles below the village is Lindewald, the home of Martin Van Buren, and before that the home of Peter Van Ness. Time should be taken to visit the house, if possible, particularly the entrance hall with its picturesque wall paper of Van Buren's time. Near Upper Red Hook is North bay, in which Fulton constructed the Clermont. Poughkeepsie, the seat of Vassar College for girls, is the night stop, although it would be possible to continue the drive into New York City

A Glimpse of the Mountains on the Way to Manchester, Vt.

Digitized by Google

on this side of the river during the day's run if found desirable.

As planned, the tourist is expected to cross the Hudson at the Garrison-West Point ferry, visiting the United States military academy and running down the west bank of the river, where some of the grandest scenery in America is to be seen. Magnificent views of the Palisades are to be had as the city is approached, and the roads are of macadam practically the whole distance.

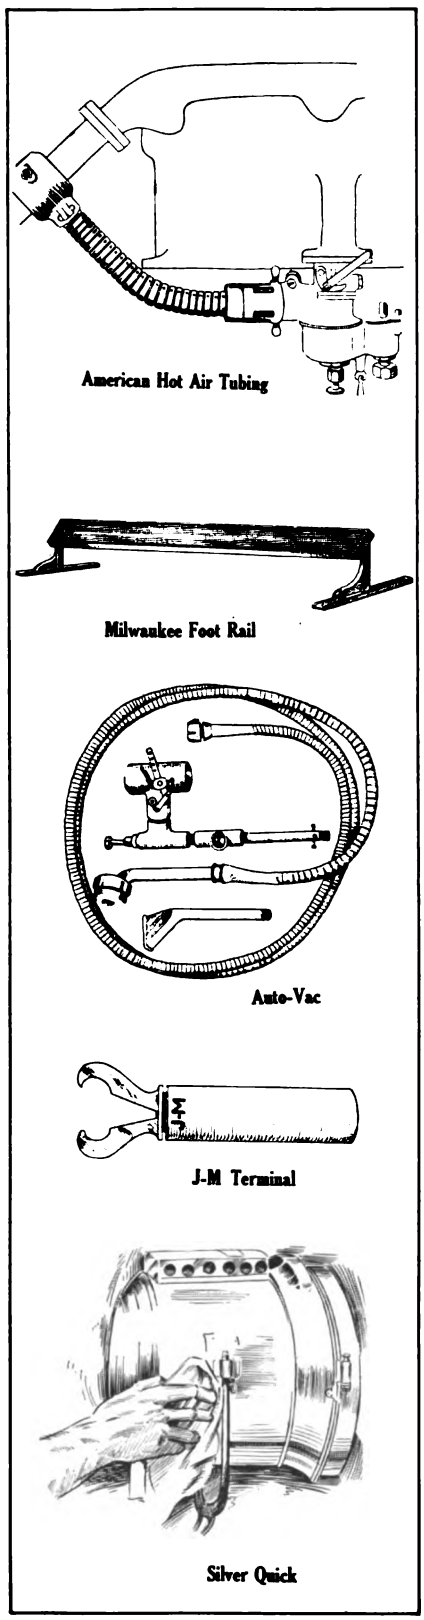
NEW AND NOVEL ACCESSORIES THAT APPEAL TO MOTORISTS.



The American Hot Air Tubing is produced by the American Metal Hose Company, Waterbury, Conn., and is designed for conducting warm air from the exhaust pipe or manifold to the air intake of the carburetor. The tubing is flexible and made in inside diameters ranging from .75 to two inches. Its approximate bending radius is from 2.5 to five inches, a quality making for convenience in installation. The tubing is inexpensive and is furnished in exact lengths if desired.

—— ★ ——

The Milwaukee Foot Rail is the product of the Garage Equipment Manufacturing Company, Milwaukee, Wis., and differs from the usual members in that the foot rest proper is constructed of wood covered with rubber matting bound with brass moulding. It is produced in two styles, one having a track in which the rail proper slides, and the other non-adjustable. They are made in four sizes, 11, 15, 29 and 32 inches, respectively, and are moderately priced.

—— ★ ——

Auto-Vac is the product of the Auto Vacuum Cleaner Company, 253 23rd street, Milwaukee, Wis., and works on the same principle as the vacuum cleaner. It is operated by the exhaust of the automobile motor and comprises an attachment for the exhaust pipe, flexible metal tubing, suction brush and squeegee. By it the dust and dirt collecting in places inaccessible by the hand brush are removed easily and quickly, as well as from the clothing. It saves the trouble of brushing the clothes at the end of the day's run and as the connections are easily made it is a simple matter to operate the device. The hose is of sufficient length to reach all parts of the car.

American Hot Air Tubing

Milwaukee Foot Rail

Auto-Vac

J-M Terminal

Silver Quick

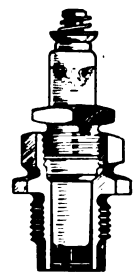
—— ★ ——

The J-M Universal Terminal, marketed by the H. W. Johns-Manville Company, New York City, is designed for attachment to any type of spark plug and may be detached or replaced by the fingers, dispensing with the use of pliers, etc. The device is provided with a pair of elliptic brass jaws which are contracted or expanded as desired by simply turning the fibre sleeve. It is pointed out by the maker that the accidental breaking of the threading device does not incapacitate the terminal as proper contact can be secured through the design of the jaws. The secondary wire is attached easily, the exposed strands being locked by a simple device.

—— ★ ——

Silver Quick is a new preparation being marketed by the Atlas Auto Supply Company, 99 East Adams street, Chicago, and the utility of it will appeal to motorists who take care of their own machines. It is a liquid preparation which is applied to the brass and copper work of the lamps and other accessories of the car, and it is pointed out by the maker that one rub with it on a piece of cheesecloth will produce a genuine, lasting silver plate. By its application the tedious work of polishing brass is eliminated and the appearance of the automobile is considerably enhanced. The composition is claimed to be free from mercury or quicksilver and that it will endure for a long time. Each bottle contains enough to apply several coats of plating, which may be renewed from time to time.

Digitized by Google



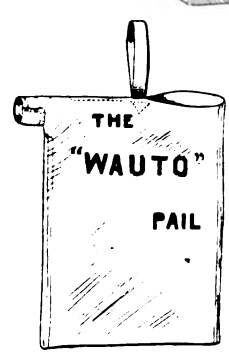
The Black Eagle Spark Plug is manufactured by the Progressive Manufacturing Company, Torrington, Conn., and although moderate in price embodies all the desirable features of more expensive members. The best of material and workmanship are incorporated and a feature of the design making for high efficiency is that the base of the plug provides double electrodes so located that they present a round surface to the action of the spark, eliminating pitting. The design of the shell and shape of the insulator are such that the plug is absolutely gas tight, and it may be disassembled if desired without danger of breakage.

—— ★ ——

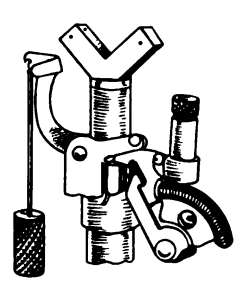
Gun Metal Finish is the product of the Gun Metal Finish Company, Decatur, Ill., and is a liquid which comes in a small can and is utilized for converting the brass or copper of the lamps, parts, etc., of the motor car into a dull finish. It is applied easily with a brush after the part has been thoroughly cleaned and it is claimed by the maker that the liquid will dry hard in 30 minutes. Usually one coat will cover, but in some instances a second may be necessary. If a gloss is desired it is obtained by treating the surface with linseed oil and rubbing with a soft cloth.

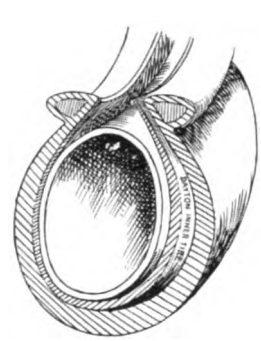
—— ★ ——

The Wauto Pail, manufactured by the Wauto Pail Company, New York American Building, New York City, is a practical and inexpensive device which will appeal to the tourist as it may be folded flat and placed under the cushion of the front seat of the motor car. It is constructed of a waterproof canvas, has a handle and spout of the same material and its capacity is two gallons.



Black Eagle Spark Plug





Gun Metal Finish

Wauto Pail

Alco Lighter

Dayton Inner Tire

There are no hinges, rivets or pins utilized in its manufacture and it is claimed by the maker that it will withstand severe usage and last indefinitely.

—— ★ ——

The Alco Lighter is marketed by Chas. E. Miller, 97-103 Reade street, New York City, and is designed for attachment to the base of the acetylene burner. By it the gas may be lighted easily, the operation simply involving the pressing of a lever which moves in contact friction material producing a shower of sparks in the path of the escaping gas. The tip is the well known Alco and throughout the mechanism is sturdily constructed and of high grade material. The sparking material is said to be very durable, may be replaced when worn out and is inexpensive, the same as the device itself.

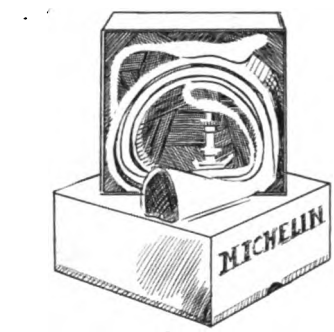
—— ★ ——

The Dayton Inner Tire is one of the products of the Dayton Inner Tire & Manufacturing Company, Dayton, O., and is utilized between the casing and the inner tube. It is constructed of a flexible but puncture resisting material and serves to strengthen the walls of the shoe, preventing blow-outs, etc. The edges of the liner are tapered, preventing pinching of the inner tube. As an example of the increased mileage obtained with the inner tire the company points out that one shoe gave over 14,000 miles service. The liner is made in two, three or four-ply, depending upon the size of the casing fitted, and special sizes are made to order.

—— ★ ——

The Michelin Red Inner Tube for motorcycles is the product of the Michelin Tire Company, Milltown, N. J., and is of the butt end type, a design

Digitized by Google



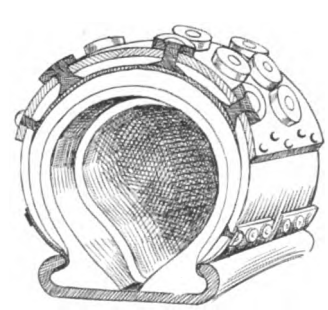
enabling the fitting of the member to the wheel without removing it or the tire from the frame. The tube is made of a high grade Para rubber and it is claimed it will retain its elasticity and will not crack, check or harden. It is made in four sizes for standard wheels.

—— ★ ——

The Allen Friction Wrench is a patented device manufactured by the Allen Wrench & Tool Company, 4 Meadow street, Providence, R. I. It differs from the ordinary type of socket wrenches in that it operates on the friction principle and is consequently free from teeth, springs, etc. The inventor points out that its grip is instantaneous and its design is such that it may be operated in smaller spaces than a ratchet member, as well as in much faster time. The wrench comes in a neat box containing sockets of different sizes, a short and long extension, screw driver, universal joint, etc. The sockets are of pressed steel, heat treated and case hardened, while the wrench proper is of drop forged high carbon steel, carefully machined and finished. It is made in three sizes.

—— ★ ——

The Red Head Magneto Plug is a new product of the Emil Grossman Company, 250 West 54th street, New York City, and to identify it from the other plugs made by the company the shell and cap are nickel plated. The shell and bushings are similar to the other members and the central electrode has a solid platinum point, .03125 inch thick which is secured by a special welding process. A feature of the plug is the combination screw top and magneto type terminal which will accommodate snap, ring or slip cable connections. The plug comes in a torpedo



Michelin Inner Tube

Allen Socket Wrench

Red Head Magneto Plug

Autosun Glasses

Indianapolis Tire

shaped telescopic box and threads into a cavity in the base of the container, protecting the points and preventing disarrangement of the spark gap.

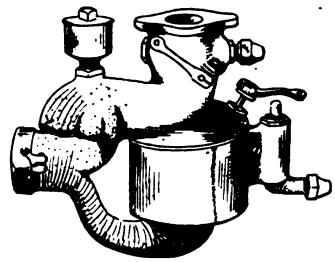
—— ★ ——

Autosun Glasses are manufactured by the Brown Autosun Company, Cleveland, O., and are designed especially for motorists, although they may be used by those exposed to artificial light. It is stated by the company that the peculiar blending of amber shades in the lenses neutralizes the ultraviolet rays of sunlight which disturb the eyes. The glasses are fitted easily and not only save the eyes from bright lights, but prevent the entrance of dust or foreign elements.

—— ★ ——

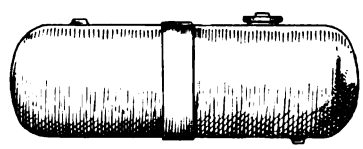
The Indianapolis Tire, made by the Indianapolis Tire Company, Indianapolis, Ind., is covered by a broad guarantee inasmuch as it is claimed it will wear 5,000 miles without puncturing, rim cutting or injuring the casing. There are three thicknesses of a special material through which it is stated that it is impossible to drive a nail. The tread is provided with a number of patented steel discs which prevent skidding and the members are made with taper holes so that they may be worn to the tread of the shoe without coming off. The tire is secured to the rim by means of steel hooks, a design which it is stated places the driving strain upon the wheels instead of the casing. It is claimed that the device is as resilient as a rubber casing and that it affords complete protection from water, sand or mud.

—— ★ ——



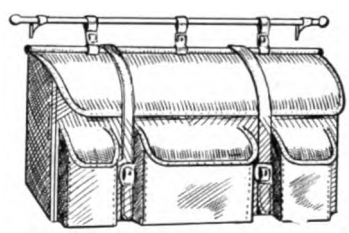
The Mayer Carburetor, manufactured by the Mayer Carburetor Company, 2673 Main street, Buffalo, N. Y., is com-

Digitized by Google

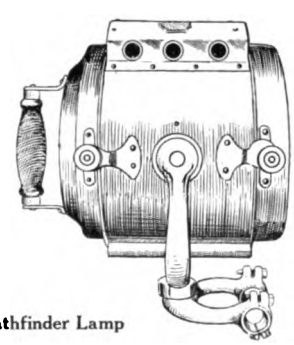


pact in design and simple in construction, features which will appeal to the motorist caring for his own car. It is of the float feed, automatic type and the level of fuel at the spraying nozzle is held constant, insuring efficiency. The design is such that both the main and auxiliary air are obtained from the same source and the construction of the air inlet prevents the entrance of mud, water or foreign elements, as well as provides means for deflecting the stream of a backfire from the pan, eliminating danger of fire. A quality of the Mayer is the dashpot over the auxiliary air inlet, this being virtually an air chamber having a piston attached to the valve rod on which is seated the auxiliary air valve spring. It is pointed out that this arrangement makes it possible for the motor to respond quickly by virtue of the piston pushing against the air in the dashpot itself and creating correct resistance to the impulse of the auxiliary air valve to open suddenly. This regulation of the air valve makes, the company states, for flexibility, silence, economy and great power. The adjustment of the carburetor is a very simple matter, the dashpot and needle valve being the only parts requiring attention. The latter is provided with means for adjusting from the dash. The model H is water-jacketed and means are provided for fitting a connection for taking heated air from the exhaust if desired. One of the qualities claimed for it is that starting is made easy.

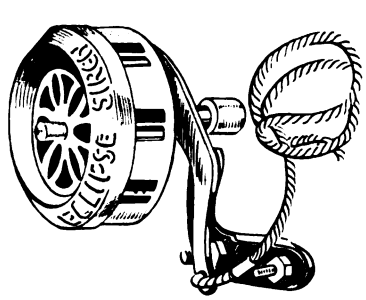
—— ★ ——



Seamless Steel Tanks are favored for the storage of gasoline and compressed air as the construction eliminates the possibility of leaks, making for economy. Janney, Steinmetz & Co., Fourth and Market streets, Philadelphia, manufactures a large variety of steel tanks which are carefully tinned and tested. The company also makes special tanks for containing compressed air for motor starting and tire inflating. A large number of both fuel and air tanks are carried in stock to meet the different requirements of installation.



Mayer Carburetor



Janney, Steinmetz Tank

Gordon Luggage Bag

Pathfinder Lamp

Eclipse Siren Horn

—— ★ ——

The Gordon Luggage Bag, manufactured by the Vehicle Apron & Hood Company, Columbus, O., will appeal to touring motorists as it is designed for attachment to the robe or coat rail and is provided with three collapsible pockets in addition to the main space. It is 30 inches long, 18 wide and five deep and when not in service occupies but little room. It is constructed of high grade material, weather and dust proof,

—— ★ ——

The Pathfinder Lamp is the product of Bennett & Morse, Columbus, O., and is designed for attachment to the handle bars of the motorcycle. It is of the searchlight type, being equipped with a swivel bracket and is turned easily in the desired direction by means of a handle. A quality of the lamp is that the rear opens, facilitating cleaning.

—— ★ ——

The Eclipse Siren Horn is a signalling device operated by friction and is designed for motorcycles and bicycles. A ball bearing wheel is forced in contact with the road wheel by a cord, and the momentum imparted causes the horn to give forth a penetrating sound. The device is nickel plated, is attached easily and is inexpensive. It is marketed by the Eclipse Specialty Company, 250 West 54th street, New York City.

Digitized by Google

AUXILIARY PRIMING DEVICE.

The growing tendency to equip the automobile with some type of motor starter has stimulated the efforts of accessory makers to produce various attachments to the carburetor and intake pipe or manifold to facilitate starting of the motor. Abroad the motor starter has not been given serious consideration by the manufacturer and as a result numerous devices are being marketed to enrich the mixture when starting the engine.

At Fig. 1 is presented one of the latest attachments brought out and patented by an Eng-

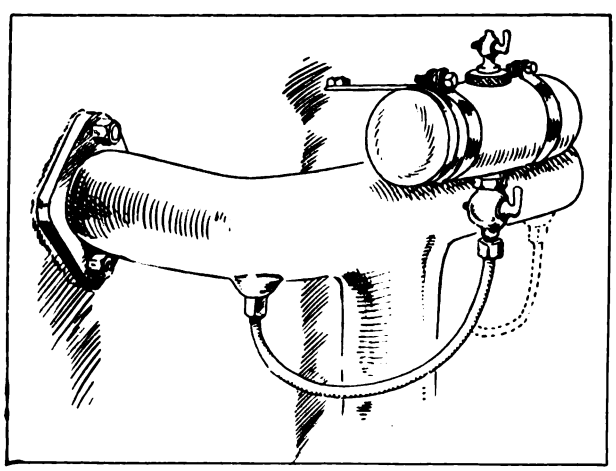


Fig. 1—Auxiliary Priming Device Attached to Intake Pipe or Manifold.

lish motorist and described in The Autocar. It is similar to several devices utilized for flushing the walls of the intake pipe or manifold, but differs in one respect in that the fuel is led to a cup shaped recess which serves as a surface carburetor.

As will be noted by the drawing, a small vessel containing a pint or so of gasoline, is mounted upon the intake manifold by means of straps, or bolted to an extension secured to the motor. The filler cap of the miniature tank is provided with a petcock, its function being to allow a small quantity of fuel to flow to the cup member. A tube connects the container and cup and a valve also is incorporated in the line, it serving to prevent the suction of the piston drawing any fluid when the engine is utilizing mixture from the carburetor.

When it is desired to start the motor, the petcock in the filler cap is momentarily opened and a small amount of fuel passes to the cup, the amount being limited because of the lack of air entering the tank to take the place of the gasoline withdrawn. Upon the motor starting the lower petcock is closed.

Although the device provides for priming of one side of the intake manifold it could be improved by fitting a lead to the other section of the intake member as indicated by the dotted lines in the drawing. This would be a simple matter, the work requiring but a branch member below the lower petcock.

THE EISEMANN TYPE E M MAGNETO.

The Eisemann type E M magneto, made by the Eisemann Magneto Company, New York City, provides a dual high-tension ignition system with one set of spark plugs and the magneto is of the true high-tension type; that is, current is supplied direct from the instrument to the plugs without first passing through a step-up coil or transformer. The coil, however, is utilized in connection with the battery system in order to build up the voltage of the current, but unlike some dual ignition systems, the Eisemann employs two separate contact breakers, one for the battery and another for the magneto.

Being a true high-tension magneto the armature coil has a primary winding of medium gauge copper wire and a secondary winding consisting of several coils of fine copper wire, the bare wire being specially insulated the entire length, and the layers insulated from each other. The low-

Digitized by Google

tension current induced by the rotation of the armature between the pole shoes produces a secondary or high-tension current in the fine coils. This is brought about by suddenly interrupting the low-tension current by mechanical means called the contact breaker or make and break mechanism.

Function of Contact Breaker.

The make and break mechanism, so-called because it alternately joins the two ends of the primary current members and then suddenly separates them, is depicted at Fig. 2 A, and the drawing also illustrates the battery contact breaker. The contact breaker device plays an important part in the operation of the magneto as it opens and closes when the armature is in a position where current developed is at its maximum strength. The current is led from the primary winding through the armature shaft to the contact screw securing the breaking lever, which is moved or lifted by two abutments attached to the magneto body. When this action takes place the primary current is broken or interrupted and induced in the secondary winding. The latter is grounded at one end, and the other extremity, when attached to the spark plug, produces a spark in the combustion chamber.

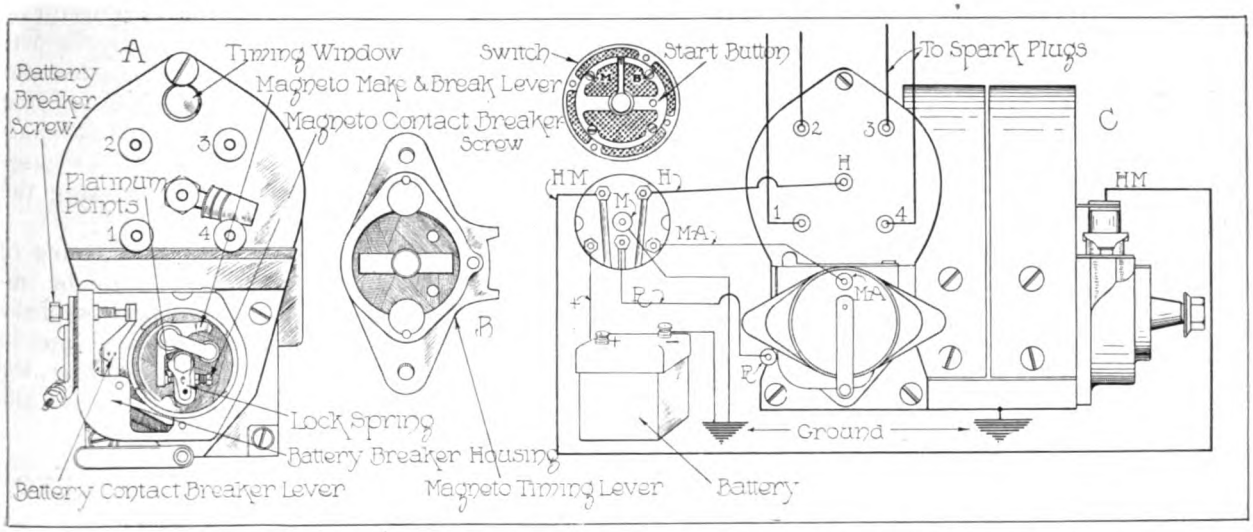

Fig. 2—The Eisemann E M Type Dual Ignition Magneto: A, the Make and Break Mechanism; B, Magneto Timing Lever; C, Wiring Plan for Battery and Magneto.

Operation of Distributor.

As four plugs are to be supplied with current in proper firing order of the motor, a distributor is employed. The high-tension current is led from H M on the magneto and led to H M on the coil, thence to the switch H on the coil, and to H on the magneto which delivers it to the distributor by means of a carbon brush in the centre of the distributor plate. A rotating arm distributes the current through four metallic connections in the plate to the different spark plugs.

With a true high-tension magneto, however, operating as a single system, a wire is led from the circuit breaker terminal to the frame of the car for grounding the primary circuit and a switch incorporated in the lead, the secondary wires going direct from magneto to plugs. In the Eisemann dual system this arrangement may be secured by disconnecting all wires from the instrument except those to the plugs. A connection is then made with secondary cable from H M to H on the magneto, which will permit of starting the motor on the magneto by cranking. A wire should also be led to the frame from M A on the circuit breaker box to ground the primary current as previously explained. This is done in the event of accident to the coil or battery components.

By referring to the sketch at A it will be noted that the magneto is fitted with a battery circuit breaker, mounted at the back of the magneto breaker. It comprises a steel cam, having two projections which actuate a steel lever mounted into the breaker housing. Platinum points are provided for contacting members in both devices. When the lever of the two-way switch, "magneto" and "battery," is thrown to the latter the magneto is prevented from generating a high-tension current because the primary current from M A is led to the ground, or short circuited as explained. The battery current from the positive terminal of that member flows to the positive + of the coil, thence through the primary winding of the coil to R on the coil, to R on the magneto,

Digitized by Google

thence to the battery through the ground, completing its circuit.

In order to build up the low-tension current, it must be interrupted in a manner similar to that of the magneto. This is accomplished by the battery circuit contact breaker when the motor is operating, but when the engine is inactive and it is desired to start from the switch, the starter button takes the place momentarily of the circuit breaker. The depressing of the button produces a spark in the proper cylinder to fire, and if the latter be charged with the proper mixture, and the motor be in order, an explosion will occur.

Wiring and Timing.

The wiring plan is simple, although it may appear complicated to the amateur. The rear of the non-vibrating coil with its terminals is depicted at C, also the leads from the magneto, these being marked with letters for making easy identification in the event of trouble. If for any reason the magneto is displaced and the driving

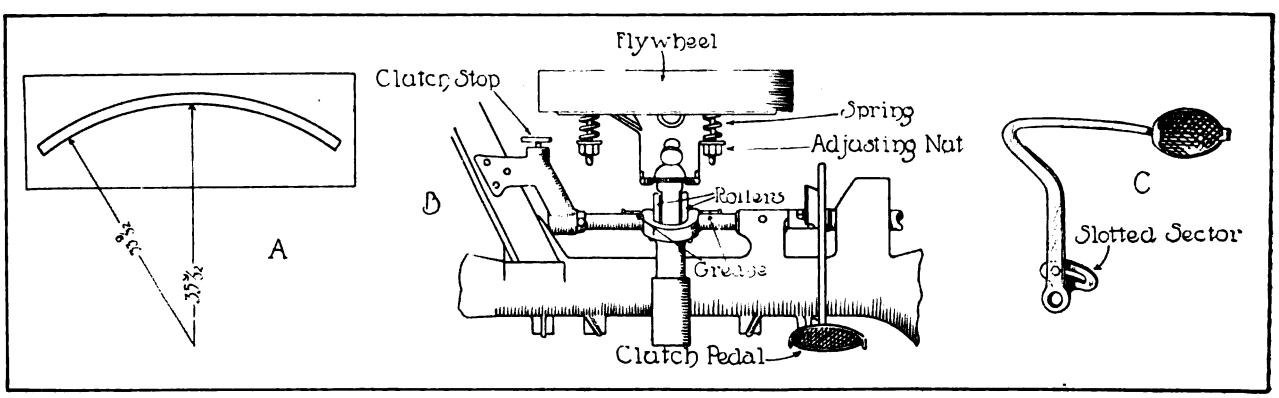

Fig. 3—Hints on the Care of the Overland Clutch: A, Pattern for New Lining; B, Showing Components and Adjusting Members; C, Sector for Adjusting Throw of Clutch Pedal.

members are not marked, it is a simple matter to retime the instrument.

Before replacing it, push the timing lever to full retard; that is, in the direction of its rotation looking at the driving end. Turn the armature until the figure 1 appears in the timing window and insert the special timing key, supplied with each instrument, in the hole drilled in the gear casing of the magneto. The armature is now held securely. The piston of the No. 1 cylinder is placed upon dead centre or top of the compression stroke and the points of the contact breaker should just begin to separate. The gears or coupling operating the magneto are then made secure and the timing pin withdrawn. The leads to the spark plugs should be made in accordance with the diagram published in the Aug. 25th issue of The Automobile Journal.

There are three places requiring a few drops of oil about every 1000 miles. One is on the bearing drive end, another on the top of the gearcase housing, and a small slot in the housing of the battery circuit breaker. All connections should be kept tight and if a wire shows signs of fraying or breaking, replace it with new. The platinum points of both circuit breakers must be kept clean and correctly adjusted. Those of the magneto should open about .015625 inch and those of the battery a little further. The points may be cleaned with gasoline and if pitted, smoothed with a very fine file, taking care that the surfaces are square to one another. The adjustments are made by screws locked by nuts. The carbon brushes may require cleaning after continued service and gasoline may be employed sparingly. The carbon brushes are removed easily and it may be desirable to increase the tension of the spring if the carbons are worn.

While a six-volt storage battery is recommended by the maker, dry cells may be employed and 10 of these are connected in multiple series. Two sets of five are formed in series; that is, the cells are connected zinc to carbon in the usual manner and the two groups joined by wiring together the two zinc and carbon terminals left free. This will increase the life of the cells.

CARE OF THE CLUTCH.

Although the design of the clutch on the modern automobile is such that it requires little attention, if used improperly it will breed trouble for the operator. Some drivers make a practise of slipping the clutch when operating in crowded traffic, rather than resort to a change of gears, but it is not to be recommended. The transmission is provided with its different ratios because it is necessary and the maker includes it for other purposes than for climbing hills. The habit of start-

Digitized by Google

ing on the second speed is favored by many and because the motor has power enough to move the car many drivers acquire the habit, a poor one, because the low speed is built for the work and should be used in starting the machine from a standstill. The writer is aware of the fact that some will disagree with him but the owner who desires to reduce his operating expenses to a minimum will do well to heed the instructions of the maker who advises the use of the low gear in starting.

Effects of Slipping Clutch.

Constant slipping of the leather faced cone clutch will have a tendency to harden the material if not burn it, and in time the slipping becomes a fact; that is, the clutch will slip when operating on the high gear and when climbing slight grades. The application of dirt, etc., under these conditions is poor practise. The proper cure is fitting a new leather.

At Fig. 3 is presented the clutch and operating components of the Overland car, models 69 and 71, and while it is accurately adjusted at the factory and will not require attention if used properly, abuse of the member as outlined above, may cause slipping and ultimately the fitting of a new leather.

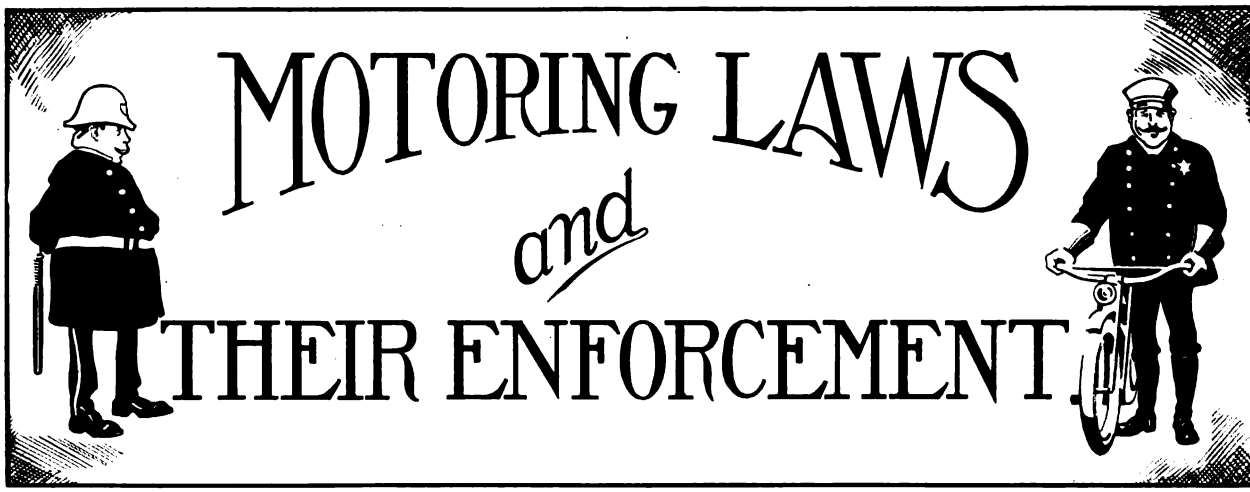
Assuming that a new member is needed, it should be secured from the factory, but if the clutch must be relined in an emergency and the old member is not available or practical for a pattern, the sketch outlined at A will be of service. Secure a piece of high grade unstretchable belting, .1875 inch thick, 12 wide and 45 long. Next lay out the correct pattern of the facing. This is accomplished by drawing on a piece of heavy paper the arc of a circle having a radius of 39.28125 inches, and below it another arc having a radius of 33.28125 inches as depicted in the sketch. The exact length of the belting will be 44.1875 inches, but it is advisable to have it a trifle longer and refrain from cutting the ends until the member is ready for fitting.

Treatment of Leather.

The leather should be soaked in water or neatsfoot oil until pliable and then stretched tightly over the face of the clutch with the rough or flesh side of the leather on the outside. In riveting, the heads of the members should be driven in until they are well below the surface and the small ends peined over securely. If the rivets are flush or nearly so, in time they will make contact with the flywheel and the clutch will be harsh in its action. The new leather should not be allowed to dry too quickly and artificial heat should not be employed as the lining is likely to pull away from the rivets, spoiling the material.

In the work of removal of the clutch the novice is apt to be bothered by the tension of the clutch springs. This may be accomplished by fitting a lever between the cylinders in a horizontal position and utilizing another lever with a forked head, connecting the two members by a piece of stout wire. The second lever will make it an easy matter to compress the spring and to remove the adjusting nut. In replacing the latter, care should be exercised to take up each alike. If the clutch is too tight it will drag, burning the leather, and the pedal should be worked or the clutch thrown out and the parts examined to note if contact is broken. In adjusting the clutch the short, spring pressed studs around it and under the lining require adjusting and should be so set that the engagement is gradual, not harsh, thereby saving the mechanism from severe stresses.

Lining Requires Attention.



When the clutch is fierce in its action it may be due to dryness or to the rivets making contact. If dry the leather should be treated with neatsfoot oil and it is an excellent practise to treat the leather about once in 10 days, employing about a tablespoonful of the lubricant. If the clutch is greasy, a condition making for slipping, the surface should be wiped clean with a rag saturated with kerosene or by using a little fuller's earth. The use of ordinary lubricating oils should be avoided.

If upon letting in the clutch the car gains momentum slowly, although the motor is turning up, it is an indication that the clutch is slipping and it may be due to the foot rest of the clutch pedal being too close to the toe board of the car. This condition may be remedied by moving the lever to the rear, a slotted sector being provided for this purpose as shown at C.

Function of Clutch Stop.

In making adjustments to the clutch, etc., it should be noted whether or not the male member makes contact with the clutch stop which is depicted at B. The object of the device is to overcome the inertia of the flywheel and to make changing of gears easy and without a clashing of the pinions. The stop should be adjusted so that it comes into action easily and its correct position may be ascertained by moving the clutch in and out of engagement. The clutch oilers require attention and these should be well lubricated and in accordance with the instructions of the maker, turning down the cups at least once or twice a week. It is attention to these small details that makes for reliability in the operation of the member as well as for economy in upkeep.

UNIVERSAL LIGHTING PROVISIONS.

No less than four states have enacted legislation covering the use of lights on all vehicles using the highways during the hours of darkness. Apparently no attempt has been made to make these laws uniform in text, but the step is one calculated to work for the safety of all users of the highways at night. The four states are Massachusetts, Minnesota, New Jersey and Oregon. The several laws are as follows:

Massachusetts—Section 1. Every vehicle on wheels, whether stationary or in motion, on any public highway or bridge, shall have attached to it a light or lights which shall be so displayed as to be visible from the front and the rear during the period of one hour after sunset to one hour before sunrise: provided, however, that this act shall not apply to any vehicle which is designed to be propelled by hand, or to any vehicle while upon any lighted street or highway where street lights are maintained at a distance of 500 feet apart or less, or to any vehicle designed for the transportation, as its principal freight, of hay or straw while loaded with such freight.

Section 2. Upon the written application and presentation of reasons therefor by the owner of a vehicle, the Massachusetts highway commission may, in writing, in such form and subject to such requirements as it may elect, and without expense to the applicant, exempt said vehicle from the provisions of this act for such period of time as said commission may elect.

Section 3. Any person who, while driving or in charge of or occupying a vehicle during the period of one hour after sunset and one hour before sunrise, shall refuse, when requested by a police officer, to give correctly his name and address, shall be punished as provided in section 6 of this act.

Section 4. Nothing contained in this act shall be construed to affect the provisions of any existing statute, rule or regulation requiring lighted lamps on motor vehicles and the obligations of operaors or occupants thereof.

Section 5. The driver or custodian of a vehicle shall be deemed to be the responsible party and liable to the penalty as provided in this act for a violation thereof.

Section 6. Any person violating the provisions of this act shall be subject to a fine not exceeding $5.

Minnesota—Providing further that all other vehicles other than motor vehicles shall carry, while travelling on any public highway of this state, between one hour after sunset and one hour before sunrise, a white light, visible from both front and rear.

New Jersey—Every vehicle drawn by horse, horses or other beasts shall carry during the period from 30 minutes after sunset to 30 minutes before sunrise, and whenever fog renders it impossible to see a long distance, at least one lighted lamp, which said light shall be of such nature and so displayed that it may be seen both from a point at least 250 feet distant in the direction toward which the vehicle is proceeding and a point at least 250 feet in the direction from which the vehicle is proceeding. Any person or corporation violating the provisions of this act shall be subject to a fine in any amount not less than $2.50 and not exceeding $5, recoverable before any justice of the peace, magistrate or recorder or other proper officer having jurisdiction thereof. Magistrates and officers in proceedings under this act shall be entitled to the fees provided in an act entitled "An act defining motor vehicles and providing for the registration of the same and the licensing of the drivers thereof, fixing rules regulating the use and speed of motor vehicles, fixing the amount of license and registration fees, prescribing the proceedings for the violation of provisions of the act and penalties for said violation," approved April 12, 1906. Money received in accordance with the provisions of this act shall be accounted for and forwarded to the treasurer or collector of taxes of the municipality within which the proceedings are taken for the punishment of the violation of this act.

Oregon—Provided, that motor vehicles and motorcycles, and all vehicles other than motor cars shall be required to display but one lighted lamp, such lamp to be placed on the front of the vehicle so that it shall be visible 100 feet in the direction in which the vehicle is proceeding, and show red lights to the rear.

NANTUCKET WANTS AUTOMOBILES.

Since the acquisition of a motor fire engine, the people of Nantucket, Mass., have come to look upon automobiles in a different light than when they went to the Massachusetts legislature with a request for a law excluding them from the island. It is stated that the call for the next annual meeting will contain a clause asking for a repeal of the law in question.

INTERESTING COURT DECISION.

Magistrate Fitch of the police court in Jamaica, N. Y., recently gave a decision in a case before him which will prove of interest to all mo-

Digitized by Google

torists in that state, at least. Edward Mayor, a salesman for a real estate firm, was arrested for driving a machine without a chauffeur's license. He contended that he was not operating the machine for hire, and therefore was not a chauffeur within the meaning of the automobile law. In this opinion the court agreed. The decision is in accord with a similar action taken by a magistrate in the borough of Manhattan, New York City, earlier in the year, when a salesman for a tire concern was held not to be a chauffeur under the same rule.

SEEKING VIOLATORS.

Police officials are active in several states as follows:

Connecticut—Waterbury, over speeding and failure to sound horn at crossings; Norwich, exceeding speed limit; Naugatuck, reckless driving at street corners.

Pennsylvania—Baltimore pike between Angora and western end of Clifton, speeding and passing standing trolley cars; Darby, speeding and failure to sound warning signal; Chester, passing trolley cars and driving faster than 17 miles an hour in open country and eight miles in congested sections; Cheltenham, failure to use muffler cut-out; Myerstown, speed and horn traps; Elizabethtown, violations of speed and signal laws.

New Hampshire—Seabrook, misleading signs stating 25 miles an hour is permissible should be ignored. Driving over 15 miles an hour is invariably followed by arrest and fine. Sixteen motorists report having picked up nails in this town.

Maine—Waterford, motorists should take right hand road in going south toward Harrison and North Bridgton. It is intended that tourists should go to the right of Bear pond, instead of the left.

New Jersey—Elwood, tourists are warned against a trap on the route between Camden and Atlantic City. Hammonton, motorists are cautioned to slow down to 20 miles an hour four miles outside of town. Newton, new speed trap and heavy fines. Sea Bright, several officers stationed on Runison road between Long Branch and Asbury Park.

Massachusetts—Athol, speed trap on Main street, and officers at Main and Exchange streets for violation of signal law.

UNIFORM LIGHTING LAWS.

While motorists admit there may be need for differing regulations where traffic conditions warrant such action, they also contend that there are many situations in which it is both unnecessary and unwise for conflicting statutory provisions. There can be little doubt that the cause of interstate touring would be promoted by the enactment of uniform laws regarding the use of lights, and there seems no good reason why the same provisions could not obtain in each state. As an indication of the present lack of uniformity in this regard witness the following table of lighting provisions summarized from the existing laws in the several states:

Number and Character of Lights Required.

	Front.		Rear.		When Lighted
	No.	Visible.	No.	Tag Visible.	After Sunset.
Alabama	2	.....	1	50 feet	30 minutes
Arkansas	2	200 feet	1	plainly	1 hour
California	2	*reasonable	1	plainly	1 hour
Connecticut	2	200 feet	1	60 feet	30 minutes
Delaware	1	200 feet	1	plainly	1 hour
Florida	2	lights plainly visible from sunset to sunrise.			
Georgia	1	100 feet	1	effectually	1 hour
Illinois	2	200 feet	1	150 feet	1 hour
Indiana		must carry lights after dark.			
Iowa	2	500 feet	1	50 feet	30 minutes
Kentucky	2	*200 feet	1	.....	1 hour
Maine	2	.....	1	plainly	30 minutes
Maryland	2	200 feet	1	.....	1 hour
Massachusetts	2	200 feet	1	60 feet	30 minutes
Michigan	2	200 feet	1	illuminated	1 hour
Minnesota	2	200 feet	1	plainly	1 hour
Mississippi		rear numbers must be plainly seen at all times.			
Missouri	2	200 feet	1	.....	30 minutes
New Hampshire	2	200 feet	1	50 feet	30 minutes
New Jersey	2	350 feet	1	.....	30 minutes
New York	2	200 feet	1	50 feet	30 minutes
North Caroina	2	reasonable	1	reasonable	1 hour
North Dakota		not less than two in front, one on either side.			
Ohio	2	200 feet	1	.....	30 minutes
Oregon	2	200 feet	1	.....	1 hour
Pennsylvania	2	200 feet	1	plainly	1 hour
Rhode Island	1	200 feet	1	sufficiently	1 hour
South Dakota	1	reasonable	1	plainly	1 hour
Utah	2	reasonable	1	plainly	1 hour
Vermont	2	200 feet	1	50 feet	45 minutes
Virginia	1	100 feet	1	effectually	1 hour
Washington	1	showing white front, red rear, during hours of darkness.			
West Virginia	2	*reasonable	1	.....	1 hour
Wisconsin	1	reasonable	1	distinctly	1 hour

*Front light must display numbers.

It may be assumed in each instance that the rear light is a combination member, displaying a red light backward and a white light to shine on the number plate. There would appear to be ample justification for a revision of this feature of the laws, making provision for the same number of lights in front, visible the same distances, for the same display of number plates, and for lighting the lamps at the same time in each state. Surely, this would entail no hardship upon the citizens of the several states, and it would eliminate all possibility of violation on the part of visiting motorists.

Digitized by Google

The recent decision of Judge Neville in a British court in the action brought by Knight & Kilbourne against Argylls, Ltd., alleging an infringement on the so-called Knight patent of 1905, is of interest in America because of the fact that the Knight motor is an American invention. Argylls, Ltd., of Scotland, brought out a single-sleeve motor late in 1911, and almost immediately the

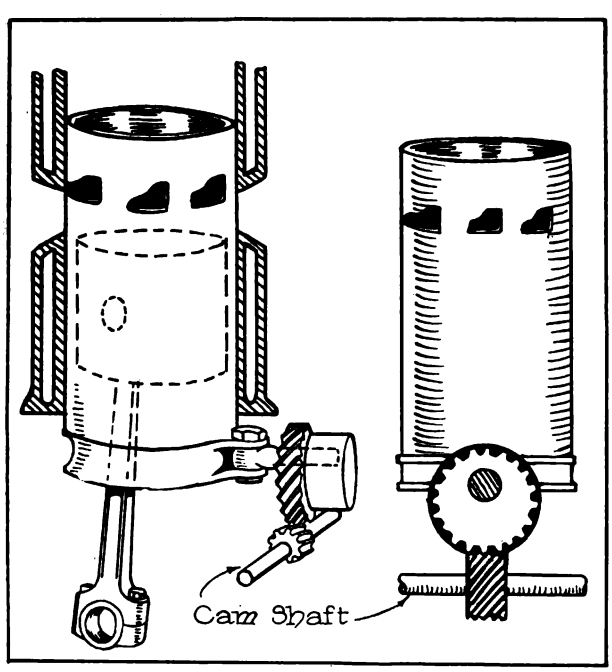

Fig. 1—Depicting Means for Operating Argyll Sleeve.

Knight interests claimed an infringement. Judge Neville holds that the defendant does not infringe. and the plaintiff has carried the matter to a higher court on appeal.

It should be borne in mind that the Knight patent of 1905 was for a single-sleeve motor, and the action bears only indirectly upon the Knight double-sleeve motors now in use in cars in this country and abroad. It was, however, the original Knight patent, and as such is of particular interest. Judge Neville holds as follows, in part:

The sliding valve used for the purposes of inlet and exhaust was a mechanical device well known and used in connection with steam and other engines. After the introduction of the internal combustion four-cycle engine mechanicians turned their attention to the question of its application to the four-cycle engine, but there were difficulties in the way owing to the fact that, during two strokes of the piston—inlet and exhaust—the appropriate valves must be open, while during the remaining two—compression and explosion—the cylinder must be tightly sealed. The cylinder, therefore, must be open at the first and last stroke of the piston which follow one another, and sealed during the two intermediate strokes.

In steam and other engines methods of opening and closing inlet and exhaust valves by means of a reciprocating cylinder or a reciprocating sleeve within a cylinder, were known. Dawson and King endeavored to apply the idea to four-cycle engines by attaching to the piston a sleeve containing a port which, by virtue of a rotary movement applied to the piston and sleeve together, registered with a series of inlet and exhaust ports or with slots placed on one side of the cylinder only, the sleeve making a complete revolution once in four strokes, so that during one-half of its rotation, or two strokes of the piston, the port of the sleeve remained out of registration with any of the openings in the cylinder. You had here, therefore, an internal sleeve, which, by a suitable movement imparted to it through the piston, opened the inlet ports during one stroke, the exhaust during another, and kept the cylinder closed during the remaining two. This seems to me to have solved the problem theoretically, but the evidence does not show that any engines were made in accordance with these patents, or that if they had been made they would have been efficient engines.

The plaintiff and another in 1905 conceived the idea of reciprocating the cylinder itself within a fixed head and valve seating by a movement differing from the movement of the piston in such a way that the cylinder should move rapidly during two strokes of the piston and remain substantially at rest during the other two, the ports being so arranged that during one of the rapid movements the inlet port should register and the exhaust ports during another, both being closed during the remaining two strokes of the piston. This invention appears to me to have solved the problem in another way and about as satisfactorily as those which had preceded it. An engine was invented which no one at the time, so far as the evidence goes, thought it worth while to translate into metal. An experimental engine was made for the purposes of the action which, in my opinion, was, for practical use, worthless, and I do not think that by any deviations from the specification within the fair limits of the patent any engine could be made which could bear comparison with the poppet valve engines on the market in 1905, or which at that date would have been of any commercial value. The method of opening and closing the valves appears to me to be inconsistent with a satisfactory result for a high speed engine.

To claim for the patent for this invention the title of

Digitized by Google

a master patent is, I think, extravagant. Dawson and King had solved the problem of the application of sliding valves to a four-cycle engine unsatisfactorily. The plaintiffs' patent solved the problem in a way which was little, if any more, satisfactory. A claim in the plaintiffs' patent for all ways of solving the problem in which the movement of the cylinder or of a sleeve in the cylinder was variable to the movement of the piston, could not, in my opinion, be sustained. We shall see upon examination of the specification whether such claim was made.

The inventors declare the primary object of their invention to be to provide an improved form of internal combustion engine in which the moving parts shall be directly connected and positively acting and the use of poppet valves and springs avoided. They declare that the invention consists in certain features of novelty in the construction, combination, and arrangement of parts all as fully described and more particularly pointed out in the claims. They then enumerate the parts and declare that either the cylinder described or a member telescoped with it shall be operatively connected with the piston, but, so far, we have not been told which of these parts is to be moved; the invention being in effect declared to be compatible with the movement of either. They then proceed to tell us that in the exemplification of the invention shown in the drawings of the two telescoped parts the cylinder is the one to be moved. I think, as a matter of construction, that the exemplification is an exemplification in which one of two alternatives is adopted, but that subject to that the succeeding parts of the specification describe the invention itself, and not merely one way of carrying it into effect. As I read the specification the invention is for a combination and not for all means of carrying a new principle into effect, nor for a novel application of a principle. When we come to consider the claim I think this is made clearer.

Claim 1 is the widest claim, and, turning to it, it is to be noted that "telescoped" has no technical meaning, and that in English its meaning is derived from the analogy of the tube of a telescope, but is not applied with any degree of accuracy. In the claim it refers to the relation borne by a fixed annular groove to a cylinder sliding up and down, and in this sense the use of the word does not seem very accurate. The movement is described as relative to the aforesaid telescoped part and variable with relation to the movement of the piston, the movement to effect the covering and uncovering of ports. There is no technical meaning attached to the word "variable" in this connection, and I think what the inventors meant to express by the use of the word is a movement of a part which, though operatively connected with the piston, varies or differs from the movement of the piston. If the plaintiffs' monopoly extends to the making of any internal combustion engine which has a cylinder formed by two parts, one fixed and the other moving against it with a movement which differs from that of the piston, it is a monopoly of an extremely wide character. It is upon this view of the patent alone, I think, that the defendants could be said to infringe.

It is clear upon the facts, indeed there is no dispute about it, that the defendants employ a different movement brought about by different means, but they have a cylinder composed of two members, one of which is fixed and the other moving against it with a movement which differs from the movement of the piston. The question as to what is a cylinder and where its parts begin and end is open to endless and, to my mind, wholly unprofitable discussion. If the defendants infringe, I think the engines of Dawson and King, had they appeared after 1905, would have infringed also, for they have a sleeve the movement of which differs from that of the piston if you consider the operative functions of the piston and sleeve separately, and I think, in considering a master patent for an invention of the merit and novelty claimed for the plaintiffs, the court would probably have held the attaching of the sleeve to the piston, so that the latter perforce partakes of the movement required only for the sleeve, a merely colorable modification. It appears to me that the device of the defendants follows very much more closely the devices of Dawson and King than it does that of the plaintiffs.

The Argyll engine, which was alleged to infringe the Knight patent of 1905, has a single sleeve which in addition to vertical reciprocation also has a twisting motion. The ports in the sleeve are not continuous, as in the Knight, but take the form of peculiarly shaped slots. There is an inwardly projecting boss to the cylinder head upon which the sleeve seals at the top, as in the Knight engines. The means by which the sleeve is moved up and down and twisted are shown at Fig. 1, while Fig. 2 depicts the engine itself.

The single-sleeve Knight, the patent which the Argyll was alleged to infringe, is shown at the left of Fig. 3. The drawing presents an engine with fixed head containing inlet and exhaust ports, the cylinder being given a vertical up and down motion upon the fixed head and registering through slots with the two ports. At the right of Fig. 3 is depicted the double-sleeve Knight, patented in 1908, which is the basis of the present Knight engines. This has no direct connection with the suit in question, and is presented largely to indicate the difference between it and the older Knight.

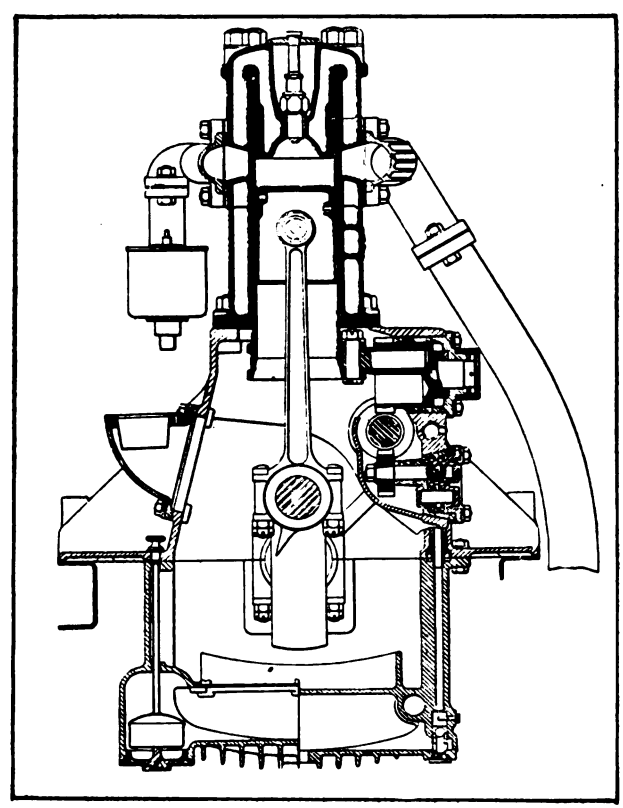

Fig. 2—Outline Drawing of Single-Sleeve Argyll Engine.

The Dawson engine, referred to in the decision of Judge Neville, is presented at the left of Fig. 4. This was designed as a gas engine and patented in 1890. A variation of it was utilized in a motor tricycle in 1896. It had a piston, suitably

Digitized by Google

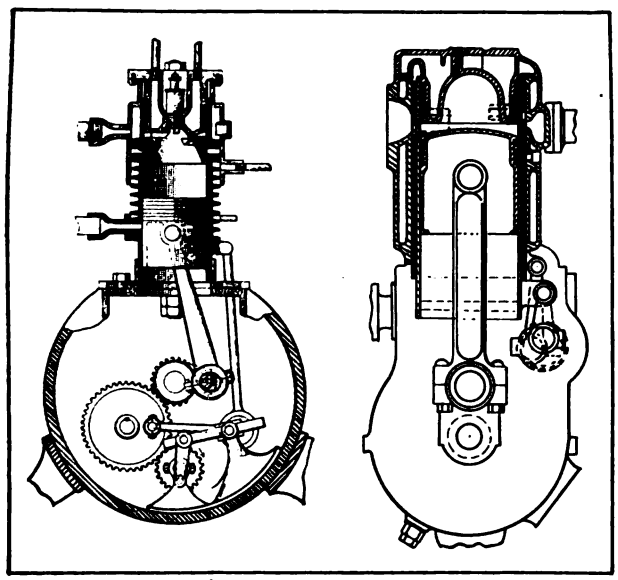

Fig. 3—Knight Motors: At Left, Single-Sleeve Type; at Right, Double-Sleeve.

lengthened to form a sleeve, which also was a working piston. In addition to the usual reciprocating motion within the cylinder, it rotated, and the combination of movement caused it to open and close inlet and exhaust ports. The means of causing the piston to rotate are indicated in the drawing, and as may be seen they were distinctly complex.

The King engine, shown at the right of Fig. 4, was patented in 1884. The idea of the inventor was not to secure silence, but increased efficiency. The motor consisted of a fixed cylinder in which moved another cylinder working as a piston, or more properly a capped sleeve. Inside this was the working piston proper, which was connected to the crank by a connecting rod in the usual manner. In the capped sleeve were ports communicating with ports in the fixed cylinder walls as the cycle required. Incidentally, it may be mentioned that the King was a two-cycle engine.

—— ★ ——

According to George H. Pickerell, United States consul at Para, Brazil, final arrangements have been concluded between the Bank of Brazil and the parties interested in and forming the syndicate organized in 1910 to increase the price of rubber, whereby the latter will, under conditions as yet unknown, take charge and dispose of the rubber. The amount of rubber held by the Bank of Brazil as collateral for money advanced to finance this scheme is 2400 tons. Consul Pickerell is informed that it is the present intention of the directors in charge of this liquidation to dispose of this to bona fide manufacturers only, hoping in this manner to avoid manipulation by dealers who might be interested in affecting the price of the coming crop. It is understood that the rubber is to be sold and shipped from Para, as its storage in either London, Liverpool or New York might have the effect of depressing present prices. The rubber is said to be all of the first quality, being bone-dry, and should on its merits command a higher price than new rubber.

—— ★ ——

The introduction of the American power wagon with carrying capacity of about 1000 pounds, has called the attention of the British manufacturers to the previously unexploited large demand for this class of commercial vehicles. As a result of the considerable popularity which has been evidenced, the subject is receiving decided study in England. One particularly prominent firm, it is understood, is about to expend $250,000 in erecting a plant, making designs, etc., for the production of this type, while another is said to have prepared its plans and is about ready to market its product.

—— ★ ——

Representatives of the automobile associations of Canterbury, South Canterbury, Otago, Wellington, Wanganui, Manawatu and Hawke's Bay, New Zealand, recently met in Wellington for the purpose of forming a general dominion organization. Several matters of import were discussed at the conference, among them being universal lighting, good roads, and the registration of cars.

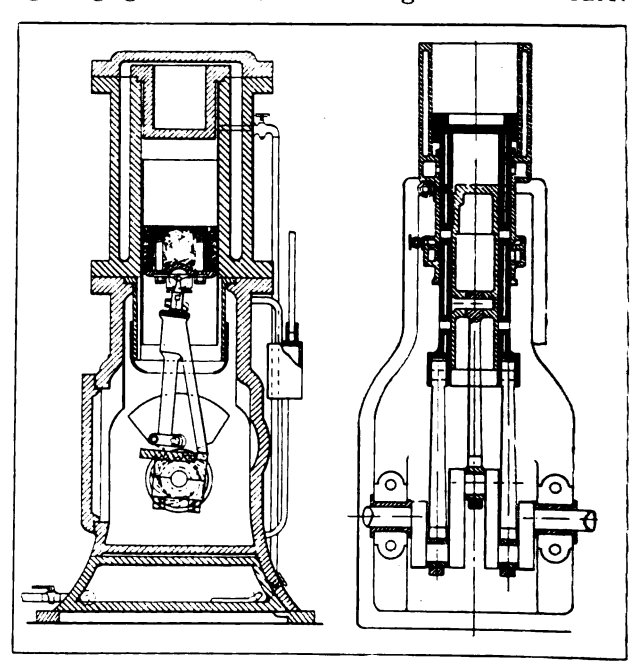

Fig. 4—Two Older Sleeve Valve Engines: At Left, Dawson, 1890; at Right, King, 1884.

As evidence of the fact that Ford cars, made by the Ford Motor Company, Detroit, Mich., are well represented in England, it may be mentioned that during the recent August meet at Brooklands track, a special Ford race was one of the features. A Ford car also finished in second place in one of the short handicap events. Another feature of the meet was the presence of Henry Ford as a spectator.

—— ★ ——

The condition of the market in South Africa is such as to give encouragement to American manufacturers. Within a year dealers and owners were unanimous in declaring that this territory was not suited to the extensive use of automobiles, particularly in the country districts. Today motor cars are in common use and travelling men frequently employ them in traversing large sections of the district. Roads are being improved gradually, and as the farming community is prosperous, the sale of automobiles should increase decidedly with the extension of good roads. Cars with good clearance are most desirable. The increasing popularity of the motor vehicle is shown by the comparison of imports, which amounted to $919,219 in 1911, as against $724,486 in 1910.

—— ★ ——

Aix-les-Bains, France, has passed an ordinance limiting the speed of automobiles and motorcycles to five miles an hour within the town limits, and this speed must be reduced to a walking pace in the narrow streets, at crossings, in the vicinity of schools, etc.

—— ★ ——

The Princess Patrica of Great Britain, daughter of H. R. H., the Duke of Connaught, Canadian governor-general, is an ardent motorist. It is to be expected that she would favor British products in this respect, but an accompanying illustration shows her in her latest limousine, shod with Goodyear tires, made by the Goodyear Tire & Rubber Company, Akron, O. The photograph was taken in front of one of the government buildings in Montreal.

—— ★ ——

As an indication of the popularity of American cars in Australia, the following statistics regarding registrations in the three principal divisions will prove of interest:

Victoria—Ford, 309; Clement, 259; DeDion, 255; Renault, 224; F. N., 153.

South Australia—Ford, 196; DeDion, 178; Talbot, 134; Argyll, 132; Oldsmobile, 92.

New South Wales—Ford, 351; Clement, 270; Renault, 256; Star, 223; Hupmobile, 159.

ATTRACTIVE DESCRIPTIVE FOLDER.

Most American motorists are aware that the J. S. Bretz Company, 250 West 54th street, New York City, is the sole importer of F. & S. ball bearings, made by Fichtel & Sachs in Germany. However, this concern has found it desirable to issue a neat and attractive folder describing the product, a particular feature being the cover page, which bears the title, "German Chrome Steel Balls," and underneath, a splendid steel engraving of one of the balls surmounted by an eagle with widespread wings. Manufacturers and

Princess Patrica of Great Britain in Limousine Shod with Goodyear Tires.

others will find this folder of special value to them.

ST. LOUIS' OUTDOOR SHOW.

Following the plan adopted last year, the St. Louis Automobile Manufacturers & Dealers' Association will hold an outdoor show at Forest Park Highlands, Oct. 8-14. This summer resort is in the heart of the city and lends itself admirably to the display of the various models. The exhibit is open to all dealers in St. Louis and to accessory manufacturers elsewhere.

The Touring Club of America is issuing a neat booklet of information, entitled "America from a Touring Car."

PROPORTIONING THE COST.

The organization of the Association of Connecticut Road Officials would appear to be a logical step in the progress of the good roads movement. The principle upon which these men have banded themselves together is that the present methods of securing money for highway purposes impose a larger proportion of the burden upon the rural communities, than their wealth bears to the whole taxable wealth of the state.

This must be held to apply to the so-called ordinary roads of the state, since much the same plan is followed in Connecticut as elsewhere with reference to the so-called improved ways. With these latter, such money as is expended over and above what is contributed by motorists in the form of registration fees and fines for violation of the motoring laws, is distributed in the several towns, accordingly as they make application for state aid and in proportion to the amount to be expended by the town itself.

It is understood that the new organization is prepared to advocate a plan under which the state, as such, or co-operating with the cities in some other manner, shall bear a larger proportion of the expense, thus distributing the tax more evenly in regard to the taxable wealth. This is in line with the so-called federal aid proposition, and is based upon the assumption that the general public derives an indirect, if not a direct, benefit from the improved way, through a lessened cost in transportation.

This is a situation which all states must face sooner or later, and possibly the national government will be called upon to assume its share of the burden, as between the several states, some of which are not so well able to provide improved ways as others. It is a big problem, and one which involves certain economic factors that are not apparent on the face of things. Whatever the final solution, the step taken in Connecticut must be regarded as one of progress.

ENCOURAGING HOME INDUSTRIES.

Mayor Fitzgerald's letter to President Russell of the Boston chamber of commerce is of particular interest, because of that official's past attempts to secure the passage of laws increasing registration fees of motor cars, particularly those owned in Boston, or at least to so arrange the distribution of fees collected from motorists that Boston might derive a larger income therefrom. What the mayor has to say concerning the subject, at this time, is decidedly true, and since he closes his letter with an offer to do everything in his power to aid in bringing to Boston an industry which would be of such benefit to the city, it may be taken for granted that there is to be less attempt to discourage the ownership of cars in that city.

In this connection, opportunity is afforded to suggest that the legislature of that state would do well to emulate the example of Mayor Fitzgerald in his determination to assist in encouraging home industry to this extent. It will be remembered that during the last session of the legislature, two or three bills were introduced, among which may be recalled that prohibiting trucks above a stipulated carrying capacity from using the state highways. This bill was not enacted into law, but is understood to have been passed along to the next legislature.

So long as there is a possibility that business men are to be denied the use of vehicles, it goes without saying that the sale of motor trucks, for instance, is to be hindered thereby. As Mayor

Digitized by Google

Fitzgerald points out, the power wagon is only now being generally adopted as the logical and economical vehicle for the transportation of merchandise. It is particularly unfortunate that a state with the reputation for conservative legislation that has been enjoyed by Massachusetts, should even seem to question the inadvisability of discouraging the extension of its use.

CAUSE AND EFFECT.

Not long since the price of shoes was increased, those responsible therefor declaring that the use of leather in upholstering seats of motor cars had so reduced the available supply of that commodity that it was necessary to add something to the wholesale, and of course the retail, price of shoes in order to overcome the advance in cost of leather. It appears, however, on more mature reflection that the rapidly growing use of automobiles has affected the shoe business in yet another manner.

From an acknowledged authority in such matters it is learned that a great number of people—and the number is said to be increasing annually—who formerly wore out two pairs of shoes a season now manage to get along with two pairs a year, or, worse still, make their winter and summer shoes do for two and even three years. It is pointed out that many do very little walking, save to and from the garage or around the front end of the machine to crank the motor. Of course, this latter will disappear with the more general utilization of the self-starter.

Here, then, is a curious application of the old adage concerning cause and effect. Fewer shoes are being worn, therefore the supply must be increasing more rapidly than the demand. In order to bring about the desired equation, the manufacturer sees fit to advance the price. The automobile industry affects the situation in about the same proportion as it does the price of beef.

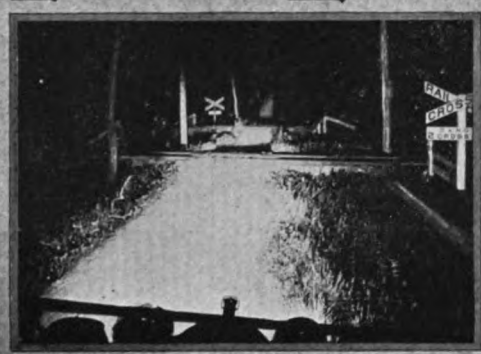
CATERING TO MOTORISTS.

With the increase in automobile touring has come a desire on the part of business men to cater to their needs, largely because it is believed that motorists on tour are willing to spend money. One noticeable feature of this situation is found in the recent establishment of automobile inns, so-called, along the lines of through travel. These occupy very much the same position as the old time wayside hostelry which catered to the wants of travellers over the stage coach lines, with the exception that they are not located quite so closely together.

This same view is held in a measure by business men and others in the cities most often visited by tourists, and every legitimate effort is made to seek a good reputation as a noon or night stop. However, it too often happens that too much attention is paid to the matter of getting money from the tourist and too little to the expenditure of money in an effort to attract tourists. And it may be added that such business men have it within their power to aid the cause of touring by seeing that their representatives in the legislature are informed of the advisability of catering to tourists in the matter of uniform motoring laws, etc.

CONDITION OF INDUSTRY.

Some idea of what is expected in the way of business by the automobile industry for the coming year may be gained from the statements made at a recent conference of motor car manufacturers and railroad men in Detroit. The object of the meeting was to arrange for the transportation of machines to be produced in that city during 1912.



It was claimed that 102,000 freight cars would be needed for the shipment of the output, which means that the factories expect to manufacture some 330,000 automobiles. The call is for at least 2000 freight cars a week. And while Detroit is supposed to lead all other centres in the production of automobiles, it by no means manufactures them all.

YELLOWSTONE NATIONAL PARK.

It appears that the petition of motorists, backed by various bodies of business men in the West, asking that Yellowstone national park be opened to automobiles, is to be denied. Army engineers are said to have gone over the situation thoroughly, and to have come to the conclusion that it would cost $2,500,000 to put the roads in the park into proper condition for automobiles. But are such roads absolutely necessary for the proper enjoyment of the park by motoring tourists?

Electric Lighting of Motor Cars

Outlining Various Systems Employed and Methods of Operation.

By C. P. Shattuck

Part XIV—The Aplco Combination System.

EARLY in the '90's, V. G. Apple of the Apple Electric Company, Dayton, O., presented the Apple dynamo-storage battery ignition system, which was utilized by automobiles and motor boats. The dynamo or generator which charged the battery, was a compact little machine, friction driven off the flywheel of the gasoline motor, and equipped with a governing device to equalize the excessive speeds of the engine. Although the storage battery of this equipment was practical for lighting the car, the high resistance of the carbon lamp, consuming as it does considerable current, was a decided drain upon the cells. The advent of the economical Tungsten filament for electric lighting, and the perfected devices for automatically controlling the flow of the generated electricity to the battery, stimulated interest in the more progressive method of lighting.

The Apple Electric Company was early in the field; in fact, it may be stated that the concern was one of the first to exploit the practicability of lighting the motor car by electricity. The experiments conducted by it in solving the problem of constructing a dynamo that would develop sufficient current at low speeds, yet not be affected at high ratios, has resulted in the Aplco combination lighting and motor starting system described herein. Although the company manufactures several types of lighting dynamos, these being designed to meet the differing requirements of design of the power plant, the combination lighting dynamo and motor starter, which is a unit, will prove of especial interest.

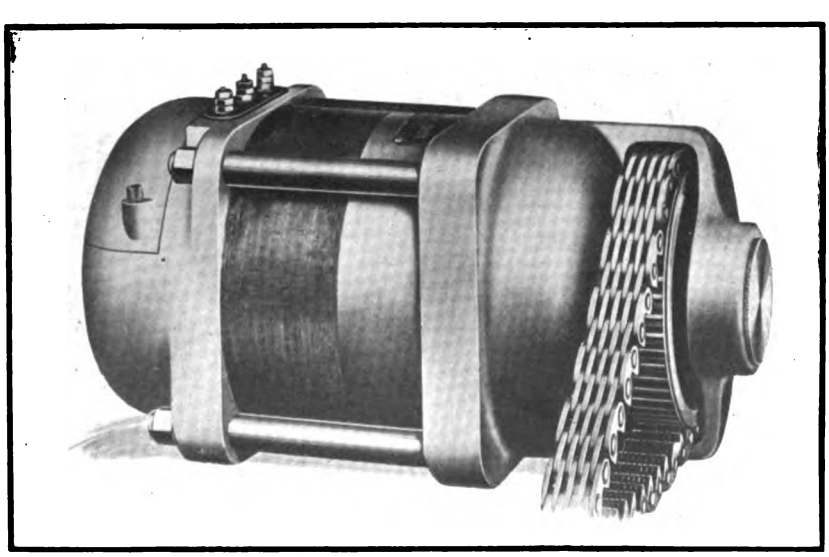

Fig. 99—The Aplco Dynamo-Motor, a Combination Lighting and Motor Starting System.

The system practically comprises three units, a dynamo-motor, a controller and a 15-cell unit storage battery. When the machine is operating as a dynamo or generator, it not only charges the battery but supplies current for lighting and ignition, the cells furnishing current when the speed of the motor car falls below a predetermined rate and when the explosive engine is inoperative. The battery also is utilized to energize the motor for starting the automobile engine, for which operation the cells are automatically connected in series to provide the necessary voltage. During the starting process the ignition circuit is

Digitized by Google

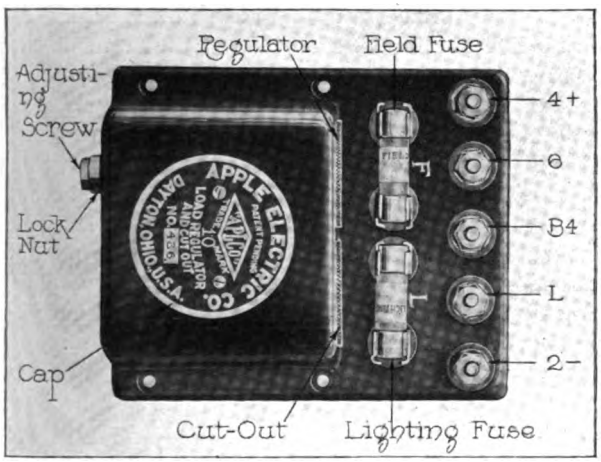

Fig. 100—The Automatic Cut-Out and Regulator Controlling Current Generated and Its Amperage.

automatically switched on and when the gas engine begins to operate under its own power, the controller cuts out the electric motor, rearranges the battery cells for charging and permits, through a regulator, the flow of electricity from the dynamo to the battery, as well as various circuits of the system.

The Lighting Equipment.

As previously explained, the lighting dynamos manufactured by the company are designed for motors of different speeds. When the lighting equipment only is installed it comprises a dynamo, regulator and cut-out panel, volt-ammeter and a six-volt, 100 ampere-hour storage battery. The different types of generators are designed to be operated at moderate, medium or engine speed, and may be driven by shaft, gears or chain, the method depending upon the convenience of installation. The silent chain drive is practical where increased ratios are desired and the company manufactures a variety of sprockets for this purpose.

Compactness of Dynamo.

The dynamo is a compact machine and its frame is of a special electrical steel with solid bearing heads, a design making for perfect alignment and rigidity. It is pointed out that its efficiency is due to its being of the multi-polar type and the fact that the armature and commutator are constructed of 21 sections, insuring proper commutation. The armature shaft is of a high grade steel, carefully ground to size, and rotates in high grade ball bearings. The brushes are self-lubricating and are held in a brush holder apron of insulating material. They stand at an angle of 45 degrees to the vertical to prevent the accumulation of foreign elements. A hinged door of pressed steel, so arranged that it may be opened in either direction, provides easy access to the brushes and commutator.

As with systems utilizing a generator to charge a storage battery, an automatic cut-out is employed the function of which is to connect the dynamo with the cells when a sufficient voltage has been developed, also to cut out the generator when its speed falls below a proper charging rate. This device is depicted at Fig. 100 and is mounted on the dash inside the hood or at any other convenient place. As will be noted, there is mounted upon the panel a regulator the utilization of which makes it possible, the company claims, to dispense with speed governing devices upon the dynamo, such as centrifugal governors, etc. It is pointed out by the maker that the Aplco current regulator acts as an automatic field rheostat, controlling the current generated by the dynamo, and permitting the machine to be operated at a positive speed.

The regulator comprises a series of carbon discs, one upon the other, and held in contact by a spring. This pressure or tension is magnetically controlled; that is, when the current generated by the dynamo increases, it augments the resistance in the field circuit and cuts down the field exciting current.

Regulator Adjustable.

Believing that the output of the dynamo should be varied to meet the different operating conditions, such as a fast or slow driving, and to provide efficiency for the owner who operates almost entirely during the day or the reverse, the Aplco regulator is fitted with a simple screw ad-

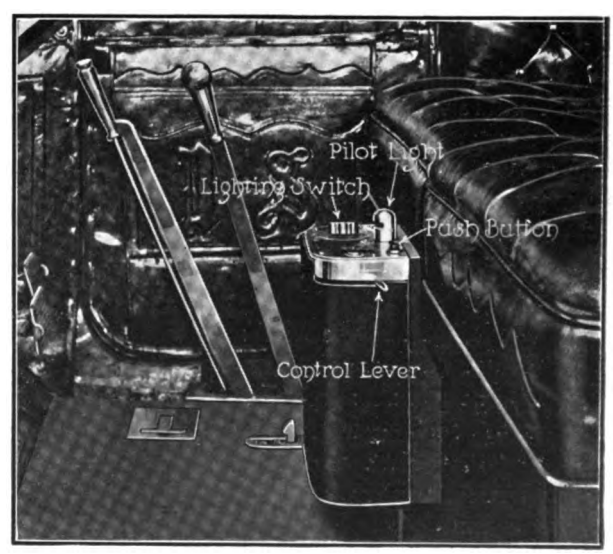

Fig. 101—The Controller of Combined Lighting and Starting System, Showing Compactness and Convenience of Operating Members.

Digitized by Google

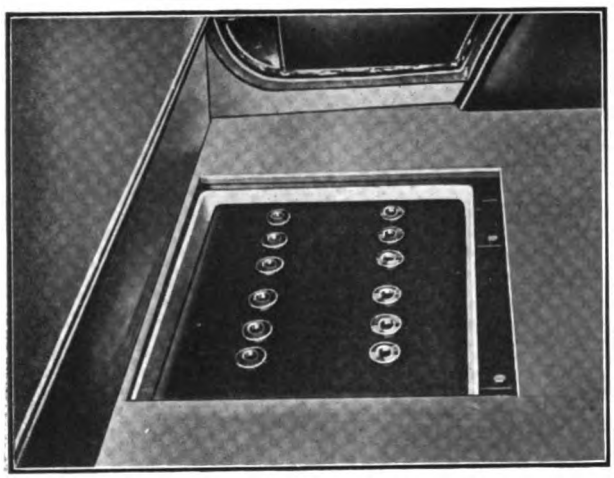

Fig. 102—Depicting Location of Battery and Connections for Converting Cells from Series to Multiple and Vice Versa.

justment by which the output of the dynamo may be varied from two to 16 amperes, according to requirement. The company points out that this is very important as it enables the proper maintenance of the cells and lamps.

The adjustment is a simple matter. Referring once more to Fig. 100, it will be seen that on the left of the regulator is an adjusting screw held by a lock nut. By screwing this in the regulator spring is so set that the output of the generator is increased, while a reverse movement decreases the amount of current. Although the cut-out is adjustable the maker holds that as it is properly set at the factory it will require no further attention. However, provision is made for this, the operation being similar to that of setting the regulator.

Function of Volt-Ammeter.

Mounted upon the dash of the motor car is the volt-ammeter, depicted at Fig. 103. This instrument shows the complete operation of the system and is provided with two scales, upper and lower, volts and amperes, respectively, the former reading to eight and the latter to 16 and 32. When the needle swings to the left it denotes that the dynamo is charging the battery and when to the right, current is being discharged from the battery. To read the voltage, a button is pressed as amperes are always indicated under normal conditions. The volt-ammeter serves another useful purpose inasmuch as it is of service when adjusting the regulator and cut-out, any variations being denoted easily by the needle and scales.

Provision is made for utilizing the current from the dynamo for ignition, if desired, the installment being simple, it consisting of attaching the battery leads to plainly marked terminals. Any synchronized, single spark, non-vibrator ignition system may be employed and one of the qualities of the equipment is that it provides a proper spark at low motor speeds as well as a constant and economical source of current. The dynamo may be operated in either direction; that is, clockwise or anti-clockwise, by interchanging the field connections at the binding posts and these as well as all other connections are plainly marked. A feature of the system is the utilization of a field fuse F on the regulator and cut-out panel. Should the battery be fully charged, and the car employed in long tours during the day time, the fuse may be removed, preventing current from flowing from the generator into the cells.

Lamp Loads.

All Aplco lighting systems have a capacity of 60 candlepower which may be divided as desired, but the company states the best results are obtained by employing the following grouping: Two 20 candlepower headlights, three four candlepower side and tail lamps, a six candlepower dome and a two candlepower dash light. The Aplco Electric Company manufactures a line of high grade lamps and fittings and special attention is called to the Golden Glow headlights. These are equipped with a glass parabolic reflector known as the Fry lens which is stated to absorb the ultra-violet rays to a great extent, not only reducing glare but making for fog penetrating qualities.

The Combined System.

To meet the requirements of the owner and

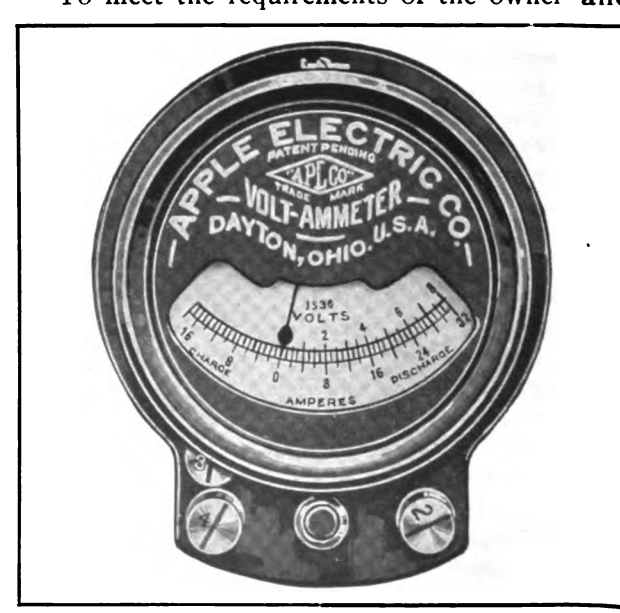

Fig. 103—Volt-Ammeter Utilized with Lighting System Only.

Digitized by Google

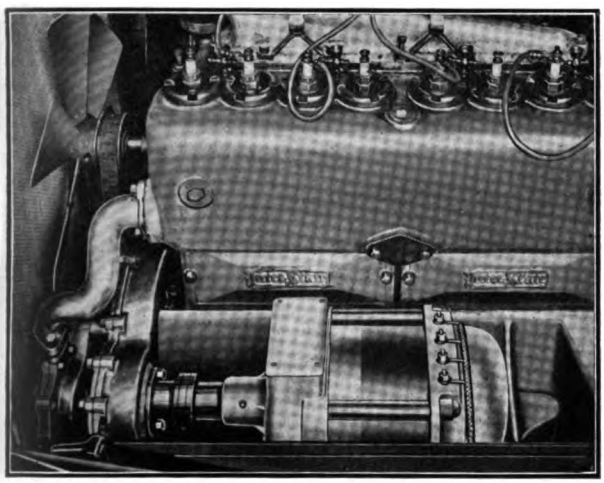

Fig. 104—Showing Motor Starter Installed on an Inter-State Car.

manufacturer desiring both an electric lighting and starting system, the company has constructed a combination lighting dynamo and motor starter which is depicted at Fig. 99. The machine is compact, its overall dimensions being slightly over 17 by seven inches, these including the extension of the armature shaft. The machine illustrated differs from former types in that an improvement has been made by the addition of a new head which is provided with a substantial bearing for the end of the armature shaft, the design being particularly adapted to installation on the majority of cars by means of a flexible gear drive. The compactness of the dynamo-motor with its chain drive through sprockets permits of securing it to a bracket attached to the frame and placing a driven sprocket on the crankshaft of the gas engine. The gear reducing mechanism, by which the energy of the electric motor is augmented, is contained within its head together with the automatic clutches which transmit or interrupt the power. All mechanism is enclosed and is dust proof.

In addition to the dynamo-motor the components of the system comprise a 15-cell-unit storage battery and a controller. The latter is of special interest in that it controls the operation of both the lighting and starting systems, and the compactness and convenience of the member is illustrated at Fig. 101, which depicts its location between the front seats of a car. Within the housing is contained the automatic cut-out and regulator of the lighting equipment, already described, also the switches for converting the voltage of the cells of the battery from six to 30 for starting purposes. The operation of both systems is simple. The driver can start the automobile motor, light, dim or extinguish the lights and operate the electric horn without leaving his seat.

Operation of Motor Starter.

The operation of the motor starter is as follows: The starting lever on the side of the controller is pushed forward, a movement which switches on the ignition current, arranges the cells of the battery in series to supply 30 volts, and makes connection between the motor and battery. Previous to this it is essential that the spark lever be retarded, as with it advanced the ignition current is cut out, an arrangement preventing the possibility of a back fire or premature explosion of the mixture in the cylinder. Upon the engine starting, the controlling lever is moved into a running position, breaking the connection between the battery and electric motor and re-establishing the cells of the battery in multiple for receiving a charge from the dynamo. The spark lever, however, may be manipulated in the usual manner after the engine is operating under its own power. Ignition is cut off by moving the control lever to a central position. Current is supplied for ignition by the battery at car speeds of below 10 miles an hour and above this rate by

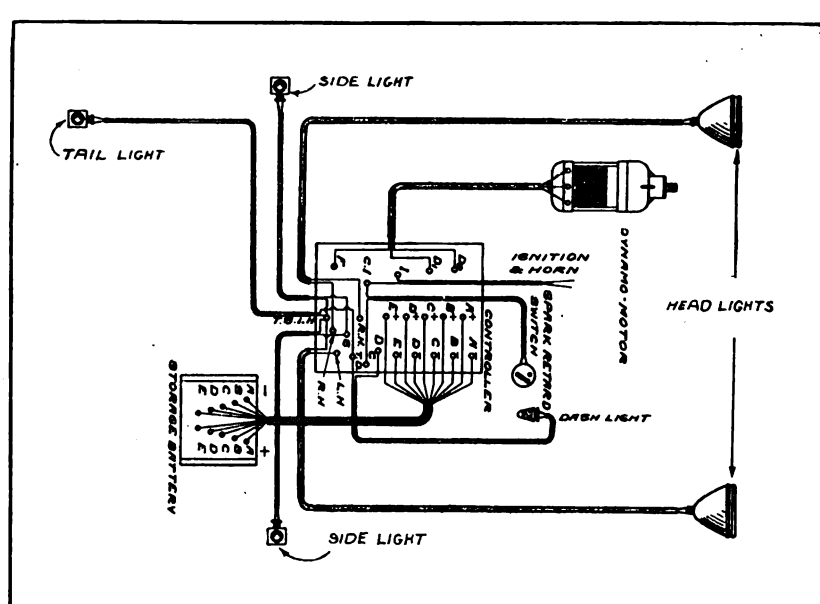

Fig. 105—Wiring Plan of Combination Lighting and Motor Starting System, Outlining Components of the Equipment.

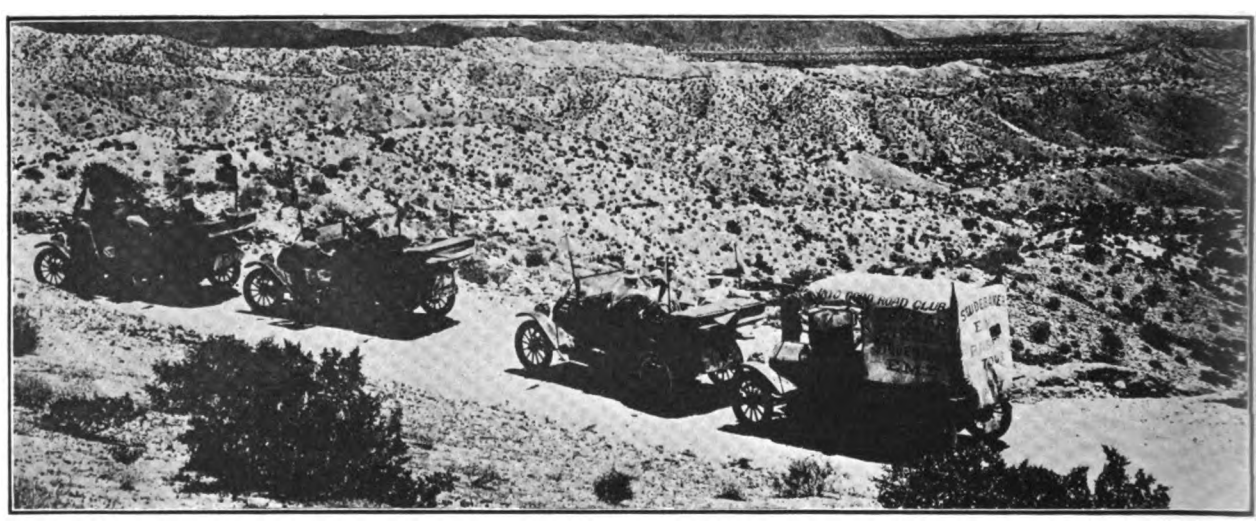
Digitized by Google

the dynamo, this being automatically regulated.

The control of the lights is by a switch mounted upon the controller and any group may be utilized or extinguished as desired. A feature of interest is that provision is made for dimming the lights; that is, by a simple movement of the switch lever the brilliancy of the bulbs may be so reduced as not to blind the occupants of an approaching vehicle. The top of the controller is equipped with a small lamp shaded by a metal cap and operated by a press button. The bulb serves a double purpose inasmuch as it acts as a pilot light, indicating the proper operation of the system as well as lighting the controller. A feature of the controller is that it is under the control of lock and key, preventing tampering with even the signalling horn.

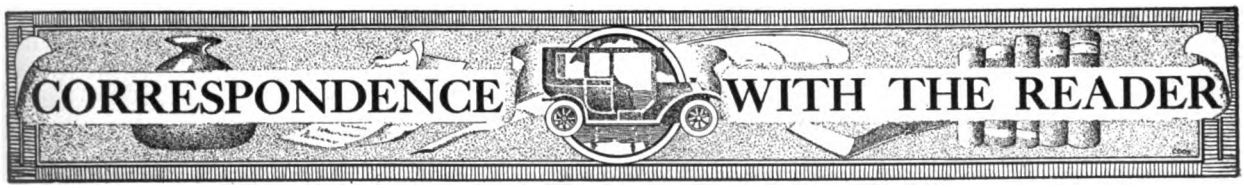


In the matter of locating the battery, the maker has carried out the idea of accessibility as well as having all components out of sight. The member is placed under the floor boards as shown at Fig. 102, the illustration also depicting the connections for the various wires, the arrangement of which is outlined in the wiring diagram presented at Fig. 105. The diagram shows the various components of the combined lighting and starting system and their relation to one another. Throughout the best of material and workmanship are incorporated and the Apple Electric Company points out that the compactness of the equipment permits of its installation on any car.

MAY FREE TOLL BRIDGE.

When the new bridge over the Connecticut river between Saybrook and Lyme, Conn., was opened something like a year ago, there was some surprise on the part of motoring tourists to find that it was to be operated under the somewhat antequated toll system. A movement is on foot now to seek the passage of a law by the next legislature opening the bridge to free traffic. Thousands of dollars have been paid since Aug. 24, 1911, and practically all of the money has been contributed by irate motorists, most of whom were induced to tour Connecticut because of the very liberal motoring laws that have been enacted in that state.

ANTICIPATING EXPOSITION TOURISTS.



California expects that a very large percentage of those who will visit the international exposition in San Francisco in 1913, will be motorists, many of whom will make the trip across country from their homes. In order to make the stay of these people as enjoyable as possible, the state officials are co-operating with the automobile clubs of the commonwealth in laying out a tour which shall embrace a large number of historic, scenic and natural attractions in the vicinity of the Sierra Nevadas.

Studebaker Pathfinding Cars Laying Out Pasear Route Through Jawbone Pass in Sierra Nevadas.

The so-called Pasear route has been completed, an accompanying illustration showing the caravan of 30 horsepower Studebaker cars, made by the Studebaker Corporation, Detroit, at work in the Jawbone pass, overlooking the Mojave desert. Considerable enthusiasm for good roads was awakened all along the line of the 2000-mile trip. A unique part of the run was its reliability feature, all of the cars coming through without changes in adjustment.

The Automobile Journal cordially invites the owner, driver, repairman, sales agent and manufacturer to discuss subjects pertinent to the motor car, motorcycle and aeroplane in these columns, believing that the automobile industry and those closely allied with it will be benefited thereby. Complete information dealing with the construction, operation, maintenance and repair of these machines will be published upon the receipt of a communication addressed to the editor of The Automobile Journal. Suggestions or discussions of a mechanical nature, or those facilitating repairs and adjustments, should be accompanied by a rough sketch which will be redrawn for publication. Detailed touring information will be supplied by The Automobile Journal's Touring Bureau upon request. All communications should be accompanied by the full name and address of the sender, but for publication purposes the name will not be used unless desired.

Auxiliary Fuel Tank.

(1427)—During a recent tour of the White mountains I was unable to climb a certain steep hill as I could not get any flow of gasoline to my carburetor, although the tank had been filled when we left the hotel in the morning. Have not been bothered before, but the hills encountered have not been as steep as the one on which we got stuck and had to be towed. As I intend to repeat the trip in the fall and cannot raise the tank as it would bring the seat too high, desire to fit some device so that I can climb the troublesome and other steep grades. I don't care to use a pressure feed as the gravity is good enough for me. Can you suggest any method?

A CONSTANT READER.

Providence, R. I., Sept. 1.

There are several methods of fitting an auxiliary tank, among which is that of securing to the inside of the dash and as near the top as possible, a small container holding anywhere from a quart to a gallon, this depending upon the amount of space available. A tubing is attached to the tank and connected to the main line near the carburetor, and a petcock or valve fitted to the pipe leading from the tank. With this device it would only be necessary to open the valve when a grade was encountered where the main tank would not supply fuel. The auxiliary member, however, would have to be refilled from time to time.

A better way is shown in the accompanying illustration which also serves to show why the supply of fuel is cut off when the machine is ascending a steep gradient. The sketch at B brings out this feature very clearly and it will be noted that the carburetor is well above the level of the fuel in the main tank and that it is due to the grade. The dotted lines indicate the normal level as conditions would be if the car were on level ground as at A.

The installation shown is made easily and consists of attaching an auxiliary tank under the hood in a convenient positon near the carburetor. It is important that the container be at least upon the level with the top of the float chamber of the vaporizer. A better location would be above it.

The connections are made easily and without extensive alterations. As will be noted the main line instead of being connected to the carburetor is led to the auxiliary tank. From the bottom of the latter a tube connects it with the carburetor and a shut-off valve may be incorporated in this line if desired, it replacing the usual member at the main supply tank.

The main tank should be a few inches above the small member so that the latter will be filled when the car is on the level or descending a grade. In filling the auxiliary member for the first time the petcock should be opened and care exercised to prevent an air lock.

The operation of the tank is obvious. When the machine is travelling upon level ground or descending a grade, the fuel flows from the main member into the auxiliary which at all times supplies the carburetor. When the car is climbing a steep grade the supply in the small vessel will permit of operation for a considerable time, and upon reaching level ground again the tank will be refilled by gravity. This arrangement will enable one to climb the steepest hills as well as insure an even and constant pressure of fuel at the carburetor at all times. The work may be performed by anyone familiar with piping the fuel line and the parts needed will not be expensive.

Desires Motor and Radiator.

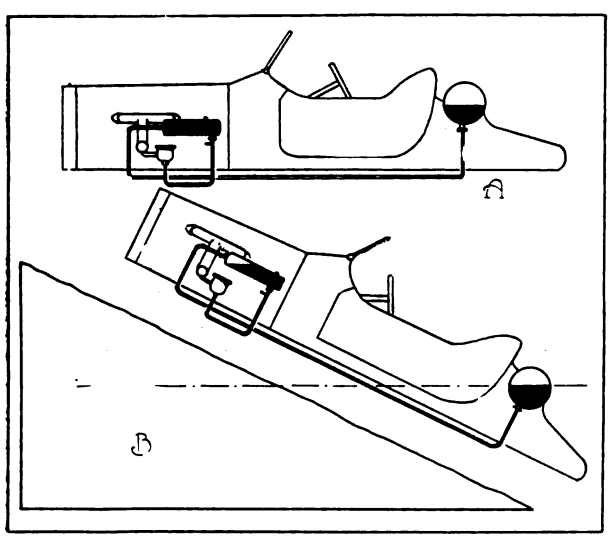
(1428)—I want a 16 or 18 horsepower, four-cylinder, four-cycle motor with radiator, or a 20 horsepower two-cylinder engine with radiator ready for installation on the frame of my car which is from 22 to 28 inches. Any information given will be greatly appreciated.

E. W. RENFRO.

Osawatomie, Kan., Sept. 2.

The addresses of motor manufacturers are given in the Classified Buyers' Guide, elsewhere in this issue. It is advisable to submit to the maker a sketch of your chassis, giving dimensions, etc. Relative to the radiator the manufacturer of the motor will suggest some particular type adaptable to his product.

Four Speed vs. Three.



(1429)—Am thinking of buying a car with a four speed transmission and would like to ask your opinion and experience of which is the better of the two and the ad-

Digitized by Google

vantages of one over the other, if any, on a four speed transmission, one to be direct on third and the other on fourth and what gear ratios you would recommend in either case? Also, which transmission, in your opinion, will ultimately predominate? J. F. H.
Muncie, Ind., Sept. 5.

There has been considerable discussion among mechanical engineers relative to the merits of three versus four speed transmissions and each has its advocates. W. H. Cameron, M. S. A. E., presented in the July 25th issue of The Automobile Journal an article which favored the four speed transmission, pointing out its advantages. Several engineers have disagreed with Mr. Cameron in some details of the discussion, principally in the matter of steps between the gears.

In the writer's opinion the factors to be considered are the number of cylinders, bore and stroke and weight of the car. This is borne out in practise as figures show that of 37 representative cars, 34 selected at random employ the three speed transmission, 13 the four speed with direct on the third, and 26 the four speed with direct on the fourth. Of the latter type, 15 were six-cylinder motors, with S. A. E. horsepower ratings of from 40 to 60. Of the four speed with direct on third, six of the 13 machines were six-cylinders and the general average horsepower was well above 45. In this class the four-cylinder motors were, with two exceptions, 40 horsepower and above.

Method of Fitting Auxiliary Fuel Tank Where Supply Is Cut Off on Steep Grades: A, Showing How Vessel Is Filled When Machine Is on the Level; B, How the Device Operates When Automobile Is Ascending Grade.

Coming to the three speed transmission: Of 34 cars selected, only five were equipped with six-cylinder motors and the average horsepower was nearly 45. The balance of the machines were slightly above 30 horsepower. The general average of the gear ratios of the cars referred to are as follows:

	First	Second	Third	Fourth
Four speed, direct on fourth	11.7	6.7	4.7	3.2
Four speed, direct on third	9.9	5.6	3.4	2.7
Three speed, direct on third	11.4	6.3	3.5	..

From the above table it would appear that neither the number of cylinders nor the horsepower seems to have affected the transmission system insofar as the ratio between the revolutions of the motor and the speed of the rear wheels is concerned. For example: One of the three speed cars is equipped with a six-cylinder, 54 horsepower motor and its gear ratios are first, 12; second, 6.7; third, 3.5. The four-cylinder, 36 horsepower machine of the same make has the following ratios: First, 11.7; second, 6.3; third, 3.5. It may be stated, however, that the smaller vehicle is considerably lighter, a factor that should be considered in making comparisons.

Mr. Cameron points out that about 85 per cent. of the three speed transmissions have the following ratios:

Speed	Transmission Ratios	Ratios—Engine to Wheels
Third	1.00-1	3.5
Second	1.80-1	6.3
First	3.88-1	11.2

Avoiding New York City.

(1430)—Can you tell me about the condition of the roads on Tour No. 50, appearing in your issue for Aug. 16, and can you tell me if there isn't some way, on the return trip, to avoid New York City? TOURIST.
Dorchester Center, Mass., Aug. 26.

Our information is that the roads covered by this tour are for the most part fair-to-good dirt and macadam. A little trouble may be experienced between Delaware Water Gap and Allentown, Penn., but otherwise there should be no difficulty.

In the matter of avoiding New York City: The following itinerary, beginning at Newark, N. J., and ending at Port Chester, N. Y., is suggested, although still others may be taken:

Newark to	Miles to	Total Miles
Rutherford	7.5	7.5
Hackensack	5.2	12.7
Tenafly	2.6	15.3
Tappan, N. Y.	7.7	23.0
Nyack	6.1	29.1
Ferry to Tarrytown.		
White Plains	7.0	36.1
Port Chester	6.2	42.3

Fixed Vs. Variable Ignition.

(1431)—Am contemplating equipping my machine (an old model) with a magneto and have a chance to purchase a Bosch of the fixed ignition type. Have been told that the fixed magneto is not a success for a pleasure car. Is this correct? Also which is the best method of driving the magneto, by chain, gears or shaft? I wish to use the magneto for starting and employ the battery and coil system simply for reserve. MAGNETO.
Wichita, Kan., Sept. 2.

Digitized by Google

High-tension magnetos with fixed spark are said to give good results for certain service, such as operating in the city, etc. The magneto referred to could be reconstructed by the Bosch Magneto Company, 225 West 46th street, New York City, and in writing give model, etc., of the instrument.

If the design of the car will permit, drive magneto by gears or shaft in preference to the chain. In the installation of a magneto on an old model, more or less difficulty will be experienced in the work of fitting, and another handicap of the chain will be the changing of the setting of the timing. With the gear drive, it is an easy matter to mesh the teeth a tooth earlier or later as may be necessary and the method will also be of service in the overhaul as the teeth may be marked, making proper replacement an easy matter. In fitting the magneto, it may be possible that after installation it will be found that it is timed too early or late, and this varies according to the design of the motor. If possible use gears of 10 pitch; that is, 10 teeth to the inch. Stock gears may be obtained from any of the concerns making gears, and catalogues will be mailed upon request.

Dragon Repair Parts.

(1432)—I have an opportunity to purchase a second hand Dragon car at a reasonable price, but cannot find out where I can obtain parts for same. I understand that the machine is not being made, as the company has gone out of business. Can you inform me where I could secure parts as I will not buy if parts cannot be obtained?
JOURNAL SUBSCRIBER.

Rome, N. Y., Sept. 8.

The Philadelphia Machine Works, 67 Laurel street, Philadelphia, announces that it has on hand all parts for the car mentioned and makes a specialty of repairing the same.

REGISTRATION IN VERMONT.

Receipts from the registration of automobiles in Vermont, according to the report of the secretary of state, Aug. 14, was $75,894.84, which is $15,259.60 more than in 1911, and $49,226.50 more than in 1909. The receipts from this source in the last four years follows: 1909, $26,668.34; 1910, $43,112.89; 1911, $60,633.24; 1912, to Aug. 14, $75,894.84.

PLOWS WITH WARREN CAR.

A novel test was applied to a 40 horsepower Warren car, made by the Warren Motor Car Company, Detroit, near that city recently. Lucius E. Wilson, vice president and general manager of the company, took the car to his summer home in the country and hitched it to a No. 11 Oliver sulky plow, with which he turned over a portion of a 30-acre field. The machine was run two hours on low speed without overheating motor.

COMING EVENTS.

September.

Sept. 11-14—Reliability run, Buffalo, N. Y.
Sept. 13—Track eventc, Sandusky, O.
Sept. 14—Track events, Fort Wayne, Ind.
Sept. 17—Grand Prize race, Milwaukee, Wis.
Sept. 20—Pabst Trophy race, Milwaukee, Wis.
Sept. 21—Vanderbilt Cup race, Milwaukee, Wis.
Sept. 21—Track events, Detroit, Mich.
Sept. 21—Track events, Pittsburg, Penn.
Sept. 28—Track events, Dayton, O.
Sept. 28—Track events, Kalamazoo, Mich.
Sept. 28-Oct. 6—Electrical show, Boston, Mass.
Sept. 29-30—Track events, St. Louis, Mo.

October.

Oct. 4-5—Track events, Sioux City, Ia.
Oct. 7—National tour, Detroit, Mich.
Oct. 7-11—Reliability run, Chicago, Ill.
Oct. 8-14—Show, St. Louis, Mo.
Oct. 12—Track meet, Salem, N. H.
Oct. 12—Track events, Springfield, Ill.

November.

Nov. 6—Track events, Shreveport, La.
Nov. 8-16—Olympic show, London, England.
Nov. 16-23—Show, Atlanta, Ga.
Nov. 28—Track events, New Orleans, La.

December.

Digitized by Google

FEATURES OF THE NEW STANDWELD RIMS.

ANNOUNCEMENT is made by the Standard Welding Company of Cleveland, O., of its new line of automobile rims which will be marketed under the name of Standweld. The new types are the result of much study and experimentation and are designed to meet the requirements of the motorist who desires to change the make of shoes and who wishes the quick detachable and quick demountable features incorporated. The rims are universal in that they will accept either a straight side or clincher casing.

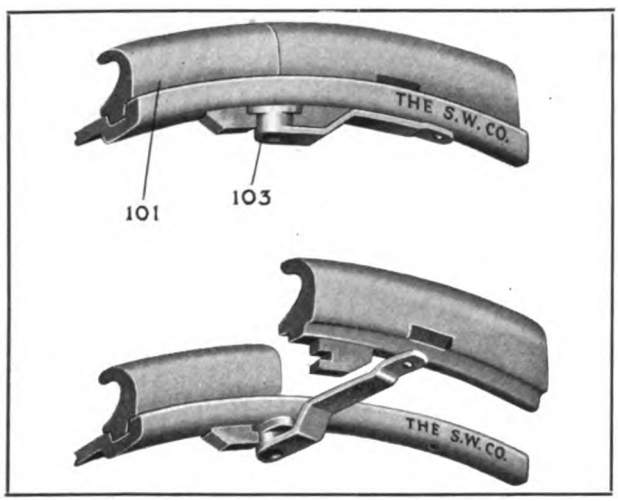

Fig. 1—The Standweld Detaching Mechanism, a Positive Locking Device—The Upper View Shows Latch and Ring Locked.

To meet the demand for a quick detachable rim without the demountable feature, the company has designed three types of rims the only variation being the type of tire they will accept,

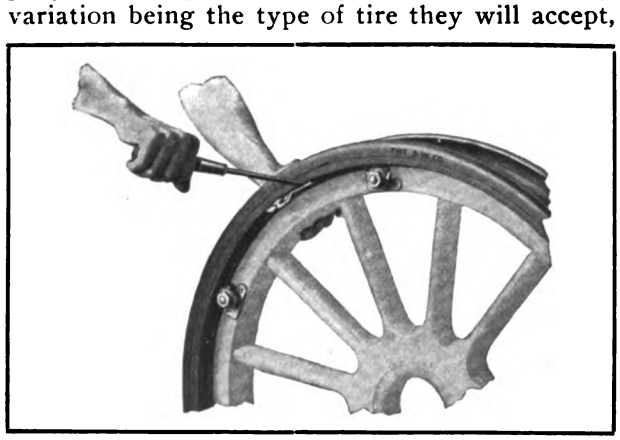

Fig. 2—Depicting Simple Operation of Releasing Latch from Lock—The Only Tool Required Is a Screw Driver.

these being known as Standweld rim types 50, 51 and 52. The first named is a universal rim in that it has two removable side rings, one continuous and one split, both of which can be reversed and the rim utilized for a straight side or clincher tire. On the types 51 and 52, one straight or clincher side is made integral with the rim base, making for durability as well as minimum weight. Type 51 is for straight side tires only, while 52 is for clincher, although by using a rim filler on one side, and reversing the detachable ring, this type may be employed with straight side casings.

A quality of the design is the detaching mechanism shown at Fig. 1. This side ring is split transversely and has slotted lugs on either ends which protrude through slots in the rim base when the ring is in position. The latch is easily operated, being securely attached to the rim, and in normal position absolutely locks the ring to the base as depicted in the sketch. The ease of operation is shown at Fig. 2, the only tool required being a screw driver, which is inserted in a recess and given a slight upward pull, releasing a projection, after which it is a simple matter to swing out the latch and remove the split ring.

Fig. 3—Outlining Construction of Clamp Utilized with Demountable Rim.

The demountable rims are known as types 30, 40, 41 and 42, and have the quick changing qualities of the rims just mentioned, but demountable features also are incorporated. These are simple and effective, comprising practically four parts, the rim base, adjusting ring, felloe band and clamping devices. The adjusting ring, which is depicted at Fig. 4, is a new feature, as it is split transversely, making for accurate centring and continuous bearing of the rim base on the felloe band. Its outer circumference is designed to fit the ledges on the rim base flanges in such manner that the rim base cannot move in a lateral direction, as the bevels of the rim base flanges and adjusting rings fit each other so that the weight of the car tends to force the rim in a direction towards the retaining flange of the felloe band. The continuous bearing of the retaining flange against the rear of the rim base prevents lateral movement in that direction. The maker points out that the construction relieves the clamping devices of

Digitized by Google

all direct strain, as the pressure on the rim base transmits its greatest displacing force to the adjusting ring and towards the felloe band flange, the bolts assuming but a slight strain.

The design is noticeable for simplicity and it is impossible for the wheelmaker to attach the felloe band in other than the proper location and the rim will run true with the wheel. A quality claimed of the adjusting ring is that it gives a contemporaneous radial expansion to the rim base at all points of its front and rear circumference, preventing wabbling and consequent tire expense. It is not necessary to carry a spare adjusting ring with each spare rim as the adjusting ring can be removed easily and quickly placed in the spare rim that is to be fitted.

To positively lock the rim base it is only

Fig. 4—The New Standweld Adjusting Ring, Making for Accurate Centring and Continuous Bearing of Rim Base on Felloe Band.

necessary to hold the adjusting ring in a position between the rim base and felloe band. This is quickly and easily done by the utilization of six clamping bolts, placed equidistant.

The locking bolt is depicted at the right at Fig. 5 and comprises a bolt 105, which has a head made integral with it and which provides a support for the back flange of the felloe band; the clamp washer 109, which is secured to the front of the felloe with screws and the clamping device, which is an assembled piece consisting of a concave clamp 107, a conical clamp 106, and a friction spring. These parts are inseparable after being assembled and are designed to withstand severe usage.

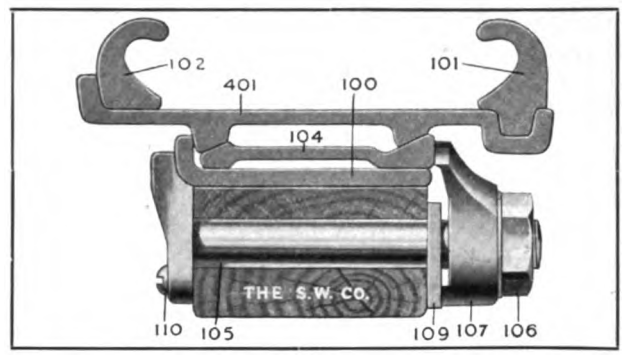

Fig. 5—Cross Sectional View of Demountable Rim Type 40, Showing Locking Bolt and Clamp.

The clamp when locked, bears upon both the adjusting ring and clamp washer. It has a universal movement on the conical clamp nut which provides for considerable variation in the position of the clamp, as well as prevents possible bending of the bolt through misalignment. Only a few turns of the conical clamp nut are necessary to release or tighten the clamp and during the operation the clamp turns with the nut, but only until the desired position is reached. The clamp washer has a projection which prevents the clamp from turning further. When the clamps are unlocked the rim base with its adjusting ring can be removed easily from the wheel. The clamps do not have to be tightened in a released position in removing the rim as the clamp nuts perform this work.

All Standweld demountable rims embody the quick detachable feature and are very light in weight as well as water tight, qualities making for efficient service. The demounting device comprises several wedges operating on bolts extending through the felloe. These wedges form a simple yet efficient method of retaining the rim base with its tire on the wheel. The rim is produced in both the straight side and clincher types and its simplicity and light weight may be cited among its more noticeable features.

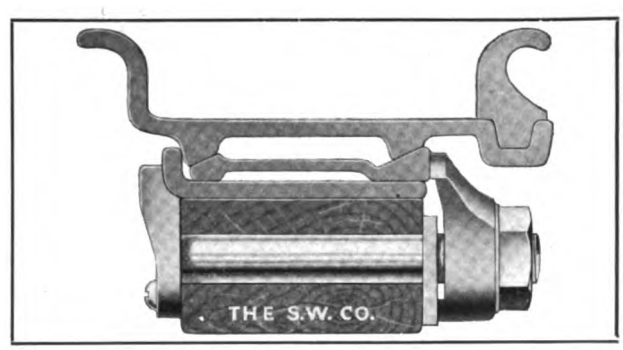

Fig. 6—Depicting Sectional View of Demountable Type.

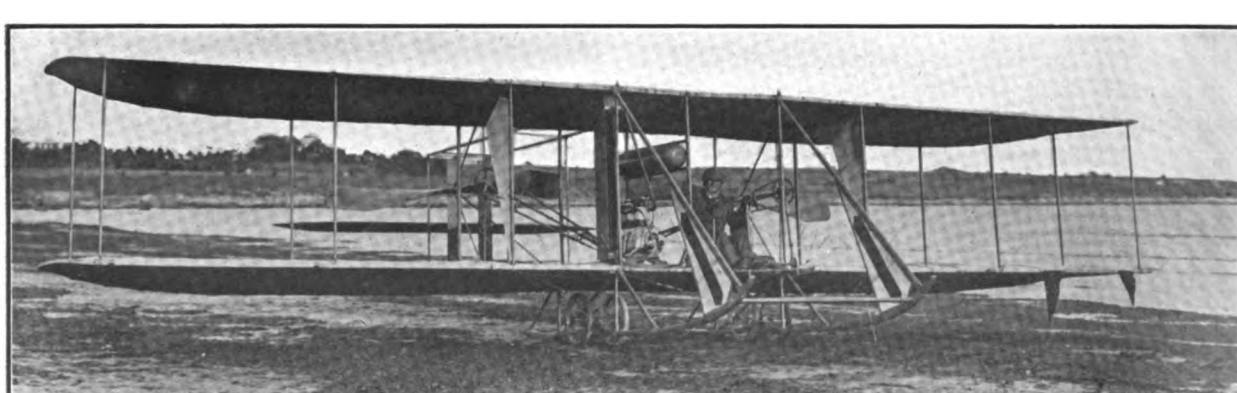
In The Aviation Field



With the Manufacturer and Operator in America and Abroad

Although rated as an amateur aviator, not having attempted to secure a pilot's license from the Aero Club of America, John McGee of Pawtucket, R. I., gave a splendid exhibition of skill in handling his Burgess-Wright biplane in a flight from Saugus, Mass., to Newport, R. I., Aug. 25-27. It was during the first portion of the flight, from Saugus to Readville, Mass., that he demonstrated his ability most satisfactorily.

McGee was well acquainted with motors, having driven automobiles for a number of years, before becoming a pupil of Harry Atwood at the Saugus flying field. At the end of five lessons, and against the advice of friends, he flew a machine cross country from Saugus to Revere and return. He seems to have special aptitude for cross country flying. In his flight to Newport, he took the air late in the afternoon of Aug. 25, when more experienced aviators declined to leave the ground. A fair breeze was stirring near the earth, but this became a gale as soon as the biplane was well aloft. Hardly was the flight begun before McGee was blown over Boston harbor, to a point almost directly over Boston light. Here he appeared utterly unable to make the machine obey his commands for a time. The air seemed full of holes and the strong wind compelled him to continue against his will. After trying one stratum of air after another, he finally was able to turn the biplane landward, and succeeded in alighting on the race track at Readville.

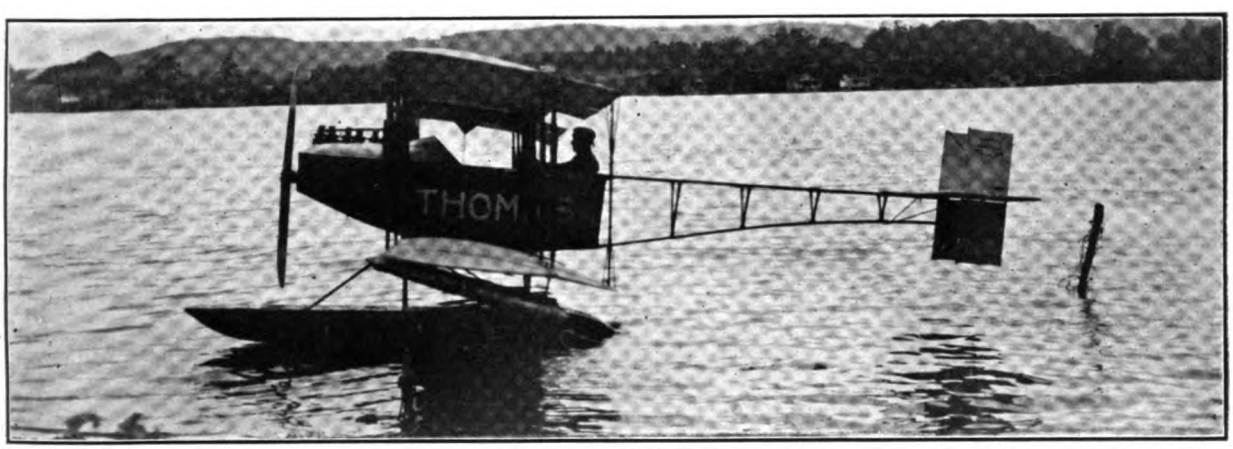
The flight to Pawtucket, his home city, was resumed the next morning and without incident. In trying to leave Pawtucket, the right wing of the machine was damaged, because the crowd failed to give the aviator sufficient room. After replacing the damaged plane, the trip to Newport was finished late Tuesday afternoon. With the exception of the experience over Boston harbor, the flight was in no way unlike many others, but the manner in which McGee handled himself under those trying circumstances, is sufficient to indicate that he will soon become one of America's best known pilots.

The official report of the British military trials, as cabled to this country, shows that B. F. Cody, formerly an American, but now a natural-

John McGee in His Burgess-Wright Biplane on the Beach at Newport, R. I., After His Remarkable Cross Country Flight from Boston.

Digitized by Google

ized British subject, took the first prize of $20,000 with his Cody biplane. He also took the first prize of $5000 for British made aeroplanes with the same machine. The second prize of $10,000 in the international competition went to Armand Deperdussin of France with a Deperdussin monoplane.



An accompanying illustration presents Walter E. Johnson in a Thomas hydraeroplane, made by the Thomas Bros., Bath, N. Y. Since July 8 he has covered 550 miles in one of these machines without experiencing any difficulty either with the biplane or the pontoons. There can be little doubt that the construction must be regarded as practical in every way.

As an indication of the strength and rigidity of the Thomas hydraeroplane, it is pointed out that landings have been made on plowed ground, in hay fields, etc., without in any manner injuring or straining the landing gear. On one occasion the machine turned completely over, striking on the upper main plane, without harming the pilot or breaking a single portion of the mechanism.

The Thomas Bros. has been engaged in the production of aeroplanes since January, 1910. The present designs do not differ materially from the original, the only changes being in such details as experience has indicated could be improved. There seems to be abundant evidence that Thomas machines are to play a prominent part in the future of aviation in America.

The entire world will sympathize with Belgium in the loss of one of its representatives in the international race for the Gordon-Bennett cup. Charles Frank van der Merrsche, who was known in the field of aviation as Charles Morok, died in Brooklyn, N. Y., Aug. 25. He had been named as one of Belgium's representatives in the race, and was to have flown a Morok biplane, in the construction of which machines he had been engaged for a number of years. His death was the result of typhoid fever. Although a native of Belgium, he had been in America for some months and many of his machines were manufactured in this country.

Charles Terres Weymann of America, holder of the Gordon-Bennett cup, won the cross-channel race for hydraeroplanes, the chief event in the hydraeroplane meet of the Aero Club de France, at St. Malo, Aug. 27. The distance was approximately 91 miles, which Weymann covered in a Nieuport monoplane, fitted with pontoons, in 1:44:24. Rene Labouret in an Astra-Wright biplane, similarly equipped, was second in 2:31:46, and Jean Benoist in a Sanchez-Besa machine was third in 2:49:14.

Walter E. Johnson Trying Out the Latest Thomas Hydraeroplane Near the Works of the Thomas Bros., Bath, N. Y.

Edmund Audemars of Switzerland recently completed the first aeroplane trip between Paris and Berlin, a distance of 535 miles, winning a prize of $20,000.

What is regarded as a record for number of flights in a given day, was accomplished Aug. 21, by Hugh Robinson, the well known aviator connected with the Curtiss Aeroplane Company's staff at Hammondsport, N. Y. He flew 56 different times, and carried a passenger on each occasion. None of the flights was for less than eight to 10 minutes. A total of more than 800 miles was covered during the day.

Apparently, in an effort to follow the example of the German people, the Aerial League of the

Digitized by Google

British Empire has undertaken the collection of a popular subscription of 1,000,000 shillings, to be spent in prizes and awards tending toward the general development of home business in and to promote the safety of aircraft. It has been suggested that at least a portion of the money be devoted to the purchase of aeroplanes for the British army and navy, as was the $1,500,000 raised in Germany, but there is a strong feeling that the nation is well able to purchase its own machines and that it should be compelled to do so.

The Aero Club of America has removed the suspension against eight aviators who took part in the recent unsanctioned meet at Boston, this action being taken upon the application of the Aero Club of Illinois. It was stated that it was desired to secure the services of some of these men in connection with the international meet in Chicago. The aviators affected are: Lincoln C. Beachey, Paul Peck, Charles K. Hamilton, Phillips Ward Page, Glenn L. Martin, Farnum T. Fish, Arch Freeman and F. J. Terrill.

Several new aviators have been trying their skill at the Hempstead Plains flying field on Long Island during the past few days. Miss Bernetta Adams Miller, employing a Moisant monoplane, has been added to the list of women aviators in America, having flown for her pilot's license Labor Day.

Harold Kantner recently tried out the all-metal monoplane designed by the late John B. Moisant, and with excellent success. At times he was 1500 feet in the air, and the monoplane responded promptly to the control at all times. This machine, while designed by Moisant, was never flown by him with anything approaching success. Apparently, some good work has been accomplished by those connected with the Moisant Aviation Company, since the death of the designer.

Among the others who have been flying at Hempstead Plains are the following: George Dyott, Deperdussin monoplane; Eugene Godet, George Ecker, Gustave Ely and William Chambers in Curtiss biplanes; Frank Seidel, McLaughlin biplane; Charles Baysdorfer and Oscar Oleson in biplanes of their own construction.

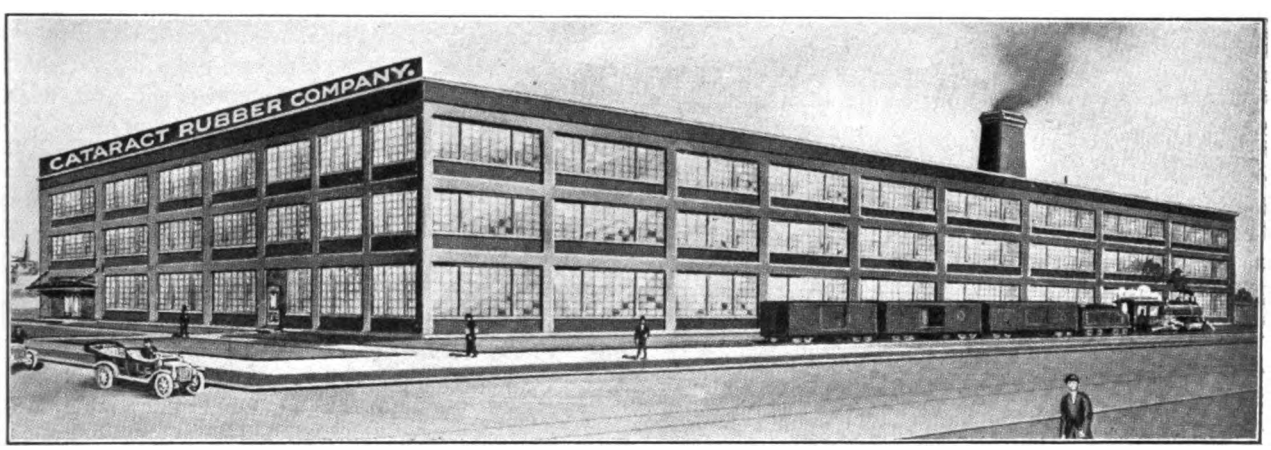
Providence, R. I., was selected by Miss Ruth Law as the scene of her first flights alone, Labor Day. Miss Law had been a pupil of the Atwood school in Saugus, Mass., and had made several flights with her instructor in a Burgess-Wright biplane. This was the machine she utilized in making the Labor Day flights at Providence.

At the same time Lincoln Beachey appeared with a Curtiss biplane. This was regarded as the second annual Providence aviation meet, since this city was made one of the stops in the triangular cross country flight of Labor Day, 1911, when Earle Ovington in a Bleriot monoplane, and Lieut. T. D. Milling in a Burgess-Wright biplane, flew from Boston to Nashua, N. H., to Worcester, Mass., to Providence and back to Boston.

Glenn H. Curtiss, inventor of the Curtiss biplane and hydraeroplane, left New York Aug. 21 to close contracts for his hydraeroplane with the governments of England, Germany, Italy, France, Russia and Japan. He expects to be abroad about six weeks.

H. J. D. Astley, a well known British aviator, crossed the English channel, from Hendon, England, to Hardelot, near Boulogne, France, Aug. 28, carrying Miss Mary Davis as passenger. His time was 3:05:00.

Revised rules of the Federation Internationale Aeronautique for the licensing of aviators, permits the applicant to use a hydraeroplane in making one or two distance tests over a closed circuit of 3.1 miles, alighting on and arising from the water. One of the distance tests and an altitude flight must be made from land. The use of the marine craft is optional with the candidate.



Chicago claims the honor of being the first to witness the use of an aeroplane for fire department purposes. Recently, while in flight from the Cicero field in that city, A. C. Beach's biplane caught on fire, a portion of the wing surface being burned away. Max Lillie and his mechanician jumped into another biplane half a mile distant, and carrying a small hand extinguisher, soon caught up with the blazing machine and put out the fire before it reached the earth.

While it was announced recently that Capt. Paul W. Beck, U. S. A., had been relieved from duty in the aviation corps and returned to duty with his regiment, full explanation of the move was not forthcoming at the time. It is stated that under the army rules an officer who has been away from his regiment for four years must return at the end of that period. Capt. Beck has been two years with the signal corps and two with the aviation school. A movement is now on foot to secure another four years of service with the aviation corps.

Digitized by Google

CATARACT CAR AND TRUCK TIRES.

THE Cataract Rubber Company, with main offices at Boston, Mass., branches at New York, Providence and Buffalo, and factory at Wooster, O., is marketing tires for automobile pleasure and service vehicles which are claimed by the maker to have unusual qualities of endurance and are guaranteed to have extreme mileage in actual use. This concern was organized March 11, 1911, with capital of $500,000, to engage in the manufacture of automobile tires and tubes, truck tires and mechanical rubber goods. It was formed as the result of efforts of men long identified with the rubber tire and goods industry and trade, and with a purpose to place in the market products having qualities that would not only recommend them to the discriminating owner of automobile vehicles, but would yield the service guaranteed under normal conditions of use.

The New Factory of the Cataract Rubber Company at Wooster, O., Now Nearing Completion, to Be Ideally Equipped and in Operation Jan. 1 Next.

The company was organized with William J. Bullock, New Bedford, Mass., former mayor of that city, president; Samuel J. Greene, treasurer of the Eastern Coal Company, Providence, R. I., vice president; George N. Steere, 2nd., manufacturing jeweller, Providence, R. I., vice president; Francis M. Adams, treasurer of the Brotherhood of St. Andrew, Boston, Mass., treasurer, and Edwin F. Dodge, treasurer of the Mu-Col Company, Buffalo, N. Y., secretary. These five men and four well known business men of Boston compose the board of directors.

With the organization of the company it acquired extremely valuable formulae and processes possessed by the organizers and with this knowledge of manufacturing the necessity of experimental work at large expense was avoided. The company was also in a position to begin manufacture with exact knowledge of the requirements of the motorists, the methods of distribution, and the conditions of general use, so there was nothing uncertain whatever as to the qualities of the productions necessary to meet the high guarantee placed upon them.

Following the establishment of the company its policy was decided, and this included the purchasing of the best material that could be procured, the careful compounding of the materials to secure a product better than standard, extreme care in manufacture, securing the highest character of workmanship, marketing with a view of minimizing distribution cost, guaranteeing to the consumers the mileage that the products justified, and affording a service to all purchasers that insures that the guarantee will be realized. In maintaining this policy it was necessary to demonstrate results and obtain evidences of service to establish the products in the market, and this could only be done through actual use, so that it was several months following the organization of the company before the tire was recognized as a high grade product in competition with standard tires.

The company began the manufacture of all standard sizes of tires in the proportions as to size that the market appeared to justify, and the types decided on were the plain and the break-skid treads, the latter form being built on the vacuum principle, with an extremely heavy tread from which segments are cut in perfect alignment on either side, as illustrated, the recesses forming vacuums under pressure that hold the tires firmly

Digitized by Google

and prevent side slip whenever the car is in motion on a muddy highway or on wet paving. It is claimed for this break-skid tire that it not only will not skid, but it is unnecessary to use chains with it, even when conditions are extreme. These are made in both clincher and quick detachable forms for use with all standard rims, and these conform to all rim dimensions standardized by the Society of Automobile Engineers.

The Cataract Plain Tread Pleasure Car Tire.

For use with these shoes two types of tube were decided on, the one made from a high grade of Para rubber and known as the Selector, which is extremely heavy, red in color, and guaranteed for hard service, and the other the Cataract gray tube, made of a less expensive grade of material, but also of unusual quality.

These shoes and tubes were the original productions and they were sold with an assurance to the purchasers that they would be equal to the expectations, there being a guarantee of 4000 miles for the shoes and unusual results for the tubes, the life of the latter being dependent upon the use given. The Cataract quick detachable and regular clincher tires are manufactured with the idea of giving maximum service at reasonable cost, and are in all sizes, both regular and oversize, from 28 by three inches to 39 by six inches, there being 27 in all of each type, and there are an equal number of sizes for both plain and break-skid shoes, so it will be seen that there are no less than 108 different sizes in the four types.

There are nine different French or metric sizes in both the plain and break-skid types and in clincher and quick detachable shoes. These range from the equivalents of 31.5 by 3.5 inches to the 36 by 5.5-inch sizes.

In the manufacture of these tires the finest grade of pure Para rubber is used and it is compounded to secure the highest degree of resistance to wear, strength, resilience and endurance, and the fabric used is the best quality of Sea Island cotton, woven with special reference to the use to be made of it, and having the highest strength of any cotton cloth produced.

All of the Cataract tires are of the hand-made wrapped tread type. The shoe is carefully built up to the desired thickness and it is claimed for the Cataract product that it weighs at least 10 per cent. more than any other tire of similar size to be found in the market. This additional weight is not fabric, because the cotton duck is the best that can be procured, and has unusual strength, but it is rubber, carefully compounded, and applied to the tread and walls of the tires, making them thicker and stronger, and at the same time there is no loss of resiliency through the heavier and more enduring walls. There is but one breaker strip used in the standard tire tread, and this is a single ply of the fabric that enters into the construction of that particular shoe. The greater weight of the rubber and compound in the Cataract tire is the basis of the guarantee given, and this additional weight and the quality of the materials is expected to make for a decidedly larger mileage under normal wear and with reasonable care.

In the making of the tires the greatest care is taken to insure the uniform tension of frictioned fabric, this being applied by hand and stretched evenly to secure equality of strength throughout the tread and walls, while the bead is shaped of the same fabric. The fabric bead has been adopted for all tires because of its greater resistance to all stresses and immunity from breakage in installing and removing. This construction has been found especially desirable for clincher rims, where manipulation of a casing is absolutely necessary in use, while it is equally advantageous in quick detachable shoes because of the possible slight variance in the tires after curing. All of the Cataract tires are vulcanized under the Thropp single cure open steam patented system, a method which is regarded as favorable to yield-

The Cataract Break-Skid Pleasure Car Tire.

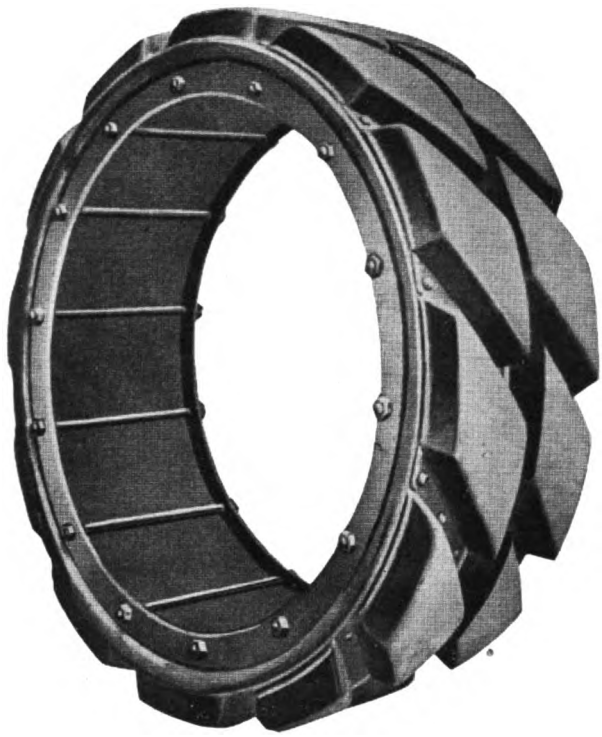
Digitized by Google

Cross Section Cataract Plain Tread Tire.

ing the most satisfactory and certain results.

In the design of the tires it is intended to insure against the possibility of rim cutting and the possible separation of the rubber walls from the fabric of the cover. In the building of the carcass the work is inspected with extreme care and at frequent intervals, the object being to insure against any condition that might result in defect or weakness. The rubber is applied with great care and worked to positive contact before the shoe is wrapped for the curing process. The tires are made on collapsible cores and they are subjected to no undue strain in the making, and the sizes are carefully established to make certain exact fit upon all rims of standard proportions. With the break-skid shoes the tread is built of from seven to 11 more layers of the finest Para rubber than are put into the plain tread tires, which are graduated from the tread down to the bead. and this increases the weight of this form from 2.5 to 3.5 pounds in the larger sizes, the difference in weight being made up of the finest of rubber. But with this increased weight there is no loss of resiliency.

In establishing prices for the tires consideration has been given to every detail entering into manufacturing and distributing, the quality of the shoes and the service that has been guaranteed. Much emphasis is placed upon the fact that with no increase in the number of plies of fabric used the tires are as an average 10 per cent. or more heavier than the makes regarded as standard, and that these have every quality that long experience with the manufacture of tires can suggest. The prices are based on the guarantee, which fixes the maximum that an automobilist shall pay for his tires, while it is known as a positive fact that with anything like the care that should be given to tires a much larger mileage shall be realized. As a matter of fact 6000 miles is very frequently obtained, and often the total has reached as much as 9000, which indicates what is possible and practical with reasonable attention.



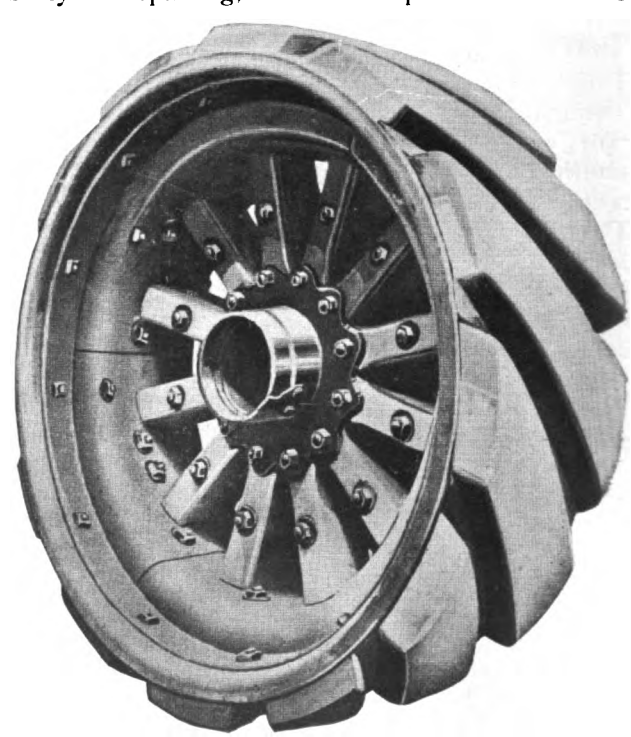
The Cataract diagonal block tire offers the users of commercial trucks a solution of their tire troubles. As heat is the main factor in tire destruction, there is claimed to be no tendency or possibility for heat generation in the diagonal block tire. To overcome this heating the tire is constructed in sectional blocks.

These blocks are so adjusted as to be quickly removable from the rim. Flanged on both sides and fitting snugly to the flange of the rolled steel rim they are fastened by a cross sectional steel strip with three bolts inserted through the strip and the wheel and tightened by nuts on the inside thereby preventing all possibility of creeping and stretching. Each section having a steel trellised base molded right in the rubber and extending to the extreme of the flange of the block prevents all chance of base spreading. Under road contact,

Cross Section Cataract Break-Skid Tire.

Digitized by Google

Cataract Double Diagonal Block Tire for Motor Truck Use.



by this method each section takes care of its own rubber displacement, which is held to cause friction that results in heat—hence, tire destruction.

The diagonal construction affords greater traction, eliminates the vibration and gives the smooth rolling as of a continuous tire. In case of damage to a block its removal is accomplished in a very short time, the only tool necessary being a wrench. It is unnecessary to jack the wheel—simply take off three nuts, push up the bolt and lift the block from the wheel. To replace the block, insert bolts and tighten nuts, the whole operation of removing and replacing the block requiring less than 10 minutes.

Cataract tire service has been systematized on the basis that has been stated, and the purpose is to maintain it to a standard that will be satisfying to every customer. This is done through the branches, and by the first of January, 1913, these will be located in New York, Boston, Hartford, Providence, Buffalo, and probably Philadelphia. By that date the new factory, now nearly completed, at Wooster, O., will be in operation. This plant will be ideal from every viewpoint of tire manufacturing. It is located on a site of 15 acres on the main line of the Pennsylvania railroad, almost in the heart of the town and within a stone's throw of the $3,000,000 Wooster University. The building is 125 by 210 feet, three stories, of brick and concrete, and all but a small section will be finished. Two 150 horsepower Erie Engine Company's boilers have already been installed and a 250 horsepower Corliss engine has been delivered at the factory, and the other machinery, including calenders, mills, washers, tube machines and vulcanizers of the latest design and the best makes have been bought for delivery Sept. 1. All the equipment and facilities are of the highest efficiency as regards to labor saving and productiveness, and these are to be installed by men recognized as experts in shop practise in rubber manufacturing.

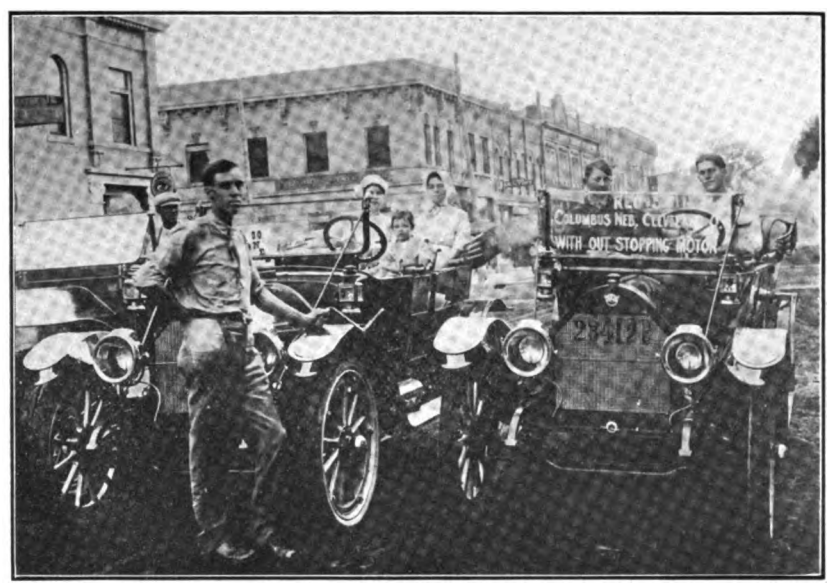
With the completion and operation of the factory the company will start making 100 shoes and 100 tubes daily, and 25 truck tires of the designs illustrated, besides a considerable volume of mechanical rubber products, which include a highly perfected horse shoe pad, shoe heels, etc. While the mechanical goods are expected to be a secondary production, yet there is an established and constantly growing demand for this class of goods.

The intention is to locate the executive offices of the company at Boston, in connection with the salesrooms in that city and to establish in that city a completely equipped repair department, which will remove from the factory all responsibility for repairing, and make it possible to direct

Cataract Single Diagonal Block Tire for Motor Truck Use.

Digitized by Google

the entire endeavors of the organization to manufacturing, although it may be possible that the factory will take care of the repairing for the Buffalo branch. The intention is to have all the adjustments made at the Boston office, which will simplify this work and insure to all customers uniformity of attention, and all work necessary will be performed under the supervision of an expert. This repair shop will have a blacksmith shop in connection, where whatever work is required in the installation of truck tires, fitting rims, etc., can be done.



As another insurance of quality, the fabric that will be used is to be produced by a high class cotton mill in which the president of the company is a large stockholder. Provision has been made to insure the supply of the fine grade of rubber required, and the company will be able to maintain the standard of materials that go to make up its products.

REO'S NON-STOP RUN.

Several times within the past six months purchasers in the Middle West have subjected their Reo the Fifths, made by the Reo Motor Car Company, Lansing, Mich., to long distance tests, in each of which the machines have come through with remarkable success. In one of these a number of purchasers in Iowa went to the factory in Michigan for their cars and drove them home over the road.

The latest event of this nature was undertaken recently by John Abts and Louis Parsons of Columbus, Neb., who drove their Reo from that city to Cleveland, O., a distance of 1200 miles, without stop. The two men took turns at driving, 71.5 hours. The route was by way of Omaha, and the night and day run was accomplished in Marshalltown, Cedar Rapids, Clinton, Chicago, South Bend and Toledo.

An accompanying illustration shows the car in Columbus at the completion of the run. It will be noted that it appears little the worse for the experience, and it is stated that the total consumption of oil was two quarts; fuel, 60 gallons of gasoline, and water, one gallon.

John Abts and Louis Parsons of Coumbus, Neb., Finishing Non-Stop Run with Reo the Fifth.

NON-SKID TIRES POPULAR.

According to an official of the United States Rubber Company, New York City, the best evidence of the popularity of the non-skid tire lies in the fact that its Nobby tread and Chain tread types are always sold far in advance of production. He says:

"There are several reasons why motorists prefer the non-skid. In the first place there is an ever present protection against skidding, and where the tread is raised the user gets a much thicker and heavier wearing surface. This has an effect in increasing the mileage rendered. Another advantage claimed for them is that they reduce the number of punctures, throwing off sharp objects entirely or picking them up in such manner that they do not penetrate the casing or puncture the tube."

AMERICAN WINS QUEER RACE.

An American underslung car, made by the American Motors Company, Indianapolis, Ind., was victor in a recent novelty race at Marshalltown, Ia. The driver was required to drive once around the half-mile track with a passenger, stop and let out the passenger, crank the car, drive another half-mile, stop, pick up the passenger and repeat the performance. Orville McIntyre completed the two miles, under these regulations in exactly five minutes.

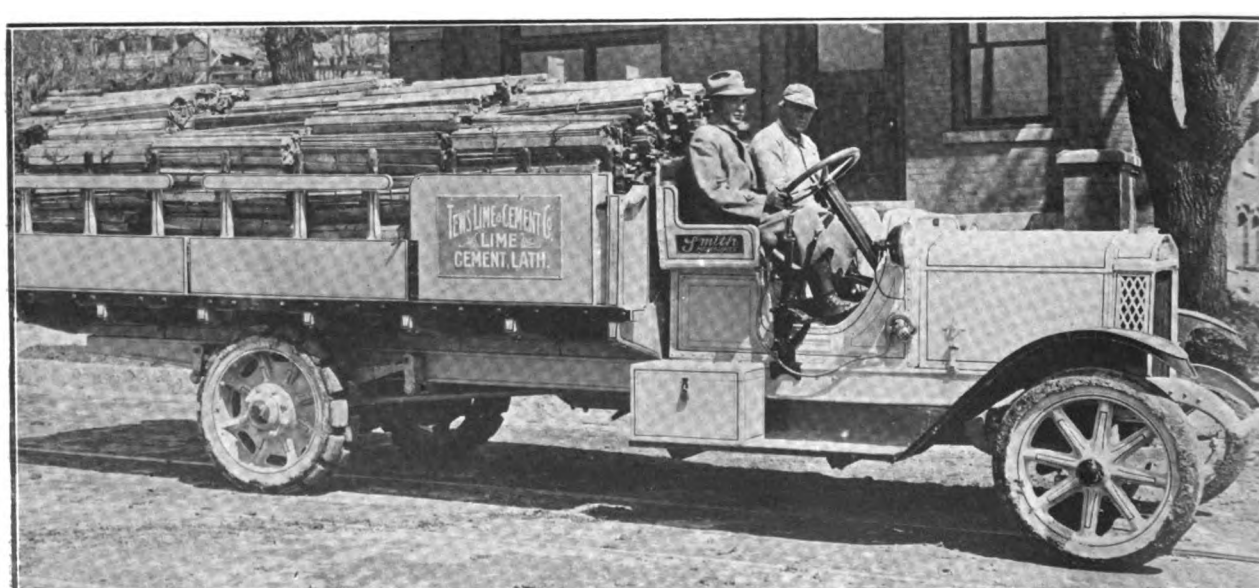
IN THE Commercial Vehicle Field

New Trucks and Applications, Time and Money Saved, and Other Items of Interest.

INTERESTING MILWAUKEE PRODUCT.



An accompanying illustration presents one of the new three-ton Smith-Milwaukee worm driven trucks in service with the Tews Lime & Cement Company of Milwaukee, Wis. It is the product of the A. O. Smith Company of that city, a concern which has been engaged in the production of automobile parts for a number of years. For the past 10 years it has devoted its entire time and attention to this work, excepting, of course, such effort as has been necessary in experimenting with the new car.

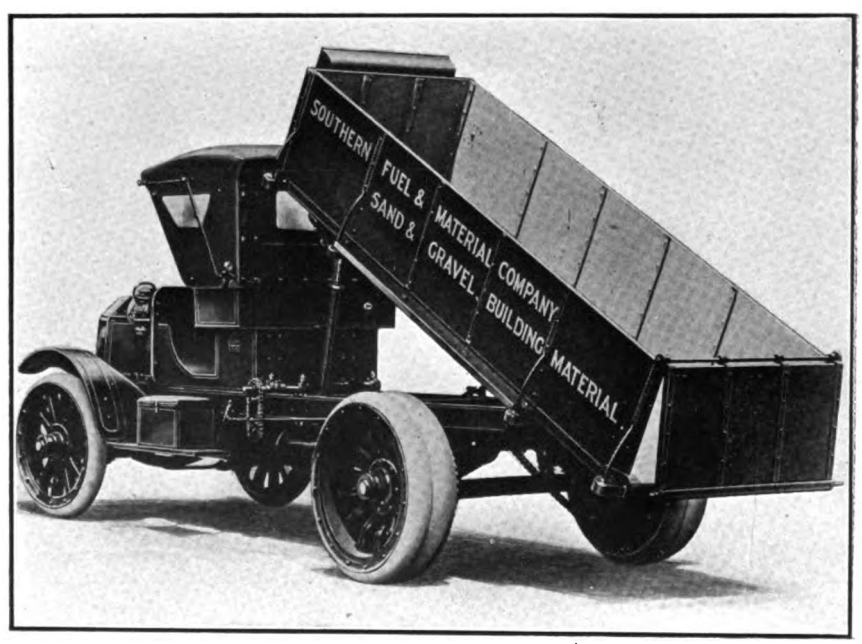
The chassis has been designed on the unit assembly plan, and each of the more important units can be removed bodily from the truck without disturbing any other part and with the least possible loss of time. Besides being of the worm driven type, the construction is such as to permit a straight line drive. The transmission also is worthy of special mention, it being of selective individual clutch type in which the gears always are in mesh.

While this vehicle was first exhibited during the Chicago show, and was commented upon at that time as being a splendid example of sturdy construction, making for simplicity and accessibility, it is interesting to note that the car shown herewith has been in service with this company for some months and has given entire satisfaction from every viewpoint. The reputation of the maker appears to be still further enhanced by the Smith-Milwaukee worm driven truck.

FEDERAL TRUCK CLIMBS MOUNTAIN.

The record of being the first commercial vehicle to climb Mount Wilson in California, is held by a Federal, made by the Federal Motor Truck Company, Detroit. The altitude of the peak is

Three-Ton Smith-Milwaukee Worm Driven Truck in Service with Tews Lime & Cement Company, Milwaukee, Wis.



Digitized by Google

5700 feet, and the only means of reaching the top is over an old toll road, utilized solely by burro caravans. Recently, E. Roger Stearns, vice president of the Standard Motor Car Company, Los Angeles, Pacific Coast distributor for this make of car, drove a one-ton machine the entire 14 miles in less than three hours.

NEW PEERLESS DUMPING BODY.

The Southern Fuel & Material Company, Mobile, Ala., has accomplished the transportation of 150 tons of material every 24 hours by the use of a special dumping body, fitted to a five-ton Peerless truck by the maker, the Peerless Motor Car Company, Cleveland, O. Night and day work are undertaken, the daily mileage averaging 100 miles. Twelve mules are being replaced, the truck body carrying from five to six tons of gravel, while the truck acts as a tractor hauling 25 tons more in the mule wagons. The average haul is five miles.

An accompanying illustration shows the truck with its body hoisted. It will be noted that the rear gate is arranged so that it may be tripped by a lever conveniently located at the driver's seat. Another lever throws the motor into engagement with the mechanism which hoists the front end of the body. This arrangement is such that the truck may be started when the load is dumped and the body returns to its normal position during the return trip. As soon as it has lowered itself upon its bed, the hoisting mechanism is disconnected automatically.

Peerless Truck with Self-Dumping Body Replaces 12 Mules in Alabama.

KNOX FOR ALASKAN TRAIL.

Recently the management of the White Pass & Yukon Railroad, in Alaska, decided to give motor trucks a trial in covering the stage line between the northern terminus of the route and Dawson. This line has required the services of between 350 and 500 horses and several men in order that it might be operated successfully. The trail is decidedly rough and with many steep grades, and it was considered a difficult task to secure a motor vehicle which would prove satisfactory. The car decided on was a two-ton Knox, made by the Knox Automobile Company, Springfield, Mass. Sufficient time has not elapsed as yet to make a definite determination as to what the result will be, but it is of moment to note that the car has begun its work and has demonstrated that it is capable of negotiating the difficult trail in such manner as to give indication of its being the forerunner of a complete motorization of the line.

GROCER INVENTS TRUCK BODY.

In an effort to solve the loading and unloading problem Fred Haworth of the wholesale grocery firm of Haworth & Dewhurst, Pittsburg, Penn., has brought out a demountable body for use with the trucks owned by the concern. The arrangement is such that the goods are packed in one body on the warehouse floor, while the truck is making delivery, and upon its return the empty carrier is replaced with a filled one in seven minutes.

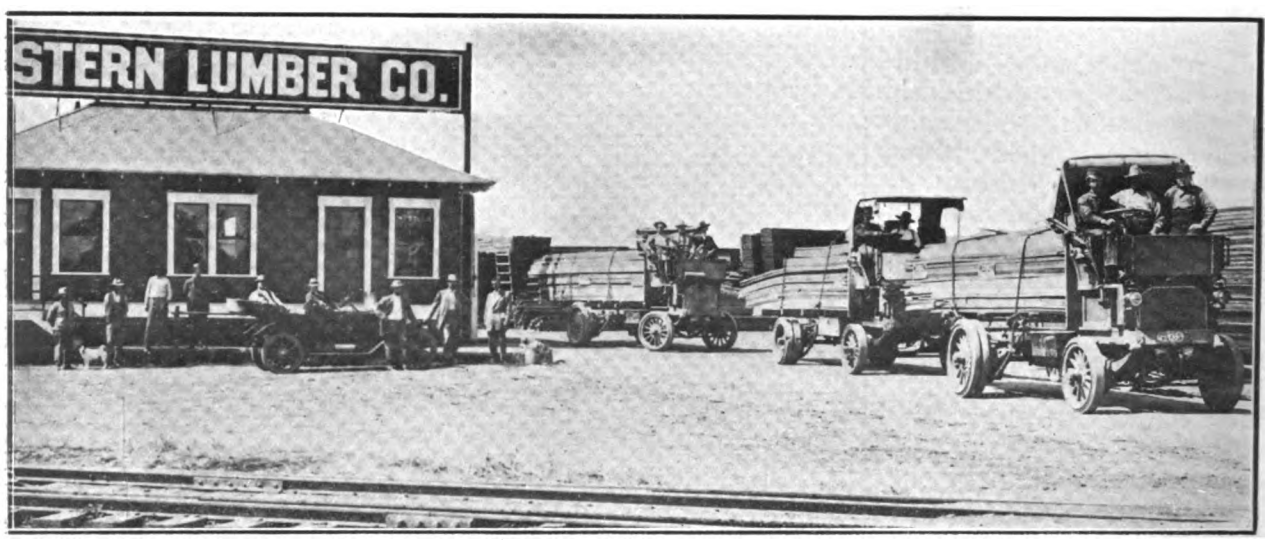
Angle irons are placed on the chassis frame in such manner as to form a wedge. Corresponding irons are set in the longitudinal bolsters of each body. As the latter swings into position from a travelling crane above, the angle is wide enough to overcome any slight variation in the position of the chassis. The body is lowered into position by means of an electric crane and a positive locking device prevents it from coming loose

Digitized by Google

from the chassis. The crane, motor and three interchangeable bodies represent an investment of $2500, and it is stated that they have brought about a saving of over $800 a year.

KISSELKAR CO-OPERATIVE SYSTEM.

Three leading merchants in Minneapolis, Minn., have demonstrated the advantage of a co-operative delivery system in which six KisselKar trucks, made by the Kissel Motor Car Company, Hartford, Wis., play a prominent part. One of these machines makes five calls daily at each of the stores, collecting the packages and taking them to a central station, at which they are sorted and assigned to the five others, each of which makes three delivery trips daily. The cars are manned by a neatly uniformed driver and assistant, and it is said that the cost of delivery under this system is about one-half that under the old arrangement with horses.



TWO NEW WORM DRIVE MODELS.

The success which has attended the use of the worm drive abroad appears to have interested the manufacturers in this country. Two years ago there was but one concern actively engaged in the production of cars of this type in America. No less than six different makes were displayed during the show season of 1912. Several others have been announced within the past few months.

It is stated that Walter E. Flanders, who has withdrawn from the Studebaker Corporation and is to bring out a new truck in connection with his other interests, has decided upon a worm driven one-ton truck as at least one of his new models. At the same time comes the announcement that the Schacht Motor Car Company, Cincinnati, O., which has been devoting its attention in the past to the production of pleasure vehicles, largely, is to enter the field with a one-ton worm driven model.

MACKS IN LUMBER HAULAGE.

Two Mack trucks, made by the International Motors Company, New York City, at its plant in Allentown, Penn., have been demonstrating their practical worth in lumber haulage with the Western Lumber Company, San Diego, Cal. The concern was undecided whether or not to replace its horses in this work and the two cars shown herewith, one of which is of five tons capacity and the other of seven, were engaged to deliver material for the construction of a private residence, to cost approximately $150,000, in Miramar, some 20 miles distant from San Diego.

Mack Trucks of Five and Seven Tons Capacity Hauling Lumber on Pacific Coast.

The vehicles were equipped with a derrick, which is not shown in the illustration, however, and by this means the work of loading and unloading was reduced to a minimum. It is stated that the experiment showed that one of the trucks could do the work of 10 two-horse teams.

PIERCE-ARROW COAL FIGURES.

The demands upon the coal dealer for more prompt and efficient service are growing more and more pronounced. This is due largely to the fact that some dealers in each city are installing motor trucks, and the possibilities of this method

Digitized by Google

of transportation have been demonstrated as of such high standard that the public has come to regard it as something to be expected generally.

The firm of Spaulding & Spaulding, Buffalo, N. Y., had felt the need of better equipment for some time, and after making careful survey of its requirements decided to give commercial vehicles a trial. As has been true of a large number of dealers, this concern found itself lacking in dependable figures with reference to the horse equipment, and for some time before purchasing its initial Pierce-Arrow truck, made by the Pierce-Arrow Motor Car Company of that city, it began keeping accurate account of its delivery costs, as well as complaints on service.

Five-Ton Worm Driven Pierce-Arrow Engaged in Coal Delivery with Spaulding & Spaulding, Buffalo, N. Y.

The first truck, of five tons capacity, was started at work about Sept. 1, 1911, and the figures to June 1, 1912, show that it actually handled 7916 tons of all grades of coal at a cost of 27.9 cents a ton, this figure including six per cent. interest on the investment, general insurance of necessary kinds, the wages of one driver and helper, tire expense, gasoline, lubricants, repairs and a fair allowance for annual overhaul, as well as an ample margin for depreciation. It was found that in tonnage, the truck did the work of two two-horse teams and one single, reducing the cost by 20 cents a ton.

Within the same period, 8093 miles were covered. In the matter of tire service it was found that the allowance for this was far below the actual results, it being estimated June 1, that the tires were still capable of at least 1000 miles. That the installation was in every way satisfactory appears to have been borne out by the fact that the Pierce-Arrow Motor Car Company delivered the second five-ton worm driven truck to this concern June 1.

G. M. C. REPLACES SEVEN HORSES.

H. J. Purse, Detroit, has been obtaining satisfactory service from a three-ton G. M. C. gasoline truck, made by the General Motors Truck Company, Pontiac, Mich., judging from his statement that it is doing the work formerly accomplished by two double teams and three single horses. Mr. Purse is engaged in the wholesale fruit and vegetable business.

The car leaves the garage every morning between 1 and 1:30, and delivers several loads of fresh produce to the markets in Detroit before 9:30. During the remainder of the day it is employed in making deliveries to retail grocers and marketmen all over the city. Besides the produce raised in the vicinity of Detroit, it is called upon to handle large shipments of berries, peaches, apples, etc., coming into that city from the South by railroad. The daily service aggregates from 12 to 17 hours.

Digitized by Google

THE CLAYTON AIR COMPRESSOR.

The air compressor has a wide range of utility, for in addition to being of service for inflating tires, cleaning upholstery, supplying air blast for brazing, soldering, etc., it provides means for removing grease and accumulations from the chassis, work usually accomplished by the brush and can of gasoline, a laborious operation.

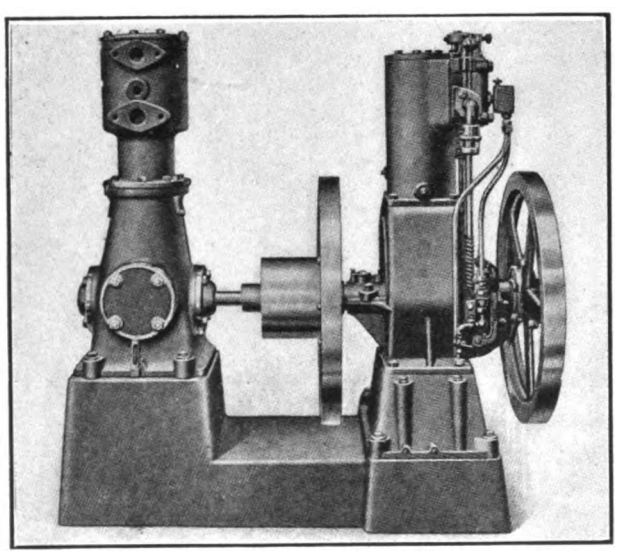


Fig. 1—The Clayton Air Compressor Operated by Gasoline Motor and Designed for Garages Beyond Zone of Central Electric Service Station.

There are numerous methods of driving the compressor, these including by belt off the main power line, by an electric motor and by a gasoline engine, the design depending upon the garage equipment. In order to comply with the varying conditions the International Steam Pump Company, New York City, successor to the Clayton Air Compressor Works, is manufacturing a line including the types outlined above.

The unit illustrated at Fig. 1 is designed for the garage outside the zone of the central electric service station and one of its qualities is that it may be utilized when the power of the shop is inoperative and the tank requires refilling. The unit is very compact, comprising as it does a gasoline motor directly connected to the compressor and requiring a floor space of 22 by 27 inches. The bore and stroke of the compressor are 4.75 by 4.75 inches and it is designed to operate at 125 pounds pressure, the company maintaining that an excess of the amount is not adaptable for garage service owing to the danger of bursting of tires when utilized by the inexperienced or careless workman.

The compressor is driven at a speed of 240 revolutions a minute by a three horsepower standard motor and is of the water-cooled type, although the company makes a wide variety of both air and water-cooled members. The machine is constructed of high grade material and accessibility is a feature. It is self-lubricating, an oil reservoir in the bottom of frame base supplying oil to all working parts by the splash system. The absence of grease cups and other lubricators is noticeable. The air pistons are fitted with self-adjusting spring rings and if desired the unit is equipped with an automatic unloading device which throws off the load when the proper air pressure has been attained. These serve to shut off the supply of air to the compressor, maintaining it constant in the receiver at all times.

The company also manufactures compressors designed to be driven by gasoline motors of horsepowers ranging from 1.75 to 21.5 operating at speeds as high as 2000 revolutions a minute.

Compressors are produced for operation by the power of the garage or supplied with motors.

ADJUSTING SHOCK ABSORBERS.

Although The Hartford Suspension Company, Jersey City, N. J., maintains service stations for the fitting and adjustment of the Truffault-Hartford shock absorbers, there are times when the owner will drive into the garage for repairs to the car and request the foreman to readjust these members. The maker provides ample data as to fitting, care and maintenance, but the suggestions contained herein will be of service, especially if an owner desires the attachment of a set taken from another car. The workman should bear in mind, however, that the shock absorbers should be adapted to the weight of the motor car and that the company does not advise the fitting of those utilized on another machine.

Assuming that a set is to be attached under the above conditions and that the design is applicable to the frame, etc. By referring to Fig. 2 C it will be noted that the Truffault-Hartford shock absorber comprises a single arm a and a double member b, frictionally joined by an adjusting nut h. The arm a operates between the two sections of the arm b, providing an up and down movement, corresponding to that of the frame of the car. The arm a carries a flanged cover d, forming a cup like space on either side. Within these spaces are located friction discs. These members are adjusted by the nut at h. The work of obtaining the desired tension is facilitated by an adjustment dial f having an indicator g. A compensating spring e is provided for automatically taking up any wear and for maintaining a uniform friction after the adjustment has been made. The arms a and b are secured to the frame and axle by two frictional adjustable joints. The function of these members is to offer constant resistance to the vibration of the spring in either direction. Each absorber has three frictional points: One each at the ends of the two arms and the third where these members join. The tension is made at this point and a dial and indicator are employed to denote the amount of the tension. When the absorbers are new and from the factory, the pointer is set at zero and to move it requires a 25-pound pull on a spring balance or ice scale for the standard size. The factory adjustment on the intermediate model is 23 pounds, that on the junior is 19 pounds and that on the juniorette is 16 pounds.

To increase the tension, the nut above the pointer should be turned to the right or clockwise with a wrench, and in an opposite direction to decrease the tension. As the pointer moves with the nut, the increase or decrease is denoted on the dial. The method of operation is outlined at A, the drawing showing plainly the proper movements. The company points out that it is

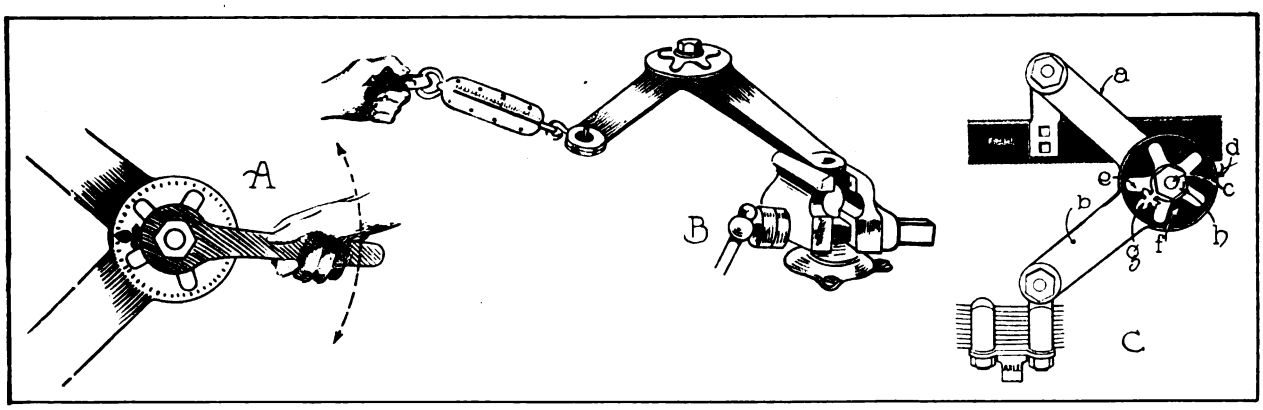

Fig. 2—Outlining Adjustment of Truffault-Hartford Shock Absorbers: A, Showing How to Use Wrench and Direction of Rotation to Obtain Desired Tension; B, Method of Testing or Resetting with Spring Balance; C, Depicting Components of Absorber.

desirable to have a greater tension on the rear absorbers than on the front and that each pair should be adjusted alike; that is, the front members should be similar.

If after attachment the car does not ride easily as it should, and the pointer although set at zero does not accurately register the 25, 23, 19 or 16 pounds tension, according to the model of absorber, it may be tested and adjusted by the method outlined at B. Secure the double arm in a vise as indicated in the drawing and turn the tension nut toward the right until it requires the desired pound pull on a spring balance, which is secured to move the single or free arm. The brass cover or rim is then marked with a file to denote the position of the pointer.

Next loosen the nut with a wrench, taking care to count carefully the number of revolutions of the tool, then turn the dial until the zero mark

Digitized by Google

is in alignment with that made by the file. The nut is now turned back the same number of revoluions as was necessary to loosen it. This will give the proper tension with the indicator at zero. The shock absorbers are then adjusted as previously outlined.

After fitting and testing on the road all nuts, fittings, etc., should be gone over to make sure that they are secure. If the car has a tendency to move up or down too freely, the tension should be increased, and diminished if the movement is restricted. Lubricant should not be employed as the friction discs, etc., are self-lubricating.

TWIST DRILL GRINDING GAUGE.

Crooked and irregular holes in drilling are generally caused by the drill not having been ground accurately. The grinding of twist drills is quite an art and these members should be accurate if good results are to be obtained The cutting edges should have a proper and uniform angle of 59 degrees with the longitudinal axis of the drill, and should be of exactly equal length. The lips should be well and sufficiently backed off or cleared. These qualities are essential for good work, and the tool will require grinding less frequently and will not be so easily broken.

The Remington Tool & Machine Company, Boston, is manufacturing a simple and practical twist drill grinding gauge which is shown at Fig. 3 E. The drill to be tested is placed in the V groove of the instrument, and the gauge jaw is raised or depressed until the point of the drill is central with that of the V gauge. The cutting edges of the drill should be horizontal with the flat surfaces of the gauge jaw. The latter are milled with an angle of 59 degrees and the cutting edges of both lips of the drill should be parallel with those of the gauge. When one lip of the drill is lower than the other, the strain comes upon the shorter member, producing an irregular and larger hole than the diameter of the drill, also increasing the liability of breakage.

THE MAGNA REFLECTOR.

Drop and portable lights in the repair shop are of carbon filaments, as this material withstands the severe usage more successfully than the more efficient Tungsten lamp. In performing certain work about the car the eyes of the workman are affected by the glare of the bulbs, and this holds true when fine work is being done on the bench or lathe under a drop light not equipped with a shade.

The Sachs Laboratories, Inc., Hartford, Conn., is marketing the Magna reflector, which costs but a few cents, and a quality of the device is that it may be fitted to the bulb easily and rotated to any desired position. It is light in weight and is composed of metal, covered with baked enamel, dark green being utilized on the exterior and white inside. As will be noted by the drawing at Fig. 3 A, a petticoat overlapping socket is provided, this extending slightly over half-way of the bulb when the reflector is attached and the latter is held at a suitable distance from the lamp by an apertured inward extension at its outer end which receives the tip, and an integral inwardly projecting clip at the other end which grips the neck of the bulb about .5-inch from its base. The reflector may be employed with the wire guard utilized in repair work, is designed for severe usage and its low price makes replacement a small item.

A less expensive and practical device is the Magna clip depicted at B and shown in attachment with the reflector. It comprises a one-piece punching of insulating material provided at one

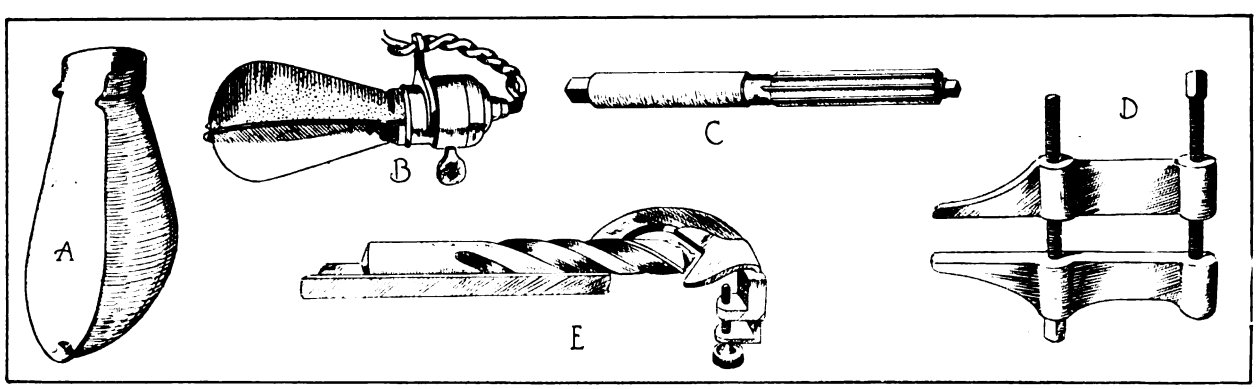

Fig. 3—Useful Devices for the Garage and Repair Shop: A, Magna Reflector for Attachment to Incandescent Lamps; B, Magna Clip, an Adjusting Device for Drop Lights; C, Peerless Expansion Reamer; D, Le Count Vise Clamp; E, Remington Twist Drill Gauge.

Digitized by Google

end with two curved clip arms which engage the neck of the socket and at the other end with a small curved hook which engages with the flexible cord when the lamp is held horizontally and the light directed downwards. The socket may be adjusted in the clip and the light directed to any desired angle when the lamp is held in the above position. It is made to fit any standard socket and cord.

LE COUNT VISE CLAMPS.

The vise clamp is a valuable addition to the tool equipment and the William G. Le Count Clamp Company, South Norwalk, Conn., is marketing these members, one of which is illustrated at Fig. 3 D. The clamps are constructed of steel castings, nicely finished, and are made in six sizes, having openings up to 1.25, 2.25, 3.25, 4.25, 5.25, 6.25 inches.

PEERLESS EXPANSION REAMERS.

Expansion reamers are of service in the repair shop and frequently an opening has to be slightly enlarged as in bushings, etc. The Cleveland Twist Drill & Reamer Company, Cleveland, O., is manufacturing a line of expansion reamers, one of which is depicted at Fig. 3 C. The diameters of these tools range from .5 inch to 2.5 by thirty-seconds. The company makes sixty-four sizes to order.

The reamers are constructed of high grade material, carefully finished to correct size and are moderate in price.

NEW IDEA IN GEAR SHIFTING.

William D. Hughs of Atlanta, Ga., has invented a new gear shifting device which is of considerable interest. It does away with the usual side lever, and substitutes a controller on the steering wheel operating in conjunction with the clutch. The gears are shifted by the movement of the clutch pedal, selection of the gear being made by the controller, so to change speed it is only necessary to depress the clutch, turn the controller to the proper point, and re-engage the clutch. The first movement of the returning clutch engages the proper gear, the engagement being complete before the clutch takes hold. The device, besides rendering it unnecessary to remove the hands from the steering wheel to change gears, prevents stripping, as the gears are shifted only when the clutch is out.

PROSPEROUS YEAR AHEAD.

George M. Dickson of the National Motor Vehicle Company, Indianapolis, Ind., maker of National cars, returned recently from a business trip throughout the West. He is decidedly optimistic concerning the outlook for the coming year. He says:

"Of course, with motor cars, as with almost everything else, success depends largely upon the crops. I find Kansas has harvested the second largest crop of wheat in its history, a gain of 70 per cent. over last year, and that corn is expected to exceed its 1911 record by about the same figure. In Missouri corn will show more than 1,000,000 bushels increase over last year. The acreage of this crop in Illinois is larger this year than last. In Nebraska, it is expected almost to double last year's production, and approximately the same is anticipated of wheat. There is a reported increase of wheat in Iowa. Oklahoma promises 196,000,000 bushels of corn as against 37,000,000 bushels in 1911, and wheat, 21,000,000 bushels as against 9,000,000. Arkansas expects at least 13 per cent. increase in corn. In Texas, the figures on corn are 211,000,000 bushels for 1912 and 69,000,000 in 1911. In fact, taking the country as a whole, the reports indicate increases throughout."

HIGHWAY OFFICIALS ORGANIZE.

In order that there may be greater co-operation between the road officials of the several towns and cities throughout the state, the Association of Connecticut Road Officials has been formed in that commonwealth with the following officers: President, W. Scott Eames, director of public works, New Haven; secretary, Charles J. Bennett, superintendent of streets, Hartford; executive committee, Alfred H. Terry, city engineer, Bridgeport; James H. Macdonald, state highway commissioner, Hartford; Robert E. Mitchell, city engineer, Willimantic; Fred L. Ford, city engineer, New Haven, and Charles J. Bennett, Hartford.

AUTOMOBILES IN MAINE.

Although the summer residents have not yet secured their special term licenses, non-residents being exempt for 30 days this year, the registration in Maine has passed all expectations to date. Aug. 17 the secretary of state reported a total of 7687, this including pleasure and commercial vehicles, but not dealers and motorcycles.

Digitized by Google

NATIONAL CONTEST AND RACING NEWS.

Spencer E. Wishart Creates New Records the First Time He Drives a Mercer---Glidden Pathfinder Completes Routing Trip---Burman and Others at Brighton Beach Meet---Late Information Concerning Vanderbilt and Grand Prize.

The first appearance of Spencer E. Wishart in a Mercer car in the 200-mile race at Columbus, O., Aug. 26, was marked by the reduction of existing track records for 75, 100, 150 and 200 miles. Heretofore Wishart always has driven Mercedes cars, and his decision to appear at the wheel of an American made machine caused some little surprise in the industry. That he should be able to create records, not only is a new experience for him, since he never was able to finish in first place with the foreign car, but it is naturally a source of much pleasure to the Mercer Automobile Company, Trenton, N. J. maker of the Mercer.

The old and new records follow: Seventy-five miles, Strang, Columbus, O., July 3, 1909, 1:19:39; Wishart, 1:19:38; 100 miles, Burman, Columbus, O., July 3, 1909, 1:41:00.4; Wishart, 1:40:51; 150, Wishart, 2:34:05; 200, Wishart, 3:28:45. Ten cars started, five of which finished, as follows:

Car	Driver	Time
Mercer	Wishart	3:28:45
Cino	Wilcox	3:35:10
Cino	Jenkins	3:35:30
National	Whalen	3:36:40
Westcott	Lowell	

GLIDDEN TOUR PLANS.

The Flanders electric pathfinder, made by the Flanders Manufacturing Company, Pontiac, Mich., completed the work of routing the 1912 national tour of the American Automobile Association, popularly designated the Glidden tour, Aug. 31. The speedometer reading showed a total mileage of 1721.7 miles covered since the car left Detroit, and the actual time employed on the road was 21.5 days, although 28 days were occupied since leaving Detroit. This discrepancy was due to the fact that disagreeable weather was encountered in Mississippi on the last lap into New Orleans. The mileage is by far the largest that has been made by an electric car in a straightaway run.

The tour will start from Detroit, Oct. 7, and end in New Orleans, Oct. 19, according to the present arrangements. While some changes in the route may be made later, the itinerary is expected to include the following cities: Ypsilanti, Clinton, Tecumseh and Adrian, Mich.; Wauson, Archbold, Bryan and Hicksville, O.; Fort Wayne, Cliffton, Petroleum, Muncie, Anderson, Pendleton, Noblesville, Indianapolis, Franklin, Edinburg, Columbus, Seymour, Brownstown, Kossuth, Salem, Perkin and New Albany, Ind.; Louisville, Bardstown, New Haven, Buffalo, Horse Cave, Mammoth Cave, Cave City, Bristow, Bowling Green and Franklin, Ky.; Goodlettsville, Nashville, Franklin, Columbia, Mt. Pleasant, Summertown and Lawrence, Tenn.; Florence, Sheffield, Tuscumbia and Cherokee, Ala.; Iuka and Corinth, Miss.; Rogers Springs, Grand Junction, Moscow, Collierville and Memphis, Tenn.; Lynchburg, Tunica, Lula, Clarksdale, Tutwiler, Glendora, Schlater, Greenwood, Sidon, Lexington, Pickens, Canton, Jackson, Terry, Hazelhurst, Brookhaven, Johnston and Magnolia, Miss.; Kentwood, Dennis Mills, Baton Rouge, Kenner, Darrow and New Orleans, La.

Entries will not close until Oct. 1, and the present indications are that about 75 cars will be represented. Already, the Flanders Motor Company, Pontiac, Mich., has entered three Flanders machines (formerly the Everitt), and the Lion Motor Car Company, Adrian, Mich., and the K-R-I-T Motor Car Company, Detroit, also have entered cars.

LABOR DAY AT BRIGHTON BEACH.

Despite the weather conditions, which were by no means ideal, the race meet at Brighton Beach, Long Island, Labor Day, drew an excellent crowd. Robert Burman in the Cutting and "Blitzen" Benz, David Lewis in a Stutz, Harry Kyle in a White, and William Burke in an E-M-F were the winners, as evidenced by the following summary:

Five Miles, 161-230 Inches.

Car	Driver	Time
E-M-F	Burke	6:02.35
Bergdoll	Casey	6:07.85

Five Miles, 301-450 Inches.

Stutz	Lewis	5:16.60
White	Kyle	5:59.25
Marion	Strauss	6:01.25

Five Miles, 600 Inches.

White	Kyle	5:05.43
Stutz	Lewis	5:09.04

Mercedes	Hickman	2:46.00
Benz	Grenier	2:49.45

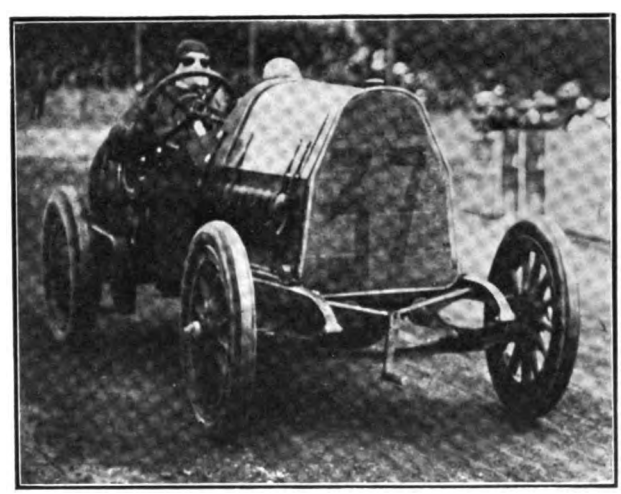
Twenty-Five Miles, W. B. Trophy.

Cutting	Burman	20:11.86
White	Kyle	26:25.48
Stutz	Lewis	26:39.63

ANNUAL BUFFALO TOUR.

The third annual reliability tour of the Automobile Club of Buffalo, N. Y., will be held Sept. 11-14. A 30 horsepower Studebaker car, made by the Studebaker Corporation, Detroit, recently completed the pathfinding trip, giving a total mileage of 838 miles. The first day's itinerary covers 202 miles, along the lake shore to Ripley, thence inland to Lake Chautauqua and Jamestown, and back to Buffalo by way of Falconer, Cattaragus, Gowanda and Hamburg. The second day's run covers the distance between Buffalo and Canandaigua and return, and the third, 216 miles throughout western New York and northern Pennsylvania, with Smithport, Penn., as the objective point. For the fourth day the most strenuous part of the trial is planned, and the committee is keeping this route secret until the day of the run.

EVERYTHING READY AT MILWAUKEE.



Work on the Milwaukee course for the Vanderbilt Cup and Grand Prize events has been completed and the various drivers have been practising during the past week. According to Teddy Tetzlaff, who holds the world's record for road races in a Fiat, this 8.2 miles is the fastest ever offered for automobile racing. This being true, it is anticipated that several new marks will be made during the week.

The race for the Grand Prize will be held Sept. 17, this being for a distance of 385.4 miles, or 47 laps of the course. This will be the fourth competition for this award, which is now held by David L. Bruce-Brown, who won it for the second time in succession at Savannah, Ga., last year. In 1910 he was at the wheel of a Benz, and in 1911 he drove a Fiat. This year he will pilot a Fiat again.

Perhaps the chief interest in this event lies in the fact that Bruce-Brown and Boillot, the latter of France and driving the Peugeot with which he took the French Grand Prix from Bruce-Brown, will be contending for like honors again. It will be remembered that the American driver lost the French race, because his car ran out of gasoline at an inopportune time, and the rules under which the race was run did not permit him to refill his tank. It goes without saying that the rules for the American event are not so strict in this regard, and very a different outcome is anticipated.

Sept. 20, two new races will be held. These correspond in a measure to the contests for the Savannah Challenge and Tiedeman trophies at Savannah last year. They are described as new, largely because the trophies are new. The first is for the Pabst Blue Ribbon trophy, donated by Col. Gustav Pabst of Milwaukee, and will cover 205 miles, or 25 laps. The second is for the Wisconsin trophy, the gift of the Wisconsin Motor Manufacturing Company of Milwaukee, and will cover 164 miles, or 20 laps.

The eighth race for the Vanderbilt cup will

David L. Bruce-Brown in the Fiat He Drove in French Grand Prix.

be held Sept. 21. This will cover 278.8 miles, or 34 circuits. At present the cup is held by Ralph Mulford, who won it at Savannah last year in a Lozier. This year he will be seen at the wheel of a Knox.

The entries do not close until Sept. 14, but already four nations are represented on the list: America, France, Italy and Germany. It is understood that England also will be included when the final announcement is made. While the lists are by no means complete, they are expected to include the following:

Bruce-Brown, Fiat; Tetzlaff, Fiat; Boillot, Peugeot; Bergdoll, Benz; De Palma, Mercedes; Goux, Peugeot; Wishart, Mercer; Hughes, Mercer; Mulford, Knox; Knowles, Lozier; Nelson, Pope-Hartford; Bragg, Fiat; Anderson, Stutz; Merz, Stutz; Whalen, National.

THOMAS OFFICIALS RESIGN.

Announcement Follows That of Placing the Concorn in the Hands of a Receiver.

Judge Hazel of the federal court in Buffalo, N. Y., appointed George C. Finley and Adolph Redabow, receivers for the E. R. Thomas Motor Car Company of that city, Aug. 29. Following this action, announcement was made of the resignation of President Humpage, Vice President Gleason and Treasurer Ramsey, to take effect Sept. 1.

The stock exchange firm of Eugene Meyer, Jr., & Co., New York City, took hold of the E. R. Thomas Motor Company in February, 1911, and the concern was reorganized. According to information filed with the court, it appears that the company now has assets of $1,700,000 and liabilities of $960,000. A short time ago, it was announced that a substantial portion of the stock had been purchased by those connected with the United States Motor Company. It is understood that the receivers will continue the production of Thomas cars.

NEW ELECTRIC CAR.

Chicago Concern Places Its First Model in the Market and Begins Active Work.

The Chicago Electric Motor Car Company, Chicago, has presented its first Chicago electric car, designed by President Frederick J. Newman, who has been connected with a number of such makers in a similar capacity. It is understood that an effort will be made to produce these vehicles in such quantities as to compete directly with gasoline machines in every phase of the selling campaign. The company expects to have several cars ready for demonstration in the near future and to have the factory working at full capacity this fall.

According to President Newman, the body design is not unlike that of the Pierce-Arrow gasoline car. This and the chassis, motor and battery features are the result of long experimentation, and it is anticipated that the assembly will receive ready acceptance by a discriminating public.

PURCHASE ESTERLINE COMPANY.

Prest-O-Lite Owners Will Move Plant to Indianapolis and Enlarge Its Scope.

Announcement was made a few days ago that one-half of the capital stock of the Esterline Company, Lafayette, Ind., which totals $250,000, has been purchased by Carl Fisher and J. G. Allison, owners of the Prest-O-Lite Company of Indianapolis. The plant will be removed to Indianapolis, where it will be located at Speedway, the new "horseless city" recently established by the new owners. There is to be no change in the management of the company.

The Esterline Company is manufacturer of the Berdon system of electric lighting and has orders booked for more than $1,000,000 worth of this product. However, it is stated that the concern has been experimenting for the past year on a combined electric starting and lighting equipment. It is understood that this is now about ready for the market.

The Esterline starter is to be unique in many respects, it is stated, and a rather radical depart-

Digitized by Google

ure from the electric starting devices already on the market. It goes without saying that it will incorporate those features of design making for convenience, simplicity and reliability, which have marked the success of the Berdon system.

Still another departure is the production of a new lamp, the reflecting surface of which is of a material which will not scratch or tarnish. A recent test of these lamps was made in Detroit, at which it was demonstrated that in a dense fog a 16 candlepower bulb in front of one of these new reflectors, projected its light six times as far as the rays from a 2000 candlepower arc lamp.

HUBER PATENT NOW.

Invention Held to Cover All Forms of Three Point Suspension of Main Frame.

Following closely upon the announcement that the Automobile Board of Trade has secured the right to licenses under the so-called Dyer transmission patents, comes information that the North American Vehicle Company, Detroit, proposes to enforce its rights under the invention of Emil Huber, which was made the subject of patent 88,407, granted to Huber, April 25, 1905. This is held to cover all forms of three point suspension of the main frame and many of the unit power plants now in use.

Briefly outlined, the company claims that the Huber patent covers "any driving mechanism of an automobile wherein the parts that go to make up the same are brought together in what is termed a unit power plant, suspended at three points upon the main frame, and wherein one of the points forming the triangle is arranged to swivel."

It is stated that already two or three manufacturing concerns have taken steps to secure licenses under this patent, based upon a fee of $1 for each $1000 of catalogue selling price, and that other suits are to be brought in the near future. Some of these actions are said to be arranged for service against owners and users, as well, the evident intention being to secure an adjudication of the patent in all its applications.

ANOTHER COMPANY IN FLINT.

Concern Organized with Capital of $300,000 to Produce Six-Cylinder Machines.

The Sterling Motor Company of Flint, Mich., has been organized with capital of $300,000 to engage in the manufacture of six-cylinder cars. While no authoritative announcement has been made, it is understood that the new concern will constitute one of the units of the Republic Motor Company, which was organized recently by W. C. Durant and others.

The new plant is to be equipped with modern machinery, made especially for its requirements, and will be ready to begin operations before the close of the year. The initial output is to be taken by the Little Motor Car Company of Detroit.

SPEEDWELL EXECUTIVE FORCE.

Several Departments Heads Assume Additional Responsibilities in Management.

The Speedwell Motor Car Company, Dayton, O., maker of Speedwell pleasure and commercial lines, has reorganized its executive force, the changes bringing about promotion and entailing new duties for several of the officials. President P. D. Schenck, who has been acting in that capacity since the organization of the concern, has assumed in addition the duties and responsibilities of general manager. J. E. Schneider, who also has been with the company since its formation, has been elected secretary and treasurer.

Frank A. Groves, Sales Manager, Speedwell Motor Car Company.

Another promotion is that of Frank A. Groves, who becomes sales manager. This information will come as a pleasant surprise to a large number of friends, particularly in the Middle West. Like many other successful salesmen in the industry, Mr. Groves is a graduate from the sales force of the National Cash Register Company of Dayton. After 14 years with that concern he found himself financially able to assume an interest in the Chicago agency for Speedwell cars. That was nearly five years ago, and his success in that field has been sufficient to warrant his selection for his present responsibilities.

MICHIGAN ESTABLISHES BRANCH.

Entire Business on Pacific Coast and in the Orient to Be Directed by It.

The distribution of the Michigan cars, made by the Michigan Motor Car Company, Kalamazoo, Mich., which is the new name of the Michigan Buggy Company in charge of manufacturing automobiles, in California, Nevada, Hawaii and the Orient, will be directed by the California branch, which was organized recently with capital of $1,000,000. The following are the officers: President, V. L. Palmer; first vice president, F. B. Lay, Jr.; second vice president, W. H. Cameron; third vice president, George H. Daugherty; treasurer and general manager, C. P. Kiel; secretary, C. C. Bobb; directors, the above and H. L. Kiel, son of C. P. Kiel.

Miss Dorothy Kanes, Advertising Manager, Abbott Motor Company.

The Michigan Motor Car Company, California branch, will occupy a handsome, modern metropolitan office building, probably in San Francisco, although the exact location has not been determined. This will include display rooms, service station and all the equipment necessary to look after the interests of Michigan users in the territory named. It is stated that the organization of the company will in no way interfere with the agencies already established, excepting that it will have direct supervision over these and all future agencies.

ADVERTISING ABBOTT-DETROIT.

Company Occupies Unique Position with Woman as Manager of This Department.

The Abbott Motor Company, Detroit, maker of the Abbott-Detroit line, claims the distinction of having the only woman advertising manager in the industry. An accompanying illustration presents Miss Dorothy Kanes, who has been in charge of this department for some time. That she has made a success in her field is evident, despite her claim to be the only woman following automobile advertising as a profession.

It may be added that Miss Dorothy Kanes really is no longer entitled to that name, although she continues to use it in her professional capacity. She was married recently, and in addition to her work for the Abbott company she finds time to direct the household problems in an apartment in town, a country home and the usual servants.

NEW FIAT COMPANY.

Motor Car Sales Company Incorporated to Take Over Retail Selling End.

The Fiat Motor Car Sales Company has been incorporated to succeed the Fiat Automobile Company of New York City, distributor of Fiat cars, that the managers of the latter company may devote their energies exclusively to development of the Fiat factory at Poughkeepsie, N. Y. J. S. Josephs and Benjamin Eichberg, who have for years been engaged in the sale of Fiat automobiles in New York, retire from the selling organization and will devote their entire time to production at the factory.

The officers of the new company are: President, E. R. Hollander; vice president, Henry M. Sage; treasurer, Charles L. A. Whitney; secretary, R. D. Willard. The new company will control the New York, Albany, Boston and Providence, R. I., and New England territory.

CONSIDERING SALES METHODS.

National Convention of Automobile Sales and Advertising Men for Indianapolis.

An idea which originated with President J. J. Cole of the Cole Motor Car Company, Indianapolis, is to result in the holding of a national convention of automobile sales and advertising men in that city, Oct. 8-9. The main object is to discuss ideal salesmanship, and it is expected that between 3000 and 4000 men connected with the industry will attend the sessions. While the programme is by no means complete, it is announced that the following will deliver addresses:

E. LeRoy Pelletier, director of publicity, Flanders Manufacturing Company, Pontiac, Mich.; A. D. Sheldon, president, Sheldon School of Scientific Salesmanship, Chicago; John Lee

Digitized by Google

Mahin and W. D. Nesbit, Mahin Advertising Company, Chicago; John Wetmore, Evening Mail, New York City; A. W. Shaw, publisher, System Magazine; C. F. Kettering, Dayton Engineering Laboratories Company, Dayton, O.; David Beecroft, Class Journal Publishing Company, New York City; Elbert Hubbard, East Aurora, N. Y.; Will P. Brown, Brown Motor Car Company, Peru, Ind.; E. A. Deeds, president, National Cash Register Company, Dayton, O.; Arthur Brisbane, American, New York City; Norman Hapgood, Collier's Weekly; G. A. Leroy, La Salle, Ill.; S. A. Leland, Cadillac Motor Car Company, Detroit; Henry Ford, Ford Motor Company, Detroit; H. C. Durant, Detroit, and Benjamin Briscoe, president, United States Motor Company, New York City.

NEW FORD BUILDINGS.

Factories to Be Erected at Denver, Col., and Memphis, Tenn.

The Ford Motor Company, Detroit, has purchased five acres of land at Kentucky avenue and Broadway, Denver, Col., and will erect a four-story plant, 75 by 200 feet, and will give employment to 200 men. Contracts have also been let for the assembling factory of the company at Memphis, Tenn., and building is to commence at once. The site is a triangular lot and the entire plant when completed will cost about $200,000.

ADD TO FIRESTONE PLANT.

Well Known Tire & Rubber Company to Make Two Additions to Factory at Akron, O.

Firestone Tire & Rubber Company, Akron, O., is erecting two wings to factory buildings of the same height and construction as these structures. The north wing will be 60 by 125 feet and the east wing 60 by 200. The concern is also erecting a new employment office in Main street.

INCORPORATE HARRIS OIL COMPANY.

Associates of the Founder of the Concern Organize for Conduct of the Business.

The A. W. Harris Oil Company, Providence, R. I., has been incorporated to succeed the company of that name formerly conducted by A. W. Harris, recently deceased. The company is incorporated under the laws of Rhode Island and the capital stock is $75,000. The officers are: President, Benjamin S. Terry; treasurer, Arthur D. Greene; secretary, George F. Heywood. The officers named were associated with Mr. Harris for years and they propose to continue the business to the same policy that has been followed for over a quarter of a century.

STOCKHOLDERS REORGANIZE.

Dahl Punctureless Tire Company Increases Capital Stock to Take Over Patent Rights.

The stockholders of the Dahl Punctureless Tire Company at the annual meeting at Minneapolis, Minn., recently reorganized the company. The capital stock was increased to $6,000,000. The new company will take over the patent rights of the Dahl Punctureless Tire Company of Minnesota, and in addition will manufacture a line of accessories. The home office will be at 246 West 59th street, New York City, with Chicago as the distributing point for the middle west.

LAMP CONCERN EXPANDS.

Guide Motor Lamp Company to Erect New Plant at Cleveland, O.

Because of a rapidly increasing business the Guide Motor Lamp Company, with a plant in East Fourth street, Cleveland, O., will erect a new factory building on Madison avenue, N. W., that city. When the structure is completed it will occupy the entire block on Madison avenue between West 114th and West 115th streets. Construction will be commenced at once.

HAS LONDON AGENCY.

The Weston-Mott Company, Flint, Mich., to Exploit Foreign Fields.

The Weston-Mott Company, Flint, Mich., has established an agency at 136 Longacre street, London, England. The step was taken to care for the rapidly growing export trade in Weston-Mott automobile axles, hubs and rims.

Correction of Error—In the last issue of The Automobile Journal, a photograph of a G. V. electric truck was used by mistake to illustrate an article concerning electric vehicles delivered to the American Express Company, by the Baker Motor Vehicle Company, Cleveland, O. Both manufacturers have sold trucks to this concern, and both have received reorders from time to time.

ACTIVITIES OF MOTORCYCLISTS, THE RIDER, THE MANUFACTURER, AND THE DEALER

M-M and Eagle Combine.

The American Motor Company, Brockton, Mass., maker of M-M mounts, is soon to take over the business of the Eagle Motor Company, Chicago, according to information from the latter city. It is understood that the former concern will market both products for the 1913 season. The new Eagles will be propelled by Spacke motors, exclusively, orders having been placed for 4000 engines of this make alone.

Wagner Company Sold.

Information comes from Minneapolis that the Wagner Motorcycle Company of St. Paul, Minn., has been sold to the Motorcycle Accessories Company of that city, and that Edward Worthington, general manager of the latter concern, announces that it will suspend the production of Wagner machines at the end of the present season. It is understood that the new owner will continue the production of parts for all machines made by the Wagner company hitherto, but the manufacture of complete mounts will be discontinued.

G. P. Ewalt, Abilene, Kan., and His Emblem Mount.

Separate Chicago Show.

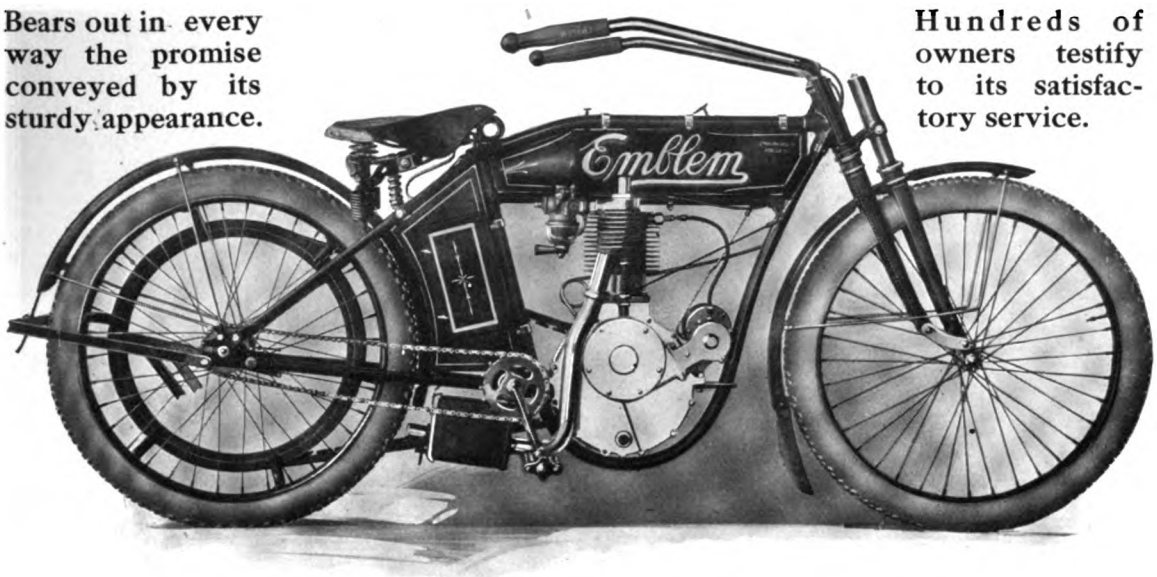
For the past two years the members of the Motorcycle Manufacturers' Association have considered that they were not treated with the consideration that the importance of the motorcycle industry deserved in the awarding of exhibition space in connection with the annual motor car show in Chicago. Immediately after the close of the display last January, it was announced that undoubtedly a separate showing of mounts would be held in 1913.

The association has now secured a lease of the Manufacturers' Exhibition building at 1319 Michigan avenue, Chicago, for the week of Feb. 3-8, which means that the first separate motorcycle show of national proportions in the country will be held at the same time as the pleasure car display in that city next year. The building is but a short distance from the Coliseum, in which the automobiles will be displayed, and the site is regarded as ideal in every particular.

Gibson in New Location.

Because of the increasing business, Dr. G. B. Gibson, Westboro, Mass., secretary-treasurer of the Federation of American Motorcyclists, has found it necessary to remove his office from the American block in that town to the third floor of the Park building. Since the offices were combined two years ago the membership of the organization has increased from 4600 to 17,700, and the need for additional room was imperative.

Holds Novelty Run.



The Providence Motorcycle Club held a novelty run Sept. 8, in which none but the pacemaker knew the destination. The idea was tried out in an effort to eliminate the possibility of the different members racing with each other to see who can reach the end of the trip first. The plan worked out well, all of the riders keeping together and enjoying the trip immensely. The club has secured additional rooms, which have been nicely furnished, and is in an excellent posi-

tion to keep up the interest during the winter season.

Jones Is Seriously Ill.

Harry M. Jones, a member of the Rhode Island Motorcycle Club, Providence, R. I., who has taken up aviation recently, flying a Burgess-Wright biplane, is serious ill at his home in that city. A small nail in his shoe penetrated the foot, resulting in blood poisoning.

Home from Long Trip.

Louis J. Knight of Providence, R. I., recently returned from a trip to Niagara Falls and Canadian points on the Harley-Davidson mount shown in an illustration herewith. He was accompanied by Bernard Steer, also on a Harley, and the two report a decidedly pleasant tour. Knight appears to have acquired the souvenir habit, from the appearance of his machine.

Four Riders Suspended.

For taking part in an unsanctioned meet held at Luna Park, Johnstown, Penn., last month, Dr. J. P. Thornley, chairman of the F. A. M. competition committee, has notified the following riders that they are automatically suspended: George J. Young, Philadelphia; William Sallers, George Baeder, Thomas A. Garber, Johnstown.

New Minneapolis Factory.

It is announced that the Minneapolis Motorcycle Company, Minneapolis, Minn., will erect a new factory building for the production of Minneapolis mounts. The present plant at 517 Seventh street has proven incapable of keeping up with the demand for the product, and the new structure will be 200 by 300 feet, two stories in height and will be of fire proof construction throughout.

Plans 24-Hour Test.

The Worcester Motorcycle Club, Worcester, Mass., has planned a big 24-hour endurance run

to be held between 7 in the evening of Sept. 20 and the same hour the following evening. The distance to be covered is 435 miles. First, the

Miss Louise Hall Utilizes Merkel and Majestic Sidecar in Her "Votes for Women" Campaign.

riders will go to Providence, R. I., thence to Boston, and back to Worcester. After a half-hour for lunch, they will leave for Springfield and Albany, at which city another delay for half an hour will be allowed, before the return is made to Worcester.

Emblem in Chicago.

During the recent visit of President W. G. Schack of the Emblem Manufacturing Company, Angola, N. Y., to Chicago, arrangements were completed for the representation of the Emblem in that territory by the Brown Music Company.

On 1500-Mile Trip.

George Elder and George Snyder, both of Reading, Penn., are on a 1500-mile motorcycle trip to St. Louis and return. They expect to make the journey on 25 gallons of gasoline, an average of 60 miles to the gallon.

Ocean-to-Ocean Relay.

In the effort to establish a record for carrying a message from the Atlantic to the Pacific, the Ocean-to-Ocean relay, sanction for which was granted during the Columbus convention of the F. A. M., will start during the first week in October, according to the present announcement. The start will be made in New York City, with Dr. J. P. Thornley, chairman of the contest committee, carrying the message on its first relay out of the city.

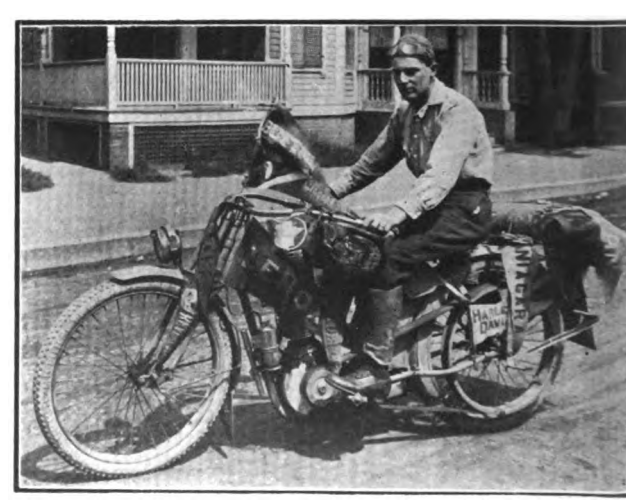
Merkel in Suffrage Campaign.

An accompanying illustration shows Miss Louise Hall, who is travelling through Ohio and some of the southern states in the interests of women's suffrage. During a recent visit to Middletown, O., where the Merkel is made, one of these machines with a Majestic sidecar was placed at her disposal. She liked the proposition so well that she was anxious to rent the outfit for an extended trip.

F. A. M. Fire Insurance.

One of the latest plans suggested by the Federation of American Motorcyclists is a blanket fire insurance policy which will cover all the machines of members wherever located. It is understood that this idea originated with Secretary-Treasurer Gibson, and will not increase the cost of F. A. M. membership. As soon as the plan is thoroughly worked out it will be submitted to the board of directors for ratification.

Portland to Portland.



Joseph F. Schanton of Portland, Ore., a plumber by trade, arrived in Portland, Me., last month, having covered 6000 miles on his motorcycle since leaving home. The journey was made by the way of San Francisco, Los Angeles and through the South. He is now on the return trip and expected to be in Milwaukee by Sept. 10.

Northampton-Worcester Run.

Fourteen riders left Northampton, Mass., for Worcester, Aug. 25, and of this number 11 arrived in the latter city. The party included: T. A. Purseglove, H. N. Gaudette, E. N. Angus, Ernest E. Tomlinson, John Sincage, John Hartnett, John Wickles, Alphonse Pettit, Albert Mongeon, George Gowash and John Baron.

Club Notes, Here and There.

third. The single class was won by Brewer on a Marvel, with other places going to Krieg, Indian, and Randal, Merkel.

A new club has been formed at Pensacola, Fla., with 20 charter members. The officers are: President, D. C. Barron; vice president, Philip Yonge; secretary-treasurer, L. W. Wells; captain, C. E. Hinsman.

The Aberdeen Motorcycle Club, Aberdeen, Wash., has elected the following officers for the coming season: President, Dr. M. O. Adams; vice president, H. R. Prentice; secretary, Leon McNeal; treasurer, R. E. Barnes; captain, Wallace Pratsch; lieutenant, C. L. Brinkley.

Thirty-eight riders took part in a recent run of the Mobile Motorcycle Club, Mobile, Ala., going to Coden, and return, a distance of some 80 miles.

The Indianapolis Motorcycle Club has been organized in Indianapolis, Ind., with 50 members. The "get acquainted" run was held to Nobleville, several riders who were not members taking part.

The Oshkosh Motorcycle Club, Oshkosh, Wis., has planned a club run around Lake Winnebago. The membership has reached the 50 mark, and it has been decided to limit it to that number.

The Sunville Motorcycle Club, Pueblo, Col., took in 12 new members at its last meeting, and it is announced that plans are under way for an active season.

The Columbus Motorcycle Club, Columbus, O., which has just had the honor of entertaining the annual F. A. M. convention, is considering the possibility of securing the 1913 assembly as well.

New clubs have affiliated with the F. A. M. as follows: Jerome, Ariz., 305; M. H. Hawkins, secretary, 13. Chico, Cal., 306; Harry Berthoff, 78 Sixth street, 25. Waco, Tex., 307; Lawrence Hall, 2700 Sanger street, 12. Park Region Motorcycle Club, Fergus Falls, Minn., 308; Henry K. Bergerud, 46. Black Hills Motorcycle Club, Deadwood, S. D., 309; P. D. Shoenberger, 766 Main street, 16. Pensacola, Fla., 310; L. W. Wells, Y. M. C. A., 21. Morrow County Motorcycle Club, Mt. Gilead, O., 311; H. R. Crock, 12.

Chicago Club at Riverview.

Members of the Chicago Motorcycle Club held a race meet on the Riverview track in that city, Aug. 25, with the following results:

Six miles—First, Constant, Indian; second, Mason, Indian; third, Hamilton, Indian; time, 5:25.8.

Two miles—First, Wenk, Thor; second, Bethkee, Thor; third, Mitchell, M-M; time, 2:00.6.

Three miles—First, Constant, Indian; second, O'Loughlin, Indian; third, Mitchell, Eagle; time, 2:09.2.

Two miles—First, Mason, Indian; second, Shaw, Indian; third, Bethkee, Thor; time, 1:46.2.

Two miles—First, Hamilton, Indian; second, Wenk, Thor; third, Rider, Indian; time, 1:53.4.

Al. Ward, Well Known Racing Rider, and His Indian.

Two miles—First, Mason, Indian; second, Hamilton, Indian; third, Shaw, Indian; time, 2:43.

Half-hour—First, Constant, Indian; second, Mason, Indian; distance, 34 miles.

Results at Cleveland.

Four races were run off on the Randall track at Cleveland, O., Aug. 26. The summary:

Five miles, novice—First, Lawrence, Harley-Davidson; second, Quackenbush, Indian; third, Ferguson, Pope; time, 5:52.4.

Five miles, club championship—First, Tracy, Indian; second, Kissig, Indian; third, Lawrence, Harley-Davidson; time, 5:31.4.

Ten miles, club championship—First, Kissig, Indian; second, Shaffer, Indian; third, Tracy, Indian; time, 9:41.

One hundred miles, open—First, Klark, Indian; second, Baker, Indian; third, Kissig, Indian; time, 1:35:10.

On the Denver Track.

The winner in three of the four races on the Tuilleries track at Denver, Aug. 25, was Fredericks on an Excelsior, as shown by the following results:

Five miles, open—First, Fredericks, Excelsior; second, Cox, Merkel; third, Swartz, Excelsior; time, not given.

Five miles, invitation—First, Boyd, Indian; second, Cox, Merkel; third, Noll, Merkel; time, 3:43.4.

Three miles, match—First, Fredericks, Excelsior; second, Cox, Merkel; time, 2:17.

Five miles, open—First, Fredericks, Excelsior; second, Swartz, Excelsior; third, Cox, Merkel; time, 3:33.2.

Indians at Brighton Beach.

Four races were on the programme at Brighton Beach, Long Island, for Aug. 30, the results being as follows:

Three miles, match—First, Mercier, Indian; second, Eckel, Indian; third, Hamilton, Indian; time, 2:16.8.

Five miles, professional—First, Lockner, Indian; second, Shields, ———; third, Wray, Indian; time, 3:44.8.

Three miles, amateur—First, Vail, ———; second, French, Indian; time, 2:14.4.

Six miles, handicap—First, Hasha, Indian; second, Ayrault, ———; third, Mercier, Indian; time, 4:24.8.

Labor Day at Newark.

Seymour and Hasha were the main attraction at the Labor Day races in Newark, N. J. The summary:

Four miles, special match, amateur—First, Weber, Indian; second, Segelbach, Indian; time, 3:18.2.

Two miles, special match, amateur—First, Segelbach, Indian; second, Weber, Indian; time, 1:43.

Two miles, special match, amateur—First, Weber, Indian; second, Segelbach, Indian; time, 1:39.

Two miles, professional—First, F. King, Indian; second, Flickenstein, Indian; third, West, Indian; time, 1:26.2.

Two miles, professional—First, Brown, ———; second, J. King, Indian; third, Ayrault, ———; time, 1:28.

Five miles, professional—First, F. King, Indian; second, J. King, Indian; third, Flickenstein, Indian; time, 3:38.6.

Two miles, professional—First, Seymour, Indian; second, Hasha, Indian; third, Peck, Excelsior; time, 1:25.6.

Two miles, professional—First, Seymour, Indian; second, Hasha, Indian; third, Peck, Excelsior; time, 1:22.6.

Three miles, professional—First, Hasha, Indian; second, Seymour, Indian; third, Peck, Excelsior; time, 1:57.

Australian pursuit—First, Flickenstein, Indian; second, Brown, ———; time, 2:30.9; distance, 3.5 miles.

Two miles, consolation—First, Carlson, Indian; second, Ayrault, ———; time, 1:29.

Two miles, match, professional—First, Seymour, Indian; second, Peck, Excelsior; time, 1:24.2.

Three miles, match, professional—First, Seymour, Indian; second, Peck, Excelsior; time, 2:06.2.

Six miles, handicap—First, Hasha, Indian; second, Peck, Excelsior; third, Seymour, Indian; time, 3:57.

A FULL EQUIPMENT YEAR.

"Enough companies have made their 1913 announcements to justify the suggestion that the coming season is to be known as a full equipment year," says R. C. Hupp, president of the R-C-H Corporation, Detroit, maker of the R-C-H car. "It is evident that the time has passed when a man, purchasing a motor car, will as a matter of course expect to invest anywhere from $100 to $500 more in accessories needful to safety, pleasure and comfort in motoring.

"The man who drives today hardly expects to get his hands soiled, much less his shoes. He expects to light up without leaving the driver's seat, and in case of sudden rain to get his storm curtains up without getting out of the car or disturbing other passengers. He wants to know what is back of him without twisting his head, so demands a rear view mirror. He doesn't want to endanger himself or passengers by skidding, so he goes in strongly for non-skid tires. And the main point is, he is getting all this, and in low priced cars."

THE LAW OF MOTOR VEHICLES.

The matter of enacting motoring laws has occupied the attention of legislators for some years, but apparently it remained for Berkley Davids, a member of the District of Columbia bar, to prepare a work which should embrace not only the laws that have been enacted upon the subject, but the interpretation of them as made by various courts. The book is entitled "The Law of Motor Vehicles," and is published by the Edward Thompson Company, Northport, N. Y.

The work is technical in every respect, but the motorist who desires to inform himself as to his rights within the law will find it exceedingly valuable. It defines the legal status of the motor vehicle, the mutual rights and duties of operators and other users of the highway, the matter of railroad crossings, the condition of highways, owner's liability, passengers, penal and criminal responsibility, etc. Another interesting feature is reproduction of existing motoring laws in the several states and the provinces of Canada.

SILVER-KOTE, A SILVER PLATING.

A new preparation for silver plating brass, bronze or copper accessories of the automobile has been brought out by the Page-Lester Company, 125 Van Buren street, Chicago. It is not a polish in that the liquid deposits a coating of silver on the article to which it is applied and the maker claims that the solution does not contain mercury or injurious materials. It is applied with a piece of cheese cloth and upon drying leaves a clear, brilliant deposit of silver, which may be highly polished with chamois or a soft cloth. The foundation of the preparation is metallic and will not injure the hands. It comes in eight-ounce, half and one-gallon containers.

The following concerns have been incorporated recently to manufacture and deal in motor cars, trucks, accessories, etc.:

Pioneer Motor Car Company, Troy, N. Y.; $10,000; directors, Henry J. Richardson, Troy; George N. Way, Hudson Falls, and others.

Hallett Vehicle Tire Company, Augusta, Me.; $500,000; to manufacture automobile tires; president, J. L. Coleman; treasurer, C. E. Beebe.

Park City Auto Company, Ashland, Ky.; $10,000; incorporators, Howard Elhoff, B. E. Tate and others.

Oconto Falls Motor Car Company, Oconto Falls, Wis.; $5000; incorporators, J. H. Delbridge, W. J. Munser and others.

Millbridge Motor Company, Millbridge, Me.; $10,000; president, Joseph Sawyer; treasurer, James S. Wyman.

Hill-Stage Company, Anderson, Ind.; $5000; to manufacture automobile repairing machinery; directors, Hugh, Forest J., and E. N. Hill and H. C. Stage.

Miller Auto Company, Jacksonville, Fla.; $10,000; to engage in automobile and garage business; president, F. C. Miller.

A. J. Meyer Motor Car Company, Cedarburg, Wis.; $25,000; incorporators, John Armbruster, Jacob Dietrich and others.

Kilbourne Thompson Company, Fort Wayne, Ind.; $50,000; to manufacture and sell automobiles; incorporators, Frank B. Thompson, Frank B. Dulin and others.

Sheboygan Auto & Supply Company, Sheboygan, Wis.; $25,000; to operate a garage.

Uneeda Tire & Sundry Company, Los Angeles, Cal.; $25,000; to sell automobiles, aeroplanes and accessories; incorporators, Hugh M. Webster, Walker D. Kidd, George H. Kidd.

C. U. Williams & Sons Company, Bloomington, Ill.; $100,000; to do a general automobile business; incorporators, C. U. Williams, Frances W. Williams and others.

Industrial Motor Company, Middletown, N. Y.; $350,000; to manuafcture automobiles; incorporators, W. A. Courtland, M. G. Crawford and others.

Southern Taxicab Company, Columbus, O.; $10,000; incorporators, James A. Allen, J. Keating and others.

Des Moines Garage & Manufacturing Association, Des Moines, Ia.; $25,000; president, G. F. Knorr.

E. C. Andrews Company, Boston, Mass.; $40,000; to produce automobile furnishings; incorporators, Everett C. Andres, E. Russell Lynn and others.

Clinton Automobile Company, Hoboken, N. J.; $10,000; to manufacture and deal in automobiles, etc.; 132 Third street, Union Hill; incorporators, B. F. Krom, W. A. Schuette and others.

Franklin Auto Company, 120 Broad street, Elizabeth, N. J.; incorporators, William H. Reynolds, William H. Reynolds, Jr., Morris Gordon.

Ideal Steel Wheel Company, Columbus, O.; $500,000; to make spring wheels for automobiles; incorporators, J. E. Streitelmeier, A. F. Parker and others.

South End Garage Company, Cleveland, O.; $5000; incorporators, A. Backin and others.

Model Garage, Charlotte, N. C.; $25,000; incorporators, R. F. Prince, E. J. Jones, R. B. Cochrane.

Mutual Oil & Auto Supply Company, Cleveland, O.; $10,000; to deal in oils, supplies and accessories; incorporators; M. L. Steuer, H. C. Killiman, Herbert Haase, C. F. Franke, A. S. Kraus.

Western Auto Sales & Manufacturing Company, Omaha, Neb.; $50,000; president, A. W. Gilman; secretary, M. M. Seales.

E. W. Johnson Company, Fresno, Cal.; $7000; directors, H. M. Johnson, E. W. Johnson and others.

Auto Air Rotar Company, Portland, Me.; $15,000; president, Albert F. Jones; secretary, James E. Manter.

Marrs-Lingo Motor Company, Dallas, Tex.; $7500; incorporators, A. A. Marrs, D. C. Lingo and others.

Tent Employed by Henderson Motor Car Company as Auxiliary to Main Plant During Construction of Factory Additions.

GARAGE AND DEALER.

H. B. Stant of 315 Broadway, Milwaukee, Wis., is planning to erect a garage on Summit avenue, to be of brick and stone construction, and to cost about $4000.

A. R. Carney, Visalia, Cal., has purchased the Home Auto & Machine Company's plant and has reopened it under the name of Home garage.

E. M. Greene, Salem, O., district manager for the Flanders Motor Company, Detroit, maker of Flanders cars (formerly the Everitt), has plans for a new garage in that city.

W. H. Adams and J. E. Wilber of Mattapan, Mass., have opened the Blue Hill avenue garage at 1509 Blue Hill avenue, of fire proof construction and supplying 10,000 square feet of floor space. A specialty of first class repair work will be made.

The Boulevarde Garage & Sales Company, 1405 Race street, Philadelphia, Penn., agent for the Warren, English Daimler and Mercedes, has added the Little Four, made by the Little Motor Car Company, Flint, Mich.

McKenney & Gilpin, Main street, West, Rochester, N. Y., has taken the agency for the K-R-I-T car made by the K-R-I-T Motor Car Company, Detroit.

The E. B. Lyon Motor Company, Durham, N. C., has filed notice of its intention to do business in South Carolina at Main and College street, Columbia.

Howard L. Crise, Baltimore, Md., has taken new quarters at 1916 North Charles street, where he will carry a full line of automobile supplies, greases and oils, under the firm name of the H. L. Crise Auto Supply Company.

The Potomac Motor Car Company, Washington, D. C., agent for the Marmon, made by the Nordyke & Marmon Company, Indianapolis, Ind., has leased the building at 1226 Connecticut avenue, and will make extensive improvements for carrying on his business.

Edward Sellman and W. B. Read, Decorah, Ia., have taken the agency for the Overland, made by the Willys-Overland Company, Toledo, O.

The Enterprise Auto Repair Company, 4037 Wabash avenue, Chicago, has been appointed agent for the Mea magneto, by the Chicago Mea Magneto Branch.

Huffer & Band-Haur, Phoenix, Ariz., has been appointed state distributor for the Moreland distillate truck, made by the Moreland Motor Truck Company, Los Angeles, Cal.

The Sheriff-Lawrence Company, 410 West North avenue, Pittsburg, Penn., has been appointed distributor for McIntyre pleasure and commercial cars, made by the W. H. McIntyre Company, Auburn, Ind.

The Rauch-Lang Company, Cleveland, O., plans to

Factory of the Moon Motor Car Company, St. Louis, Mo., Recently Augmented by the Addition of the Fourth Story.

H. F. Sundin, formerly with the National Motor Vehicle Company, Indianapolis, Ind., has opened a garage and service station for National cars at 11th and Locust streets, Kansas City, Mo.

The Horton Motor Company, Devils Lake, N. D., state agent for the Cadillac, made by the Cadillac Motor Car Company, Detroit, will open a garage and branch sales office at Fargo, N. D.

E. W. Gould of the Smithtown Automobile Company, Smithtown, Long Island, has sold the business to Edward Baxter, who already has taken possession.

Edward W. McDonough of South Orange, N. J., has taken the agency for the Little Four, made by the Little Motor Car Company, Flint, Mich., in Newark. F. T. Cogan of the latter city will act as manager.

Hugh Brown of Eagle Grove, Ia., has sold his Eagle garage to Robinson & Smalley. Various additions to the equipment will be made, and the building will be enlarged. The company markets the Overland line, made by the Willys-Overland Company, Toledo, O.

Carl E. Washburn, San Diego, Cal., is constructing an up-to-date garage at Second and Ash streets, in which the local agency for the Stutz, made by the Ideal Motor Car Company, Indianapolis, Ind., will be located.

W. G. Tennant, well known as the head of the Peerless Motor Car Company of New York, has resigned to assume the active management of the Tennant Motor, Ltd., 2447 Michigan avenue, Chicago, distributor for the Henderson, made by the Henderson Motor Car Company, Indianapolis, Ind.

erect one of the most complete garages in the United States at a cost of $200,000. The location is at Euclid avenue and East 93rd street.

Dr. Henry S. Paige, Amherst, Mass., has organized a company to operate a garage to accommodate 40 automobiles at 17 South Prospect street. An expert machinist will be placed in charge.

The Albert Boynton Motor Company, Red Bank, N. J., which has the agency for Overland cars in that vicinity, has leased the store at 24 Monmouth street, for its salesrooms.

Don P. M. McClure, Oskaloosa, Ia., has bought out the Anderson garage on First avenue, and is fitting up the premises to handle the Oakland cars, made by the Oakland Motor Car Company, Pontiac, Mich.

Arthur C. Kendall, Pasadena, Cal., manager of the California Automobile Company's branch in that city, has let the contract for the erection of a modern garage at Union street and Broadway, where the agency for Warren cars, made by the Warren Motor Car Company, Detroit, will be located.

The Carpenter Motor Sales Company, Los Angeles, Cal., has been incorporated for $500,000, to handle the local agency for Paige cars, made by the Paige Motor Car Company, Detroit, and the Dorris, made by the Dorris Motor Car Company, St Louis, Mo.

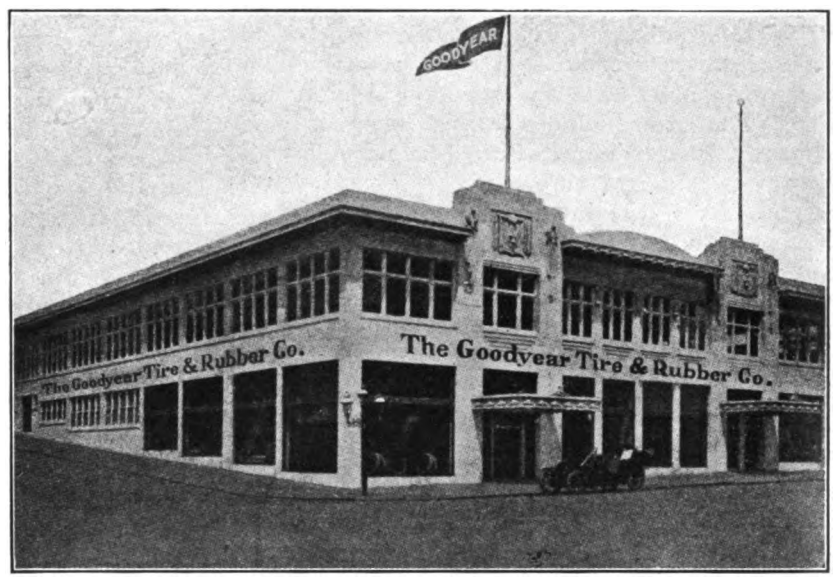
WITH THE MANUFACTURER.

The Atlas Motor Car Company, Springfield, Mass., maker of Atlas cars, which has been in difficulty because of its inability to secure Knight engines according to the contract with the Atlas Engine Works, Indianapolis, Ind., which is now in the hands of a receiver and with which concern the Springfield company has no connection despite the similarity of names, is arranging for new capital, a recent meeting of the stockholders having provided a way for such action.

The Kissel Motor Car Company, Hartford, Wis., has appointed the following new agents for KisselKar pleasure and commercial lines: Lippart-Bishop Auto Company, Dubuque, Ia.; Zimmerman Steel Company, Lone Tree, Ia.; W. D. Sessum, Longview, Tex.; J. C. Bryant, Kaufman, Tex.; H. Lowenstealn & Co., Marshall, Mo.; Brown Bros., West Point, Neb.; W. C. Evans, Sedalia, Mo.; Box Bros., La Crosse, Wis.; William C. Grace, Kalamazoo, Mich.; B. C. Kirkland, Battle Creek, Mich.; Ball-Washburne Motor Company, Rochester, N. Y.; Edward H. Bauer, Washington, D. C.; L. D. Collier, Salisbury, Md.; Howard Douglas, Nashville, Tenn.; D. L. Boureau, Regina, Sask., Can.



The Federal Motor Truck Company, Detroit, announces the following new agencies for Federal trucks: W. S. Young, Larned, Kan.; Union Motor Car Company, Pittsburg, Penn.; Gibbes Machinery Company, Columbia, S. C.; Cole Motor Company of Georgia, Atlanta, Ga.; Fairchild Auto Company, New Orleans, La.; Mobile Auto Company, Mobile, Ala.; John F. Gubbins, Memphis, Tenn.; Eckenroth Sales Company, Cleveland, O.; Sanderson & Burghardt, Buffalo, N. Y.; Interstate Auto & Supply Company, Sioux City, Ia.; L. C. Hayden, Tecumseh, Mich.

The Nordyke & Marmon Company, Indianapolis, Ind., maker of Marmon cars, has added the following agents to its list: R. C. Bowman, Wheeling, W. Va.; Lion Auto Garage, Winnipeg, Man., Can.; Lougheed & Webster, Calgary, Alta., Can.

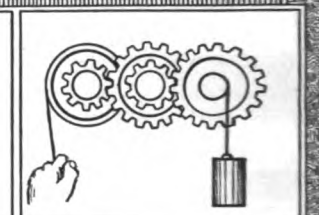
The Mercer Automobile Company, Trenton, N. J., announces the following additions to the list of Mercer agencies: Mercer Sales Company, Minneapolis, Minn.; Sitgreaves Auto Livery, Columbus, O.; R. L. Culbertson & Co., Youngstown, O.; C. J. McFarland, Wapakoneta, O.; Pine Bluff Motor Car Company, Pine Bluff, Ark.; Terminal City Motor Company, Vancouver, B. C.

The R-C-H Corporation, Detroit, maker of the R-C-H car, has added the following agents: Wallace & Tolar, Inverness, Miss.; H. A. Walton & C. W. Ellington, Roswell, Ga.; W. H. Ratcliffe, Alexandria, La.; S. H. Watts, Selma, Ala.; Automobile & Marine Motor Company, Charleston, S. C.; Albert C. Jones, Rockland, Me.; A. Elliott, Rochester, N. Y.; Robert L. Hiller, Batavia, N. Y.; F. Ebann, Chicago, Ill.; H. L. Webber, Wenona, Ill.; John E. Briggs, Williamsport, Ind.; May & McPheeters, Hardingsburg, Ind.; W. C. Sporleder, Chicago, Ill.; Karl B. Gast & A. A. Gast, Akron, Ind.; G. F. Wisegarver, Decatur, Ill.; Jackson Kline, Howard, Penn.; P. W. Pittman, Las Animas, Col.; E. L. Bradford, Albuquerque, N. M.; Carlsbad Auto Company, Carlsbad, N. M.; Crescent Garage, Deming, N. M.; Pecos Valley Auto Company, Roswell, N. M.; Frank Vegely, Santa Ana, Cal.; Alfred S. Donan Auto Company, Tucson, Ariz.; A. R. Riley, Riverside, Cal.; Boyce & Born, Green City, Mo.; G. R. Jones, Wichita, Kan.; John Nelson & Son, Ottawa, Kan.; Michael & Sappenfield Garage Company, Scranton, Kan.; P. C. Jonas, Le Roy, Kan.; Northrupp & Clark, Houston, Tex.; B. W. Carrington, Grand Salene, Tex.; Baker & Wilson, Nacogdoches, Tex.; Western Machine & Motor Company, Wessington Springs, S. D.; W. J. Baribeau, Enderlin, N. D.; L. L. Grier & L. S. Peters, Lake Wilson, Minn.; Wallace Donnelly Company, Jamestown, N. D.; E. Dieudonne & Son., Jamesville, Minn.; Walter H. Flessel, Huntington, N. Y.; I. R. Gardiner, Utica, N. Y.; W. H. Dykeman, Bayonne, N. J.; Cannon Electric Company, Bristol Landing, N. J.; Souderton Garage, Souderton, Penn.; Samuel F. Garrison, Bordenton, N. J.; Cortland L. Fort, Burlington, N. J.; Middleton Motor Company, Marlton, N. J.; McKenney & McKenney, Gilroy, Cal.; E. W. Johnson Company, Fresno, Cal.; E. E. Gross, Stockton, Cal.; F. H. Kuhn, Plymouth, Ind.; Henrickson & Smith, Live Oak, Cal.; J. W. Cramp, Rialto, Cal.; Worthington Auto Company, Aberdeen, S. D.; A. F. Lauson & Co., Burlington, Vt.; C. O. Scranton, Alliance, O.; Clark & Smith, Whitetown, Ind.; John C. Gelmers, Chatsworth, Ill.; L. G. Schoopflin Company, Buffalo, N. Y.; R. Kloopwell, Jacksonville, Fla.

The Henderson Motor Car Company, Indianapolis, Ind., maker of the Henderson car, has been forced to utilize a tent, while awaiting the completion of its factory addition, because of the increase in producion made necessary in order to keep abreast of the orders. New agencies are announced as follows: J. F. Tentant & Co., Chicago, Ill.; F. D. Parker, Decatur, Ill.; Meade McClatchey, Canton, Ill.; Standard Motor Car Company, Ltd., Edmonton, Alta., Can.; Forest Park Garage, Springfield, Mass.; F. W. Davis & Sons, Fall River, Mass.; Charles Frederick, Bay Ridge, N. Y.; Harold C. Slater, East Orange, N. J.; L. E. Grider, Fresno, Cal.; Thesan & Gronewald, Golden, Ill.; Elmer S. Maine Company, Hubbard, Ia.; Automobile & Supply Company, Lancaster, Penn.; E. C. Graham, Lindsay, Cal.; D. & W. Lawson, Northport, N. Y.; J. J. Tanner, Petaluma, Cal.; Forbes Motor Car Company, Pittsburg, Penn.; Sacramento Motor Sales Company, Sacramento, Cal.; H. F. Hunter, Swedesboro, N. J.; Auto & Truck Sales Company, York, Penn.

New Building Occupied by Goodyear Tire Branch in San Francisco.

The F. E. Murphy Automobile Company, Minneapolis, Minn., has plans for a new garage to cost about $60,000, to be erected at 13th street and Hennepin avenue.



The Moon Motor Car Company, St. Louis, Mo., has completed the addition to its factory, shown in an accompanying illustration. This comprises the entire fourth floor, which will give the company much needed room for the production of Moon cars.

The Goodyear Tire & Rubber Company, Akron, O., maker of Goodyear tires, recently opened a new factory branch in a new building at Van Ness avenue and Sutter street, San Francisco, Cal. An accompanying illustration presents the exterior of the building, which is believed to be adequate to take care of the Pacific Coast business of the company for some time to come.

The Edwards Motor Car Company, 1784 Broadway, New York City, maker of Edwards cars, in which C. G. Stoddard and H. J. Edwards are the principal owners, has chosen Long Island City, N. Y., as the location for its new plant. The company has taken a factory under lease for a year, until it can make arrangements to build. The first models will be offered for sale in the near future.

Digitized by Google

RECENT MOTOR VEHICLE PATENTS

Collard Ignition Apparatus.

David Edward Collard, Jefferson, Col., has patented an ignition apparatus for explosive motors which differs from those of ordinary construction, inasmuch as the source of current, the magneto, may be utilized when the gas engine is inoperative. The current generator is friction driven off the flywheel of the gasoline motor and is pivotally mounted, and means are incorporated to break the contact as well as to move the dynamo into contact with the manually operated device. The latter includes a wheel member which engages with the bevel of the dynamo pulley and energy is imparted through gears operated by a crank. By it the inventor claims that the gas engine may be started on the dynamo when the motor is idle and that batteries are eliminated. The mechanism provides for a return of the dynamo pulley into engagement with the flywheel upon the engine starting.

Arundel Gas Burner Tip.

Clarence E. Arundel, Washington, D. C., assignor of one-third to William F. Roberts of the same city, has been granted a patent for an acetylene gas burner tip. It resembles the ordinary gas burner in conformation and has oppositely disposed side walls with a floor or recess, said floor having a central orifice elongated transversely of, but remote from, the side walls. Air ducts are incorporated to supply air between the gas exit and the side walls. The streams of gases impinge upon each other and splay longitudinally of the depression and side walls.

Phillips Terminal.

A patent for a spark plug terminal has been granted to Ross M. G. Phillips, Minneapolis, Minn., assignor, by mesne assignments, to Henry Deutsch, trustee. The device is so constructed that the cable or wire carrying the current may be detached from the spark plug when desired. The cable is fitted with an extension of conducting and non-conducting material, the former transmitting the electricity to a metal attachment secured to the terminal of the plug. The clamp is held securely by the spark plug nut and is provided with spring jaws which engage and hold the cable terminal which may be removed or replaced as desired. The inventor points out that the device permits of breaking the circuit and that its testing is made easy and without the use of tools or the operator receiving a shock.

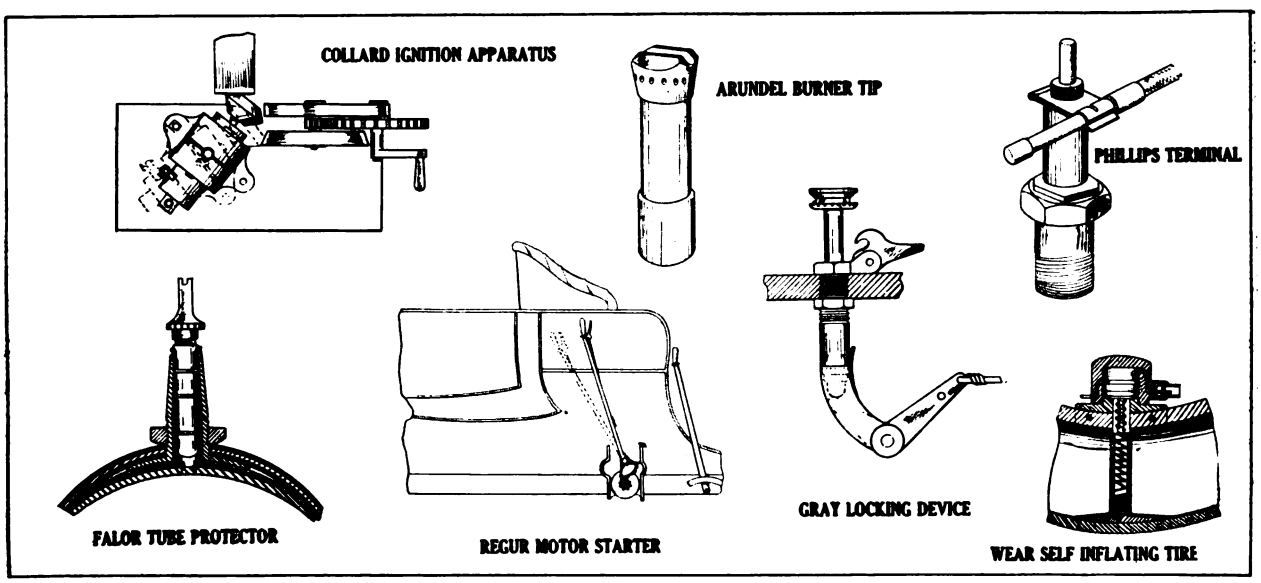
Falor Inflating Tube Protector.

Clarence E. Falor, Akron, O., assignor to the Goodyear Tire & Rubber Company of the same city, has been granted a patent for a device to prevent circumferential creeping of tires upon wheel rims, also to protect the inner tube from injury made possible by said creeping. It comprises a tubular member of greater rigidity than the inflating tube positioned around said tube. The intermediate portion of said member where it extends in the wheel rim is exteriorly threaded to receive a clamping nut for connecting it to the rim, one end of said member being provided with a disc shaped lateral flange arranged on the wall of the tire, the opposite end being so designed as to be collapsed against said inflating tube when a valve casing is positioned therein for holding the latter against displacement.

Gray Locking Device.

Emmet P. Gray, Detroit, has patented a locking and releasing device designed for service with signalling apparatus, cut-outs, etc. It comprises a tubular body secured by means of locking nuts and provision is made for the adjustment of these members. The rod operating the lever to which is attached the cable or wire is free to move up or down, and its upper portion is fitted with a head having a recess for engagement with a latch member. The latter is provided with a spring to secure the slidable rod when it is sufficiently depressed.

Regur Motor Starter.



Among the patents granted for starting the internal combustion motor other than by cranking by hand, is the Regur motor starter, patented by Winfield S. Regur, Des Moines, Ia. The device is of the mechanical type, it being operated by a lever located on the outside of the body and occupying a position just back of the gear shifting

Digitized by Google

lever. The end of the starting lever is provided with gear teeth which mesh with similar members upon a ratchet wheel and the latter is mounted upon a sleeve keyed to the power shaft. A casing member is screwed to the disc which is rotably mounted on the sleeve, and a pinion is provided on the casing member and rotably mounted upon the power shaft. The casing also is fitted with a spring actuated pawl which engages the ratchet wheel.

Wear Self-Inflating Tire.

Frank F. Wear, San Francisco, Cal., assignor to himself as trustee, has been granted a patent for a self-inflating and non-collapsible tire that presents novel features. It comprises a wheel having a rim, to which is fitted a pneumatic casing in which is contained sectional inner tubes. Between each pair of tubes is a spring plunger

Recent Developments in Motor Car Equipment, Making for Convenience, for Which Patents Have Been Granted.

pump. These pumps are mounted on the felloe of the wheel, and comprise an external cylinder, within which reciprocates a small piston controlled by a spring plunger extending into the tire, and bearing upon its lateral interior surface. The plunger is placed between the two sections of inner tube and is so actuated upon by a helical spring as to produce reciprocal movement on the part of the piston of the pump. This action takes place when the tire is displaced in moving over inequalities in the road. Air is admitted to the pump cylinder through a check valve and is discharged on the in-stroke through a small aperture or passage to the tube. In the event of a small puncture in one of the tubes the pump constantly operating would keep it inflated. Provision against over-inflation is not mentioned.

OTHER PATENTS GONE TO ISSUE.

Kraemer Valver Lifter, Edwin N. Kraemer, Cedarburg, Wis. A valve spring lifter comprising a pair of pivotally connected levers which are contracted or extended by means of a threaded rod actuated by a wing nut.

Motor Starter, Wilmur F. Boa and Karl Schoenbauer, Grand Rapids, Mich. Coacting jaw clutch members are utilized having release members and means are provided for breaking the engagement of the starting crank member with that rotating the motor shaft.

Face Protector, Oscar H. McQuary, Jr., Lawrence, Kan. A device for protecting the face comprising a shield for the nose and mouth, also goggles secured in the eye holes. The material is flexible.

Friction Clutch, William J. Hilliard, Elmira, N. Y., assignor to Charles H. Knipp of the same city. A friction clutch, having a number of rings, of inside and outside gripping members, a plurality of cylindrical cams fastened upon the outward side of the outside member, cross bars engaging said cams and revolubly mounted on the hub of the clutch, and means for turning said cross bars.

Motor Starter, Peter W. Kane, Chicago, assignor to the Kane Machinery Company of the same city A mechanical starter comprising a ratchet member mounted upon the shaft of the motor. The actuating arm or lever is fitted with a pivotally mounted pawl one end of which is provided with a similar member. The latter is brought into action in the event of the shaft rotating in a direction opposite to that in which it is intended to move.

Resilient Wheel, August Loock, Hayfield, Ia. Between the rim of the wheel and tire are provided slidable rods having springs, and guide plates are utilized to control the movement of the rod members.

Chock, Thomas J. Moss, St. Louis, Mo. A device for chocking motor car wheels, comprising sheet metal plates so constructed as to be of triangular formation and a brace for securing same. Lugs are provided for the brace member.

Spring Wheel, Frank M. Beydler, Ashland, Kan. Between the felloe of the wheel and solid tire is interposed a series of S shaped springs, these being secured to a facing strip of the traction member by blocks.

Tire, Angelo C. Rovelli, Philadelphia, assignor of one-half to Max Strozzi of the same city. The shoe is constructed of solid material with the exception of a space which is partially filled by two tension members of resilient material, these being bowed toward one another, and engaging the tire at their inner and outer edges only.

Pipe Wrench Attachment, Edward Brahan, Green Bay, Wis. The monkey wrench is provided with a recessed jaw for the purpose of securing a supplementary pipe jaw, and means are provided for the operation of same.

TWO INSTRUCTIVE BOOKS.

Two new books relating to the care and operation of motor cars have been issued recently by the American School of Correspondence, Chicago, these being prepared by well known members of the Society of Automobile Engineers, Victor Lougheed and Morris A. Hall. One is entitled "The Gasoline Automobile" and the other, "Care and Operation of Automobiles." Both are well illustrated and are intended to reach a class of motorists who would not be interested in the more technical discussions. "The Gasoline Automobile," by Lougheed and Hall, presents the development and present status of the car, and takes up all the integral components of the machine and their functions. The other book, by Hall, combines the subject of private garages and repairs, with automobile driving.

POOR ROADS IN CANADA.

Tourists contemplating a visit to Canadian points will be interested in the following letter from a motorist who recently returned from that section:

Editor, The Automobile Journal,
Sir:

I have just returned from an automobile trip covering points in Canada, viz.: Montreal, St. Agathe, St. Jerome, etc. I would not advise anyone to tour this section this season. Roads are very bad and practically impassable in wet weather. I encountered ruts and holes 18 inches deep over main highways. A road is being constructed from Rouse's Point to Montreal, which is to be known as the King's highway. This probably will be passable next season. Roads to the Canadian border are fine by way of Plattsburg, N. Y. DR. W. H. PETERS.

Providence. R. I., Sept. 2.

NEW R-C-H ROADSTER ANNOUNCED.

Announcement is made of a new long wheelbase roadster by the R-C-H Corporation, Detroit, in response to a demand for a car of this type along the lines of previous models. The new car will embody the features of the touring car and will have a wheelbase of 110 inches, fitted with an English roadster body the seats of which will be much lower than the regular models and will be provided with extra deep cushions. The fuel tank is mounted on the rear deck and will contain 26 gallons, and a trunk large enough to carry two suit cases is also provided.

The equipment is very complete, including as it does five electric lights with an 100 ampere-hour capacity storage battery, non-skid tires, Warner Auto-Meter, top with Jiffy curtains and slip cover, demountable rims, horn, rear vision mirror, tools, jack, etc. In addition one extra non-skid tire is mounted on an extra demountable rim in a self-locking tire carrier located on the right running board. A slip cover is also furnished for the trunk.

The new model is especially appropriate as a business man's machine as it is easily handled and its long rear deck provides ample space for carrying sample cases, etc. Delivery of the roadster type is announced for Sept. 15.

CADILLAC TO INCREASE OUTPUT.

According to E. C. Howard, sales manager of the Cadillac Motor Car Company, Detroit, the 1913 season will eclipse all the company's past records for number of machines manufactured. The record for 1912 was 12,000 and this figure will be exceeded by 3000 and every one of the 15,000 cars has been contracted for by dealers. Features of the new model include a larger motor, combined electric lighting, cranking and ignition system, and many notable refinements contributing to the comfort of the passengers.

ROAD TEST OF NEW PACKARD.

A recent road test of the 1913 Packard "38" from Detroit to Chicago and return resulted in the smaller six-cylinder model breaking the record made in the noted famous "Flight of Thirty" over the same route by nearly an hour. On the trip Vice President S. D. Waldon was accompanied by Edwin S. George of Detroit and J. M. Murdock of Johnstown, Penn., and the object was to give the car a final road trial and with no idea of making a record. Although the machine had the top and windshield up the 285 miles on the return trip was made in 9:58:00, about an hour faster than the record of the "Thirty."

MAYOR FAVORS INDUSTRY.

Mayor Fitzgerald of Boston has called the attention of the Boston chamber of commerce to the advisability of co-operating with manufacturers of motor cars who are seeking locations in the East, especially the makers having a large export trade. The mayor advocates that the chamber of commerce make special efforts to attract makers to the Hub, holding the establishment of automobile factories would be of great benefit to the city. The letter is the result of a published interview with John M. Willys, president of the Willys-Overland Company, Toledo, O., in which the official pointed out the shipping advantages of eastern cities.

The ultimate solution for lubricating troubles is

MONOGRAM OIL

Because

It is made from straight Pennslyvania crude—the best that can be had.

GASOLENE GALLON GAUGE

For Automobiles and Motor Boats.

For measuring the amount of gasolene in supply tanks.

The numbered markers are slidable and may be adjusted to show the number of gallons in any given tank whether it is square, round, oval or irregular in shape.

The depth of each gallon is the same in square sided tanks.

In round or oval tanks the depth of the gallons will be less towards the middle of the tank.

The outside level marker shown is to register the amount in the tank at any given time.

Handsomely finished in black stained wood, 15 inches long, with 20 brass markers.

If your tank holds more than 20 gallons, extra markers will be inserted as ordered.

Price 50 cents postpaid anywhere in the United States.

Send Express or Postoffice money order. Stamps accepted.

SPECIAL

Extra long gauges made to order for very deep tanks; not more than 24 inches in length, with markers numbered from 1 to 30 as may be required.

Price 75 cents, postpaid anywhere in the United States.

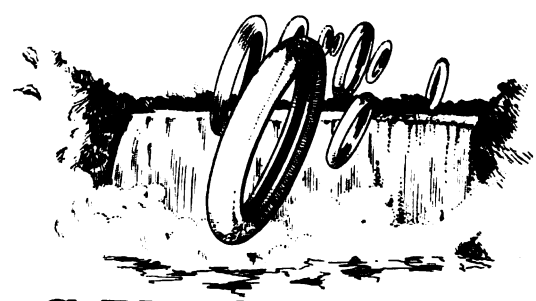
AJAX TIRES

(GUARANTEED 5,000 MILES)

DOES TIRE EXPENSE MEAN ANYTHING TO YOU?

The difference between Ajax Tires and others reduced to figures is 1500 MILES. Thousands of motorists have cut their tire bills in two by using them. That is why there are more orders on our books today than ever before.

Every Ajax Tire is a dependable value—guaranteed for 5000 MILES—a guarantee unequaled in the tire industry. It means 1500 MILES more service out of every tire.



Does the certainty that when you start out you will get there mean anything to you? Then equip with Ajax Tires and finish your tour without tire trouble.

Remember—our FIVE THOUSAND MILE GUARANTEE accompanies every tire.

DEALERS:—Tires of merit and reputation are easy to sell. Ours is an exceedingly interesting proposition. Let us send you literature.

A NEW VALUE

TO THE PURCHASING POWER OF FIFTY CENTS—A

"BLACK EAGLE" SPARK PLUG.

EFFICIENCY AND QUALITY WITHOUT EXTRAVAGANCE.

From all viewpoints the **"BLACK EAGLE"** Spark Plug represents the greatest advance in spark plug design and construction in recent years, and has given a new value to the purchasing power of fifty cents.

The base of the **"BLACK EAGLE"** Spark Plug provides double electrodes so positioned that they present a round surface to the action of the spark, absolutely eliminating pitting of the electrodes which indefinitely prolongs their life, and produces a uniform spark at all times.

When you have discovered that the price you pay for a spark plug has little to do with its service value, you will save 100% to 400% on this item of expense. Try a genuine

"BLACK EAGLE"

The 50c Spark Plug Without an Apology. TRY THEM NOW.

Don't wait until you are 10 miles from a Garage and find you need them.

Most jobbers and dealers sell **"BLACK EAGLE"** Spark Plugs. All can secure them; if you are unable to have your wants supplied we will forward them free of transportation expense upon receipt of price.

NEWTONE

The Mile Away Electric

MOTOR HORN

Patented Sept. 5, 1911

Torpedo Type

PRICE

$20.00

Including Button and Cable

The Most Perfect Warning Device on the Market

The increased demand for the Newtone Motor Horn is due to its absolute efficiency in warning and economy in operation.

The motor with Hess-Bright Ball Bearings and imported Self-lubricating brushes, eliminate all oiling and cleaning.

The chief engineers of three leading American automobile manufacturers, after a "Break-Down" test, state that, in their opinion, the Newtone Horn is the BEST warning signal made.

WEED CHAINS
PREVENT ACCIDENTS LIKE THIS

What an awful game of chance we sometimes play on the checkerboard of Life!
How narrow is Life's victory over Death at times!
What a contrast is here presented! What an object lesson this scene portrays!

Absolute control and **perfect safety** on the one hand; on the other an "unruly, balky" machine, whose seemingly greatest ambition was to bring its occupants face to face with disaster.

Picture for yourself the story:

Two cars traveling the same country road—a rainstorm overtakes them. Reaching a treacherous, slippery curve—

ONE CAR with scarcely any noticeable slackening of speed rounds the curve and **passes on in perfect safety.**

THE OTHER at the critical moment, **skids,** and in a flash, plants itself in front of the on-rushing trolley.

A mass of wreckage, "nerve-shattered" passengers and a lasting memory of what might have been if the trolley car had not been stopped.

One Car was skid-proofed with Weed anti-skid Chains. **The Other** was not. Take the lesson home.

Weed Chains
Absolutely Prevent Skidding

Are you still taking your life in your hands by refusing to take the necessary precaution against the dangers of skidding? Are you still unwisely depending on "rubber alone" for the safety of yourself, the occupants of your car and other road users?

Make safety yours—take no chances. Fully equip your own car with Weed Chains today and **insist,** for your own protection, that other drivers do the same.

Weed Chains cannot injure tires because "they creep;" are put on in a minute without the use of a jack or other tools. Use them on all four tires.

THE NAME WEED ON EVERY HOOK

At All Reputable Dealers

Weed Chain Tire Grip Co., 28 Moore Street, New York City

Why Not Let Us Tell You?

How to reach 11,500 active purchasing heads in the Automobile Industry each month. The only guaranteed service of its kind.

We can save you from $150 to $500 a month on your mailing list and give you the benefit of the best list obtainable. ***A postal will bring full information.***

"INVADER" GEAR OIL

"Puts Noisy Gears to Sleep"

INVADER GEAR OIL is a heavy, dark fluid lubricant, designed for the lubrication of sliding gear transmissions and differential gears. It can also be used for front gears where a heavy lubricant is required, if the case is tight and separate from the crank case.

This oil possesses peculiar properties which make it invaluable as a lubricant for gears. It contains no foreign matters, such as ground cork, sawdust, etc., but is 100% oil. It is stronger and more serviceable than any other lubricant made. Being free from water and chemicals, it will not foam in the gear case when running or allow the bearings to rust when idle.

Invader Gear Oil being a fluid lubricant it is only necessary to fill the case sufficiently to allow the gears to dip. It is not necessary to pack the case full, as is customary when grease is used. It faces the gears with a coating which is practically indestructible, thereby preventing wear and reducing *noise* and friction to a minimum. A trial will convince the most skeptical that "Invader" Gear Oil is the only practical and economical gear lubricant.

Sold in 10 lb. square cans, lithographed; 25 and 50 lb. wooden jacketed cans, special top; barrels and half-barrels

Classified Buyers' Guide

To facilitate selection in purchasing Motor Cars, Motorcycles, Accessories, Parts, Supplies, Fittings and Attachments, as well as Aviation Equipment, we present the following list of representative and progressive advertisers in our publications, addresses of their main and branch houses and the line of products handled by each.

ACCESSORY MANUFACTURERS AND JOBBERS.

Bi-Motor Equipment Co., 177-179 Portland St., Boston, Mass.
Branch: 113 Massachusetts Ave., Boston.

Caldwell Mfg. Co., 1756 Cranston St., Providence, R. I.

Hawthorne Mfg. Co., 29 Spruce St., Bridgeport, Conn.

Hopewell Brothers, Newton, Mass.
Branch: 1974 Broadway at 67th St., New York.

Miller, Chas. E., 97-103 Reade St., New York.
Branches: 202-204 Columbus Ave., Boston; Bridge and Dwight streets, Springfield, Mass.; 274 Trumbull St., Hartford, Conn.; 924 Eighth Ave., and 2782 Broadway, New York; 1421 Bedford Ave., Brooklyn, N. Y.; 318 North Broad St., Philadelphia; 824 Main St., Buffalo, N. Y.; 1829 Euclid Ave., Cleveland; 227 Jefferson St., Detroit; 66 Edgewood Ave., Atlanta, Ga.; 601-603 Baronne St., New Orleans, La.; 135 Central Ave., Albany, N. Y.; 274 Halsey St., Newark, N. J.

Milwaukee Auto Specialty Co., 128 Second St., Milwaukee, Wis.

Waite Auto Supply Co., 81 Exchange place, Providence.

ACETYLENE TANKS. (See Tanks.)

AIR COMPRESSORS AND TANKS.

Williams Foundry & Machine Co., Akron, O.

AUTOMOBILES. (See Cars.)

BALLS AND BALL BEARINGS.

Boyd, F. Shirley, 903 Boylston St., Boston. (R. I. V.)

Bretz Co., J. S., 250 W. 54th St., New York. (F. & S.)

New Departure Mfg. Co., Bristol, Conn. (New Departure.)

BATTERIES.

Geiszler Bros. Storage Battery Co., 514 W. 57th St., New York.

Lincoln Electric Co., 1007 Atlantic Ave., Brooklyn, N. Y. (Hi-Po Waterproof Dry.)

Waite Auto Supply Co., 81 Exchange place, Providence. (Success.)

Willard Storage Battery Co., 5716 Euclid Ave., Cleveland. (L B A.)

BLOW-OUT PATCHES. (See Patches.)

BODIES, TRUCK.

Lynch Manufacturing Co., Hammond, Ind.
Branches: East Chicago, Ind.; South Chicago, Ill.

Motor Truck Body Co., 320 Franklin St., Detroit.

BODIES—WOOD AND METAL.

Springfield Metal Body Co., 20 Medford Ave., Springfield, Mass.

BRAKE BANDING OR LINING.

Royal Equipment Co., The, 422 Housatonic Ave., Bridgeport, Conn. (Raybestos.)
Standard Woven Fabric Co., Worcester, Mass. (Multibestos.)
Branches: 903 Boylston St., Boston; 237 Lafayette St., New York.

BRAKES.

Royal Equipment Co., The, 422 Housatonic Ave., Bridgeport, Conn. (Duplex.)

BRUSHES, WIRE.

Williams Foundry & Machine Co., Akron, O.

BUMPERS AND FENDERS.

Sager Co., J. H., 271 South Ave., Rochester, N. Y. (Diamond.)

CABLES. (See Wires.)

CARBURETORS..

Mayer Carburetor Co., 2673 Main St., Buffalo, N. Y. (Mayer.)

Sumner, George, Inc., 1841 Broadway, New York; 755 Boylston St., Boston. (Rayfield.)

CARS—GASOLINE PLEASURE.

Brush Runabout Co., 3 West 61st St., New York. (Brush runabout, Liberty-Brush.)

Buckeye Manufacturing Co., Anderson, Ind. (Lambert.)

Cartercar Co., Pontiac, Mich. (Cartercar.)

Clarke-Carter Automobile Co., Jackson Mich. (Cutting.)

Cole Motor Car Co., Indianapolis, Ind. (Cole.)

Columbia Motor Car Co., 3 West 61st St., New York. (Columbia.)

Dayton Motor Car Co., 3 West 61st St., New York. (Stoddard-Dayton.)

Haynes Automobile Co., 166 Main St., Kokomo, Ind. (Haynes.)

Herreshoff Motor Co., 620 Harper Ave., Detroit. (Herreshoff.)

Hupp Motor Car Co., 1268 Milwaukee Ave., East, Detroit. (Hupmobile.)
Branches: Detroit, Buffalo, Chicago, Cleveland, Denver, Kansas City, Los Angeles, Minneapolis, Philadelphia.

Ideal Motor Car Co., Indianapolis. (Stutz.)

Imperial Automobile Co., Jackson, Mich. (Imperial.)

Jackson Automobile Co., 1400 Main St., Jackson, Mich. (Jackson.)

Kissel Motor Car Co., 174 Kissel Ave., Hartford, Wis. (KisselKar.)

Knox Automobile Co., Springfield, Mass. (Knox.)

K-R-I-T Motor Car Co., Detroit. (K-R-I-T.)

Lenox Motor Car Co., Inc., Boston. (Lenox.)
Branches: New York, Boston, Chicago.

Maxwell-Briscoe Motor Co., 3 West 61st St., New York. (Maxwell.)

Mercer Automobile Co., 1100 Whitehead Road, Trenton, N. J. (Mercer.)

Michigan Motor Car Co., 147 Lay St., Kalamazoo, Mich. (Michigan.)

National Motor Vehicle Co., 1033 22d St., Indianapolis. (National.)

Nordyke & Marmon Co., Indianapolis. (Marmon.)

Paige-Detroit Motor Car Co., Detroit. (Paige-Detroit.)

Peerless Motor Car Co., Cleveland. (Peerless.)
Branches: 660 Beacon St., Boston; Broadway and 57th St., New York; Michigan Ave., and 25th St., Chicago.

Pierce-Arrow Motor Car Co., Buffalo, N. Y. (Pierce-Arrow.)

R-C-H Corporation, 107 Lycaste St., Detroit. (R-C-H.)

Reo Motor Car Co., Lansing, Mich. (Reo.)

Sampson Mfg. Co., Alden, 3 West 61st St., New York. (Sampson.)

Selden Motor Vehicle Co., Rochester, N. Y. (Selden.)

Speedwell Motor Car Co., 80 Essex Ave., Dayton, O. (Speedwell.)

Studebaker Corporation, Detroit. (E-M-F, Flanders.)

United States Motor Co., 3 West 61st St., New York. (Brush, Maxwell, Sampson, Stoddard-Dayton, Columbia.)

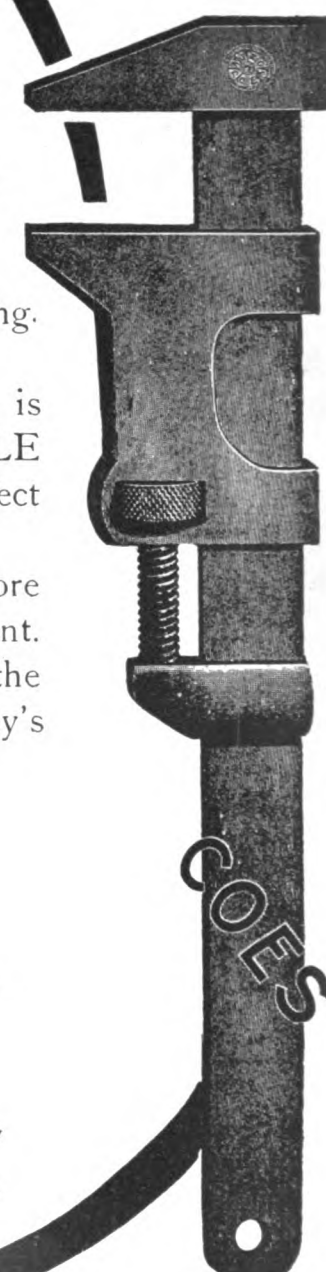
COES



THE
Wrench Supreme

Strength without bulk or clumsiness.
Ease of handling without slipping or bruising.
Perfect balance and right grip

Everything the motorist desires in a wrench is to be found in the "COES" AUTOMOBILE MODEL, and you will never know perfect wrench service until you pin your faith to it.

It stands to reason that the 5 per cent. more you pay for a "COES" wrench goes for 60 per cent. more quality and service—put this wrench in the tool kit and shop. You will get your money's worth.

THE 8-DAY HIGH GRADE "CHELSEA" AUTO CLOCK

"SPECIAL"

"OFFSET"

"ROUND"

"LIMOUSINE"

Primarily intended for use inside the bodies of large enclosed cars, and for such use its case can be given a variety of fine finishes. It also makes an attractive clock for use on dashboards. Only made in 2¾-inch size.

The Justly CELEBRATED 8-Day, High-Grade "CHELSEA" AUTO CLOCK (*Trade-mark*)

NOW and for YEARS the RECOGNIZED STANDARD of EFFICIENCY

Clocks built with a view to stand the jars and jolts and rough riding of Automobiles. Reputation the highest. Used by parties demanding the BEST.

☞ ALL SIZES STATED ARE THE APPROXIMATE DIAMETERS OF THE DIALS.

All are 8-day High-Grade. All are in DUPLEX (patent applied for) polished cast brass cases, the most thoroughly waterproof case on the market. The "SPECIAL" clocks show dial on an angle; its inner cased clock, when removed from the outer (locked) case, is excellent for use on mantels, bureaus, etc., when touring; its outer case is screwed to dashboard by hidden screws. The "SPECIAL" clocks are in large demand from dealers for owners of finest cars.

The MOTOR CLOCK has the same clock movement which for years we have supplied for the hard use on Locomotives, Steam Fire Engines, etc.; its dial is of same appearance as the Auto Clock dial, but the Auto Clock movement has a somewhat finer train.

The 3½ MOTOR "OFFSET" is likely to prove a quick, ready seller. Very attractive.

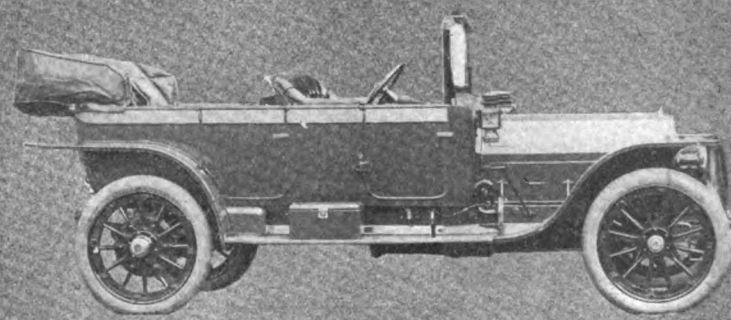
Ask for our new Auto Clock Circular and Price List, dated Oct. 1, 1911, illustrating and pricing the above and three new models, C, D and E.

PRICE LIST (Per Clock)

		"Round"	"Offset"	"Special"	"Limousine"
"CHELSEA"	2¾-in. Auto Clock.....	$26 00	$28.00	$36.00	$28.50
	3½-in. Auto Clock.....	28.00	30.00	45.00	Only made in
	3½-in. Motor Clock.....	24.00	26.00	41.00	2¾-inch size

If wanted fitted with outside (patent applied for) stem-winding and stem-setting device—the best of its kind—Add $3.00 to above Price Lists. (Such device we do not apply to the "Motor" Clocks or "Special" Auto Clocks.)

For Use on AUTOMOBILES and MOTOR BOATS



You want the Best? Ask your DEALER for the "CHELSEA"

A Motorist's Opinion Means Much to the Dealer

"What I like about Smith is, that he knows enough to handle the goods you want and isn't always shoving something at you that you never heard about."

No one ever used just those words perhaps, but the sentiment is the underlying motive for every motorist's patronage.

The 1912 motorist is a customer with a mind made up. The day when he had to grope about for advice is past. He doesn't enter your store for the benefits of an "experience" meeting.

The ten years just passed have made him motor wise. Every man, owner or onlooker is "glib" in motor matters.

You, Mr. Dealer, have no mysterious and valuable advice that your customers are not wise to already.

Pardon our saying it, but you have nothing on them when it comes to knowing what's what.

And this is the greatest blessing that has fallen to your lot since supply stores and garages came into existence.

AND HERE'S WHY

In the days when the motorist had to take a gamble on supplies, you yourself paid the price of every failure.

You were the sponsor.

Every calamity, smash or disappointment experienced with an accessory or supply was a crimp in your creditability.

You advised in all sincerity, and you suffered all comebacks.

Today it's different.

Minds are made up when your front door opens.

The equipment of a car today is all noted in a mental catalog of well known products, trade marked and trustworthy.

The manufacturers are the sponsors.

They have made their names, advanced their claims and established reputations.

You are the distributor—merely that. You have been relieved of the responsibility of comebacks. You are there to cash in on the advertising they have done.

If there is money to be made in your location, it is to be made by stocking standard goods—staples.

Your best course lies clear before you.

DOESN'T IT?

Then surely, in the name of the SMILING DOLLAR SIGN, you have no incentive to go back to the old method of assuming responsibility, of playing with the confidence of your customers, of inviting kicks and grouches by doing missionary work on *imitations* of standard products.

NON-FLUID OIL for instance is a standard product. Today Non-Fluid Oil is known to every motorist.

He regards the name as a specific assurance of lubricating efficiency.

We have said he is wise, but it is possible to deceive him.

He knows nothing of the dozen worthless imitations of Non-Fluid Oil. He doesn't expect you to introduce him to these substitutes.

He comes to you with confidence and that deserves respect. His lubrication money is intended for genuine Non-Fluid Oil. *Take it for that purpose.*

If you think he can be satisfied with a cheaper product, let the other fellow sell it to him.

Do not load trouble upon a man who comes to you with confidence. Do not allow him to think that genuine Non-Fluid Oil is responsible for the results he gets from imitations.

POST HIM, SET HIM RIGHT.

That's the kind of service you cannot sell but which pays you handsomely in profitable patronage.

Genuine Non-Fluid Oil is packed only in Orange Colored Cans.

TRADE MARK REGISTERED IN UNITED STATES PATENT OFFICE

The Perfected Tire Filler Proven by Use & Guaranteed

Airless Resiliency That Means Auto Insurance

RUN YOUR TIRES 15,000 MILES

Claims Proven

The Superior Court

Perfection Filler Company,
Old South Building, Boston, Mass.

Boston, August 15, 1912.

Gentlemen:

Noting the various testimonials you are showing at your factory, it occurs to me that my record is an exceptionally good one and that you could use the same possibly to advantage. I had my four tires filled with Perfection fillers in July, 1910, and up to the present time I positively know I have run close to 18,000 miles. My car is still fitted with two of the original shoes and filler, and I have given you at your request, the other two, which I believe you used for exhibition purposes, one having travelled more than 15,000 miles and the other 7,500 miles. I believe my car rides easier with the filler than it did on air, and I find that we have burned no more gasoline than we did on air, having taken particular pains to test out in the matter of gasoline mileage. It is a source of great pleasure to me to be able to start out on a trip knowing that regardless of the roads encountered, I am going to have no tire troubles.

I can earnestly recommend and endorse the Perfection Fillers.

Very truly yours,

William R. Todd
Official Stenographer

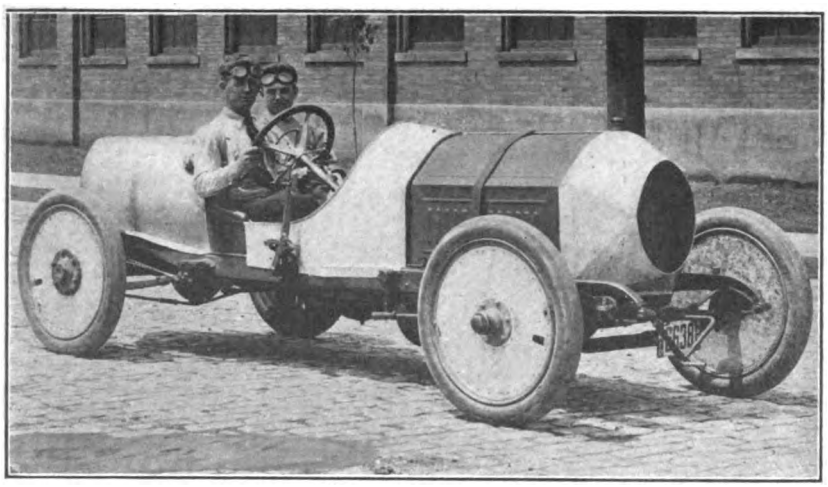
THE AUTOMOBILE JOURNAL

VOL. XXXIV, No. 4 SEPTEMBER 25, 1912 Price, $1.00 the Year

LONG DISTANCE RACING OF THE YEAR.

Resume of Contests on Road, Speedway, Track and Beach, Covering 100 Miles and Over, Shows Tetzlaff and Fiat Thrice a Winning Combination—Stutz and Mercer Divide Honors for Most Victories—Comparison of Speeds.

A REVIEW of the American long distance automobile racing events for 1912, on the eve of the Vanderbilt Cup and Grand Prize events, with the small car contests accompanying them, shows that there has been a slight decrease in the number of road races when compared with those held in 1911, and the list of such events held on speedways, beaches and circular dirt tracks is decidedly smaller. In almost every instance, however, the speed attained by the winner, and in some cases by the place cars as well, has been much greater than ever before.



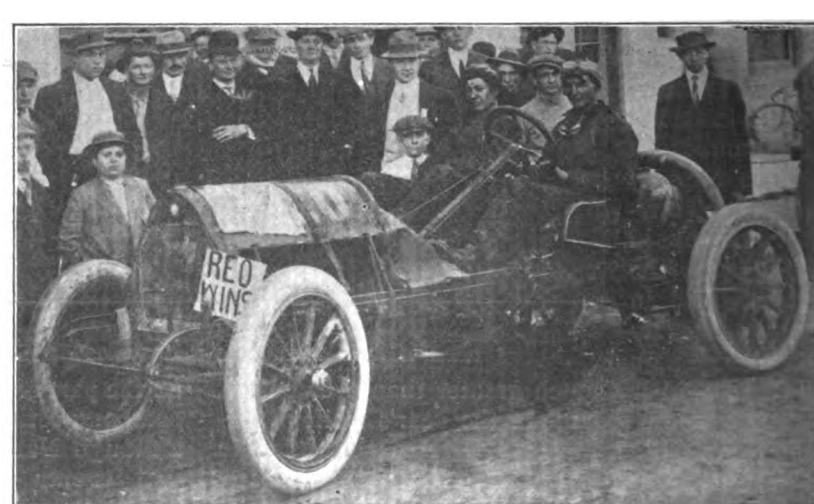
Teddy Tetzlaff and Fiat, a Combination Which Won Three Long Distance Races and Created New World's Road Record.

A complete resume of the year's work in this respect would include the events scheduled in Milwaukee and the Los Angeles-Phoenix desert race. The Milwaukee events have been postponed, as indicated elsewhere, and the date for the desert race has not been scheduled as yet. However, sufficient results have been obtained to warrant consideration of the long distance racing situation as it exists at this time.

Last year the National, made by the National Motor Vehicle Company, Indianapolis, Ind., was a most consistent winner in such events. Of the 37 held during the year the National was returned a winner 14 times, to say nothing of the second and third places secured by cars of this make. Thus far this year there has been no such demonstration on the part of any one make of car. The National company retired from racing early in the season, although National machines were driven in several events after this retirement was made known. In each instance they were entered by private owners, however.

Digitized by Google

William Endicott and Schacht with Which He Won 100-Mile Event at Old Orchard Beach, Me.



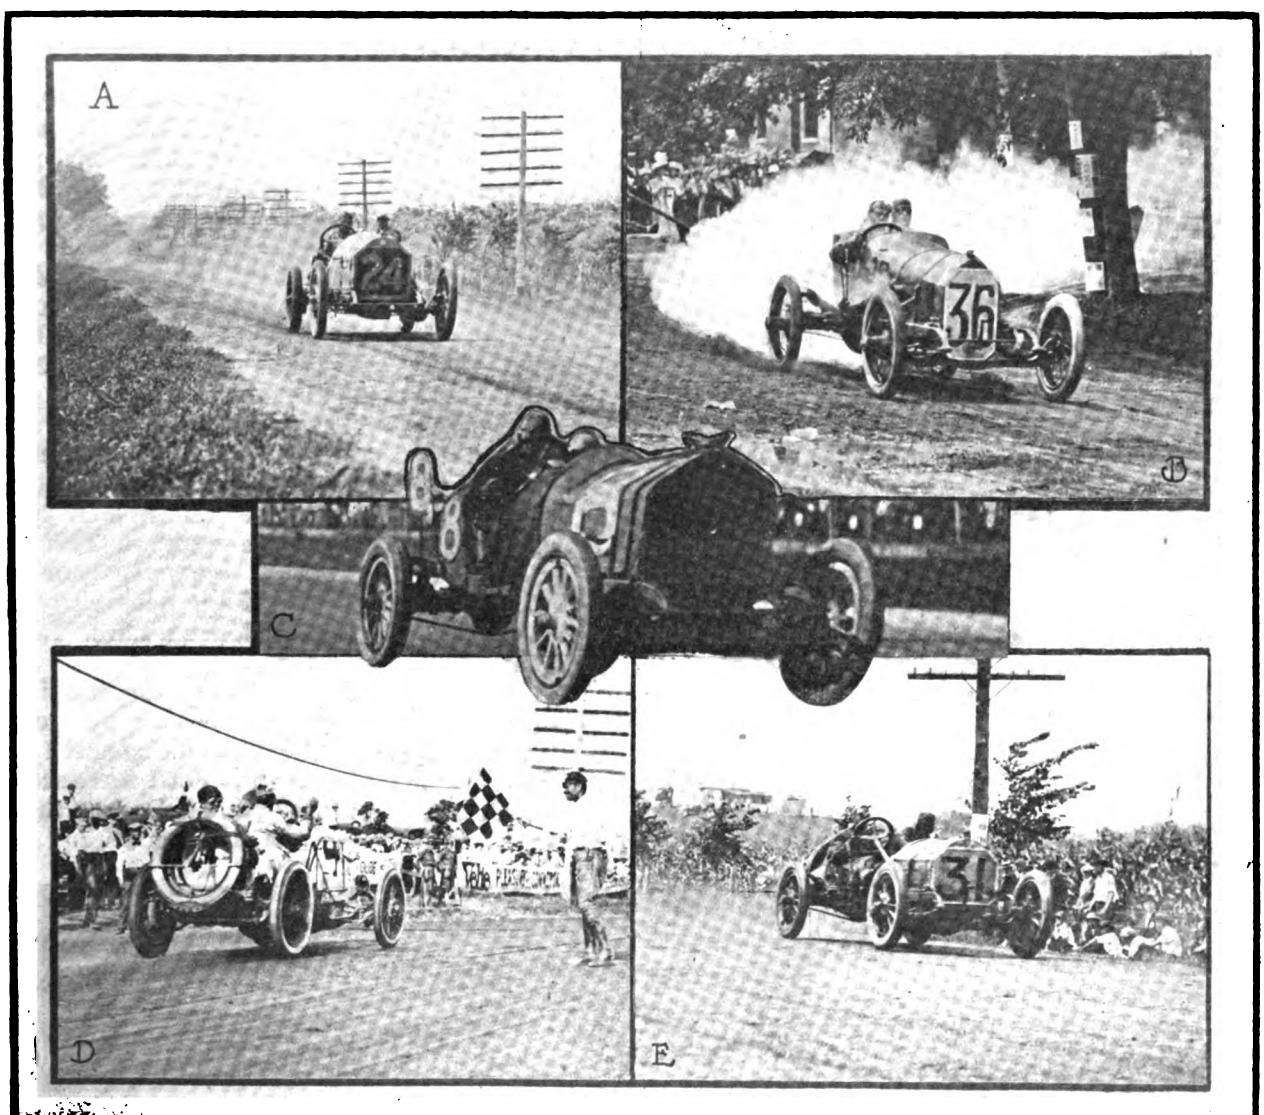
There is one feature of the situation this year which is decidedly worthy of special mention, and that lies in the fact that Teddy Tetzlaff, driving a Fiat car, made by the Fiat Automobile Company, New York City and Turin, Italy, has finished in first place in three of the 20 long distance events held thus far. This is a remarkable record, in that the three victories were obtained in three separate races, held on three separate days, and in each the same car and equipment were used. More than this, Tetzlaff and the same Fiat finished in second place in the longest race of all, the 500-mile international sweepstakes on the Indianapolis speedway, Memorial Day. And it must not be forgotten that this combination created a new world's road record at Santa Monica, Cal., May 4.

This undoubtedly is the most marked feature of the racing season, but there are others. The Stutz, made by the Ideal Motor Car Company, Indianapolis, Ind., and the Mercer, the product of the Mercer Automobile Company, Trenton, N. J., each have four victories to their credit, and as these are smaller cars, often competing in events with machines of considerable more piston displacement, this record is of decided importance.

Considering first, the Stutz: Machines of this make were victorious in the race for cars of 301-450 inches at Tacoma, Wash., July 5; first and second in the Illinois trophy event, Aug. 30; first in the contest for the Lake View trophy at Bakersfield, Cal., Feb. 22; first in a 100-mile race at Old Orchard Beach, Me., July 6; third in the Elgin National event, Aug. 31; fourth and sixth in the 500-mile race, besides finishing with honor in a number of other events. In nearly every instance they repeated the performance which brought the first Stutz machine so prominently before the public during the 500-mile event of 1911 when it completed the long grind without a stop.

The Mercer finished first for the Jepson cup at Santa Monica, Cal., May 4; first and second for the Aurora cup at Elgin, Ill., Aug. 30; first in the race for cars of 231-300 inches at Tacoma, Wash., July 5; first for the Hoster-Columbus trophy, in Columbus, O., Aug. 26, creating new records throughout, and third in the 500-mile event. When the resume of the year's racing, in all its branches, shall have been written, it will be found that the Mercer stands well at the head of the list of victorious machines in which it will have a strong contender in the Stutz.

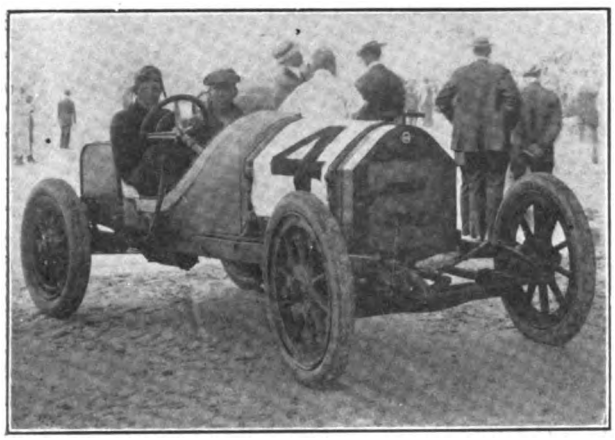
Already 20 long distance races have been held and to these must be added the four scheduled at Milwaukee and the desert event, making a total of 25, as against 37 for 1911. A careful examination of the list will show that a number of well known events have not been scheduled this year. Chief among these are the Fairmount Park contests, which added five to the 1911 total. Two



Earl Jackson, Winner of Long Distance Race at Fresno, Cal., in a Reo.

Digitized by Google

road events were contested in Cincinnati in 1911, one in Alameda, Cal., one in Bakersfield, Cal., and one in Denver. These do not appear on the 1912 list. Two long distance races were held on the Los Angeles motordrome, one on the track at Amarillo, Tex., two on the beach at Jacksonville, Fla., and two at Galveston beach. To offset these there were four road races at Tacoma, Wash., an additional event at Elgin, Ill., and another at Old Orchard beach, this year.



The results in the various events for 1912 appear in an accompanying table, but it will prove of decided interest to compare these with the figures for 1911. While this will not be possible in every instance, there is sufficient opportunity to indicate the increased speed which has been made possible.

Mention already has been made of the world's road record secured by Tetzlaff in the Fiat at Santa Monica, during the contest for the Ferris cup, May 4. Last year this race was held Oct. 14, and a new record resulted at that time. Harvey Herrick was driving a National, and the previous record was 74.3 miles an hour, held by Felice Nazarro in a Fiat since 1908, when he made it in a race for 328.2 miles over the Targa Florio

A Group of Long Distance Winners: A, Charles Merz, Stutz, Illinois Trophy; B, Hugh Hughes, Mercer, Aurora Cup; C, Joseph Dawson, National, International Sweepstakes; D, Ralph De Palma, Elgin National Trophy; E, Edward Pullen, Mercer, Tacoma, Wash.

David Lewis and the Winning Stutz at Old Orchard Beach, Me.

course. Herrick's speed was 74.62. The result of Tetzlaff's performance was to return the record to the Fiat, and the new mark was set at 78.07. In fact all three cars to finish in place exceeded the previous mark, Bragg's Fiat covering the 303 miles in 77.67, and Bruce-Brown's Benz in 76.32. Cyrus Patschke and Joseph Dawson, both in Marmons, finished first and second in 1911, the distance being 202 miles.

The next road race, in point of speed, was that for the Jepson cup, held at the same time as that for the Ferris cup. Ralph De Palma in a Mercer was the winner with speed of 69.58 miles an hour, as against 68.7 for Bruce Keene's Marmon in 1911. The distance was the same both years. This year Joseph Nikrent and Louis Disbrow, in Case cars, were first and second, and last year, Joseph Nikrent in a Marmon and Harris Hanshue in a Mercer.

The free-for-all at Elgin resulted in a speed of 69 miles an hour for Ralph De Palma in a Mercedes. No such event was held in 1911. Erwin Bergdoll, winner of last year's Fairmount Park race, was second in the same Benz with which he won the 1911 event, and Ralph Mulford, assisted by William Chandler, in a Knox was third.

Tetzlaff's second victory for the year was made at Tacoma, Wash., July 5, when he drove his Fiat 200 miles at the rate of 68.76. Mulford met with somewhat the same trouble as that which overtook him in the Elgin free-for-all, and Chandler was forced to finish the race in second place. Earle Devore in a National was third. No such event was held in 1911.

Last year's race for the Elgin National trophy was for stock cars only and covered 305 miles. Leonard Zengel in a National won the event with a speed of 66.41 miles an hour. Harry Grant in an Alco was second and Hugh Hughes in a Mercer third. This year the event was open to non-stock cars and Ralph De Palma in a Mercedes finished first with a speed of 68.28 miles an hour. Mulford in a Knox was second and Charles Merz in a Stutz third.

Earl Cooper in a Stutz took the 150-mile event at Tacoma, Wash., July 5 with a speed of 66.66 miles an hour. Earle Devore in a National was second and Rossi in a Pope-Hartford third. There was no race in 1911 with which comparison may be made.

Two Stutz cars, one driven by Charles Merz and the other by Gilbert Anderson, were the only ones to finish in this year's race for the Illinois trophy. Merz's speed was 66.15 for the 203.5 miles. Last year the distance was the same and two Nationals, one driven by Donald Herr and the other by Charles Merz, were the only ones to finish. Herr's speed was 65.81.

The third victory for the Tetzlaff-Fiat combination was in the 250-mile event at Tacoma, Wash., July 6. His speed was 66.08. Erwin Bergdoll in his Fairmount Park Benz was second, and Earle Devore in a National third. There were no Tacoma races last year.

The 1911 race for the Aurora cup was held over a 137.5-mile course and was won by Mortimer Roberts in an Abbott-Detroit, his speed being 54.59. Frank Kulick in a Ford was second and Robbins in another Abbott-Detroit third. This year the distance was 152.5 miles and the

George Joermann and Maxwell, Winner of Light Car Race at Santa Monica, Cal.

Digitized by Google

winner, Hugh Hughes in a Mercer, his speed being 65.17. Edward Pullen in a second Mercer was second and H. Trussel in a Fal-Car third.

The 1912 race for the Chanslor & Lyon trophy at Santa Monica, Cal., was won by George Joermann in a Maxwell, who covered the 101 miles at a speed of 62.23. Two Flanders cars, driven by Evans and Tower, were second and third. Last year Louis Nikrent in a Buick won the cup over the same course with a speed of 59.2. Charles in a Ford was second and Siebel in an E-M-F third.

Edward Pullen in a Mercer was the only driver to finish in the 150-mile race for cars of 231-300 inches at Tacoma, Wash., July 5. His speed was 61.19 miles an hour. In the event for cars of under 230 inches, at the same time, the conditions at the finish were somewhat reversed over those which obtained at the conclusion of the race for the Chanslor & Lyon trophy, in which the same machines competed. Evans' Flanders was first with a speed of 61.05, Tower's Flanders second and Joermann's Maxwell third. The distance was 100 miles, practically the same as that for the California event earlier in the year, and Joermann's speed this time was 58.65.

Only one machine, Harry Endicott's Mason, finished in the race for the Jencks award at Elgin, Ill., Aug. 30. The distance was 101.7 miles and the speed 60.61. No such event was held in 1911.

Another new road race for 1912 was that held at Fresno, Cal., April 21. Earl Jackson in a Reo was the winner, ,the distance being 197.4 miles and the speed 51.77. Thomas McKelvery in an Overland was second and Bruce Arent in an Elmore finished in the third position.

The 1911 race for the Lake View trophy over a 212-mile course at Bakersfield, Cal., may be compared in some respects to that for the Levis trophy over a 156.1-mile course in the same country in 1911, although the results would seem to indicate that the additional mileage was such as to give the cars a more strenuous test. Harvey Herrick in a National won last year's event at a speed of 52.35. Bert Dingley in a Pope-Hartford was second and Siefert in a Mercer third. Charles Bayes in a Stutz was the winner this year, but his speed was cut to 36.86. Klipstein in a Mitchell

was second, and a Buick was awarded third position.

This completes the list of long distance road events held thus far. Three beach races of over 100 miles were contested this year and it is possible to make some comparison in these.

A free-for-all covered 150 miles at Galveston, Tex., in 1911, with Leonard Zengel in a National as the winner, his speed being 71.39. Rader in a second National was second and Harry Endicott in an Inter-State was third. This year's free-for-all went 200 miles and apparently the beach was not as fast. Louis Disbrow in a Simplex was the winner, his speed being 64.41. Harry Endicott in a Mason was second and George Clarke in a Mercedes third.

But if the Galveston beach does not show up so fast this year that at Old Orchard, Me., appears to somewhat better advantage, and bears out the assertion that it is to become the fastest beach in the country. Last year there was but one 100-mile event there, this being won by John Rutherford in a National, with a speed of 61.24. Louis Disbrow in a Pope-Hartford was second, and Holt in a second Pope-Hartford third.

Harry Endicott and Mason with Which He Took the Jencks Award at Elgin, Ill.

This year there were two such races at Old Orchard, and in both of them better speed was made than in 1911. William Endicott in a Schacht won the first July 5 at a speed of 62.11. Rutherford in his National was second and Neil Whalen in another National third. The second event of this character was run July 6 and was won by David Lewis in a Stutz, his speed being 64.16. William Endicott and his Schacht were second and Harry Cobe in a Jackson third.

The only long distance speedway race of the year was the 500-mile international sweepstakes at Indianapolis, Ind., May 30. In every respect this may be compared to the same event in 1911. Ralph De Palma in a Mercedes gave every promise of winning the contest, until the next to the last lap, when he was compelled to withdraw. Joseph Dawson, who last year drove a Marmon, at the wheel of a National covered the 500 miles at a speed of 78.74, and finished a winner. Teddy Tetzlaff in his victorious Fiat combination was second with a speed of 77.11, and Hugh Hughes in his little Mercer was third, his speed being 76.33. It will be noted that the speed of all three was well above 74.59, that made by Ray Harroun in the Marmon with which he took the 1911 event. Last year Ralph Mulford in a Lozier was second and David L. Bruce-Brown in a Fiat third.

The 200-mile dirt track race for the Hoster-Columbus trophy in 1912 finds its counterpart in the contest for the same distance over the same course for the same trophy in 1911. Last year Harry Knight in a Westcott took the event with a speed of 53.66. M. Borst in a Jackson was second and J. Borst, his brother, in another Jackson, third. This year Spencer E. Wishart, who for the first time in his racing career was seen at the wheel of an American machine, a Mercer, created new world's track records for the distance, finishing a winner at the speed of 57.49. Howard Wilcox, an old National driver, was second in a Cino, and John Jenkins, who drove a Cole to secure a number of victories in 1911, was third in another Cino.

As an indication of what may be expected from the races yet to be held, it may be added that David L. Bruce-Brown took last year's Grand Prize for the second time, in a Fiat, his speed being 74.43 miles an hour for the 411.38 miles. This year he must cover 409.46 miles, and he will be seen at the wheel of a Fiat. Edward Hearne in a Benz was second, and Ralph De Palma in a Mercedes third.

Last year the Vanderbilt cup was taken by Ralph Mulford in a Lozier, his speed for the 291.38 miles being 74.07. This year he will drive a Knox and cover 298.5 miles. Ralph De Palma

Digitized by Google

and Spencer E. Wishart, both in Mercedes cars, were second and third in 1912.

The 1911 race for the Savannah Challenge trophy was for 222.82 miles, and compares with this year's event for the Pabst Blue Ribbon trophy, covering 220.6 miles. Hugh Hughes in a Mercer won last year with a speed of 68.34. Heinemann and Joseph Nikrent, both in Marmon cars, were second and third. Hughes will drive a Mercer in this year's event.

The event for the Tiedeman trophy in 1911 will compare with the 1912 races for the Wisconsin trophy. Three E-M-F cars, driven by Witt, Evans and Tower, finished in that order, Witt's speed for the 170.4 miles being 57.53. This year's race will cover 173.4 miles.

In the desert race, yet to be held, it is presumed that the distance will be the same as last year, 518 miles. Harvey Herrick won in a National, his speed being 24.47. Hamlin in a Franklin was second and Carrigan in a Midland third.

MILWAUKEE RACES POSTPONED.

When the Milwaukee Automobile Dealers' Association, Milwaukee, Wis., selected the dates for the 1912 Vanderbilt Cup and Grand Prize races, it failed to take into consideration the possibility of inclement weather. So much rain fell in the vicinity of that city during the early part of the month that those engaged upon the construction of the course were unable to complete their work in time for the Grand Prize event, which was scheduled for Sept. 17, and a few days before the race was to be run it was found necessary to postpone this event until Sept. 23.

This made the contests for the Pabst Blue Ribbon trophy and the Wisconsin trophy, the first on the list, scheduled for Friday morning, Sept. 20, but when the cars were lined up for the opening gun it was decided that the course was too wet for fast speed, and these were postponed until Sept. 24. The Vanderbilt event was originally scheduled for Saturday, Sept. 21, and again it was found impossible to permit the cars to get away. Accordingly a meeting of the management was held and the entire programme was put over until Oct. 2, 3 and 5.

Under the new plan the Vanderbilt Cup event will be held Oct. 2; the Pabst and Wisconsin races Oct. 3 and the Grand Prize Oct. 5. This will give two days of practise between the two big contests, which was demanded by the drivers. In addition the management will pay the expenses of the drivers during the two weeks' wait. The full list of entrants for the various events are:

Vanderbilt Cup, 298.5 Miles.

PENN WINS AT PULASKI.

Three cars competed in a 10-mile race, covering 20 laps of a half-mile track at Pulaski, Penn., Sept. 12, the winner being a Penn, made by the Penn Motor Company of New Castle, Penn. The three machines and their drivers were: Penn, Colnot; Buick, Weaver, and Maxwell, Davis. They finished in that order, the winner's time being 13:30. The contest created much interest and other events may be scheduled later.

CENSUS FIGURES SHOW ENORMOUS GROWTH.

WHILE the result of the 13th census of the United States, insofar as it related to the automobile industry, was known in a general way about a year ago, the figures now available from the director of census give the exact standing for the period of 1904-1909. The advance information contained some surprises, but even the industry itself hardly was prepared to learn that its increase during the five years was 729.7 per cent. in value of products, and 528.4 per cent. in average number of wage earners employed. In this respect the industry stands at the head of the list, its nearest competitor having an increase of 357 per cent. in value of products and 297.3 in number of wage earners.

Even the director of census is forced to remark: "The growth of the automobile industry has been phenomenal." In 1899 the general statistics for the industry were included with those for carriage and wagon manufacture, and only 3897 automobiles were reported. In 1904 the total number, including automobiles made by concerns classified under other industries, was 22,830, while in 1909 the number was 127,287, or nearly 33 times that reported in 1899.

The value of all products of the industry proper was $249,202,075 in 1909 and $30,033,536 in 1904. Gasoline machines formed 95.1 per cent. of the total number made in 1909 and 86.2 per cent. in 1904. Of the total number manufactured in 1909, 3226 or 2.5 per cent. were rated at 50 horsepower or more; 51,218, or 40.5 per cent., at from 30 to 49; 35,257, or 27.8 per cent., from 20 to 29; 29,353, or 23.2 per cent., from 10 to 19, and 7539, or 6 per cent., at less than 10. Passenger vehicles constituted 97.4 per cent. of the total number and business vehicles, 2.6 per cent.

It must be remembered that these figures are for 1909, and that was nearly three years ago. The growth of the industry since the taking of the census undoubtedly has not been as rapid as during the five years considered in this report, but it hardly will be denied that a census today would reveal a much larger percentage of business vehicles.

The report also shows that the manufacture of automobile products, other than completed vehicles, including bodies and parts, was valued at $5,431,249 in 1904, and $78,584,753 in 1909, indicating the growth of the so-called accessory end

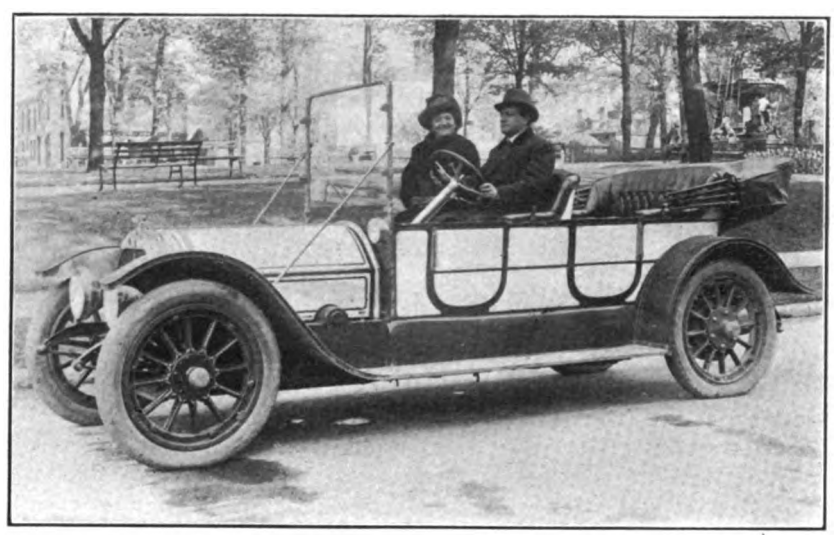
of the industry. The custom work and repairing is taken care of with a report of $851,053 in such work during 1904 and $6,347,998 in 1909.

In this same connection it is of interest to note the report concerning motorcycles, which by the way, is included with bicycles, as was the case in 1899 and 1904. And here it is stated that there has been a marked decline in the manufacture of bicycles and tricycles and a decided increase in the production of motorcycles. The exact effect of the motorcycle upon the industry may be noted from the following comparison: In 1899, 160 machines valued at $33,674; in 1904, 2300 at $354,980, and in 1909, 18,628 at $3,015,988.

There is still another phase of the situation to be found in the report concerning carriages and wagons, and here it is stated that the carriages were both fewer in number and lower in value in 1909 than in 1899. The value of wagons increased 28.5 per cent., though the number manufactured was very little larger in 1909 than in 1899. Public conveyances also show a decrease in value, but a slight increase in number. In each of these three classes, the decreases that appear for the decade as a whole have taken place entirely since 1904, in which year the numbers and values reported exceeded those for 1899. "The decreases are presumably due to the growth of the automobile industry," says the report.

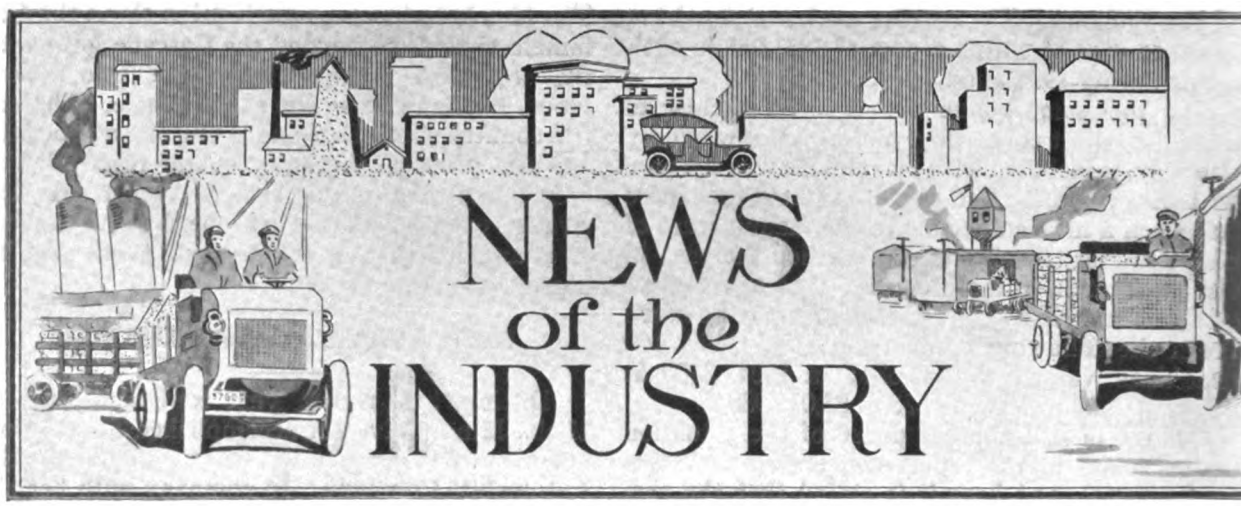


There were 743 establishments in the automobile industry, including those engaged in the production of bodies and parts, in 1909, as against 178 in 1904. In the 743 establishments, 85,359 persons were employed, 405 of these being proprietors or members of the firm, 758 salaried officials, 1401 superintendents and managers, 7074 clerks and 75,721 wage earners.

SCENIC BOULEVARD PLANNED.

Backed by the local business men and members of the Portland Automobile Club, the Lower Columbia Boulevard Association has been formed at Portland, Ore., having as its object the construction of a boulevard from Portland to the sea. The project is an ambitious one and the sponsors are confident that its realization would prove a conspicuous source of international advertising and attract tourists from all parts of the world. The idea is to have a superb drive along the Columbia river from beyond the Cascade gorges to the sea, with a branch running out to Mount Hood, Portland being the radial centre. The entire country about Portland is one of great beauty and the proposed highway would reach all the scenic treasures of the region, which are unrivalled even by famous European beauty spots. It is anticipated that construction work will be begun early next season.

MME. CALVE FAVORS AUSTIN.



During her recent visit to Grand Rapids, Mich., Mme. Calve, the accomplished singer, took opportunity to inspect the factory of the Austin Automobile Company. In company with her almost equally gifted husband, Signor Galileo Gasparri, she met Walter S. Austin, designer of the car, and was taken for a short ride through the environs of the city. Upon her return she was so well pleased with the riding qualities of the machine that she ordered it shipped direct to her home, the castle Cabrieres, in the Pyrenees mountains, south of France.

Mme. Calve and Signor Gasparri in Their New Austin Car.

Mme. Calve is an ardent motorist and the possessor of several cars de luxe. Her selection of the Austin, therefore, is a matter of decided import to the Austin Automobile Company. Her car, which is shown in an accompanying illustration, is known as the company's model 77, a six-cylinder machine in ivory white and tan. In every respect it is the regular standard Austin product, and a machine which has given eminent satisfaction in the hands of many motorists in this country and abroad.

UNITED STATES MOTOR COMPANY.

Business in the Hands of Receivers and Plans Offered for Its Reorganization.

The situation with reference to the financial condition of the United States Motor Company, New York City, capitalized for $42,500,000, was brought to a decided head Sept. 12, when the Brown & Sharpe Manufacturing Company, Providence, R. I., filed a bill of complaint in the United States court of equity, alleging that the concern was insolvent and asking for the appointment of a receiver. Later that same day Judge Charles M. Hough of the United States district court for the southern district of New York, appointed W. E. Strong, a representative of the banking interests and recently chosen a director of the United States Motor Company, and Robert Walker, an attorney, as receivers. These men have instructions to continue the business of the concern and report to the court by Oct. 28. Still later the same men were appointed ancillary receivers to look after the business of the various subsidiary companies.

The present difficulty had its origin some time in June, when it became known that the company would be unable to meet some $750,000 in paper then due, and an extension of 90 days was granted by a creditors' committee. At that time an advisory committee was appointed, some of the members being representatives of the financial interests involved, its object being to continue the business and to give equal protection to all creditors. This grace period expired Sept. 13.

Several plans for reorganizing the company, or at least of refinancing it were considered by the advisory committee, and a number of interviews were granted in which it was stated that the condition of the company was such that if it could secure necessary money all difficulties would be met. It is stated that the action of the Providence concern was taken with the approval and at the request of a majority in amount of the entire indebtedness, representing claims of some $7,000,000. The Brown & Sharpe company is a creditor for $70,000 in merchandise.

According to the petition the liabilities of the company are estimated at $12,250,000, consisting of $6,000,000 of debenture bonds and claims against the company by banking interests and for merchandise totalling $6,250,000. The assets are claimed to be valued at $15,000,000, these consisting of cash, bills receivable, etc., and are held to be embarrassed by the factory plants of the subsidiary companies, which are scheduled at $6,250,000, against which there is a mortgage of $200,000. Quick assets of July 31 are said to be $9,250,000, of which $4,000,000 represents factory inventories and the remainder cash in hand and bills receivable.

The suit involves all of the subsidiary companies, including the Maxwell-Briscoe Motor Company, Tarrytown, N. Y.; Columbia Motor Car Company, Hartford, Conn.; Dayton Motor Car Company, Dayton, O.; Brush Runabout Company, Detroit, and Alden Sampson Manufacturing Company, Detroit. It is understood that the capital stock of the E. R. Thomas Motor Car Company, Buffalo, N. Y., also was acquired by the United States Motor Company, some time within a year, and as this concern already is in the bankruptcy court it appears to be difficult to determine just how the suit affects this. There also are a number of companies engaged in manufacturing parts, etc., which are subsidiary con-

Digitized by Google

cerns of the United States Motor Company.

It is stated that all of the subsidiaries, with the possible exception of the Brush Runabout Company, and of course, the E. R. Thomas Motor Car Company, are continuing production in about the same manner as they were 90 days ago. The receivers are said to have obtained permission from the court to advance sufficient money to meet the payrolls at the various plants from the general funds of the company and to make provision for administration.

Briefly stated, it would appear that the total indebtedness of the United States Motor Company is divided into two classes, the first of which is represented by commercial paper bearing two indorsements, one by the parent organization and the other by at least one of the subsidiary companies. The other class has paper with only one indorsement, and it is stated that practically all of the claims for merchandise are of this class.

Under the receivership action there are held to be two courses of action open to the company. The first is reorganization under some plan that will take care of the creditors and permit the company to secure sufficient working capital to manufacture and sell its product. It is stated that about $5,000,000 is needed for these purposes. The other course is a sale in open court.

The committee is still at work formulating a plan for reorganization, and any attempt to state the amount of assessment or the method proposed is held to be premature by the committee. However, some mention has been made of a possible assessment of $20 or $25 a share, which former figure is said to be sufficient to raise about $4,600,000. At $25 a share, some $5,750,000 would result, and this is held to be sufficient for all present needs.

According to the petition filed in court it would appear that the subsidiary companies are indebted to the parent organization and are liable as makers or indorsers of notes as follows:

Alden Sampson Manufacturing Company.

United States Motor Company	$1,069,278.72
Notes and accounts	50,014.13
Total	$1,119,292.85

Brush Runabout Company.

United States Motor Company	$1,027,663.38
Notes and accounts	6,650.29
Total	$1,034,313.67

Columbia Motor Car Company.

United States Motor Company	$256,134.23
Notes and accounts	149,406.92
Total	$405,541.15

Dayton Motor Car Company.

United States Motor Company	$2,045,358.72
Notes and accounts	416,578.67
Total	$2,461,937.39

Maxwell-Briscoe Motor Company.

United States Motor Company	$69,929.83
Notes and accounts	1,909,949.25
Total	$1,979,879.08

The total money on hand and receivables of the subsidiaries on Sept. 7, 1912, according to the same source of information, were as follows:

Alden Sampson Mfg. Co	$40,315.79
Brush Runabout Co	79,787.21
Columbia Motor Car Co	31,036.02
Dayton Motor Car Co	247,252.69
Maxwell-Briscoe Motor Co	282,761.27

OPENS NEW FIELD.

Detroit Concern Will Produce Chassis for Those Who Desire to Fit Bodies Thereto.

The Detroit Motor Chassis Company, Detroit, has been organized with capital stock of $25,000 to manufacture complete chassis for carriage builders and other concerns which desire to supply bodies and equipment to market complete cars under their own names. The company claims to have discovered an insistent demand for this class of work. A plant has been secured at 960 Champlain street, Detroit, and deliveries are expected to begin about Nov. 1.

The officers are all men who have been identified with the motor industry for several years and are as follows: President, A. J. Kinucan, formerly connected with several Detroit automobile factories; vice president, M. C. Dewitt of the Jeffery-Dewitt Company; secretary, L. J. Stringer, formerly with the Hudson Motor Car Company; treasurer, William P. Culver of the Culver-Taylor Chain Company.

WORKING DAY AND NIGHT.

Many New Structures Urgently Needed to Take Care of Goodyear's Increasing Business.

As an indication of the wonderful growth of the Goodyear Tire & Rubber Company, the new buildings now in course of construction afford ample conception of the progress made in the past two or three years. In addition to those recently completed other structures to accommodate the increased business are being erected. A new office building, modern in every particular and housing 500 employees, was occupied recently, thus relieving the congestion previously existing.

Adjacent to the old administration building is a new two-story garage, almost completed, with an extra story at the front to be used as an assembly room. The structural iron work of the new No. 6 building also is nearing completion.

Digitized by Google

This factory will be 403 by 80 feet and will be six stories in height with a basement. Excavations are being made for a new five-story building measuring 250 by 60 feet and an extension 325 by 40 feet is being made to building No. 14.

These three structures are expected to be completed by the end of the year and will be utilized to meet the increased demand for automobile tires, bringing the capacity of the plant up to 8000 automobile tire casings a day. Two stories have been added to No. 13 shop, making it a five-story structure and increasing the capacity of tire output. The Goodyear plant is now working night and day turning out its product.

STILL NEEDS MORE ROOM.

Maker of KisselKar Finds Addition of Two Big Buildings Was Not Sufficient.

The Kissel Motor Car Company, Hartford, Wis., recently added two commodious buildings to its plant with the purpose of giving facilities that would enable the company to accomplish its annual output with less forced production schedule. It appears, however, that the demand for KisselKars has outgrown the factory growth and double the early orders of 1912 have been booked for 1913.

It is interesting to note in this connection that the Kissel Motor Car Company has enjoyed a wonderful expansion the past six years, having grown from a $50,000 to a $1,000,000 corporation.

NEW COLE SALES POLICY.

Country Divided and Placed in Charge of Experienced Men as Sales Managers.

President J. J. Cole of the Cole Motor Car Company, Indianapolis, Ind., maker of the Cole cars, has devised a system of conducting the sales department of the company so that he anticipates it will give the greatest possible efficiency. The country has been divided into territories with district sales managers in charge of certain allotted districts. The plan is to give Cole agents and owners stimulated co-operation by the sales managers keeping in direct personal touch with them. The force of sales thus created will work in harmony with President Cole and his sales force at Indianapolis.

J. R. Moler has been allotted the territory west of the Rockies and in the Dominion of Canada. He has for 18 years been connected with the promotion of sales and agency work. C. J. Corkhill, a pioneer automobile man, who entered th field with the Olds Motor Works and more re cently was with the Apperson company in Ne braska, takes the district bounded by the Missis sippi river on the east and the Rockies on th west. George H. Strout, a graduate from the bi cycle business, formerly sales manager for th Columbus electric, and later sales manager for th Apperson, is given jurisdiction over the South west and part of the Middle West; E. C. Frady head of the Cole Motor Company of Chicago takes the North Central states, while William L Colt, president of the Colt-Stratton Company Boston, Cole eastern distributor, takes charge o a territory east of a line drawn north from Wash ington, D. C., to Syracuse, N. Y.

REMOVE CARBURETOR PLANT.

Marvel Company Interests Flint Capital and Purchases Building in That City.

The Marvel Carburetor Company, Indianapolis, Ind., which recently accepted a proposition of the Flint Board of Commerce, has completed the removal of its plant from Indianapolis to Flint, Mich., and manufacturing operations in the new factory have been begun.

Several Flint business men have become financially interested in the company, the management of which still remains in the hands of A. G. Schonacker. The new plant is a three-story building on Mill street, 50 by 150 feet, and a total output of 300 carburetors a day will be accomplished.

ANOTHER TRUCK CONCERN.

Brockway Company to Produce Three-Cylinder, Two-Cycle, Air-Cooled Models.

The Brockway Motor Truck Company, Cortland, N. Y., has recently been incorporated with a capital of $100,000 for the purpose of manufacturing a line of popular priced, high grade commercial motor trucks, of which three models will be made with load carrying capacity of 1000-1500 pounds, 2000-2500 pounds and 3000-4000 pounds respectively. The officers of the company are President, George A. Brockway; vice president C. S. Pomeroy; treasurer and general manager, F R. Thompson.

George A. Brockway, president of the concern is well and favorably known throughout the United States as a successful manufacturer of high grade carriages and wagons, at present being also president of the W. N. Brockway Com-

Digitized by Google

pany. Homer, N. Y., a company known in this country for over 60 years. The Brockway trucks will also be a high grade product, manufactured to rival the quality of the horse drawn vehicles made in the past.

Rodman S. Reed is chief engineer and superintendent of the company, in which capacity he was formerly connected with the Chase Motor Truck Company, Syracuse, N. Y., for six years. Every part of the Brockway vehicle, including the motor, which is a three-cylinder, two-cycle, air-cooled unit, is built in the new plant under the supervision of widely experienced engineers.

NEW ACCESSORY MAKER.

Concern Organized in Indianapolis for Production of Tops, Seat Covers, Etc.

Frank L. Glover has been elected president and general manager of the Glover Equipment Company, Indianapolis, which has been incorporated under the laws of Indiana with a capital stock of $20,000. The concern will manufacture automobile tops, seat covers and similar goods. Temporary quarters have been secured at 142 West Market street, Indianapolis.

Mr. Glover was formerly identified with the R. J. Irwin Company and the Gates Manufacturing Company of Indianapolis and has a wide experience in the automobile accessory business. The other officers of the new company are: Vice President, Leonard Geiger; treasurer, William Umphrey; secretary, Louis Libking.

WILL DEAL IN USED CARS.

Boston Men Unite to Handle Machines Taken in Trade by Reputable Agents.

A new organization to handle high grade used cars has been formed at Boston and is known as the Massachusetts Auto Clearance House, with headquarters in the old Boston Cab Company's building at 108-110 Massachusetts avenue. George W. Tolman, for some time in charge of the used car department of the Whitten-Gilmore Company, and Edward H. Houtz, who was manager of the used car department of the Thomas Motor Car Company, will direct the affairs of the new company.

Both men have in their long experience become experts in their particular line and will endeavor to make their concern all that its name implies, a clearing house for used cars taken in trade by a number of reputable dealers.

GOES WITH CHASE TRUCK.

R. B. Curtiss Leaves Royal Equipment Company to Manage Chase Branch in Cleveland.

Royal B. Curtiss, formerly sales manager of The Royal Equipment Company, Bridgeport, Conn., has become district manager of Chase Motor Truck Company, Syracuse N. Y., maker of the Chase truck, with headquarters at Cleveland, O. Mr. Curtiss will have jurisdiction over territory embracing Ohio, West Virginia, Kentucky, Indiana, except in the vicinity of Chicago, Michigan and Western Pennsylvania.

Royal B. Curtiss, District Manager, Chase Motor Truck Company.

Mr. Curtiss is well known to many who are interested in the manufacture of motor cars or accessories and he has the well wishes of many friends in his new connection with the Chase company. He regretted sincerely being obliged to sever his relations with the Royal Equipment Company, but the idea of connecting himself with the delivery wagon feature of the industry appealed to him strongly. He is succeeded as sales manager of the Royal company by Mr. Everitt.

TWO NEW BUILDINGS.

Contracts for 1913 Remy Magnetos Make Necessary Substantial Factory Additions.

The Remy Electric Company, Anderson, Ind., has broken ground for two additional new fireproof buildings to its plant, which are expected to be completed and fully equipped within two weeks. This substantial addition was made necessary by the great volume of magneto business for which the Remy company has contracted with

Digitized by Google

car manufacturers for the 1913 season.

The new buildings will give the concern an increase of 10,600 square feet of floor space. The Remy company claims its factory is the largest of its kind in the world, employing over 1000 men and working day and night shifts. The company also makes the statement that during the next 12 months it will deliver more magnetos to the automobile trade than all other makers combined.

DAY JOINS GENERAL MOTORS.

Former Head of Mitchell Sales Force to Conduct Motor Truck Business.

The automobile world was much interested in the announcement by President Thomas Neal of the General Motors Truck Company, Pontiac, Mich., that William L. Day, formerly general sales manager, Mitchell-Lewis Motor Car Company, Racine, Wis., had been elected vice president and general manager. Mr. Day accepted the appointment and resigned from the Mitchell-Lewis Company, the resignation taking effect the first of this month.

William L. Day, General Manager, General Motors Truck Company.

Previous to his advent in the automobile business, Mr. Day was for 27 years a prominent figure in the implement industry, being associated in an official capacity with the Parlin & Orendorff Plow Company, Kansas City, Mo. He bears the reputation of being an able and efficient executive and his years of marketing and production will be invaluable in his new duties.

Gleeson Murphy, who temporarily filled the office of vice president and general manager of the General Motors Truck Company, will return to his regular work of assistant to the president of the concern. In this position he has become widely known throughout the industry as an expert on motor truck problems.

ESTABLISHES BRANCH FACTORY.

Swinehart Tires to Be Produced in Large Quantities in New St. Louis Plant.

J. A. Swinehart of Akron, O., has made the announcement that a factory and distributing station will be established at St. Louis, Mo., for Swinehart tires, the new company being capitalized at $500,000, all of which, except that provided by Mr. Swinehart, has been subscribed by St. Louis capitalists. A building in the centre of the city, near the motor row, has been secured and it is expected that the value of the annual output of the new plant will be $1,000,000.

The inducements which are said to have operated strongly in establishing the St. Louis factory, were the cheap electric power from Keokuk dam, low cost of coal, the excellent water supply the advantage of St. Louis as a distributing point and excellent labor conditions. It is pointed out that rubber comes from South America mostly and with the opening of the Panama canal it can be shipped to St. Louis on attractive terms, making that city superior to an eastern location. Besides making the full line of solid and pneumatic tires and inner tubes, the company will feature the Krots tire, a solid member for light delivery wagons and electric broughams.

THE NEW YORK SHOW.

Application Blanks Are Issued and Plans Call for Two Big Displays in One.

Like the automobile shows of the last two years the forthcoming exhibition at New York, to be held Jan. 11-25, will be two shows in one, in both the Grand Central Palace and Madison Square Garden. During the time between Jan. 11 and 18, known as the Part 1 period, passenger carrying or pleasure vehicles will be shown in both buildings and during the Part 2 period, from Jan. 20 to 25, commercial vehicles will be displayed in the same manner, while accessories will be exhibited during the two weeks.

The show committee of the Automobile Board of Trade, under whose direction the exhibition will be held, has been working on the details since early spring. It will be the 13th national automobile show and application blanks for exhibition space were issued a few days ago. Judging by the requests, which have been received rapidly the indications are that the show next winter will eclipse any exhibition of its kind ever held. Merle L. Downs, secretary of the show commit-

Digitized by Google

tee, 7 East 42d street, New York, has increased his staff of employees in order to meet the demand for information and application blanks. A plan of decoration for both the Garden and the Palace is being worked out, which will be unusually attractive.

ACQUIRES NEW PLANT.

Empire Automobile Company Prepares for Splendid Year's Business During 1913 Season.

The Empire Automobile Company, Indianapolis, Ind., manufacturer of the Empire line, has contracted for the building of 5000 Empire touring cars and roadsters during 1913. The programme as prepared provides for the manufacture of the product at three points, one at Greenville, Penn., another at Knightstown, Ind., and the third in the largest factory, at Connersville, Ind.

The first move in the realization of the project to increase the output of the Empire machines was made when the stock and machinery of the Connersville Wheel Company was purchased recently by the Muncie Wheel Company, Muncie, Ind. The latter company is to move the machinery of the Connersville plant into its own factory at Muncie, thus making room for the occupation of the Connersville buildings by the Empire company. Before its sale the Connersville Wheel Company was owned by W. B. Anstead, E. W. Anstead, C. C. Hall, M. R. Hall and J. M. Heron.

These men also control the Central Manufacturing Company, Rex Buggy Company, Indiana Lamp Company and the Anstead Spring & Axle Company, all Connersville enterprises, through which are produced nearly all the parts which enter into the Empire automobiles. Last year the parts were shipped to the factory at Greenville, Penn., where they were assembled, but the evident advantage of having an Empire factory located in the same city where most of the parts were manufactured resulted in the deal between the wheel concerns.

Since the completion of that deal the Empire Automobile Company has entered into a contract with W. B. and E. W. Anstead, C. C. and M. R. Hall and J. M. Heron for the building of the Empire cars for a period of five years. Besides the building vacated by the wheel company, two new buildings are under construction and deliveries from the plant are expected by November.

This season 2000 cars will be built there by June 1, 1913, 2500 at Greenville and 500 at Knightstown. The Empire company was reorganized this year with additional capital and with C. E. Gibson as general manager.

JOINS PACKARD COMPANY.

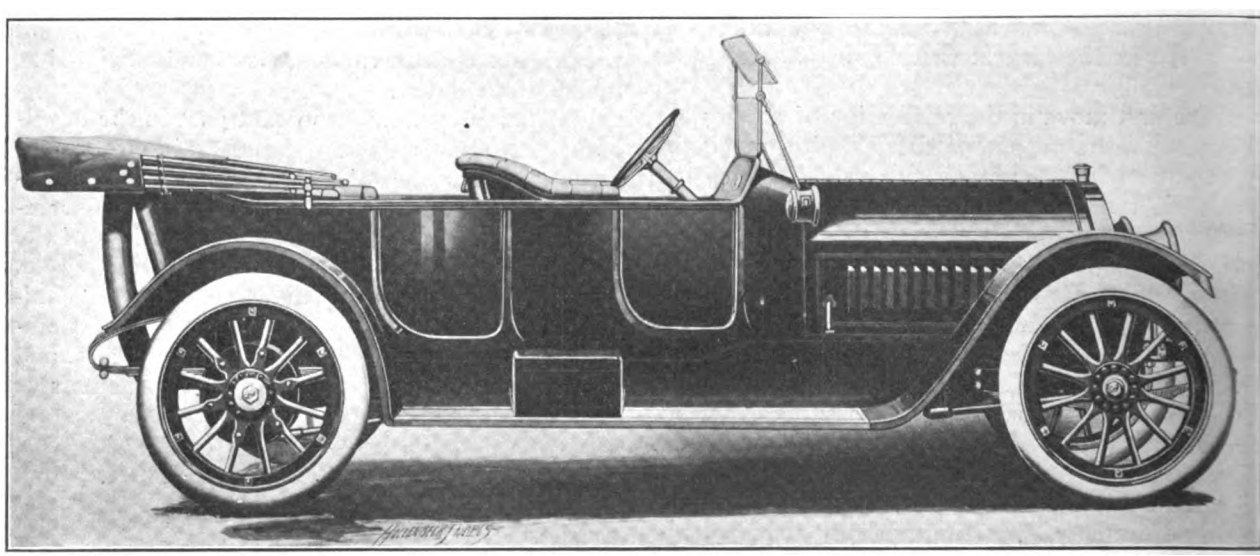
Frank H. Trego Will Take Charge of Research Engineering Department in Detroit.

Frank H. Trego, who was until recently chief engineer of the E. R. Thomas Motor Car Company, Buffalo, N. Y., maker of Thomas pleasure cars, has returned to Detroit to take charge of the department of research engineering for the Packard Motor Car Company, manufacturer of the Packard machines. Mr. Trego is widely known in automobile circles through his connection with the technical side of the American Automobile Association's contests, having drawn up the original contest rules for 1910 and officiated at international races.

He has played an important part in the development of numerous improvements in motor construction. As one of the organizers of the Chicago Motor Club he was for two years its secretary. He was also one of the six founders of the Wolverine Automobile Club, Detroit. Mr. Trego was formerly one of the managers of the technical department of the Hudson Motor Car Company, Detroit, manufacturer of Hudson cars, and for a number of years he has been an extensive contributor to technical journals.

PROMOTION FOR WILLMAN.

Succeeds Wilson as Sales Manager for Warren Motor Car Company at Detroit.



G. L. Willman has been appointed to the office of sales manager of the Warren Motor Car Company, Detroit, maker of the Warren cars, to succeed George D. Wilson, who has become the eastern representative of the Warren company, with headquarters at New York. Mr. Willman, although a comparatively young man, possesses a varied experience.

He is a graduate of Harvard University, an expert in technical telephony, has been an instructor in salesmanship, is a fluent writer and has been an irregular contributor to several national magazines. He was connected with the Detroit Chamber of Commerce during the time that Lucius E. Wilson, vice president and general manager of the Warren company, was secretary of that organization. His many friends will be glad to learn of his promotion.

Digitized by Google

THREE COLE CHASSIS FOR COMING SEASON.

SERIES 8 will distinguish the Cole line for the coming season from cars manufactured previously by the Cole Motor Car Company, Indianapolis, Ind., as the concern some time ago abandoned the yearly model. Series 7 is augmented by two new chassis, these being known as the Cole "50" and "60," the former being equipped with a four-cylinder power plant and the "60" with a six-cylinder motor. While no radical changes are noticeable in the new series, many refinements have been incorporated and the equipment is very complete, including as it does an electric motor starter, electric lights, top, windshield, speedometer, demountable rims, etc.

The New Cole Six-Cylinder "60," the Leader of the Cole Line for the Coming Season.

The Cole six chassis, the leader of the series, has a wheelbase of 132 inches, and five bodies are constructed, these consisting of a five-passenger, convertible seven-passenger touring, four-passenger toy tonneau, two-passenger roadster, three-passenger coupe and a Berlin limousine. Five types of bodies are also fitted to the Cole "50," which has a wheelbase of 122 inches. But two bodies are fitted to the 116-inch wheelbase "40" chassis, a five-passenger touring and a roadster.

Aside from dimensions, the power and number of cylinders of the motors, there is practically no difference between the three chassis, which are constructed of the same quality of material, and the workmanship is of the same high grade for which the Cole product is noted. Those mechanical features of construction which have characterized the Cole product in the past are retained, including a three point suspension, unit power plant, enclosed valves, full floating Timken rear axle, Timken I beam section front axle. Timken bearings and Gemmer steering gear.

Unit Power Plant.

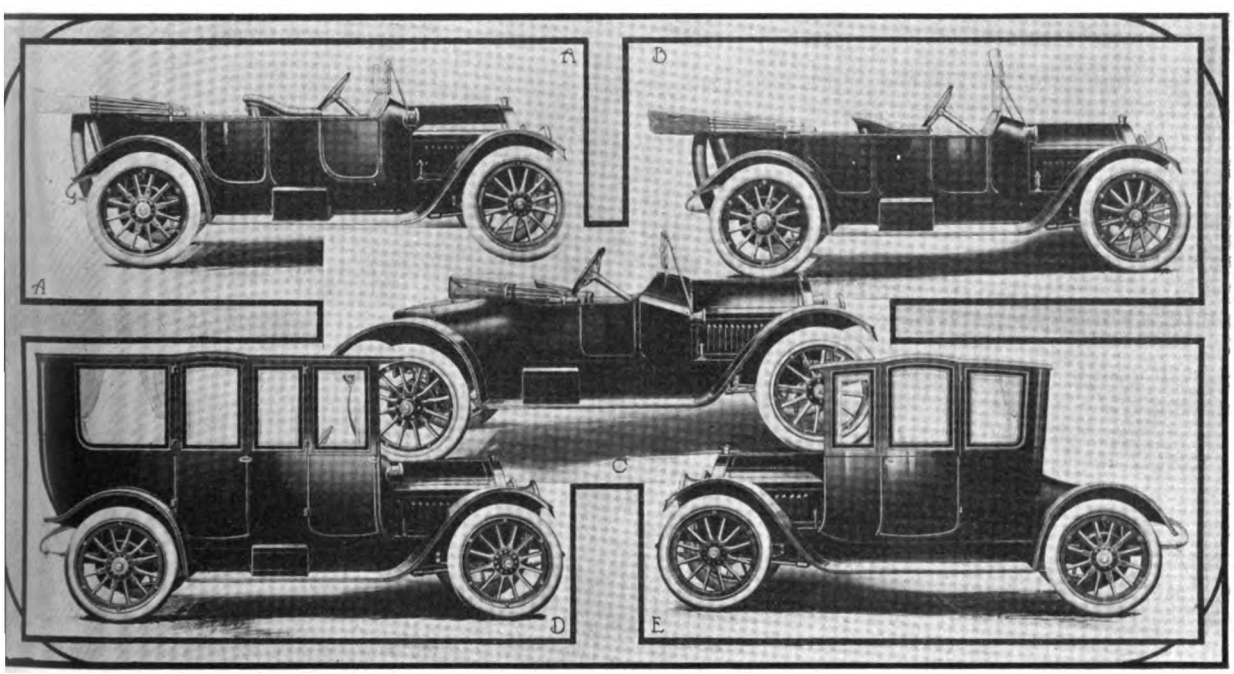
The unit power plant, mounted by the three point suspension method, makes for perfect alignment, and enclosing the clutch and transmission in an oil tight housing prevents deterioration and wear from foreign elements and provides maximum service with minimum cost of maintenance. The Cole motors are supported on either side at the rear and by one swivelling trunnion in front, relieving the power plant of any twisting stresses created by frame distortion or bad roads.

The cylinders of the six-cylinder, four-cycle, water-cooled motor are cast in pairs and the bore is 4.125 inches and the stroke 4.75. The bore to stroke ratio is 1:1.15, and piston displacement 380.8 cubic inches. The bore and stroke of the "50" are 4.5 and 5.25 inches respectively, while those of the "40" are 4.5 and 4.75 inches. The cylinders are L shaped with water jackets cast integral and both the intake and exhaust valves are located on the left side. The valves are of ample size and their operating mechanism is enclosed by removable dust and oil proof aluminum plates, which with accurately designed cams, etc., make for a silent motor.

Lubrication is by the constant level splash system, the proper level of the oil being maintained by a gear driven pump which delivers the

Digitized by Google

luid in proportion to the speed of the motor, inuring efficient lubrication without smoking. The low of the lubricant is indicated by a sight feed ocated upon the dash, and the pump is so designed that it may be adjusted to regulate the mount forced from the reservoir. The capacity of the latter is 2.5 gallons on the "40," 1.5 on the "50" and two on the "60."



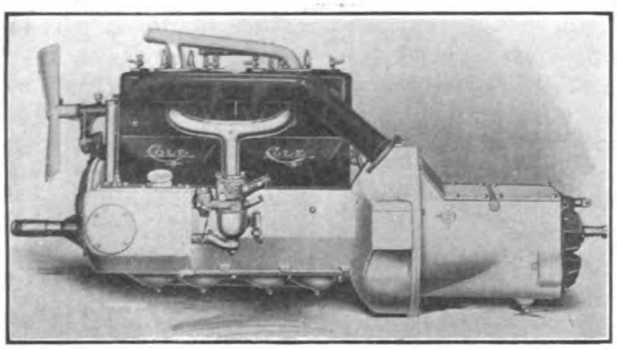
A model 0 Schebler carburetor of the improved double-jet type is located on the left of the motor on all chassis and adjustment of the air is made by a lever on the steering post.

Method of Cooling.

The same method of cooling which has proven efficient in the past has been retained. Cool fluid is taken from the bottom of the radiator by a gear driven pump located on the right of the motor, forced through the water jackets of the cylinders, thence to the radiator. The flanges of the intake and exhaust water manifolds are simple in construction and being accurately machined eliminate opportunities for leakage. The radiator is a Mayo of the improved honeycomb type and with the ample water capacity and large pipes, insures proper cooling at all times. A large three-bladed aluminum fan, mounted in such manner as to be adjustable, as well as rigid, assists in maintaining the proper temperature. The fan is actuated by a broad, flat belt driven by a pulley mounted upon an extension of the shaft operating the water pump on the right side of the motor.

Lubrication.

The crankcase is of aluminum, the upper half serving as the motor base while the lower part is employed as a splash basin for the lubricant, having four oil well like members which are provided with draining plugs. A slight difference in the shape of the aluminum housing carrying the transmission is noted, the forward inspection plate being horizontal, whereas in the series 7 motors it was inclined at an angle. The new plates are larger, making for accessibility of the clutch, transmission, etc., and the forward cover is now retained by bolts instead of wing nuts as formerly. Being accurately machined they are oil tight and easily fitted.



Presenting the Series 8 Cole Line Comprising Three Chassis and Five Types of Bodies: A, Four-Cylinder Touring Car; B, Four-Passenger, Convertible Six-Passenger Toy Tonneau; C, the "40" Roadster; D, Limousine; E, Coupe.

Delco Ignition.

Ignition is provided by the Delco system, which comprises a high-tension distributor, current for which is supplied by the storage battery actuating the motor starter, or direct from the generator. Qualities claimed of the system are: Perfect synchronization of spark, no wires to be moved in advancing the time of ignition, and freedom from mechanical troubles. The distributor is mounted upon a base extension of the crankcase on the right hand side of the motor, and the spark is advanced and retarded by a lever actuated by the control member on the steering

Digitized by Google

wheel in the usual manner. As the battery is maintained in a fully charged condition by the dynamo, efficient ignition is assured at all times.

Four-Cylinder Power Plant of the Cole Series 8 in Which the Motor, Clutch and Transmission Are a Unit.

The clutch is of the cone type, of aluminum, and is provided with leather facing behind which are six springs which make for easy engagement. The clutch is adjusted easily, being readily accessible through a large hand hole in the housing.

The transmission is of the selective type, providing three speeds forward and reverse. The gears and shafts are of chrome nickel steel, oil tempered and ground accurately to size, making for easy engagement in changing speeds. Imported annular bearings of ample size are employed.

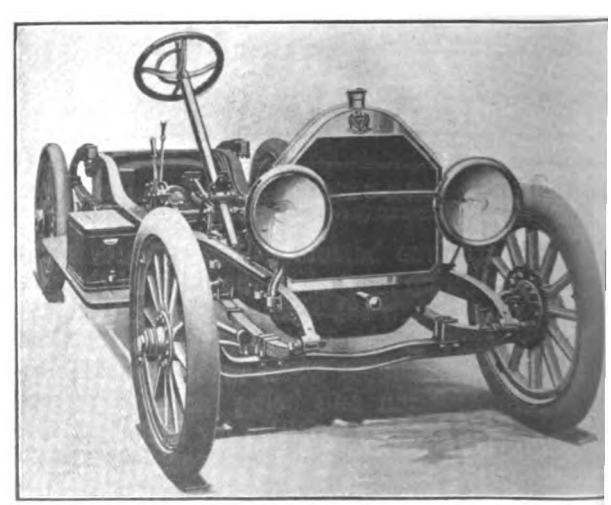
Shaft Drive.

Drive is by shaft which is fitted with two large Spicer universal joints. The torsion rods are arranged in the familiar triangular form and being ample in size provide maximum strength. The torsion bar hanger is fitted with a grease cup.

The frame is of double dropped pressed steel channel section and a change from previous design is noted. It consists of dropping the frame from a point just back of the motor, two inches. The rear of the frame is of the "kick-up" design, which provides ample room for the play of the springs, notwithstanding the low hanging of the car.

The rear axle is a Timken, full floating type, and Timken roller bearings are utilized throughout. The design permits of removing the entire driving mechanism, including the differential gears, without jacking up the machine. All gears are of high grade material, carefully cut and meshed, insuring noiseless operation. The front axle is of the I beam section, drop forged, and nickel steel is employed in the construction of the steering knuckles and spindles.

Two sets of brakes are provided, the service members being of the external contracting type on the rear wheels and operated by pedal, whil the emergency is of the internal expanding typ actuated by hand lever at the right of the drive The diameter of the brake drums on the "50" an "60" chassis is 15.5 inches with 2.5-inch facing while the "40" is fitted with two-inch facings an 14-inch diameter drums. Both sets of brakes ar provided with equalizers and adjustment is a ver simple matter.



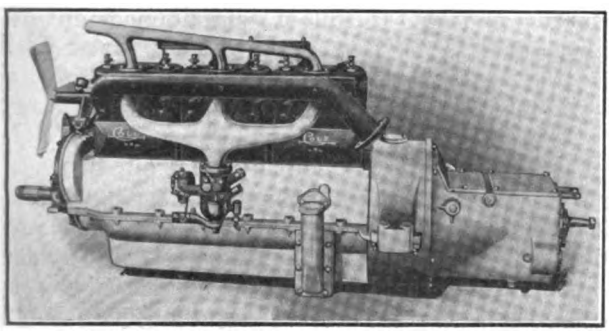
Springs.

The design and quality of springs are im portant factors in motor car construction, an the Cole Motor Car Company lays considerabl stress upon the easy riding qualities of its spring as well as their freedom from breakage. The are constructed of a high grade, special steel, an all leaves are ground and polished, reducing fric tion to a minimum. The front members are semi elliptic and the rear three-quarter elliptic. Com pression grease cups are fitted to the shackle bear ings.

The wheels are of the artillery type, of care fully selected second growth hickory and fitte with Firestone demountable rims, an extra mem ber being included in the equipment. Thirty-si by four-inch tires are employed on the "40" and "50" chassis, while the "60" is equipped with 3 by 4.5 inches. Firestone or Goodyear tires ar regular equipment.

Fenders.

The design of the front fenders has beer slightly altered. In the series 7 the front mem



Depicting New Design of Frame of Cole Chassis Permitting of Low Centre of Gravity and Comfort to Passengers.

bers were brought back to the running board at gradual angle, whereas in the series 8 the fender are sloped over the wheels more abruptly, mee

Digitized by Google

ing the horizontal of the running board some 15 inches further to the front. No material changes have been made in the design of the rear fenders.

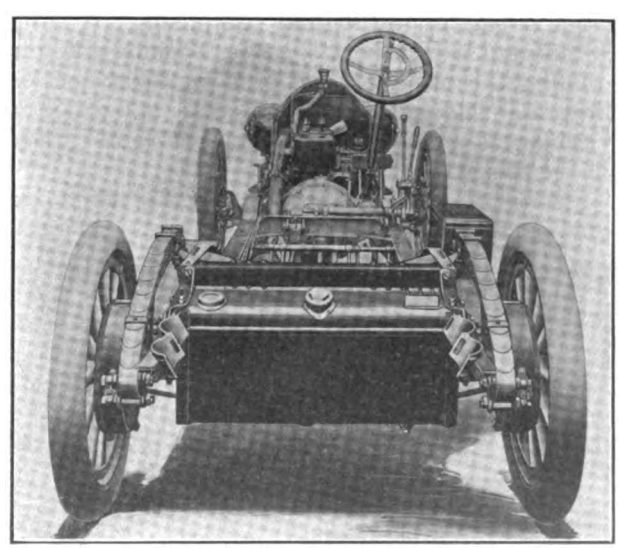
Six-Cylinder Cole Motor, Showing Enclosed Valves and Location of Carburetor at Left.

A Gemmer steering gear is employed having an 1.25-inch post and equipped with an 18-inch corrugated steering wheel with an aluminum spider. The gas and spark levers are mounted upon the wheel.

Pressure Feed Replaces Gravity.

The Cole Motor Car Company has replaced the gravity feed with the pressure type. The copper riveted fuel tank is suspended at the rear and pressure is maintained by a plunger type pump with an auxiliary hand pump convenient to the driver. The fuel capacity of the tanks of the three chassis is 20 gallons on the "60" and "50" and 18 on the "40." The gear shifting and emergency brake levers are inside the body at the right of the driver and right hand drive is employed.

Throughout the series the bodies are constructed on the straight line plan and the running boards are longer because of the design of the front fenders. The running boards are free from accessories with the exception of mounting the housing containing the Delco battery and controller. All door hinges are concealed and high grade locks are fitted. The floor boards are covered with linoleum, metal bound, making it an easy matter to keep these members clean. The upholstery is deep, providing easy riding qualities, and the front seats are of the individual type and curved to fit the back. The tool kit chest is located under the left hand front seat and is very accessible.

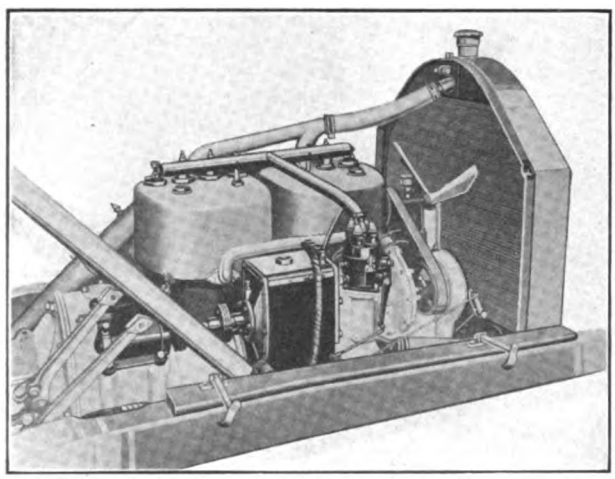


Lighting and Starting System.

The dynamo and acetylene motor starter has been replaced by a combination system, the Delco, which combines the lighting dynamo and motor as a unit. The system was fully described in the May 25th issue of The Automobile Journal. Summed up in few words, the current from the storage battery is utilized to energize the motor for starting the automobile engine and upon the latter operating under its own power the starting mechanism is automatically disconnected and the unit operates as a dynamo, charging the battery. The latter supplies current for the lamps when the explosive motor is not operating and when the speed of the automobile falls below the proper charging rate of the battery.

In adapting the Delco system to the Cole power plant it was necessary to cut teeth on the periphery of the semi-steel flywheel as this member is rotated by a gear meshing with another gear on the extension of the shaft of the electric motor. The operating mechanism is fully enclosed and protected from dust and foreign elements. The unit is located on the right hand side of the motor and is compact. The operation of the motor starter is very simple, involving the mere pressing of a button which is located on the sill of the driver's seat.

Features of Equipment.



A feature of the new series and one that is gaining in favor is that of mounting the various control and other instruments upon a highly polished board which is placed just at the rear of the cowl and inclined at such an angle that the members are easily discernible to the driver. The speedometer is mounted at the extreme left and ignition switch at the right, with the switch controlling the electric lights, air pressure gauge and oil sight feed in the centre. The operation

Showing Location of New Cole Fuel Tank at Rear of Chassis—Pressure Feed Is Fitted to All Three Chassis.

of the lubricating system may be ascertained at night as easily as in the day time, as a small electric lamp is mounted above the device. The

Digitized by Google

Showing the Location of the Delco Combined Electric Lighting and Starting Unit on the Cole Chassis.

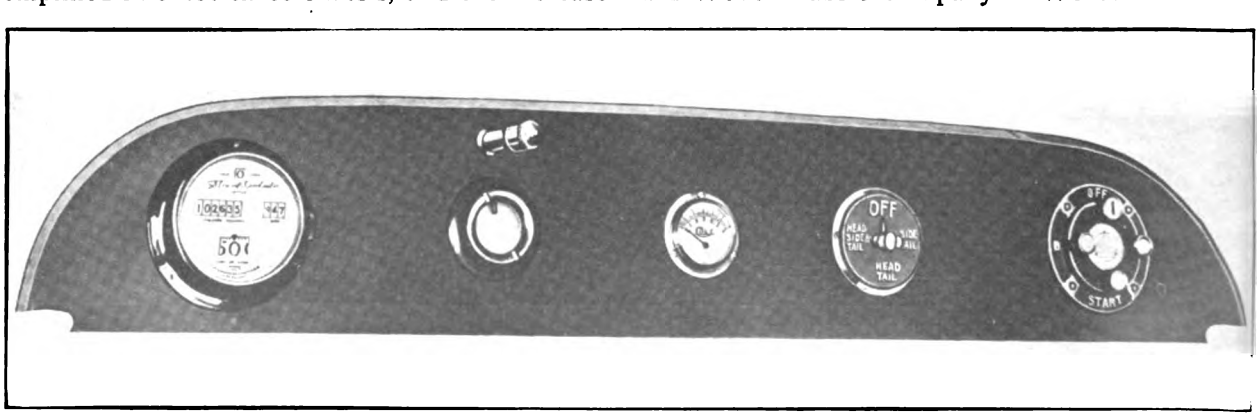
light serves a double purpose as it is connected in series with the electric tail lamp, and should the latter burn out or become broken the dash lamp would be extinguished, so that the driver would not remain in ignorance of the trouble.

The lighting switch is of the multiple type, permitting the utilization of any group of lights, and a quality of the ignition switch is that it may be locked, preventing theft of the car. The lamp equipment comprises two head, two side, a tail and a dash light.

Special Number Plate Holder.

A special attachment for the number plate in front is part of the regular equipment. It is incorporated with a horizontal bar, connecting and holding the electric headlights rigid against vibration. The end of the crankshaft is finished in German silver and the starting crank is carried in the tool box.

With the improvements and refinements exemplified in these three chassis, and the increase in manufacturing facilities represented by the construction of a new addition to its plant, now in process of erection, the Cole Motor Car Company will be enabled to care for the enlarged demand which is expected to follow its announcement of the series 8.



NEW FORD CANADIAN PLANT.

The Ford Motor Company, Detroit, has acquired 50 acres of land at Sandwich East, a short distance above Walkerville, Can., and close to the present Canadian plant of the company. The consideration is said to be in the neighborhood of $50,000 and embraces several adjoining parcels of land, one of which includes the former factory of the Regal Motor Car Company, with eight acres.

Although tentative plans were known to have been entertained by the Ford Company for extending its Canadian manufacturing facilities, not until the deal was consummated was it definitely known that the plans had taken tangible form. The Ford Motor Company recently adopted plans to increase its Canadian output to 15,000 cars next year and has built a large addition to its plant on the river front. The new property is wanted in connection with plans for further extension of the plant.

ADDS BALDWIN CHAINS.

F. Shirley Boyd, formerly of 893 Boylston street, Boston, but now at 903, the same street, has added the Baldwin chains and sprockets, made by the Baldwin Chain & Manufacturing Company, Worcester, Mass., to his already extensive line of automobile parts, supplies and accessories. Another new product with this house is the Multibestos brake lining, made by the Standard Woven Fabric Company of Worcester.

The Various Control and Indicating Instruments Are Mounted upon a Highly Polished Board on Cowl—Note the Neat Appearance of Board.

RACE MEET AT PROVIDENCE.

While the motoring enthusiasts were unable to gratify their desire of witnessing the big events at Milwaukee, Saturday, Sept. 21, some 5000 people in Rhode Island and southeastern Massachusetts enjoyed a short programme on the half-mile track at Providence, R. I. Of course the track was too small to permit of exceptionally fast driving, but Harry Kyle in a White was able to cover a mile in 1:18. This is a track record, the former mark being 1:24. The summary of the meet follows:

Three Miles, 450 Inches.

Car	Driver	Time
White	Kyle	4:12.0
Mercer	Grennon	....

Five Miles, 600 Inches.

White	Kyle	8:14.5

SALES MANAGERS' CONVENTION.

Arrangements are being completed by the trade committee of the Automobile Board of Trade for the sales managers' convention to be held at the headquarters of the organization, Monday, Sept. 30, and Tuesday, Oct. 1. The committee announces that the following subjects will be discussed: Freight, shipping, motor car equipment, enclosed bodies, selling and advertising, territory and discount, annual models. The committee having the convention in charge is composed of the following: H. O. Smith, Premier Motor Manufacturing Company; E. C. Howard, Cadillac Motor Car Company; W. E. Metzger, Metzger Motor Car Company; C. W. Churchill, Winton Motor Car Company; W. T. White, the White Company.

PLANS FOR BOSTON SHOW.

The entire Mechanics' building, comprising 105,000 feet of floor space, will be given over to the two Boston automobile shows to be held next March. The pleasure car display will be held March 8-15, inclusive, under the direction of the Boston Automobile Dealers' Association, Inc., while the commercial vehicle show will take place March 19-26 under the supervision of the Boston Commercial Motor Vehicle Association, Inc. During these two shows automobiles from factories all over the country will be on exhibition in their respective concessions. Chester I. Campbell, the veteran show manager, will be in charge of both displays, as has been true of all the previous Boston displays.

NAME CHANGED TO CUTTING.

The Clarke-Carter Automobile Company Jackson, Mich., manufacturer of the Cutting cars has changed the corporate name of the concern to the Cutting Motor Car Company. The company has also acquired a large piece of land adjoining the present plant, upon which another new factory building will be erected soon. The management of the concern remains unchanged.

ADDITIONS TO K-R-I-T PLANT.

A spacious new factory building is being added to the plant of the K-R-I-T Motor Car Company, Detroit, manufacturer of the K-R-I-T motor cars, and soon a second will be under construction. These buildings will greatly increase the floor space of the concern and enable it to handle a largely increased output. Howard R. Crawford, general manager of the company, announces that several thousand more cars will be produced than during the corresponding period last year.

NEW MOTOR CONCERN.

The Sterling Motor Company has been organized at Flint, Mich., for the purpose of making the motors to be used in the Little six-cylinder cars and for manufacturing additional motors for the open market. The concern is capitalized at $300,000 and has been incorporated by J. Dallas Dort, W. C. Durant, Edwin R. Campbell, William H. Little and Curtis R. Hathaway, all of whom are identified with the Republic Motor Car Company.

LONG TOUR IN OAKLAND.

After an 800-mile motor trip over some of the roughest roads in Kentucky and Tennessee, an Oakland car, made by the Oakland Motor Company, Pontiac, Mich., arrived at Louisville, Ky., recently, in charge of W. B. Taylor and W. S. Titcomb of the Zilio Sales Company. The tour was unique in that no air was used in the tires, the casings being filled with Zilio, a vegetable compound.

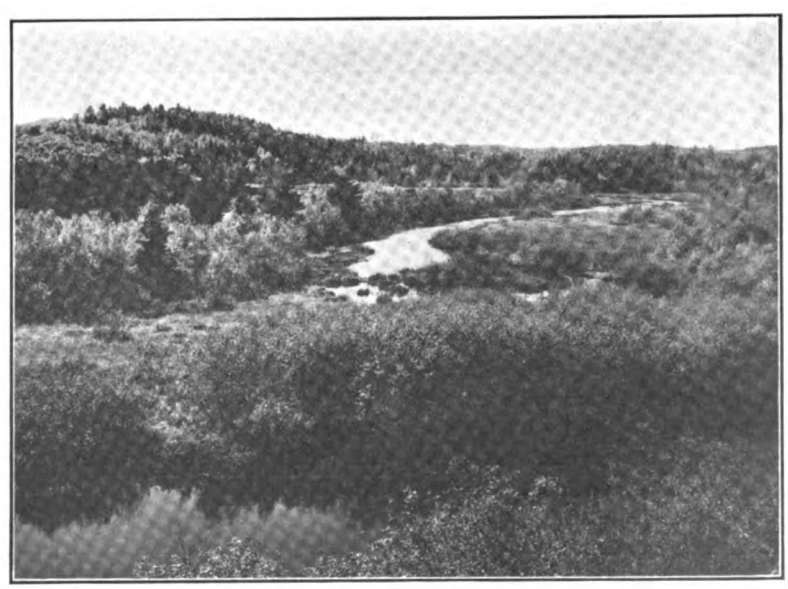
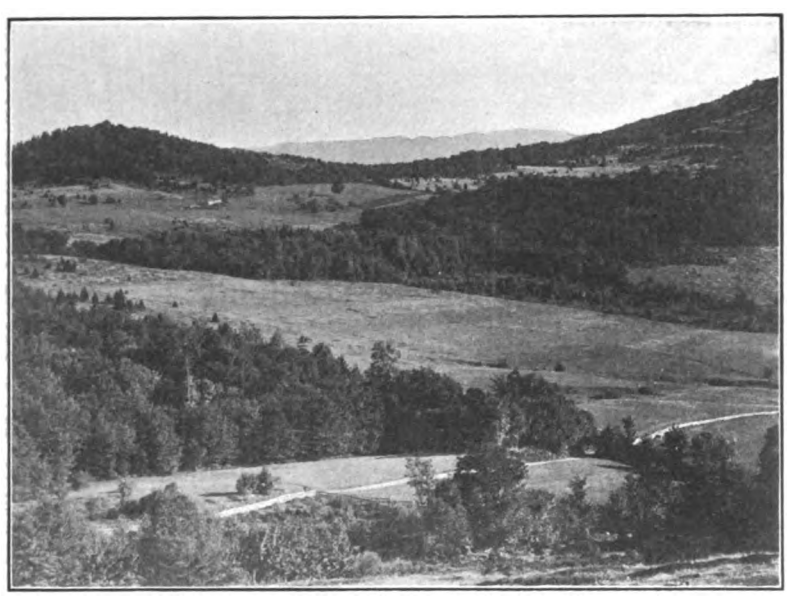
Autumnal Touring Among the Berkshire Hills



THOSE who enjoy the beauties of touring in the autumn, with all the kaleidoscopic colorings in the foliage of hill and dale, will appreciate the itinerary outlined herein. It is designed to connect Boston and Albany over two distinct routes, one of which, the outward trip, offers some slight deviations from the beaten path, while the other presents some of the best roads in the country in combination with many rich views of the Berkshires and the Connecticut valley. It is anticipated that the tourist will be on the road four days, with night stops at Greenfield, Mass.; Albany, N. Y., and Springfield, Mass.

TOUR NO. 40.

After passing through Watertown, the site of the Massachusetts arsenal, and Waltham, the home of the Waltham watch, the tourist enjoys a pleasant drive through Maynard and Stow, and emerges from this first glimpse of country beauty to visit Fitchburg, another manufacturing city of importance. At Gardner is the largest chair factory in the world. Excellent automobile roads lead through Otter River, Baldwinsville and Athol to Orange, and then the descent into the Connecticut valley is begun. At Millers Falls, Mt. Toby and its base, and Lake Pleasant divide attention with the river. Greenfield is the night stop.



Soon after leaving Greenfield, the second day, the way leads up Shelburne mountain, and then into the valley of the Deerfield at Shelburne Falls, the early home of William Cullen Bryant, Charles Dudley Warner and several other people of note. At Charlemont, a view of the $20,000,000 Hoosac tunnel is obtained, and while the shorter distance to North Adams is over Hoosac mountain, a detour is made at this point, entering Vermont, through most interesting scenery, albeit, the roads are far from ideal in places. It is anticipated, however, that the tourist will find less difficulty in covering these country ways than in climbing the mountain and descending the many winding curves and heavy grades on the other side.

The Otter River Meadows in the Vicinity of Otter River, Mass.

Digitized by Google

North Adams is in the shadow of Mt. Greylock, and about a mile north of the city is the famous natural bridge over Hudson's brook. The cascade in Notch brook is another pretty little spot half-hidden away in a glen. After leaving Williamstown, the seat of Williams college, the way leads back into Vermont, through Pownal, and thence in New York state at North Petersburg, passing near Walloomsac, where was fought the battle of Bennington. A few country villages, with their quaint old houses are next passed, and the road descends into the valley of the Hudson on the way to Troy and Albany.

Picturesque View of the Green Mountain Foothills in Southern Vermont.

Albany, the capital of New York, is full of interest. Chief among the buildings of prominence is the state house, built at an enormous cost and filled with relics of all the wars. Two other structures of note are the Catholic and Episcopal cathedrals. Van Rensselaer Manor House and its park, on the site first occupied by Kilian Van Rensselaer, Patroon of Beverwyk, also should be visited for its historic associations.

On the return trip the road leads over the hills to Pittsfield, passing through the Lebanons, a series of Shaker settlements. Pittsfield is admirably situated among the Berkshires, with a number of little lakes and several interesting mountains nearby. Lenox is described as "a gem among the mountains," and is the summer home of numerous people of prominence.

Lee was settled in 1760, and was named for one of the Virginia Lees. It is famed for its wonderful white marble, of which some $1,000,000 worth was employed in the erection of the capitol at Washington. Becket has several lakes, from one of which the Farmington river flows down into Connecticut. The route to Becket is over the famous Jacob's Ladder, now placed in excellent condition, through agitation aroused by motorists.

Chester, Huntington and Russell are all pretty Berkshire towns, and then the way dips down into the Connecticut valley, through the Indian domain of Woronoco, settled in 1660 by the English and called Streamfield. The Little River water works of the City of Springfield are near this town.

Late in King Philip's war the people of Westfield were ordered to evacuate and concentrate with those of the other settlements in the valley at Springfield and Hadley. An angry refusal was returned and for a time negotiations were under way looking toward a union with Connecticut. Later the legislature found it desirable to cancel the order.

Springfield, the night stop, is known as the City of Homes. It is a centre from which a number of motoring trips may be made in all directions. From the United States armory on State street it is possible to secure a view up and down the valley, which is unequalled anywhere in this country, and which is considered by many to be superior to the like views afforded in European countries.

From Springfield to Boston the road is macadam nearly all the way. Palmer also is famous for its scenery, combining woods and hills, the lesser mountains, lakes and rivers. Warren is a pretty manufacturing town amid rounding hills. Of West Brookfield it is stated that it produces apples and boots, and the orchards are of particular interest in the fall of the year.

In Brookfield time should be taken to visit the garrison house, in which for three days the settlers held out against a superior force of Indians. As a last resort the redskins backed a load of blazing flax and straw near it in an effort to burn it down. A sudden shower put out the flames, and the incident was regarded by both sides to

Digitized by Google

the conflict as miraculous.

Spencer was the native town of Elias Howe, Jr., the inventor of the sewing machine. Then comes Worcester, the Heart of the Commonwealth, well and favorably known by motorists. The remainder of the distance into Boston is through Shrewsbury, Northboro, Marlboro (the so-called "boro" towns), Wayland and Weston.

Shrewsbury was the native town of Levi Pease, who started the first line of mail stages between Boston and New York in 1784, previous to which a fortnightly mail was carried between these two cities in saddle bags. Northboro is devoted to cattle raising. Marlboro was the site of the Christian Indian village of Okammakemesitt. Each is filled with particular interest to the tourist.

In every respect this itinerary offers an ideal autumn tour. The Berkshires are at their very best during this season, and the two routes through them leave nothing to be desired. For those who have ample time at their disposal it would be possible to make North Adams, Pittsfield or Becket the headquarters for a more extended stay in their environs, with plenty of opportunity to enjoy nature at its prettiest.

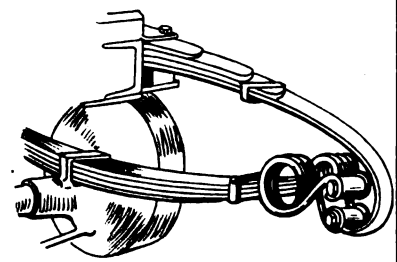
NEW AND NOVEL ACCESSORIES THAT APPEAL TO MOTORISTS

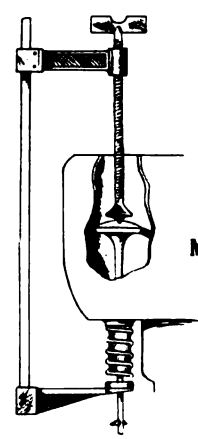


The Acme Torsion Springs, made by the Acme Torsion Spring Company, 21 Cambria street, Boston, are of an auxiliary, shock absorbing nature, being fitted to the springs of the car, usually the rear. They consist of a series of three full circular coils, the ends of which turn up on one side and down on the other. Using a pair of these together the two upper portions are held beneath the bolts on the side spring, while the two lower are caught by the spring horn or frame bolt, or in case of a three-quarter elliptic member, between the ends of the bolt at the lower extremity of the upper portion of the third quarter. In effect this combination eliminates all road shocks and vibrations.

★

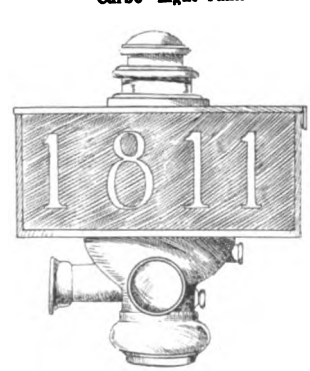
The Wagner Motor Cleaner is marketed by the C. & W. Specialty Company, 1912 Broadway, New York City, and is a device for mixing kerosene with air. The fluid and air are led to the device by separate tubes and a pressure of six pounds is employed to force the spray to the parts to be cleaned. The maker points out that the motor and components of the chassis may be quickly and easily cleaned in a very short time and that one quart of kerosene will remove all grease and dirt from any engine.

★



The Mertz Valve Spring Lifter is the invention of H. B. Mertz, 1408 Rutherford avenue, Pittsburg, Penn., and is designed for service in removing and replacing valve springs of the gasoline motor when these members require attention or the valves are to be ground. A quality of the device is that it locks automatically and quickly in any desired position, leaving the hands of the operator free to remove cotter pins or retaining parts. The device comprises a fork which straddles the lower end of the valve stem, and a lifting screw member. The first named part is provided with an adjustable gauge which centres on the valve stem and the lift screw also centres on the valve head. Rotating the screw member compresses the valve spring.

Acme Torsion



Wagner Motor Cleaner

Mertz Valve Lifter

Carbo- Light Tank

Puckett Rear Signal

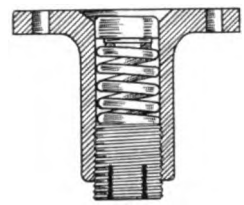
★

The Carbo-Light Tank is the product of the Carbo-Light Company, Anderson, Ind., and a quality claimed of it is that it generates gas only when the lights burn and that it supplies a clean, dry acetylene, which is filtered under pressure. The tank is of rust proof steel, is six inches in diameter and 22 in length. It has two compartments, one for water and the larger for carbide, six pounds of which is used. The carbide is introduced through an ample sized opening and when acted upon by the water generates gas, which is led to a large chamber. The maker states that a 30-hour charge may be obtained at a cost of about 40 cents. The tank carries 15 pounds pressure and is equipped with a safety device.

★

The Puckett Signal Lamp is the product of Almor M. Puckett, San Antonio, Tex., and is a combination rear light and display number device. It consists of a metal box 16 inches in length, three wide and 6.5 high. The box has a hinged opening on top where a felt lined frame is inserted which is employed for holding a number of regulation size, also a blank ruby glass for the rear signal. The numbers are white frosted and the inventor claims that they may be distinguished at a considerable distance.

Digitized by Google

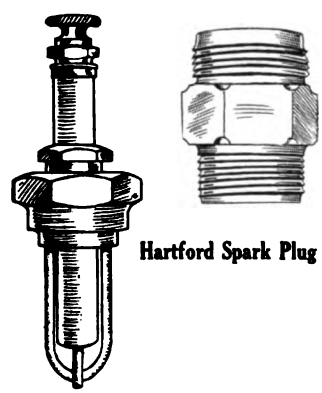


The B. M. C. Anti-Rattling Ball Socket is marketed by the Auto Parts Company, Providence, R. I., and is designed to take the place of the solid cap that holds the front axle radius rod in position on Ford model T cars. The device is provided with a spring arrangement which automatically takes up all wear as well as prevents rattling of the parts. It is applied easily, the work involving the removal of the regular cap member and replacing it with the B. M. C. No fitting is necessary as the device is machined accurately and can be attached in less than 10 minutes. The spring pressure is adjusted by means of a screw plug in the base and the retaining mechanism is locked securely by a cotter pin. The device operates in grease and is moderately priced.

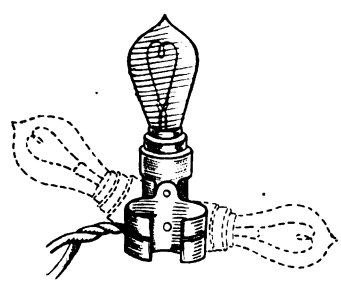
★

The Buffum Cotter Pin Holder, made by the Buffum Tool Company, Louisiana, Mo., will appeal to the motorist who cares for his own car as well as to the repairman. The device has a pair of expanding and contracting jaws which grip firmly the cotter pin, enabling the operator to insert it in places not easily accessible to the fingers. The device also holds the points of the pin together, a quality that makes it a simple matter to insert tight fitting pins. The tool is operated easily, its spring stem being depressed when a pin is to be gripped. The jaws are pointed and may be employed for spreading the cotter after its insertion. The Buffum device is made of high grade material and is inexpensive.

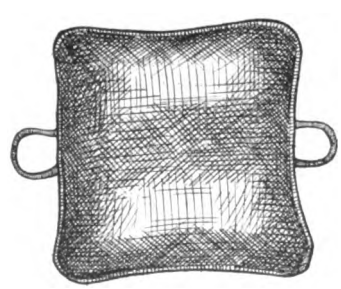
★



The Hartford Spark Plug, produced by the Hartford Suspension Company, Jersey City, N. J., maker of the Hartford auto-jack and Truffault-Hartford shock absorbers, is a two-piece plug, a design making for easy cleaning qualities. Its lower part is screwed into the cylinder head permanently, while the upper part or electrode, is removable. The plug is simple in design, and the parts so constructed that they may be separated easily, by unscrewing. It is gas tight and the maker points out that it cannot freeze.



B. M. C. Anti-Rattle Socket



Buffum Cotter Pin Holder

Hartford Spark Plug

Fitzall Adapter

Leavens Cushion

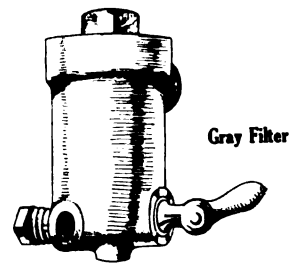
★

The Fitzall Adapter, marketed by Chas. E. Miller, 97-103 Reade street, New York City, has been improved and it may now be fitted to any gas or oil lamp, converting it into an electrical unit. The improvement consists of a special hinged arrangement at the side of the base of the adapter, whereby it may be shifted or folded entirely out of view, permitting use of the oil or gas burners. The adapter is attached securely to the outside of the burner cap by adjustable spring brass clips and the design is such that it may be utilized with any make of burner. It is supplied with fibre sockets which are wired and equipped for standard candelabra base bulbs. The adapter is inexpensive and is made for both oil and gas lamps.

★

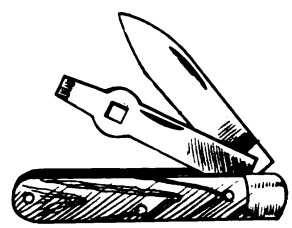
The Leavens Cushion, manufactured by William Leavens & Co., 32 Canal street, Boston, will appeal to motorists desiring comfort as it is so constructed that it absorbs all shocks and vibrations when the car is traversing rough roads and pavements. It is designed to be placed between the back of the passenger and the upholstery of the seat and its shape is such that it conforms to the contour of the body. The cushion is provided with two

Digitized by Google



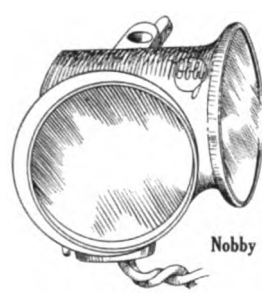
handles and is constructed of genuine Spanish leather and of three colors, brown, green or red. The secret of its shock absorbing qualities lies in the material with which it is stuffed. It is moderately priced.

—— ★ ——

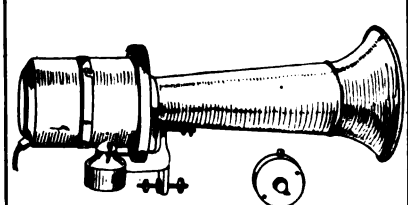


Nobby Electric Tail Lamps are produced by the Niagara Specialty Company, 19 Main street, Buffalo, N. Y., of which concern Smalley Daniels, 23 Motor Mart, Boston, is sales representative. The lamp is constructed from a solid casting and the maker states that it will withstand severe usage. It is small and compact and is made in three finishes, polished or aluminum, black enamel and brass. It is equipped with a six-volt, two candlepower bulb and is dust proof.

—— ★ ——



The Gray Gasoline Filter is a product of the Gray-Hawley Manufacturing Company, Detroit, and is designed for incorporation in the fuel line between the supply tank and the carburetor. Its function is to separate water and all foreign elements from the gasoline and prevent them from reaching the vaporizer. The filter is provided with a cap, in the lower portion of which are four screens of varying mesh. These are removed easily for cleaning by unscrewing the cap member. A three-way valve is employed, spring ratchet retained, and when the handle is turned up fuel flows from the tank into and through the filter, thence to the carburetor. When the accumulations are to be removed the handle is moved to a second position, which closes the line from the tank and the impurities may be taken out. A third position permits of draining the fuel tank of its contents.



Gray Filter

Empire Automobile Knife

Nobby Tail Lamp

Tuto Horn

J. & B. Master Vibrator

The Empire Automobile Knife is manufactured by the Empire Knife Company, Winsted, Conn., and comprises, in addition to a knife blade, a screw driver and Prest-O-Lite key in combination. The knife is constructed of high grade material and the key device will be appreciated by motorists who frequently mislay these members.

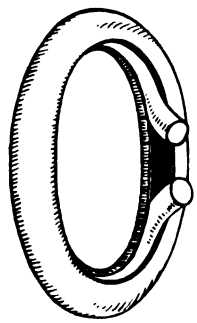
—— ★ ——

The Tuto Electric Horn, manufactured by the Dean Electric Company, Elyria, O., will appeal to the discriminating motorist as a light pressure of the switch causes a slight contact of the armature on the diaphragm, producing a mellow tone, while further depossible by the special switch the amount of current and augments the volume of sound. This range of notes is rendered possible by the special switch made by the company, which may be located on the steering wheel or spokes, enabling the operation of the signal without removing the hand from the wheel. A quality claimed of the horn is a small consumption of current.

—— ★ ——

The J. & B. Master Vibrator is produced by the well known maker of ignition specialties, the J. & B. Manufacturing Company, Pittsfield, Mass. It is designed particularly for Ford cars, although it may be employed with any make using a high-tension coil and battery system. The vibrator synchronizes the spark; that is, the ignition is made uniform, practically an impossibility with the ordinary vibrating coil having several units as it is difficult to adjust all vibrators alike. Economy of current is also effected with the master vibrator, which provides a more efficient spark, increasing the output of

Digitized by Google

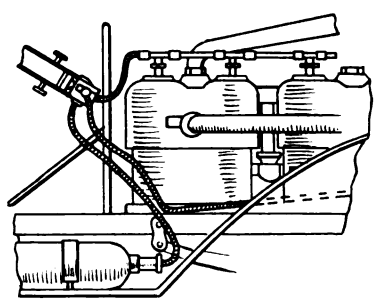


the motor. The J. & B. master vibrator is constructed of high grade material and the contact points are fitted with 25 per cent. iridium, making for durability. The device is not a substitute for the coil, but is employed in conjunction with it. The J. & B. vibrator is moderately priced.

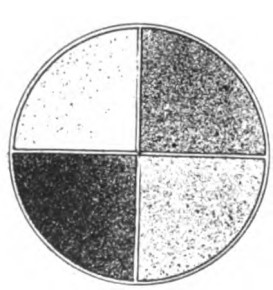
★

The P & P Tire Filler, manufactured by Fred M. Page & Co., Lynn, Mass., is a substitute for air and is not a fluid or liquid, but a solid, resilient material produced by a chemical process. It is molded in a form to fit any standard shoe and replaces the inner tube in the casing, completely filling the same. By it the use of inner tubes is eliminated as well as punctures, blowouts, etc. It is claimed that the material is not affected by heat, cold, moisture, oils or acids, and is very enduring. The P & P Sales Company, Inc., 110 Massachusetts avenue, Boston, is New England agent.

★



The Gemco Oil and Grease Gun is produced by the Garage Equipment Manufacturing Company, Milwaukee, Wis., and differs from those of ordinary construction in that it is provided with a ratchet device which actuates the plunger, permitting the use of heavy lubricants. The plunger may be operated independently of the ratchet member, if desired, and is employed when oil is to be used. The barrel of the gun is of seamless steel tubing, while the top, bottom, gears, ratchet lever and plunger are of malleable iron. The gun is made in three sizes, having capacities ranging from eight to 30 ounces and extra nozzles may be purchased. It is constructed to withstand severe service.



P. & P. Tire Filler

Gemco Grease Gun

Niagara Motor Starter

Lightning Valve Compound

The Niagara Motor Starter, manufactured by the Niagara Sales Company, Buffalo, N. Y., is of the acetylene type, the gas being combined automatically with the proper amount of air to obtain the desired mixture in the cylinders. The barrel of the compressor is constructed of seamless steel tubing and the maker lays great stress upon its construction, pointing out that the brass plunger is superior to leather as the latter dries up, affecting the efficiency of the mixer. The latter is equipped with steel check valves retained by springs, making for gas tight connections. The starter is operated easily, a simple turn of the wrist forcing the mixture to the cylinders, where it is exploded in the proper chamber by means of a spark, the operation involving the throwing of the switch lever to "on." A feature of the device is that the headlights may be adjusted from the seat. The material and workmanship are high grade and it is claimed that 15,000 starts can be made with a medium sized gas tank.

★

Lightning Grinding Compound, is produced by the Lightning Manufacturing Company, Cornish Flat, N. H., for whom T. F. Russell & Co., 176 Federal street, Boston, is distributor. The compound comes in a neat metal box which is divided into four compartments and is employed for grinding in of valves. It comprises four grades of carborundum mixed with a special heavy mineral grease which is blended with the abrasive in such manner that the work of grinding is made easy. The maker also points out that one box contains enough compound to grind a large number of valves.

Digitized by Google

NEW SPRINGS CHEAPEST.

Broken springs are common and the average motorist has experienced the annoyance of being delayed upon the road until a temporary repair could be made, then driving home at a slow rate of speed. Where more than one leaf of the spring is broken it is advisable to secure an entire new spring from the factory or agent as it will generally be found that a new part is cheaper than repairing the old one.

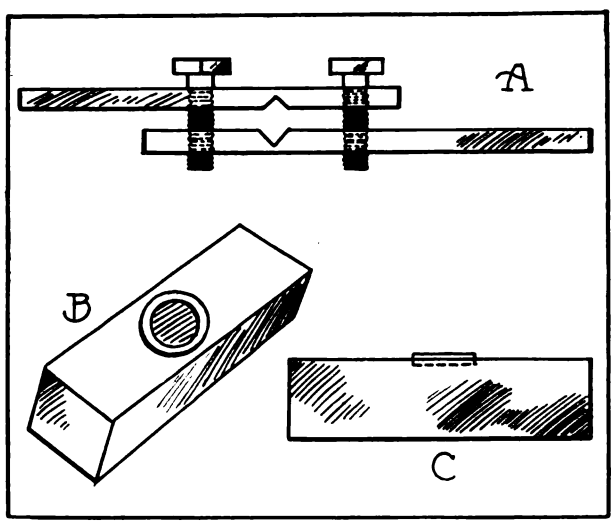


Fig. 1—Suggestions for the Owner-Repairman: A, Home Made Tap Wrench; B, Kink for Retaining Metal Washers When Filing Is to Be Done; C, Showing How Washer Is Imbedded in the Block of Wood.

A well known owner of a shop which makes a specialty of repairing automobile springs advises his customers to fit new in preference to repairing several leaves of old members. This may appear strange, but it should be considered that makers of springs have facilities for manufacturing on a large scale while the small shop is obliged to make the springs by hand.

Many motorists wonder why it is that after having the springs rebent or reshaped they do not retain their form for any length of time. This is due to the fact that the metal has lost its elasticity and it is a waste of money to reshape them again. Frequently a new spring can be purchased at a less cost than the repair of the old one.

Considerable spring trouble could be avoided if the driver would take time to give the springs, clips, etc., a little attention. Loose clips tend to breakage and the lack of lubricant between the leaves also breeds trouble. The body should be jacked up to relieve the springs of all weight, the leaves pried apart and cleaned, after which the surfaces should be smeared with graphite. It is surprising how smoothly the car will ride after rusty springs have been treated in this manner.

JIG FOR FILING WASHERS.

Many times the amateur repairman desires to fit a washer to take up lost motion and discovers that it is either too thick or too thin. Filing these members in the vise is a difficult matter as not only are the flat members awkward to retain, but the surface of the vise jaws is likely to be spoiled in filing.

At Fig. 1 B is shown a simple method of securing a washer requiring filing down. It is imbedded in a block of wood, taking care to leave about half of the part above the surface of the wood as shown at C. The block is then gripped in the vise and the work of filing is easily performed.

NATIONAL TYPE B 4 MAGNETO.

The National Type B 4 magneto, manufactured by the National Coil Company, Lansing, Mich., presents several interesting features, among which is a timing window at the rear of the instrument through which a travelling arrow on the distributor is discernible. The head of the

Digitized by Google

arrow registers with the number of cylinder to be fired; that is, when the No. 1 cylinder is about to fire the arrow points to the figure 1 on the distributor. This makes it a simple matter to wire and time the magneto, especially for those not familiar with the operation of these ignition devices.

The components of the National system comprise a high-tension magneto and a step-up or transformer coil. The latter is mounted upon the dash and is provided with the usual switch affording "battery," "off" and "magneto" positions, and in addition has a push button for starting the motor upon the switch. The maker claims that the engine may be started upon a quarter of a turn, provided it is in proper working condition and the knurled thumb screws which when removed allow the housing to be withdrawn after which the travelling distributor contact may be displaced by sliding it forward, it being held by two rod or stud like members.

The collector brush and assembly are located at the lower part of the magneto, a sectional drawing of which is shown at B. The brush contact plates are of hard steel, ground and polished, and the brushes, wire gauze of ample size gauge.

The wiring plan is presented at Fig. 3 showing how the magneto is wired and the leads are plainly marked. When batteries are employed it is very important that negative and positive leads from the battery be not grounded. It is well to observe caution in making sure that the switch

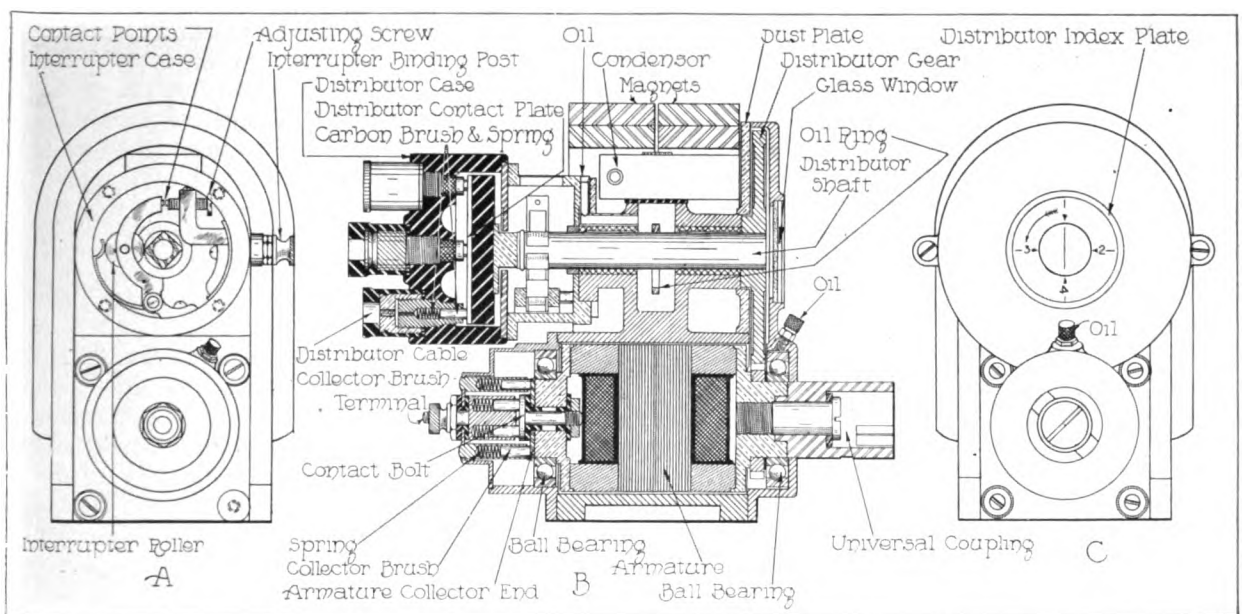

Fig. 2—National Type B 4 Magneto, Presenting Interesting Features of Construction, Having a Timing Window and Breaker Box Fitted Back of Distributor.

cylinder filled with mixture. The system provides dual ignition with one set of plugs.

The National magneto differs from those previously described in that the breaker box is mounted at the top of the instrument and located on the half-time shaft directly in back of the distributor. The design is such that the platinum contact screws may be adjusted easily with a screw driver when the motor is running. The breaker box or interrupter is shown at Fig. 2 A and the platinum points are separated by a cam and roller arrangement, and adjustment of these members is by a screw which, moved in or out, regulates the timing. Turning the screw out causes the spark to occur earlier and vice versa. The distributor housing is retained by two lever is not left on "battery" when the motor is inoperative.

Adjustment and Care.

In order to obtain maximum efficiency from the system the connections should be tight and fairly large conductors employed. In the event of the missing of a cylinder it is well to examine the platinum points as these may have become dirty. The maker points out that the metal should not be filed but cleaned. If, however, the points are uneven or pitted, they should be smoothed up with a very fine jeweller's file. The company states, however, that the points seldom pit as the current is alternating and as the system does not rely upon a vibrating coil, continuous current is not passing through the points.

Digitized by Google

The timing of the magneto is a simple matter. Assuming that the points have been removed for cleaning, it will be necessary to retime the break of these members. The points should be set to break so that the spark occurs when the arrow located at the drive end of the magneto points to one of the lines of the dial device shown at Fig. 2 C. The spark will take place at the moment of separation. Another method is to utilize the marks upon the flywheel of the motor.

The timing of the spark varies with the opening of the platinum points. It will be early with a wide gap, and late with a narrow. The distance between points, when set properly, should be about .03125 inch, but can be varied slightly in either direction when a slight difference in timing is desired. The method of adjusting the screw has been explained.

To obtain the best results from the spark plugs

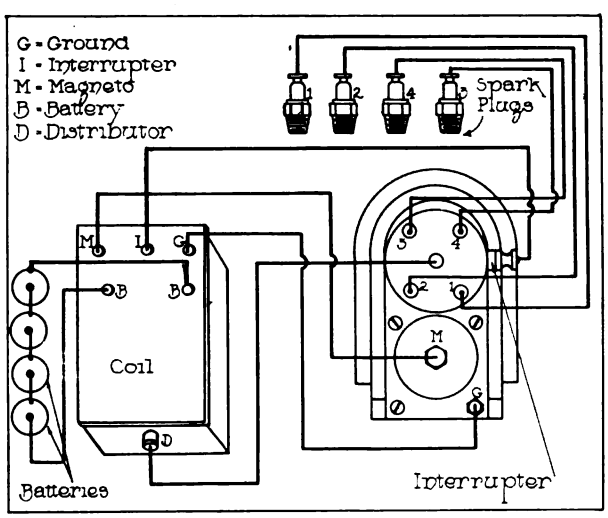

Fig. 3—Illustrating Wiring Plan of National Type B 4 Magneto, Providing Dual Ignition.

their gaps should be .03125 inch or slightly less and the maker points out that in connecting the leads from the magneto to the plugs, the cables should not run parallel for any great distance to metal if this can be avoided. The collector and ground brushes are located in the brush cap marked M on distributor end of magneto and directly below distributor and breaker box. The brushes should be examined about every 5000 miles as they sometimes wear unevenly and short circuit or stick in the holder. It is important that the brush box be kept clean.

Lubrication.

There are three places requiring lubrication. Two oil cups need a small amount of lubricant about every 4000 miles while the oil hole on the top of the breaker box underneath the curve in the magnets leads to the oil well that lubricates the distributor shaft and will hold about a quarter of an ounce of oil. It is provided with an overflow to prevent the lubricant from flooding the breaker box.

HOME MADE TAP WRENCH.

Motorists who take care of their own cars have occasion to employ a tap in the overhaul and the small garage is not usually provided with a tap wrench. In place of the latter a small monkey wrench is used, but this tool has its disadvantages in that the pressure applied is uneven and there is also more or less danger of breaking the tap.

At Fig 1 A is shown a simple tap wrench that may be constructed easily and which is inexpensive. The material comprises two strips of iron or steel, four or five inches long, .25 inch thick and .375 inch wide. A recess is cut in either piece, as illustrated in the sketch, for the purpose of securing the head of the tap. The pieces are locked by means of set screws or bolts as indicated. The screws may be of any convenient length in order to allow the use of different sized taps.

MYSTERIOUS SKIP DUE TO BATTERY.

It is surprising to note the number of operators who blame the carburetor for any erratic operation of the motor and when the engine begins to miss intermittently, change the adjustment of the vaporizer without considering the ignition system or other components which may be the cause of the trouble. This error is not confined alone to the amateur. Many experts are apt to diagnose the case similarly.

An instance of this kind was noted by the writer recently. A four-cylinder car came into the garage and the owner complained that the motor skipped when throttled down and, in reply to the usual questions as to condition of plugs, valves and battery, stated that these components were in proper condition.

The repairman concluded that the carburetor was at fault and spent over an hour trying to set it so that the motor would idle and run on all four cylinders. Different adjustments failed to cure the trouble although the operation of the engine was improved. Finally the helper suggested that the batteries might be to blame, as the machine was not equipped with a magneto. The owner stated that the batteries had been charged recently and that when tested the day previous registered six volts.

After a while a voltmeter was applied to the

Digitized by Google

batteries, two of which were employed, and it was found that one was completely dead, while the other registered less than four volts. A new battery was installed and the car started from the switch. The case illustrates the tendency of some to take it for granted that certain components are in good condition and brings out the necessity of testing each component before condemning the carburetor.

PROTECTING BATTERY WIRES.

Among the many refinements noted in the modern motor car is the tendency of the maker to make provision for protecting the wires of the ignition system. One cannot be too careful in the installation of batteries, especially storage members, and carelessness in this respect is likely to lead to serious trouble.

When storage batteries are fitted, and employed either for lighting or ignition work, the wires should be well insulated and covered with tape or tubing where the leads are likely to come in contact with metal. This is especially true where the battery is located on the running board and the wires pass through metal battery boxes.

An instance of a car being set on fire through faulty wiring of a storage battery was noted recently. The wires were allowed to swing and the insulation became chafed, causing a short circuit which set fire to a mass of grease which had accumulated upon the frame. This blaze was caused by the sparks produced when the two leads came in contact, or the battery short circuited.

FILING HINT.

When metal is to be filed and it is desired that the surface be left smooth, take a piece of chalk and rub it over the face of the file when the finishing cut is being taken. This will tend to give a smooth surface as the small pieces of metal will not stick to the file and scratch the work.

TOURING WITH KISSELKAR.

The winding mountain road to the geysers in Sonoma county, California, generally has been considered a bad and dangerous one for the motorist, but that reports have been greatly exaggerated appears to be evident from the successful tour recently completed by Mrs. J. W. Leavitt and party of San Francisco. The trip was made by a six-cylinder KisselKar, the product of the Kissel Motor Car Company, Hartford, Wis.

"The journey from Cloverdale to the geysers was one of the most enjoyable imaginable," writes Mrs. Leavitt. "We had been warned that the roads were bad, so we were happily surprised in making the 17-mile mountain climb in 1:30:00. It was a continuous and wonderful panorama throughout the entire distance, and at the geysers—well, there it is simply a miniature Yellowstone park."

ASSOCIATION POSTING TRAIL.

The Cannon Ball Trail Association, Leon, Ia., is accomplishing good work in the matter of road improvement for motorists. The object of the association is to build and post a route from Quincy, Ill., where the Waubaunsee and Blue Grass trails intersect, through that state to Kansas City, Mo., and Des Moines, Ia. The road has already been established and marked from Quincy to Trenton, Mo., and with the exception of the posting has been completed to Kansas City. Signs are being made giving distances to the next town, also to its terminal, which will be Kansas City, Quincy, Ill., or Des Moines, Ia.

West from Quincy the trail enters Princeton, Mo., Trenton, Chillicothe, Carrollton, Richmond, Excelsior Springs, Liberty, Harris, Milan, Kirksville, Edina and LaBelle, Mo. The telephone poles along the Cannon Ball route are marked with a 25-inch red band three feet from the ground, in order that the light of a motor car, running at night, will shine upon it. Large black balls are also painted just above the red band on both sides. The best roads have been selected and motorists touring in that section of the country can easily follow the "Cannon Ball" route, so-called. A motor truck is employed for transporting the painting material, etc.

DROVE CADILLAC WITH ONE HAND.

In his enthusiasm over the merits of the Cadillac car, made by the Cadillac Motor Car Company, Detroit, Harry von Stein Grover, St. Louis, agent for the Bagnell Auto Company, recently drove a Cadillac machine from Denver to St. Louis, 619 miles, in 33:36:00. To make the feat remarkable, Mr. Grover drove the entire distance with one hand, being the result of a wager. The best previous time for the distance, with the driving done with two hands, was in the neighborhood of 38 hours.

Wiring Splitdorf Coil.

(1433)—I have a burned out Splitdorf coil. I started to repair it some time ago and now find that I have lost the wiring diagram. There are two condensors in the unit and I don't know whether they are both connected in the primary circuit or not. The coil is fitted to a 1908 model A Maxwell machine and is a model 1905. Can you set me right in the matter?

CLARENCE H. PARKER.

Brockton, Mass., Sept. 12.

The coil referred to is of the vibrating type and in the accompanying illustration is presented the wiring plan. It will be noted that the battery is provided with two leads, these being marked positive + and negative —. The wire from the latter terminal is led to the frame and secured while the other wire is attached to the right hand terminal underneath the coil.

The leads from the timer or commutator are marked 1 and 2, representing the cylinders. The No. 1 is led to the right hand post or top of the coil and the No. 2 to the left hand terminal. The secondary wire, or cable, is next connected to terminal on the bottom of the coil and led to the plug of the No. 1 cylinder. The other lead will be the remaining cylinder.

The diagram is followed easily but if desired the wiring may be tested. Take the spark plugs out of the valve caps and lay them upon the cylinders, taking care that their terminals do not come in contact with metal. Next, turn the No. 1 cylinder up on compression; that is, until the roller of the timer makes contact with the contact block marked No. 1 in the drawing. Upon throwing the switch to the "on" position the coil should buzz and a spark show at the plug of the first cylinder. The second cylinder may be tested in a similar manner.

Dynamo-Motor Wiring.

(1434)—Will you please inform me whether a dynamo-motor could be arranged by having the positive and negative wires from a battery attached to the field of the dynamo-motor to start an automobile engine, and after it was started switch the positive and negative wires from the field of the dynamo-motor to the armature to charge a storage battery? It might be necessary to have two batteries. I will be greatly obliged for your opinion on the above question. E. L.

Morristown, N. J., Sept. 15.

A direct current shunt wound motor will not turn over if either the field or armature is excited only. A direct current shunt wound dynamo will generate current only when the dynamo is capable of exciting its own field or this field is separately excited. In a motor the field and armature should be excited simultaneously by different sources or by one source of electricity. When the motor is driven by an engine conditions can be arranged for charging storage batteries and the motor then becomes a dynamo. Of course the desired results would depend upon the design of the electric combination.

Buying Second Hand Cars.

(1435)—As a subscriber I would like to ask if you can give me some hints on how to judge a second hand automobile. I am thinking of purchasing a light touring car and would like all the information I can secure as to what parts should be examined and how to tell if the parts are in good condition. In short, what is the best plan to pursue in looking over a car in the few hours a buyer would have? Do second hand dealers have any way of fixing up a car so that it will appear all right long enough for them to demonstrate it and get the money?

H. O. WILLIAMS.

Concord, N. H., Sept. 11.

There are numerous parts which should be inspected for wear and condition, such as the power plant, clutch, transmission and rear system. The motor may be tested by turning it over slowly and noting if the compression is good and even on each cylinder. Its power will be noted in the demonstration during which the working of the clutch may be observed, especially if the prospective buyer drives the machine.

If possible the transmission should be inspected and the condition of the gears noted, as these may be badly worn. The rear system may be tested by jacking up the rear wheels and moving them to and fro to ascertain the amount of play. The steering gear should not be overlooked.

If not familiar with the mechanical details of motor cars it is advisable that some friend who is an expert look over the car. Regarding dealers fixing up machines, they generally repair and place a car in good running condition, and many concerns dealing in second hand vehicles maintain a repair shop for this work.

Charging Storage Batteries.

(1436)—I have a six-volt, 60 ampere-hour storage battery and the charging rate given by the maker is three amperes. I have a 110-volt direct current in the garage and wish to employ it to charge the battery. Please inform me how to connect lamps to properly charge the cells. C. BISK.

Hanover, Penn., Sept. 17.

Storage batteries can be charged with house or garage current provided it is direct, and the

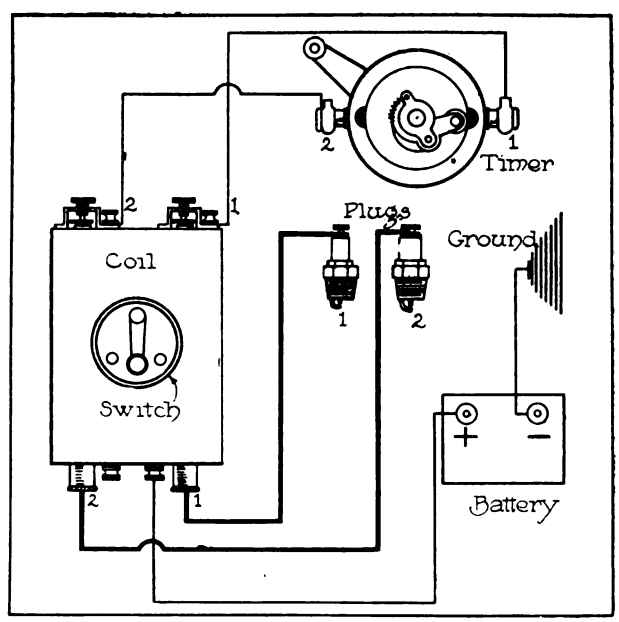
Digitized by Google

method was explained fully in the Dec. 10 issue of The Automobile Journal. To reduce the rate to the amount recommended by the maker, lamps are employed and the number and candlepower depend upon the charging rate.

To determine the number required to bring about the necessary amperage is a simple matter, especially if carbon bulbs are employed. It is better to utilize this type as there is considerably more resistance than with the Tungsten. Either 16 or 32 candlepower lamps may be used and six of the former will be required to reduce the rate to three amperes, or three 32 candlepower members.

A charging board is made easily, is not expensive and if considerable charging is to be done will more than repay for the labor. The material required is an eight-volt miniature switchboard voltmeter, an ordinary electric lamp wall socket, an electric door push bell button, a snap switch and six 16 candlepower carbon lamps or three 32 candlepower bulbs. These are mounted upon a hardwood board about 15 by six inches.

The positive wire + is led to the snap switch at the top of the board and the lead continued from the switch to the lamps, thence to the right hand side of the lamp socket. The negative wire — is connected to the other or left side of lamp socket. From these two terminals is connected the storage battery and care must be taken to note that the polarity is observed; that is, the negative wire from the battery must be connected to the negative lead from the lamp socket and the positive to the positive.



The voltmeter is placed in the centre of the board and the negative terminal connected by a wire to the negative lead from the main. The positive post of the voltmeter is led to the push button, thence to the positive wire leading from the lamps to the lamp socket.

Polarity must be observed and to determine which wire of the 110-volt current is the positive, immerse both leads in a glass of water to which has been added a little salt. By holding the wires apart, and turning on the current, bubbles will arise from one of the wires. This will be the negative and the connections are made to the charging board which should be marked + and — for future service.

Before charging, the cap or screw plug of each cell should be removed and if the plates are not covered with solution, distilled water should be added. This is accomplished by a syringe made especially for the work and it is not expensive. In charging the instructions of the maker should be followed carefully.

To test the battery with the current flowing from the main and through the lamps, press the button below the voltmeter. To test without the charging current flowing, turn the switch to "off" and press the button. Never press the button with the switch on and battery disconnected as the voltmeter will receive 110 volts, which will ruin it.

The function of the voltmeter is to enable the operator to note the action of the current. When the instrument is incorporated in the line it will be noticed that as the current is allowed to flow the voltage across the terminals of the battery will increase gradually, this being indicated by the instrument. When the rate is three amperes and the voltage reaches 2.5, reduce the current flowing to one ampere. The increasing or diminishing may be effected by adding or removing a lamp from the number specified in the circuit. Allow this one ampere to flow until each battery, if there are more than one, gives a voltage of 2.5 a cell, when it will be fully charged.

Illustrating Wiring Plan of Two-Unit Splitdorf Coil of the Vibrating Type.

During the operation the plugs or screw members should be removed to allow the gas generated to escape freely and a naked flame should not be brought in proximity to the members. The charging rate should never exceed the maximum of the 10 amperes for the 60 ampere-hour battery. The maximum voltage on charge should be, for a three-cell, six-volt battery, about 7.5 volts. If no low reading voltmeter be at hand, charge freely at the high rate until the cells gas or bubble free-

Digitized by Google

ly, and then cut down to the minimum rate until they again gas freely. When using lamp resistance not more than four batteries should be charged at the same time.

Excessive overcharging will bring about disintegration of the plates. If the cell be new the manufacturer should be consulted as to the proper purity and specific gravity of the electrolyte to be used and the duration of the initial charge. After the battery is charged the solution should be tested by placing some of it in a vessel made for that purpose. These are inexpensive and may be obtained at any supply house with the hydrometer, and an acid syringe also should be purchased.

The solution should register 29 degrees Baume, or 1.25 specific gravity; the division on the graduated scale of the tube at the level of the fluid will indicate the amount. Adding water lowers the hydrometer reading, while acid raises the specific gravity. When a new solution is mixed it should be allowed to cool before placing it in the cells. Chemically pure sulphuric acid should be employed and nothing but distilled water used. After charging is completed, remove all surplus solution with the syringe and wipe perfectly clean with tissue paper and replace the plugs.

SHOULD USE CAUTION.

Tourists are advised that the police in the following cities are particularly active against violation of the motoring laws:

Connecticut—Berlin, special traffic regulations; Bridgeport, overspeeding; Darien, speed traps; Fairfield, overspeeding; Greenwich, speed and muffler ordinances, also ordinance requiring license tag to be at least 18 inches from ground; Groton, muffler and license tag ordinances; Hartford, special traffic regulations; Meriden, traffic regulations; New London, muffler cut-out; Noroton, speed traps; Norwalk, speed traps; Ridgefield, special traffic regulations; Rowayton, speed traps; Stratford, overspeeding; Westbrook, speed traps; Winsted, overspeeding.

Massachusetts—Marlboro, overspeeding; Gardner, speed traps; Holyoke, fast driving in vicinity of schoolhouses; Attleboro, speed traps.

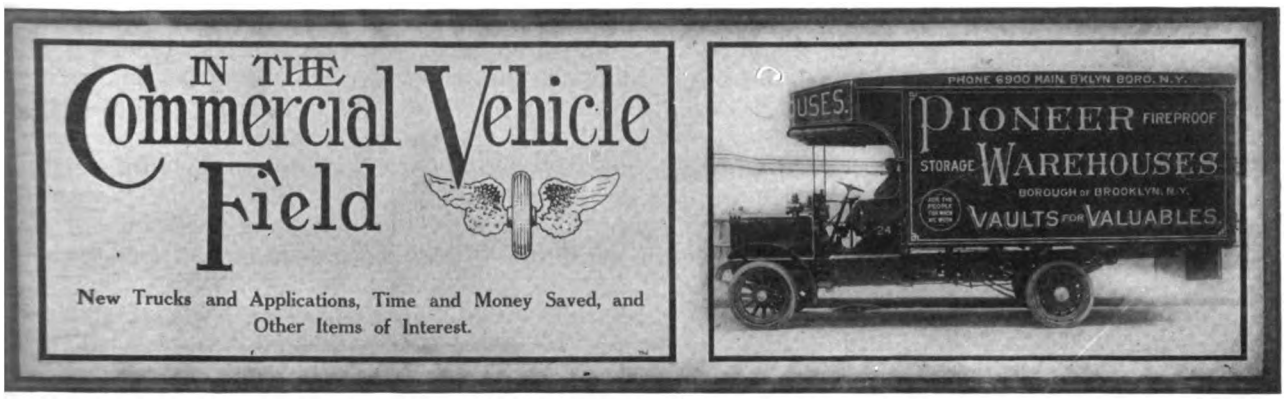
New Hampshire—Smithtown, speed traps; Seabrook, speed traps.

BEAVERS UNDERMINE ROAD.

Motorists recently visiting the Dead River region, Skowhegan, Me., reported considerable trouble on "Horseback" road, Highland. A culvert where a brook crosses the road had been dammed by beavers and the highway was flooded for over a foot. When a dam is removed the animals, who never desert a dam once established, rebuilt it in a night. Old trappers maintain that this will occur as long as there are two beavers left in the colony, so its extermination will be the only cure.

CARROLL PURCHASES BUSINESS.

William E. Carroll, for 14 years with the G. L. Brownell carriage factory and for the last three years with the S. C. Pease Carriage Building Company, Merrimac, Mass., has purchased the latter business and has transported it to New Bedford, Mass. In addition to continuing the carriage business, Mr. Carroll will manufacture specially ordered bodies for automobiles, motor hearses and undertaking wagons, fire and patrol wagons. Mr. Carroll has already achieved some success along this line, having built, it is said, the first complete automobile hearse ever made in the United States, for Frank E. Campbell, New York City.



WILL REMOVE TO DETROIT.

The Pontiac Auto Castings Company, Pontiac, Mich., composed of Detroit and Muncie, Ind., men, has decided to move to Detroit and has been incorporated for $15,000. A factory will be built on Linfere street and the plant will add aluminum work and iron castings to its output, making necessary the employment of a large number of workmen.

PRESENT CLARKSON WITH CAR.

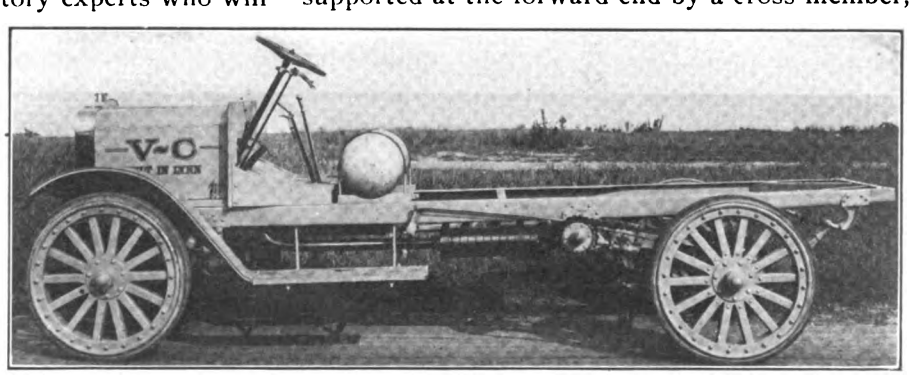
Secretary and General Manager Coker F. Clarkson of the American Society of Automobile Engineers has been the recipient of a handsome new 1913 Hudson car, made by the Hudson Motor Car Company, Detroit, from 1300 members of the society. The presentation is an appreciation of Mr. Clarkson's efficient service in furthering the cause of standardization in motor car engineering and thus accomplishing the saving of many thousands of dollars to motorists by means of ratified engineering. Mr. Clarkson's car is a large five-passenger touring model, fully equipped with an electric motor starter, electric lights, jewelled speedometer, clock, rain-vision windshield and every convenience.

Digitized by Google

PEERLESS PROVES EFFICIENCY.

The new 30 horsepower, four-cylinder Peerless combination police patrol and ambulance, recently put in service by the city of Medford, Mass., has demonstrated its efficiency over horse drawn vehicles. It has reduced the time required to reach any of the city's boundaries from 20 minutes to about five. But one man is required to operate the machine, whereas an extra man was formerly employed to care for the horses. The vehicle is equipped with a first aid to the injured kit and has two stretchers when used for ambulance purposes. Fire extinguishers loaded with chemicals are carried in front. The machine will answer alarms of fire as well as police and regular calls.

THE NEW VC 3000-POUND CHASSIS.



Announcement is made of a 3000-pound truck chassis by the VC Motor Truck Company, Lynn, Mass., a new concern organized recently with a capital stock of $100,000. The stockholders comprise well known business men and delivery of the machines is expected during the present month. A feature of the policy of the company is its service, it being proposed to maintain weekly inspection of all cars by factory experts who will travel by motorcycles.

But one chassis will be built which will be designated as model B, and is presented in an accompanying illustration. It is equipped with a four-cylinder, four-cycle water-cooled Continental motor having a bore of 3.75 inches and stroke 5.25. The cylinders are of the L head type, cast en bloc with water jackets and intake manifold integral. The S. A. E. rating is 22.5 horsepower, but 30 horsepower is claimed by the maker at 1000 revolutions a minute.

Lubrication is by a combination of splash and force feed, while cooling is by a centrifugal pump, shaft driven. The radiator is of the Mercedes type and is mounted upon ball trunnions, which eliminates all stresses upon the cooler. Radiation is assisted by a four-bladed steel fan mounted upon an adjustable ball bearing bracket on the forward end of the cylinder block, driven by a flat belt from a pulley installed on the extension of the camshaft.

Ignition is by a Bosch magneto, driven by the same shaft actuating the water pump. There is also a battery of dry cells from which current is supplied through a transformer coil located on the dash under the hood. A model D Schebler carburetor is fitted. The gasoline tank is of steel, cylindrical in form and located under the driver's seat. The capacity is 20 gallons, three gallons of which is in reserve.

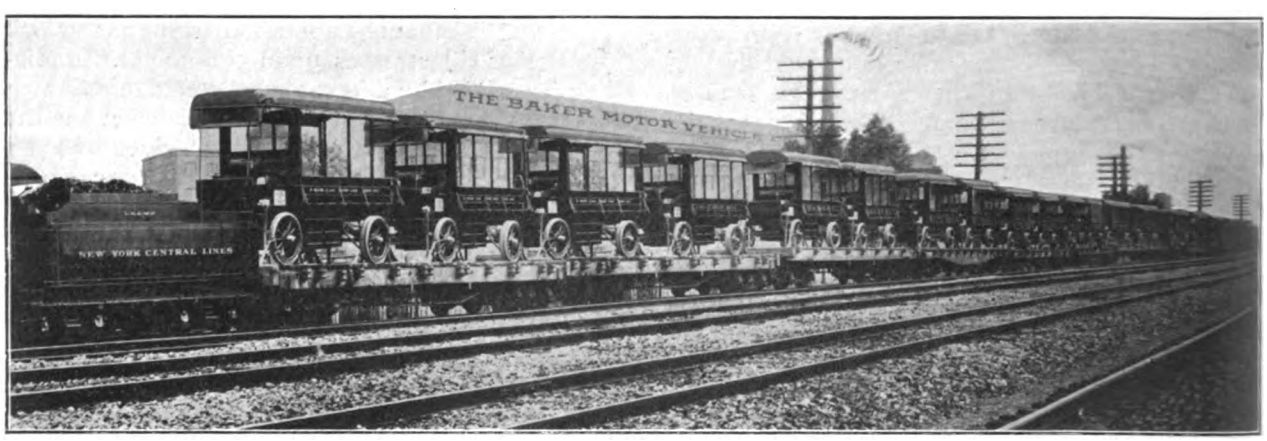
The clutch is cone having a facing of Raybestos and is fitted with a clutch stop, preventing spinning and making for easy shifting of gears. The transmission gearset is of the selective type with three speeds forward and reverse and it is supported at the forward end by a cross member,

New VC 1.5-Ton Chassis, Made by the VC Motor Truck Company, Lynn, Mass.

Digitized by Google

and at the rear is bolted to the jackshaft housing. The shafts and gears are of nickel steel, ample in size, and New Departure annular ball bearings are employed.

The jackshaft is in a pressed steel housing that contains the differential gearing. This housing is supported at either end by heavy brackets that are combined with the spring hangers and by loosening the retaining bolts the jackshaft may be dropped from its supports.



The rear axle is a steel drop forging and the radius rods are fitted on bearings on the axle and attached to the jackshaft housing with screw and lock nut means of adjustment. The springs are semi-elliptic, front and rear. The steering wheel is at the left with control levers at right. The clutch is actuated by the left pedal and the service brake by the right. The service brake is an external contracting type, the shoes being lined with Raybestos and contracting on a steel drum 14 inches in diameter. The emergency brake is of the internal type, of ample size and means are provided for an easy adjustment.

The wheels are of the artillery type, 36 inches in diameter, fitted with demountable tires, the make being optional with the purchaser. The wheelbase is 130 inches and the tread 56. The weight of the chassis is 3540 pounds and the equipment comprises tool and battery box, two dash and one tail lamp, jack and tools.

TRAIN LOAD OF BAKER ELECTRICS.

Nineteen two-ton electric wagons, made by the Baker Motor Vehicle Company, Cleveland, O., were shipped recently in part fulfillment of an order given by the American Express Company. When the shipment was made it was found that 10 flat cars were necessary to transport the machines. The accompanying illustration is interesting for the reason that it was probably the first time that such a large shipment was made all at once. It is claimed by the Baker company that the order from the American Express Company is the largest ever given a vehicle manufacturer.

When the present orders are filled the American Express Company will have Baker machines in 18 different cities, which are New York, Chicago, Boston, Dallas, Portland, Me.; Springfield, Mass.; Buffalo, Milwaukee, Lawrence, Mass.; Kansas City, Memphis, Worcester, Mass.; Syracuse, Rochester, St. Louis, Cleveland, Cincinnati and Los Angeles.

Train Load of Baker Electric Trucks Consigned by the Baker Motor Vehicle Company, Cleveland, O., to the American Express Company.

LA FRANCE HYDRAULIC TRUCK.

For certain kinds of city haulage motor truck engineers have discovered decided economy in the use of tractors and trailers; that is, auxiliary wagons hauled by the power wagon proper, both carrying loads on their bodies. In order to demonstrate the value of such equipment in its work as contractor, the Van Kuren & Sons Company, New York City, recently gave a test to a six-ton La France truck, distributed by the Hydraulic Truck Sales Company, 1777 Broadway, in that city.

The entire load carried by the truck and trailer was 15 tons, which was hauled over the road at the rate of eight miles an hour without difficulty. In order to make the test complete in every way the entire outfit was sent up Montgomery avenue hill, with an eight to 10 per cent. grade, at a speed of four miles an hour. It is of particular interest, in this connection, to note that the La France car is equipped with the Manly system of hydraulic transmission.

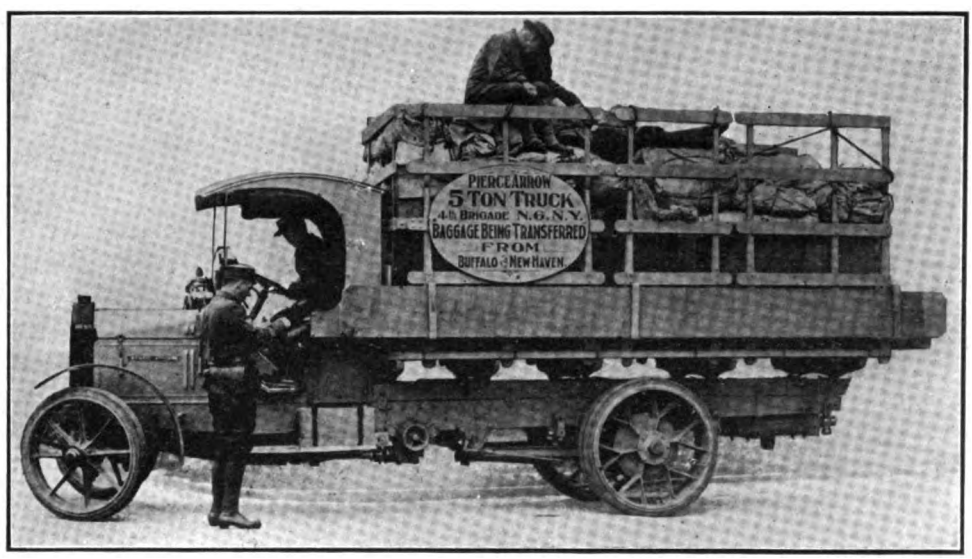
TESTING TIRE EFFICIENCY.

A series of trials, extending over a period of several years, to determine the average length of life of three standard types of tires on light delivery trucks were recently completed by the engineers of the Motz Tire & Rubber Company, Akron, O. Machines in the service of some of the largest retail houses in the country were utilized for this purpose, and the tires were solid rubber, pneumatic, and the special cushion type made by this company. The trucks were divided into relays, each type of tire being employed in the same order on each. That the firms represented by these cars have since adopted the Motz cushion tire appears to be sufficient evidence that the tests were most convincing to those interested.

It is claimed by the company that the result was a double victory for the Motz tire, in that it was found that these so conserved the mechanism of the machines that breakage of parts in all tests amounted virtually to nothing. It is further stated that the tests showed a substantial saving in the cost of the equipment, covering the long period of the experiment. Additional and specific data are promised in the near future, and will be awaited with interest by the trade.

PIERCE-ARROW IN ARMY MANOEUVRES.



During the army manoeuvres held recently in Connecticut commercial vehicles played an important role and among the numerous makes which were utilized to transport baggage, etc., was a five-ton Pierce-Arrow truck, made by the Pierce-Arrow Motor Car Company, Buffalo, N. Y. The machine, which is presented in an accompanying illustration, probably covered the longest distance of any industrial transport, as it was sent overland to the scene of the manoeuvres from Buffalo, N. Y.

It carried the property of the Fourth Brigade, New York National Guard, with headquarters in Buffalo, which took part in the manoeuvres.

It is stated that the load weighed some 10,750 pounds, which made the total weight about 10 tons. On the way from Buffalo to New Haven an average daily mileage of 150 miles was maintained. During the trip planks were employed to reinforce bridges because of the weight of the truck. In spite of the heavy load the machine accomplished the journey without experiencing any trouble.

PEERLESS TO REPLACE TROLLEY.

To take the place of a trolley service in the environs of San Juan, Porto Rico, three three-ton Peerless truck chassis, made by the Peerless Motor Car Company, Cleveland, O., have been delivered by the Peerless Motor Car Company of New England, with headquarters at Boston. All of the vehicles are fitted with 30 passenger bodies, as shown in the accompanying illustration.

Five-Ton Pierce-Arrow Worm Driven Truck Carrying Property of Fourth Brigade, New York National Guard, to Scene of Recent Army Manoeuvres in Connecticut.

The seats are furnished with removable spring cushions, covered with rattan. There are five of full width back of the driver's seat and two shorter ones in the baggage compartment at the rear. The top is somewhat similar to that of an open trolley car and is provided with pantasote curtains suspended on spring rollers and running on wire grooves at the roof, making it possible to enclose the car during showers. The running boards on each side are arranged to be closed when not in use. A large swivel searchlight on the dash and a hand operated siren horn are included in the equipment.

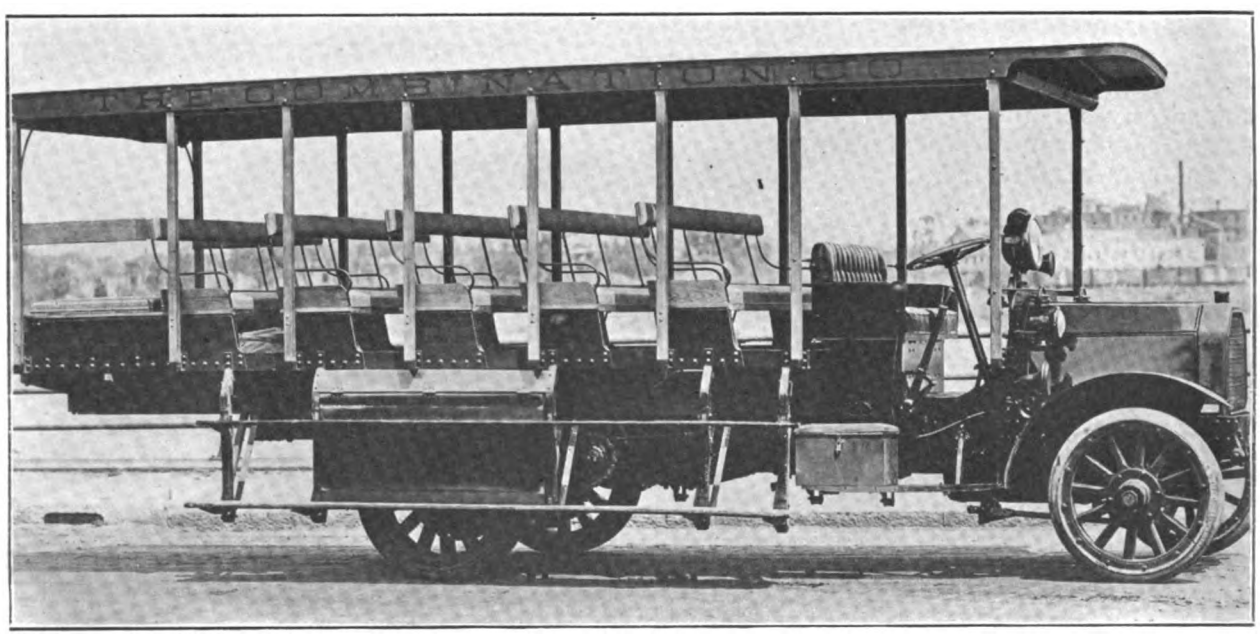
VELIE TRUCK IN ARMY SERVICE.

The final reports of Lieut. Bubb of the United States Army, in connection with the Velie three-ton truck, made by the Velie Motor Vehicle Company, Moline, Ill., shows that a perfect score in war service was made for the recent trip, starting at Dubuque, Ia., and finishing 26 miles out of Madison, Wis., where the army went into camp. The truck run was held under the direction of Capt. Williams of the United States Army station at Dubuque. The first run of the machine was from Moline, starting at 5 in the morning and arriving at Dubuque at 2 in the afternoon, a distance of 86 miles, when it was at once put into service. It was used for hauling supplies for 2200 soldiers and several times was found useful in assisting horse vehicles which had become stuck in the mud and sand.

DAILY INSPECTION IMPORTANT.



Vice President Gleason Murphy of the General Motors Truck Company, Pontiac, Mich., is pronounced in his views regarding the care of commercial vehicles. He points out that they should be given attention at all times, and advocates that an owner should get his driver into the habit of making a thorough inspection of his machine at the completion of each day's work. Speaking of the contention that the life of a truck is limited, Mr. Murphy says:

"I know a truck that has been in service for over six years and is doing good work today. Proper care has brought about this long record. This also embodies the statement that a truck's period of usefulness is limited. It all depends upon the care given and if owners would realize the importance of this point they would find that motor trucks would not depreciate so rapidly, and would give a surprise in the daily work."

MECHANICAL SPEED TRAP.

E. H. Pendleton of Venice, Cal., has invented a mechanical speed trap which is said to have been so successful in numerous tests that its official adoption by the authorities of a California county is practically assured.

Equipped with mechanical stop watches the trap can be set at any point along the thoroughfares. The machine is fitted with 1320 feet of telephone wire, stretching 660 feet in either direction. At either end is a telephone. When a motorist enters the trap the officer at that end flashes the news to the man in charge of the device, the stop watches being automatically released. When the motorist passes the middle man his time is taken by the stop watches and if he is exceeding the speed limit the man on the far end is 'phoned to stop him. Already several convictions of speeding have been secured in the courts by the aid of the apparatus.

Peerless Three-Ton Chassis Fitted with Special Body for Passenger Service in San Juan, Porto Rico.

NEW ROUTES MAPPED.

A new route between Montreal, Can., and Plattsburg, N. Y., has been mapped out, which is about 15 miles shorter than the old road, the distance between the two cities now being 65.5 miles. Automobilists are advised to follow this new route through Moores, St. Edwards, La Tatue and La Prairie into Montreal. There is a good macadam road for over 20 miles of the journey and the balance is a good dirt road with the exception of about 10 miles of clay, which is in good condition.

An important new route, a distance of 85.5 miles, from Malone, N. Y., to Montreal, Can., has been surveyed and the trip can be made easily by motor car in four to five hours. The road is part macadam and stone for 28 miles, the rest being clay free of ruts and stones. Announcement of this new route will be of particular interest to automobilists in northern New York as well as those residing in the Province of Quebec.

It will probably become a popular highway for motorists desiring to tour into Canada from the Adirondacks. Heretofore they have been forced to go by way of Rouses Point, N. Y., and they will now be able to do away with shipping their cars down the St. Lawrence river. The new route will take the tourist along the south shore of the St. Lawrence river from Chateaugay Basin through the Indian village of Caugh-Na-Waga to La Prairie, St. Lambert and thence across the famous Victoria bridge into Montreal.

LARGE ORDER FOR OVERLANDS.

The Willys-Overland Company, Toledo, O., maker of the Overland car, has announced that it has received orders for 36,580 cars, 3000 of which will go to the Pacific Coast; 1500 each to the New England states, New York City, Minneapolis, Kansas City and Philadelphia, while Iowa has ordered 2500. Each state in the Union has taken from 25 to 100 per cent. more Overlands than last year and the demand has been especially heavy in the extreme western and middle western states, the farming sections showing the largest increase.

COMPARES RIDE TO MOVING PICTURES.

Leo M. Nevis, a Sacramento dealer in American motor cars, made by the American Motors Company, Indianapolis, Ind., indulged in a trip from his home city to the famous Lake Tahoe in a big American and during the 31 miles did not change from the high. He compares the ride with a moving picture display in that the scenes when the car was travelling at 60 miles an hour constantly changed at a high rate of speed and the effect was unusually attractive.

CAR OPERATES ELEVATOR.

Necessity has improvised a new use for the automobile. A garage manager at Philadelphia, in building an addition to his place of business, made use of his Regal touring car, manufactured by the Regal Motor Car Company, Detroit, to operate an elevator. When the problem of raising bricks and mortar to the upper floors arose, a rope was secured to the elevator, passed over suitable pulleys at the top and bottom and attached to the rear axle of the car.

To raise the elevator the car was run about 60 feet, this being sufficient to bring the elevator to the second floor. Although the car was in service four hours each day, it was apparently none the worse for wear. About five gallons of gasoline were used in three days for this work and the manager claims he saved himself about $60 a week in labor, as the machine performed the work of five hod carriers and saved the annoyance of handling that number of men.

LOCOMOBILE LOWERS RECORD.

Leo Galitzka, in a Locomobile Six, made by the Locomobile Company of America, Bridgeport, Conn., lowered by several hours the record for an automobile journey from Denver to Chicago, a distance of 1200 miles. Mr. Galitzka's actual running time for the distance, over extremely rough roads, was 39:25:00.

CAPE COD ROADS POPULAR.

Cape Cod has this year proved one of the most popular touring regions of New England and the roads are reported in excellent condition. As indications point to breaking all records for touring during the fall months, the hotels on the Cape will remain open longer than usual to accommodate tourists who are expected to visit New England before the end of the season. The best way to reach Boston from Cape Cod is by way of Onset, Wareham, Middleboro, Bridgewater, West Bridgewater, Stoughton and Mattapan. The road is mostly macadam.

REGULATING PEDESTRIAN TRAFFIC.

Pedestrians have become so accustomed to the position that they have the first right of way on a public thoroughfare that there is bound to be some little criticism of the proposition that their use of the highway should be regulated. Many of the larger cities have been confronted with the suggestion that something must be done to relieve congested conditions, and among the European municipalities, ordinances have been passed compelling those on foot to remain on the sidewalk except at regularly appointed crosswalks.

A few months since New York City was involved in a plan, to be submitted to the next legislature, looking toward some means of eliminating the possibility for accidents on its streets. While the American metropolis was busy suggesting new methods of controlling the speed of automobiles, Vienna, in Austria, was passing regulations governing the use of city streets by pedestrians.

It is of interest to note, in this connection, that some of the smaller cities in America have recognized the merit of this suggestion. Springfield, Mass., for instance, has considered the advisability of passing an ordinance similar to that reported from Vienna. Sooner or later the general public will realize that the motorist cannot be expected to bear the major portion of the responsibility for safeguarding the public.

Automobiles have a distinct value in modern economic conditions. When it was first suggested that horse drawn vehicles using the highways at night should carry lights, it met with much the same opposition that may be expected to result from an attempt to restrict the right of the pedestrian to use any and all portions of the highway. Wherever the universal lighting proposition has been given a fair trial it has been found to reduce accidents and to work no hardship. The same thing will hold true of regulating pedestrian traffic, when once the public has become accustomed to accepting a fair share of the responsibility for protecting itself.

MOTOR CARS VS. HORSES.

No sooner were automobiles demonstrated as practical road vehicles than it was announced that within a few years they would entirely supplant the horse. Motor cars have been practical institutions for some time now, and an effort to determine what effect, if any, they have had upon the use of horses, taken in the aggregate, is worthy of consideration.

The Boston Transcript recently interviewed a well known veterinary surgeon in an effort to learn to what extent the increasing use of motor vehicles had affected his business. He replied that fully 75 per cent. of the people now owning automobiles never had owned a horse, and so far as he could determine there had been practically no change in his profession.

About the same time the Massachusetts highway commission completed a seven days' count of vehicles passing over the railroad tracks of the Boston & Albany railroad at East Brookfield, Mass., with the result that during that period 2584 vehicles of all kinds were counted. Of these 2178 were automobiles, either commercial or pleasure cars, and 406 horse drawn wagons of both types.

Those who desire may set out to prove almost anything. As a matter of fact it would appear that every new method of transportation stimulates those already existing. It is quite probable

Digitized by Google

that there are more horses in use today than ever before.

Looking at the matter from another viewpoint, the automobile has done little to eliminate any means of transportation existing previous to its advent. This holds true with the railroads, as well as horses, albeit there has been a suggestion from certain quarters that the net profits of some few railroads have suffered in competition with the newer method. As a general proposition the automobile acts as a feeder for the railroad, and the best means of solving the transportation problem lies in relegating each factor to its proper sphere.

AUTOMOBILES IN KANSAS.

Kansas is looked upon as one of the agricultural states, and the recent report of the state tax commission concerning the personal property held in the commonwealth is of interest as giving some indication of the increase in automobiles owned and operated therein. In 1911, there were 14,456 motor cars owned in Kansas, and this number was increased to 18,623 last spring, when the assessors made up the list. It is estimated that if these were formed in line, one behind the other, they would extend for a distance of about 70 miles.

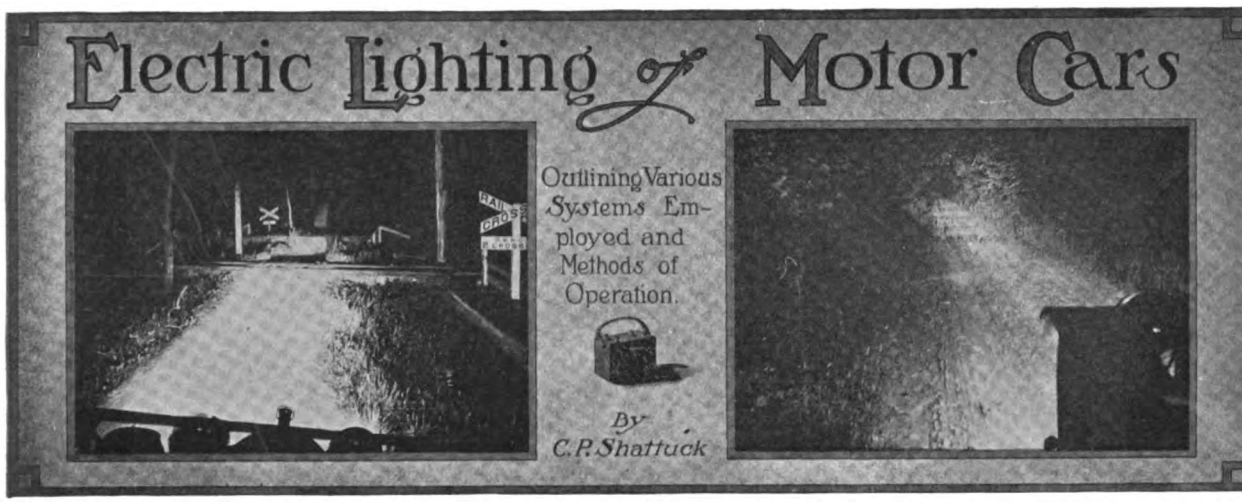
The average listed value of the automobiles in Kansas this year is $419.82, giving a total valuation of $7,818,273. Farm implements head the list of personal property—after eliminating household goods, money on deposit in banks, mortgages, stocks and bonds—with a total valuation of $10,358,339. Hogs occupy second place with $8,174,591. Automobiles are third, and pianos fourth with $7,461,741.

THE PROBLEM OF GOOD ROADS.

Motorists will not lose sight of the recent decision of the Massachusetts supreme court with reference to the liability of the several towns for damages done to vehicles using the public highways. It will be remembered that the court held that the municipality was responsible for damages resulting from water bars in country districts. It is true that this phase of the situation was the only one before the judges at the time, but the action of automobile owners in still another Massachusetts town would seem to indicate that other situations will soon be before the supreme court for its adjudication.

Good roads are an asset to any community. When the people begin to realize that poor ways mean a possible source of heavy expense, there will be more strenuous efforts to eliminate the conditions which may mean suits for damages. Public opinion has been aroused to the advantages of better highways, and the decision of the Massachusetts supreme court will do quite as much as any number of good roads conventions to bring about the desired results.

AVIATION IN AMERICA.



It is somewhat disappointing that America, to which country belongs the honor of winning the first international aviation race for the Gordon-Bennett cup, should have been placed in such unfavorable light with respect to flying the fourth race for this trophy. The new winner of the award promises to create a speed of 200 miles an hour, or some such matter, within the next two years, and intimates pretty strongly that America is losing ground in the matter of developing the aeroplane.

The late Wilbur Wright was of the opinion that little was to be gained in creating speed records. Both he and his brother, Orville, turned their attention to other matters which seemed to them to be of more importance. The Wright brothers will be recognized as the pioneer world aviators, and their advice in such matters must bear weight.

Glenn H. Curtiss, who won the first international race, evolved the original successful hydraeroplane, the practicability of which does not appear to be questioned by the governments who have purchased his machines. Other American constructors have produced satisfactory results.

In the field of sports American aeroplanes do not appear to have the same prominence as those of other nations. It undoubtedly is true that American constructors do not receive the same encouragement as those who are working abroad. However it is by all means too early in the history of aviation to state definitely that America's progress this year is represented by its situation with reference to the international race.

Digitized by Google

Part XV—The Splitdorf System.

PRODUCED by a concern which is prominently identified with the automobile industry as maker of ignition equipment for automobiles, the electric lighting system manufactured by the Splitdorf Electrical Company, Newark, N. J., is noticeable for its compactness and simplicity. Believing that the lighting outfit should have as few parts as practical, the company has designed an equipment that consists of a highly efficient generator, a fuse box and ammeter. All controlling devices, that is, the parts regulating the output of the generator as well as the flow of the current to the battery, are incorporated in the machine which is dust, oil and water proof.

With the Splitdorf system the battery is floated upon the line and the generator depicted at Fig. 106 is an improvement over the types formerly manufactured by the company and contains, as above stated, regulating features that compensate for the different rates of speed and control the output. This is performed automatically and as every instrument is carefully assembled, adjusted and tested at the factory, will not require any attention whatever from the user.

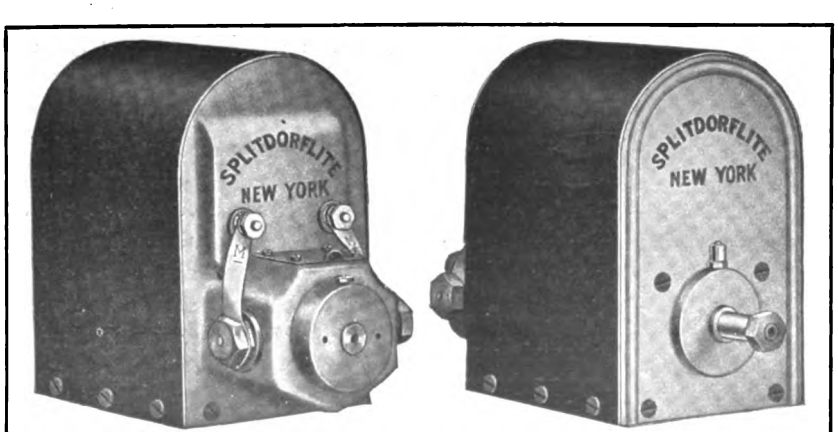


Fig. 106—The Splitdorf Lighting Generator, a Compact, Simple Machine, Developing Uniform Current Regardless of Speed of the Automobile.

Operation of Cut-Out.

The function of the cut-out is to close the circuit from the generator to the lamps and battery when the generator has reached a speed giving a voltage slightly above that of the battery, or to disconnect the machine from the lamps and battery when it drops to a speed and voltage equal to that of the battery. This is necessary as means must be provided for preventing the battery discharging itself through the generator and for connecting the latter to the battery when the proper charging current is developed by the speed of the automobile.

High Speed Control.

A feature of the Splitdorf generator is the method of compensating for the variable speeds of the motor car. Unlike some types, the machine is not fitted with friction clutches, governors, etc., but relies upon its construction. The control is accomplished by the differential windings and a special construction in the arch of the generator that is claimed to positively and effectually control its output above a predetermined speed and hold the voltage and amperage at a uniform quantity and pressure suitable for maintaining the battery in a properly charged condition as well as preventing the burning out of the

Digitized by Google

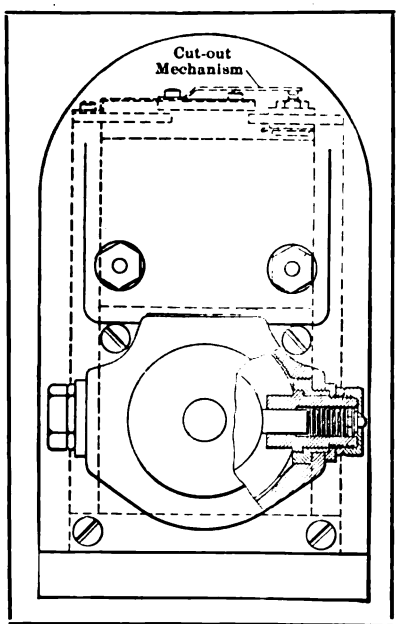

Fig. 107—Showing the Cut-Out of the Splitdorf Generator, Also Manner of Retaining Brushes.

lamp filaments.

The magnetic field evolves in part from two or more pairs of permanent horseshoe magnets similar in size to those employed in the well known type B Splitdorf ignition magneto. The field is strengthened by the addition of electro-magnetic compound wound fields, enabling the generator to supply the required amount of energy to the lighting circuit when the armature is rotated at the proper speed. Situated within the arch of the protecting metallic cover is an electro-magnetic device which automatically connects or disconnects the generator to the lighting circuit; also differential windings and special construction in connection with the field windings that automatically control the output of the generator, as shown by the chart of current curves depicted at Fig. 109.

Function of Windings.

The readings illustrated are from the improved type of generator and were taken with a full lamp load of eight amperes and an 100 ampere-hour battery floating upon the line as indicated in the wiring diagram presented at Fig. 111. The reading gives the output of the generator in amperes, the line voltage at the lamps and the generator voltage across the brushes at different rates of speed as indicated.

It will be noted that when the armature of the machine revolves at a rate of from 1750 to 2000 revolutions a minute, at which speed it is developing about 1.5 amperes over the lamp load, the differential windings, together with the special construction, come into action and hold the voltage of the generator so that as the battery voltage rises there is a corresponding diminishing of the generator voltage which the maker states eliminates any possibility of overcharging the battery.

The action of the generator is as follows: When the armature is rotating at a low rate of speed, the magnetic field provided by the permanent magnets results in the rapid building up of the auxiliary field produced by the passage of the armature current through the shunt winding of the compound wound electro-magnets. When the auxiliary field attains sufficient strength the regulator contact closes and connects the generator to the battery line so that almost the entire armature current flows through the series coil of the compound wound field magnet, thus further increasing the strength of the magnetic field up to an armature speed of 2000 revolutions a minute and 10 amperes output. At this period the differential windings come into action and automatically hold the output of the generator irrespective of higher speeds. It is also pointed out by the maker that, through the differential windings, the excess output of current above a predetermined speed is utilized in recharging the permanent magnetic field, thus maintaining the latter in a fully saturated condition.

Components of Generator.

The armature is slotted and form wound and the laminations are punched from a special grade of soft steel. The magnets are constructed of a high grade special steel and are fully enclosed, as will be noted by the illustration at Fig. 106, which shows both views of the generator. The commutator is made of hard drawn copper segments, 1.625 inch in diameter and one inch face, making for efficient commutation. The brushes are of

Fig. 108—Fuse Panel of Splitdorf System, Each Circuit Being Protected by a Fuse.

Digitized by Google

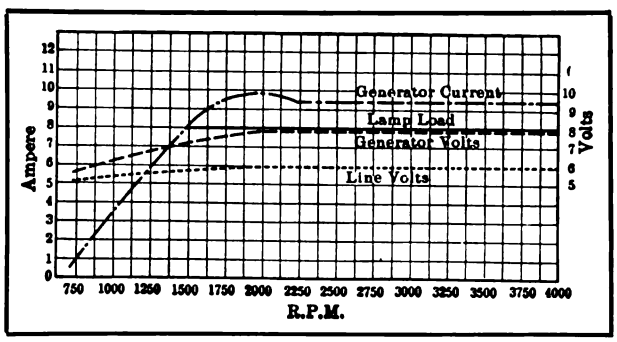

Fig. 109—Chart of Splitdorf Generator Showing Readings Taken with a Full Lamp Load of Eight Amperes and Battery Floating on the Line—The Output of Generator in Amperes, Line Voltage at Lamps and Generator Voltage Across Brushes at Different Rates of Speed Are Also Indicated.

French carbon, fitted carefully, and so held that sparking is eliminated. They are located in the commutator housing and are easily accessible from the outside through a sliding cover in the top of the housing. The field coils are of the shunt and differential type, the pole shoes of soft cast iron and of special construction as previously explained. The housing over the magnets is of sheet brass and is easily removed, being retained by screws. The entire construction makes for durability as all working parts are fully enclosed.

Method of Drive.

The generator may be driven by gear or by silent chain according to convenience in installation. Polarity must be observed, however, and the armature must be rotated in accordance with the design; that is, clockwise or anti-clockwise, the company making both types to meet the varying requirements of installation. The connections are plainly marked, and the machine operating in a clockwise direction has the positive + pole on the left side of the commutator or driving end as shown at Fig. 111 B. When the direction of rotation is opposite, the positive pole is at the right as shown at A.

Battery.

Any standard type of lighting battery of six-volt, 100 ampere-hour capacity or over may be employed with the system which as pointed out requires no other attention than a periodic examination of the battery to note that the plates are covered by electrolyte in accordance with the instructions of the maker.

The equipment comprises a fuse box containing a separate fuse for each lighting circuit so that in the event of a possible short circuit the fuse of the particular line will blow out, eliminating the faulty circuit and preventing injury to the lamps, battery or wiring. By referring to the wiring plan at Fig. 111 it will be noted that the fuse box also contains a fuse for the battery. The fuse panel, shown at Fig. 108, is very compact and may be installed in any convenient place, preferably on dash under the hood, and each terminal is plainly marked, making it an easy matter to remove and replace connections.

The wiring plan is simple and the circuits may be installed easily by anyone not familiar with electricity. The wiring should be of oil proof insulation not less than No. 12 or 14 B. & S. gauge and should be securely fastened by clamps, but metal members should not be employed. The ground leads should be securely attached to the frame or metal by bolts or machine screws and all connections soldered to the terminals. All joints or splices should also be carefully soldered, for it is important that possibility of short circuits be eliminated.

Lamps and Switch.

The bulbs employed with the Splitdorf system are Tungsten six volt and 16 candlepower members are fitted to the headlights, four candlepower to the side lamps and tail light. Any type of selective switch may be employed, provided it complies with the wiring arrangement of the system. That illustrated in the wiring plan is of the push button type permitting of the service of any group of lamps.

The ammeter shown at Fig. 110 was designed especially by the company for service with its lighting equipment and is attached to the dash in plain sight of the driver at all times. The dial is calibrated, showing the amount of current being utilized for lighting and it also indicates the

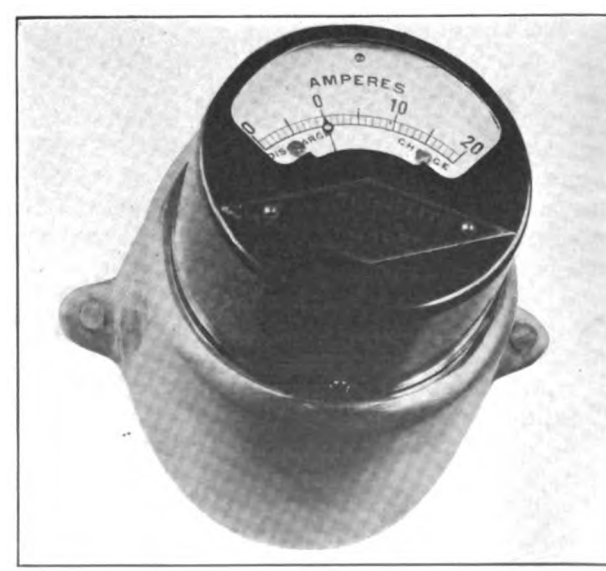

Fig. 110—The Splitdorf Ammeter, Enabling Driver to Note Readily the Operation of System.

Digitized by Google

charge rate. Its function is to enable the operator to note the working as well as condition of the system.

This is an important feature with an electric lighting equipment and the Splitdorf instrument is constructed of high grade material and the ammeter carefully tested for accuracy. The dial is calibrated to show the charging rate up to 20 amperes, readings of a single ampere being easily discernible. The discharge rate reading is limited to 10, which is more than sufficient. The location of the device is shown in the wiring plan presented at Fig. 111.

Although the storage battery is employed for supplying current when the motor car is inoperative and when the speed of the generator is not sufficient to develop proper current for lighting the lamps, it must be maintained in conjunction with the generator as the latter is not designed for supplying current to the lights alone.

As with many lighting generators the Splitdorf may be employed in connection with the ignition system and for this service a special coil has been designed. It is of the non-vibrating type, encased in a black fibre tube and its special winding is such that in the event the switch be left at the "on" position over night the coil would not be injured.

Throughout the material and workmanship are the best and in keeping with the high standard maintained by the Splitdorf Electrical Company. The features emphasized of the system are: A simple, compact generator, giving a steady and uniform output of current not affected by the variable speed of the motor car, absence of complicated governing devices, few units in the system, ease of installation and that it affords efficient service with the minimum of attention.

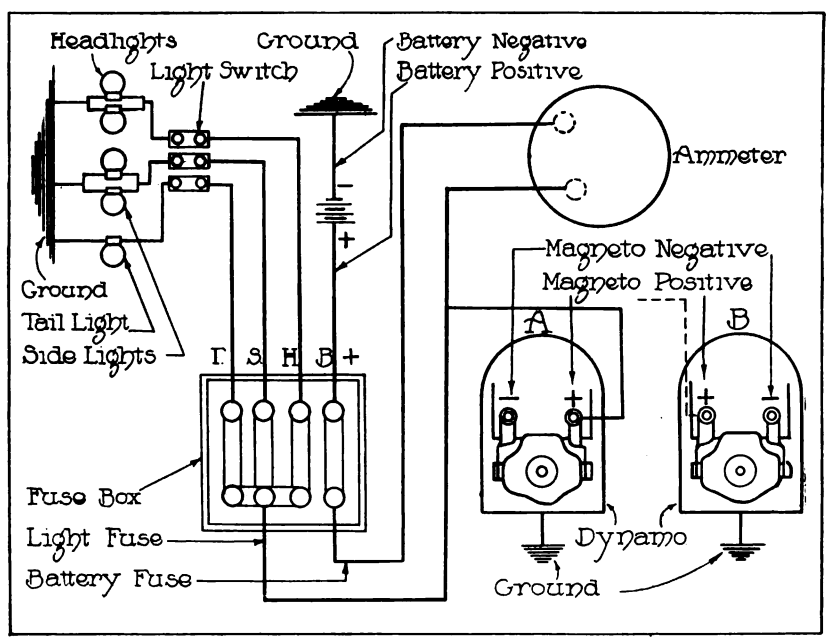

Fig. 111—Showing the Simplicity of Wiring Plan: A, Illustrating Connections of Generator When Driven in a Clockwise Direction; B, How Wired When Operated Anti-Clockwise.

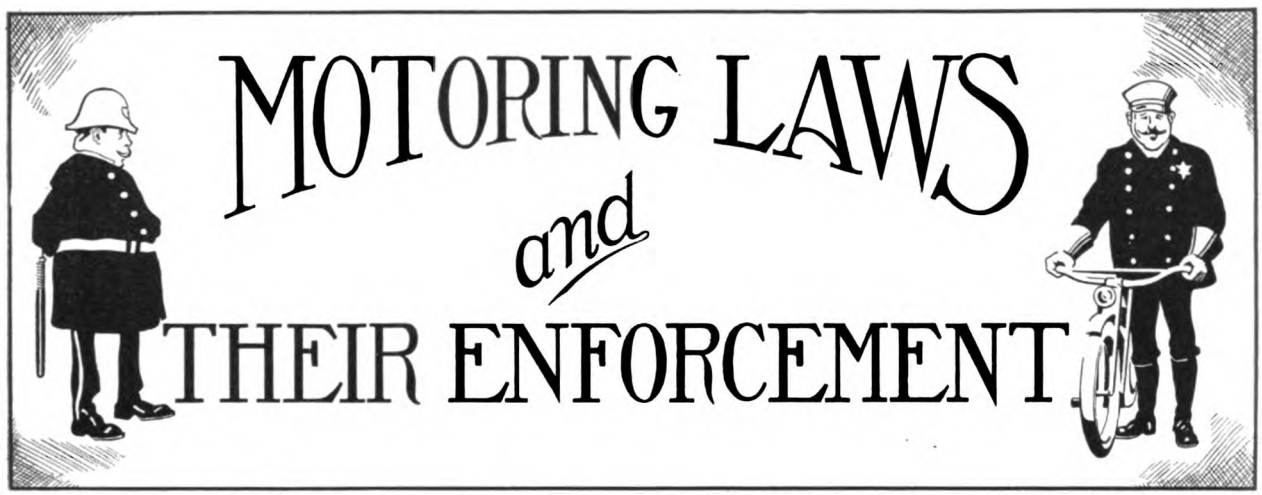
FORD TO BUY 90,000 TONS OF STEEL.



It is estimated that the Ford Motor Company, Detroit, maker of the Ford car, will the coming year utilize 90,000 tons of steel in the manufacture of its product. This is said to be only second to the amount of steel used each year by the International Harvester Corporation in its many factories. The Ford purchase will amount to 3000 full car loads of steel and a single train carrying that amount would extend a distance of 21 miles. The material will be used at the Detroit factory.

GOODYEAR TIRES ABROAD.

The Goodyear Tire and Rubber Company, Akron, O., has decided to invade the foreign field, which offers a peculiarly alluring prospect at present and branches will be opened in several countries of Continental Europe, in England with headquarters in London, and in South Africa and Australia. L. C. Van Bever of Toronto, Can., vice president of the Canadian branch of the Goodyear Company, has gone to England to complete arrangements for opening the London branch and to establish a complete distributing system throughout the British Isles. He will form an English company of the American house which will control the interests of the concern, as well as those in South Africa and other British possessions.

Automobile tires and other products will be manufactured at present in the Canadian plant of the Goodyear Tire and Rubber Company and shipped to various points abroad for distribution.

USE OF MUFFLER CUT-OUT.

Within the past few months there has been a growing demand for the elimination of the muffler cut-out on all machines, whether motor cars or motorcycles, and there is abundant evidence that the legislatures of the several states will be called upon at their next sessions to take up this matter in a more determined manner. It will prove of interest to note what has been accomplished by the various commonwealths along this line, and the excerpts given below will give sufficient indication of the way in which the subject has been handled heretofore. The New Jersey and Rhode Island laws are the latest additions to the list, having been passed this year.

Connecticut—No motor vehicle shall be operated upon the public highways within the limits of any city or borough of this state at any time nor on any public highway between the hours of 9 o'clock in the evening and 6 o'clock in the morning unless the engine of such vehicle shall be muffled while so operated. No motorcycle shall be operated at any time with its muffler open.

Maryland—It shall be unlawful for any operator of a motor vehicle to operate such motor vehicle without an adequate muffler or to cut out the muffler at any hour of the day or night within the limits of any city, town or village of this state.

Massachusetts—Every motor vehicle so operated shall be provided with a muffler or other suitable contrivance to prevent unnecessary noise ———. ——— nor shall said operator at any time permit said motor vehicle to make any unnecessary noise by cutting out the muffler or otherwise.

Minnesota—Every such motor vehicle using gasoline as motive power shall use a "muffler," so-called, and the same shall not be cut out or disconnected within the limits of any city or village, within the state, or at the time of passing any horse or animal being led, ridden or driven.

New Hampshire—Every motor vehicle, operated or driven upon the public highways of this state shall be provided with ———, a muffler ———.

New Jersey—Every motor vehicle must have devices to prevent excessive noise, annoying smoke and the escape of gas and steam, ———. ——— devices known as "muffler cut-outs" shall not be used within the limits of any city, town or borough, or within 200 feet of any horse drawn vehicle on the public highway.

North Dakota—Every automobile or motorcycle using gasoline, steam or any other substance as a motive power, shall use a muffler, so-called, when operated, driven or moved upon the streets of any town, village or city within the state, or when meeting or passing animal propelled vehicles on any public road or highway within the state.

Pennsylvania—The unnecessary sounding of bells or horns, or other signal device, and the use of muffler cut-outs upon any motor vehicle, when passing any other vehicle is prohibited.

Rhode Island—No person shall operate, or cause to be operated, a motor vehicle or the engine or motor power thereof, on any of the public highways, where the territory contiguous thereto is closely built up, so as to permit at any time any excessive amount of smoke to escape from such motor vehicle. No operator of a motor vehicle on any public highway where the territory contiguous thereto is closely built up excepting motor ambulances and fire and police department vehicles, shall cut out the muffler.

Vermont—An automobile or motor vehicle while being operated shall be provided with an adequate brake, a muffler, ———.

Washington—Every automobile or motor vehicle using gasoline as a motive power shall use the "muffler," so-called, and the same shall not be cut out or disconnected within the limits of any city or village within this state.

BAR HARBOR WANTS MOTORS.

According to Charles J. Glidden, whose name is well known in motoring circles, the people of Bar Harbor, Me., are particularly anxious to admit motor cars to all the roads on Mt. Desert island. He only recently returned from a visit to this resort and his observations lead him to believe that during the past five years the business has shown a marked decrease, a large portion of which can be traced to the fact that summer visitors are not permitted to bring their cars with them.

It will be remembered that some years ago the Maine legislature, at the request of the people of Bar Harbor, passed a bill excluding motor vehicles from the island. Several citizens had begun to realize the effect of this legislation upon the summer business in 1910, and the matter was brought before the town meeting, with the result

Digitized by Google

that an attempt to ask the legislature to repeal the bill was defeated.

Another attempt was made in 1911, as a result of which the legislature of 1912 passed a bill permitting the operation of automobiles on one street within certain limits. Last March the matter was again placed before the town meeting, and fully 80 per cent. of the voters registered their desire to have the original act repealed. It seems probable that one of the first bills to come before the legislature next session will be that permitting the use of motor cars over all the roads on Mt. Desert island.

NEW HAMPSHIRE'S SPECIAL FEES.

Several residents of Massachusetts and other states who have been spending the summer at Hampton Beach and other places along the New Hampshire coast were surprised early in the month by a visit from an agent of the secretary of state informing them that they would be compelled to take out special non-resident licenses. Evidently these visitors had not taken the precaution to read the motoring laws of the state.

Under the so-called reciprocity clause, non-residents are permitted to operate their cars in that commonwealth for 10 days in one calendar year, and it is explicitly stated that for the purpose of computing this time, fractional parts of a day shall count as a whole day. The fee for the special license, good during July, August and September, is half that paid by residents of the state, and machines are taxed according to their horsepower rating.

REGULATING PEDESTRIAN TRAFFIC.

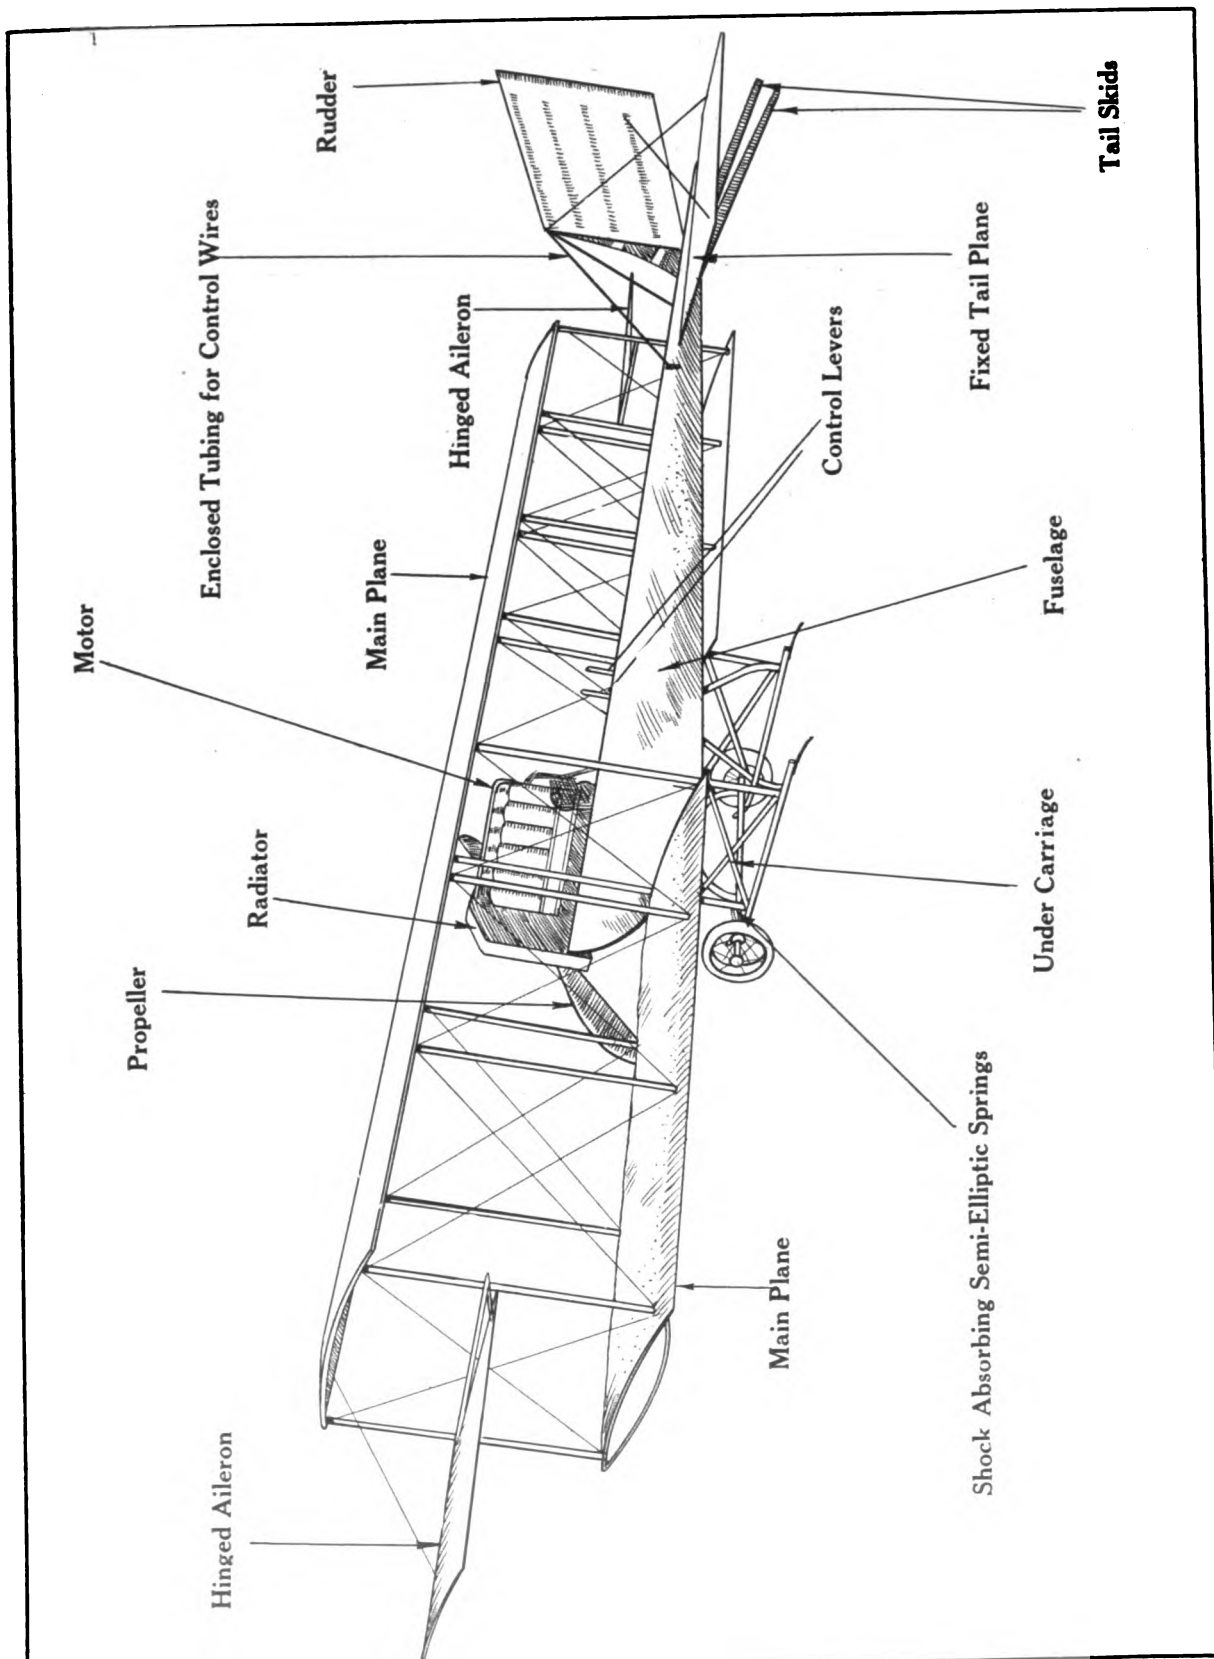
While it has generally been admitted as a legal axiom that the pedestrian has the first right on the highways, and practically all attempts at regulating traffic have been made with this view in mind, there has been a growing feeling among motorists for some time that they were being called upon to assume a larger proportion of the responsibility along this line than was necessary in the proper safeguarding of the public. It is of interest in this connection to note that the cities of Europe are taking a new view of the matter.

According to the reports from abroad, London is taking steps to convince pedestrians that while they may have first right to the road, they do not have the sole right to it. Vienna appears to have taken a still more advanced step, the regulations compelling those on foot to keep to the sidewalk until they come to regular crossings. Violations of this ordinance by pedestrians are punishable exactly as in the case of vehicles which fail to observe the precautions assigned to them.

SEEK DAMAGES FOR POOR ROADS.

Following the recent decision of the Massachusetts supreme court in the matter of damages resulting to automobiles and other vehicles because of the road conditions presented by water bars in the country districts, motorists in all sections of the state have taken decidedly more interest in this phase of the situation. Word comes from Whitman that several bills have been presented to the town asking for the payment of damages alleged to have been received by automobiles as a result of the poor condition of South avenue, between Park avenue and the railroad crossing. The situation has been brought to the attention of the road department on several occasions and it is believed that suits for damages will have a determined effect upon the town officials.

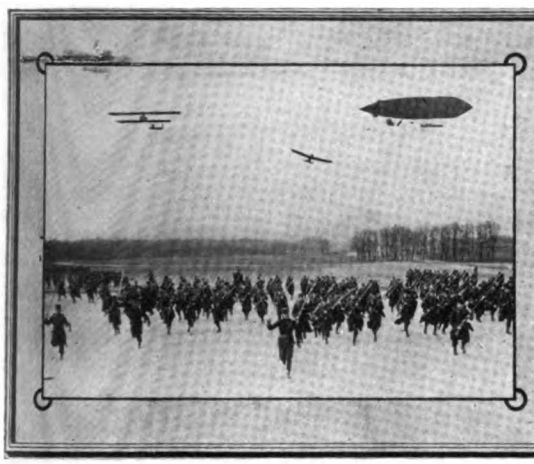
TESTING ALABAMA LAW.



W. H. Bozeman of Montgomery, Ala., claims that the automobile law of that state is unconstitutional, on the ground that the action of the state in creating an automobile department and giving it power to issue licenses is violating the rights of muncipalities to levy taxes, etc. Bozeman was arrested for driving his car without a license and was convicted in an inferior court. He took an appeal to the Montgomery city court, in which the constitutionality of the law was upheld by Judge Armstead Brown. The action will now be taken to the supreme court for final adjudication.

RESPONSIBILITY FOR ROADS.

Col. Edwin A. Stevens, road commissioner in New Jersey, holds a somewhat new view of his personal responsibility for the condition of the highways under his charge. In a recent statement, after commenting upon the increased volume and destructiveness of modern traffic over the highways, Col. Stevens says:



"We must either change this system or go without good roads. We will do the former. As to the lines on which reform must be based, the one ruling principle must be personal responsibility. As soon as the state takes over a highway I shall at once become responsible for its condition, and if I fail to make good I shall be at once replaced by some one better fitted for the job."

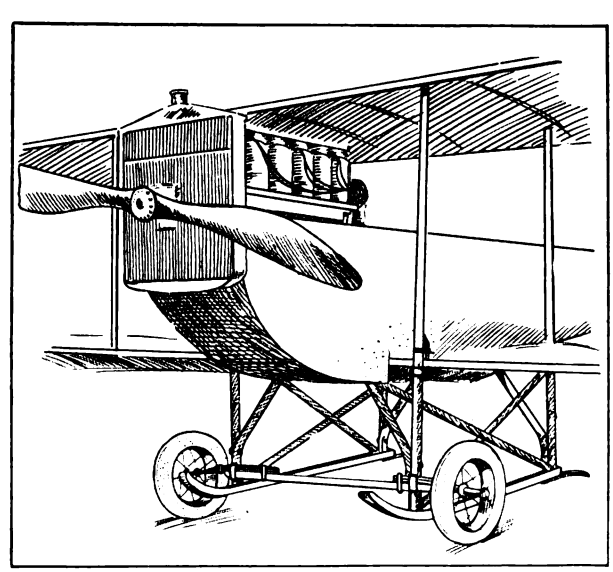
Progress of Aerial Navigation.

Mechanical Details and Features of Construction.

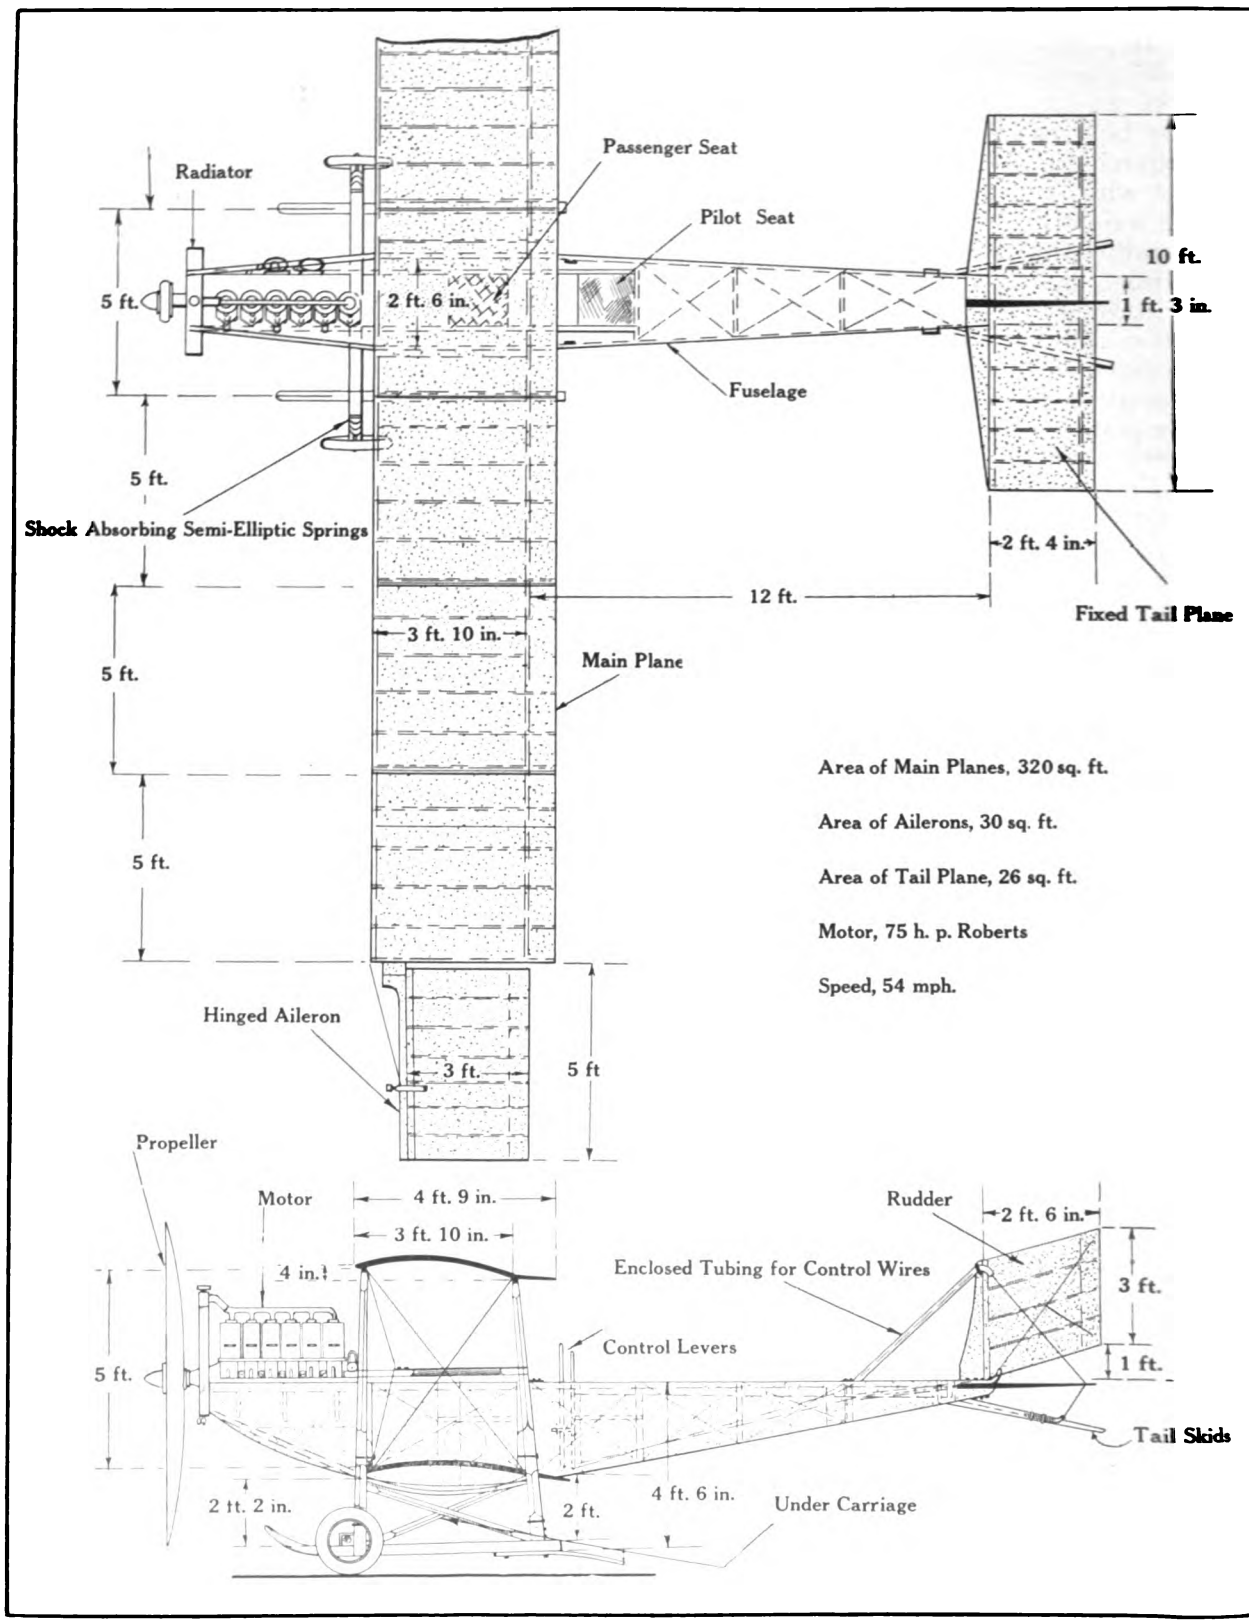
THE BENOIST BIPLANE.



While the Benoist biplane, made by the Benoist Aircraft Company, St. Louis, Mo., is by no means a new product, having been upon the American market for the past two years, the present type XII, which is being manufactured for the 1913 season, differs in many respects from those which have preceded it. In general appearance it bears little resemblance to any other machine made in this country. However, its main features of construction have been demonstrated as thoroughly practical, and it cannot be forgotten that it was from a Benoist biplane that Albert Berry executed the first parachute jump from an aeroplane in flight, March 1, 1912. This feat was a success in every respect, a factor that leaves little room for questioning the stability of the Benoist.

At first glance the new machine appears to have enormous wing spread. There are seven cellules, each five feet long, making a total spread of 35 feet, which in itself is not large, particularly when it is remembered that the Model C, two-passenger Wright has a spread of 38 feet. Undoubtedly, this appearance is heightened by the fact that the ailerons are hinged to the outer struts, and as these ailerons are each five feet long, this adds another 10 feet to the apparent wing spread, a total of 45 feet. As compared with its immediate predecessor, this is an addition of practically seven feet, the 1912 model having but five cellules of six feet length, and ailerons, three feet, 11 inches long.

The chord of the main planes is four feet nine inches, and the gap five feet. The length of the machine is 22 feet, as against 23 feet six inches for the older model. The height is eight feet, as compared with seven feet six inches in the 1912 model. The spread of the tail is 10 feet, and the depth 32 inches. There are several points of difference which will be mentioned in proper sequence, but sufficient already has been written to indicate the reason for the changed appearance.



Briefly described the Benoist biplane, type XII, is a two-passenger tractor model, with motor in front, passengers seated tandem, enclosed fuselage and non-lifting tail. It follows that it is headless, as was the older design, which had the motor and propeller at the rear of the trailing edge of the main planes, open framework fuselage and passengers seated side by side.

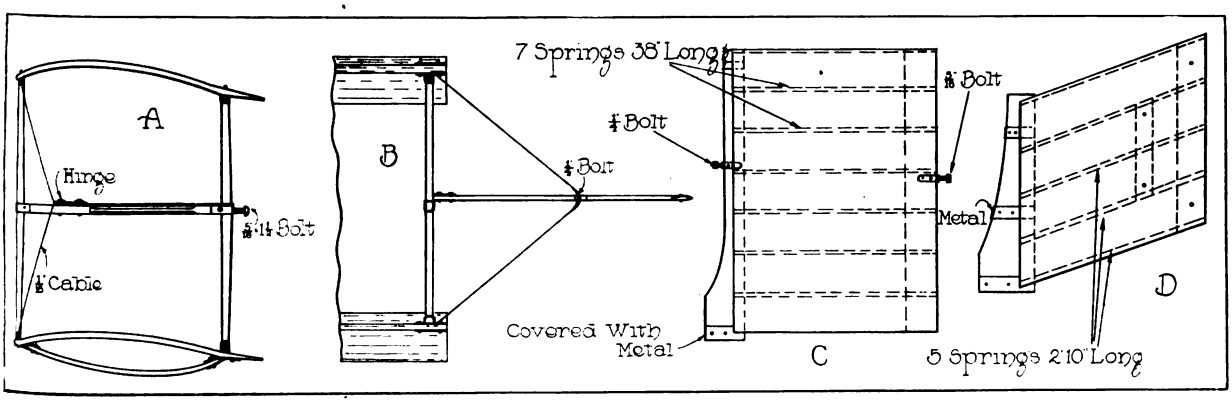
The motor is still a Roberts, a six-cylinder model rated at 45 horsepower. The engine is so mounted that the radiator is located between it and the tractor, and the whole makes a very compact assemblage. The standard gasoline tank holds 15 gallons and is mounted inside the engine

Under Carriage and Engine Mounting on Benoist Biplane.

Digitized by Google

Plan View and Side Elevation of the Benoist Biplane, Showing Detailed Dimensions and Components.

Digitized by Google



frame, carrying an air pressure of two pounds. There is very little head resistance, as the radiator, engine, passenger and pilot are arranged one behind the other in stream line formation.

It may be a trifle out of the ordinary method of description to take up the landing chassis next, but with the Benoist this seems logical, since the weight of the fuselage and empennage are transmitted direct to the wheels through the steel springs employed, instead of being constructed in connection with the main planes. By examination of the accompanying drawings it will be noted that while the upper main plane presents a continuous line throughout the entire spread, the lower plane virtually is two planes, the covered portion of the fuselage supplying the bottom portion of the main cellule. By this arrangement it is claimed that the main planes, although clamped to the running gear and power plant assemblage, only serve to lift the machine, the only

elevator being hidden until they emerge from the last control guide next to the empennage. The object is two-fold, that of eliminating all possibility of wind resistance and that of making a cleaner looking assemblage.

The wings are built up of interchangeable sections, so that shipping in crates may be effected easily. Another feature is the large master guy wire running from one wing to the other, its function being to hold the machine together should any portion of the wing become broken off in the air.

The ailerons are constructed somewhat differently from anything else in this country or abroad. The ribs are built up of pieces of spring steel reinforced on either side by oak strips. It is maintained that the steel furnishes strength and the strips stiffness. Great efficiency is claimed for them by virtue of the fact that the oak stiffeners are much stiffer in the rear, so in the rib,

Additional Constructional Details in Benoist Biplane: A, B and C, Hinged Aileron; D, Vertical Rudder.

logical thing they may be expected to do, instead of also resisting the shock of the weight of the power plant and passengers from above when striking the ground.

Shock absorption is taken up, when landing, by mounting the wheels on special semi-elliptic steel springs, instead of the usual rubber bands or stretchers. In addition, seven-foot skids project 18 inches in front of the advancing edge of the main planes. Curved extremities of the fuselage proper protect the tail in a similar manner. It is maintained that this running gear construction lends itself quite readily to the attachment of pontoons, and both pontoons and wheels can be furnished if desired. The wheels are fitted with 20 by four-inch clincher tires.

The engine carrying beams are in line with those carrying the seats and tail stringers. As previously stated, the fuselage is completely inclosed, even the control wires to the rudder and

the deepest part of the curve will occur nearer to the advancing edge of the aileron, thereby taking advantage of the properties of the usual curve, which is held to have greater efficiency when the deepest part of the camber is nearer the front. This is the advantage of the Benoist construction, and the subject of a special patent, for while other ribs may have been built up of steel springs and oak stiffeners, it is maintained that no other has been constructed so as automatically to take a camber of the highest efficiency. The advancing edge is hinged to the forward strut, midway of the gap, and guyed to the upper and lower main planes from a central point.

The empennage consists of a non-lifting tail surmounted by a vertical rudder, the latter being set at a slight angle from the perpendicular. Both are flexed in much the same manner as the ailerons.

The ailerons and elevator are operated by a

Digitized by Google

single lever at the right of the pilot. By pushing this lever to the right the right side of the machine is brought down, and of course pushing it to the left lowers the left side. A forward movement causes the machine to descend and a backward movement, to ascend. There is a double crank arm connected to the rear portion of the ailerons, by the use of which the running of control wires through pulleys is eliminated. The lever at the left operates the rudder, which steers to the left and right. A second set of levers, which may be detached when desired, is furnished for the passenger's use, making this machine of particular value, when utilized for teaching.

In this connection it should be stated that the entire plant of the Benoist Aircraft Company was destroyed by fire Oct. 20, 1911, entailing a loss of $25,000, without insurance. The destruction was most complete, comprising not only the buildings, five machines and their motors, but all correspondence, blue prints, tools and special machinery that had been accumulated in several years of manufacturing in this and other fields. In spite of this setback, the present Benoist biplane has been evolved, and it must be agreed that it represents a most interesting type of successful aeroplane.

TO HAVE NEW HOME.

Having outgrown its present quarters, the Massachusetts Automobile Club is to consider plans which call for a new structure at the junction of Commonwealth avenue and Beacon street, Boston. The present clubhouse on Boylston street is too small to accommodate the growing membership and the lease expires within a year. The new structure contemplated will be six stories in height and erected on land owned by Governor Foss, providing 16,000 feet. The plans call for an up-to-date building which will provide every convenience for the members as well as facilities for caring for motor cars, etc. A meeting will be held shortly to consider the plans, lease, etc.

MAY OPEN YOSEMITE VALLEY.

According to a report of six newspapermen of Oakland and San Francisco, Cal., who completed a tour of the Yosemite Valley recently, that territory which has been closed to automobiles will be opened to the touring motorists. The trip was made to ascertain the sentiment of the residents and it was unanimously in favor of opening the valley to automobiles on at least one road at once. The most practical way at present is known as the Big Oak Flat road on which there are no public means of conveyance.

The pathfinders utilized two Buick cars, made by the Buick Motor Company, Flint, Mich., and during the six days of the tour experienced no tire or mechanical trouble. The Goodyear No-Rim-Cut shoes, made by the Goodyear Tire & Rubber Company, Akron, O., were employed, these being the same casings which covered 520 miles on the Lake Tahoe endurance run, on the press car in the motorcycle reunion last September and in the Jackson Napa-Soda Spring pathfinding trip, May, 1912.

FOREIGN TARIFF NOTES.

All changes of any importance in the customs tariff or customs regulations of foreign countries during the past two years are shown in Foreign Tariff Notes of which No. 7, with a cumulative index, has just been issued by the bureau of foreign and domestic commerce of the Department of Commerce and Labor. Notices are reprinted for permanent reference of the changes published in the daily consular and trade reports for the information of the American exporters. These tariff changes are based largely on consular reports and official gazettes of foreign countries. The Foreign Tariff Notes, which is published about once in three months, furnishes convenient means of reference available to American readers interested in foreign tariff legislation. Copies of the seven numbers so far issued may be obtained from the above bureau at Washington, D. C.

COMPLIMENTS NEW ENGLAND.

The beauties of touring through New England are appreciated by a Canadian motorist, I. Sharpless of Quebec, who recently completed a tour from his home to New York and return in a KisselKar, made by the Kissel Motor Car Company, Hartford, Wis. Mr. Sharpless wrote the factory that during the 3000-mile trip through the White mountains and the Berkshires he experienced no trouble whatsoever and that he is enthusiastic over the natural scenery of New England.

Repairs on the state highway between Hartford and Norwalk, Conn., are now completed and the road has been opened to travel.

In The Aviation Field

With the Manufacturer and Operator in America and Abroad

Six months ago Jules Vedrines of France lay on a hospital cot in his native land, swathed in bandages from head to foot, the result of a fall in his Deperdussin monoplane. Today he holds the world's greatest air prize, the international Gordon-Bennett cup. In fact it may be said that Jules Vedrines is the world's speediest aviator, and the Deperdussin the world's fastest machine. He already held the world's record for speed, and exceeded that yet again after winning the international prize.

Six nations were entered for this year's race, the fourth in the series. Only two competed, and it is hardly proper to employ the word in conn c-tion with the event. As a matter of fact but two aviators really competed and both drove Deperdussin monoplanes. Marcel Prevost was the only other aviator to complete the course. Andre Frey flew 23 of the 30 laps in an Hanroit monoplane. These three represented France. America, the cup defender, was represented by Max Lillie in a Wright biplane, but his performance can by no stretch of imagination be termed a competition for the big prize.

The fourth race for the Gordon-Bennett cup was held at the Clearing aerodrome, Chicago, Sept. 9. England, Switzerland, Holland and Belgium withdrew at the last moment. Those selected as the American team were: Glenn Martin, Burgess-Curtis "Chicago Defender" biplane; De Lloyd Thompson, Nieuport monoplane; Paul Peck, Columbia monoplane. The Burgess-Curtis machine was withdrawn shortly before the start was to be made and Howard Gill in a Wright biplane was substituted for Martin.

Vedrines was the first to get away and after he had finished none of the American flyers was anxious to try for the prize. They realized that

Jules Vedrines of France and the Deperdussin Monoplane, with Which He Won the Race for the International Cup.

Digitized by Google

his 140 horsepower, Gnome engined Deperdussin was much too fast for their machines. Lillie was drafted into service at the last moment, merely so that it might be said that America had made an attempt to defend the prize it has held twice during its existence. He carried a passenger, the first time an aviator has flown for the cup with a companion.

The Gordon-Bennett cup was first offered for competition in 1909, and its history may be summarized as follows: Rheims, France, Aug. 28, 1909, 20 kilometers—First, Glenn H. Curtiss, America, Curtiss biplane, 15:50.6; second, Louis Bleriot, France, Bleriot monoplane, 15:55; winner's speed, 47.06 miles an hour. Belmont Park, Long Island, Oct. 29, 1910, 100 kilometers—First, Claude Grahame-White, England, Bleriot monoplane, 1:01:04.74; second, Alfred LeBlanc, France, Bleriot monoplane, 1:57:44.85; winner's speed, 61.93 miles an hour. Eastchurch, England, July 1, 1911, 150 kilometers—First, Charles Terres Weyman, America, Nieuport monoplane, 1:11:36.2; second, Alfred LeBlanc, France, Bleriot monoplane, 1:13:40.2; winner's speed, 90.61 miles an hour. Chicago, Ill., Sept. 9, 1912, 200 kilometers—First, Jules Vedrines, France, Deperdussin monoplane, 1:10:56.85; second, Maurice Prevost, France, Deperdussin monoplane, 1:15:25.7; winner's speed, 105.07 miles an hour.

Prevost's machine was equipped with a 100 horsepower Gnome engine, as was Frey's Hanroit. The latter remained in the air for 23 laps of the course, which he covered in 1:12:13.7. Lillie's machine was the regulation two-passenger Wright with a 40 horsepower motor. He covered but six laps, his time being 28:41. Vedrines' time by laps and in elapsed time follows:

	lap	elapsed		lap	elapsed
1.....	2:24.57	2:24.57	16.....	2:22.33	38:02.53
2.....	2:23.24	4:47.81	17.....	2:20.79	40:23.32
3.....	2:22.47	7:11.55	18.....	2:21.78	42:45.10
4.....	2:22.65	9:34.15	19.....	2:20.87	45:05.97
5.....	2:23.12	11:57.27	20.....	2:21.15	47:27.12
6.....	2:21.88	14:19.15	21.....	2:20.21	49:47.35
7.....	2:21.77	16:40.92	22.....	2:21.21	52:08.56
8.....	2:22.90	19:03.82	23.....	2:20.32	54:28.84
9.....	2:22.66	21:26.48	24.....	2:20.24	56:49.08
10.....	2:22.77	23:49.25	25.....	2:20.97	59:10.05
11.....	2:22.42	26:11.67	26.....	2:20.66	1:01:30.71
12.....	2:22.36	28:34.03	27.....	2:20.73	1:03:51.44
13.....	2:21.25	30:55.28	28.....	2:20.83	1:06:12.27
14.....	2:22.57	33:17.85	29.....	2:22.11	1:08:34.38
15.....	2:22.35	35:40.20	30.....	2:23.47	1:10:56.85

After completing the 200 kilometers for the international cup, Vedrines continued to fly an additional 20 kilometers for a world's speed record, covering this distance at the rate of 109.2 miles an hour.

The withdrawal of the "Chicago Defender" was a sore disappointment to America and Americans. It was built by the Burgess Co. & Curtis, Marblehead, Mass., and was fitted with a 160 horsepower Gnome engine. Like most of the Burgess-Curtis machines it was equipped with the Wright form of control, with which Martin was not familiar. Several aviators had been requested to pilot the biplane but without result. An attempt was made to substitute Norman Prince at the last moment, but it is claimed that the rules forbade such action after Martin had been announced as the pilot.

Following the international race at Chicago an international aviation meeting was held at the Cicero and Grant Park flying fields in that city. The meet was marked by the death of Paul Peck and Howard Gill, two of America's best known aviators.

In a general way the results showed the French monoplanes to be possessed of much more speed than the American biplanes. The programme included speed events, duration trials, accurate landing, accurate throwing of mail into a net, etc. In the tests for accuracy the American machines showed up to particular advantage. Some of the aviators, their country and the machines they flew appear in the following table:

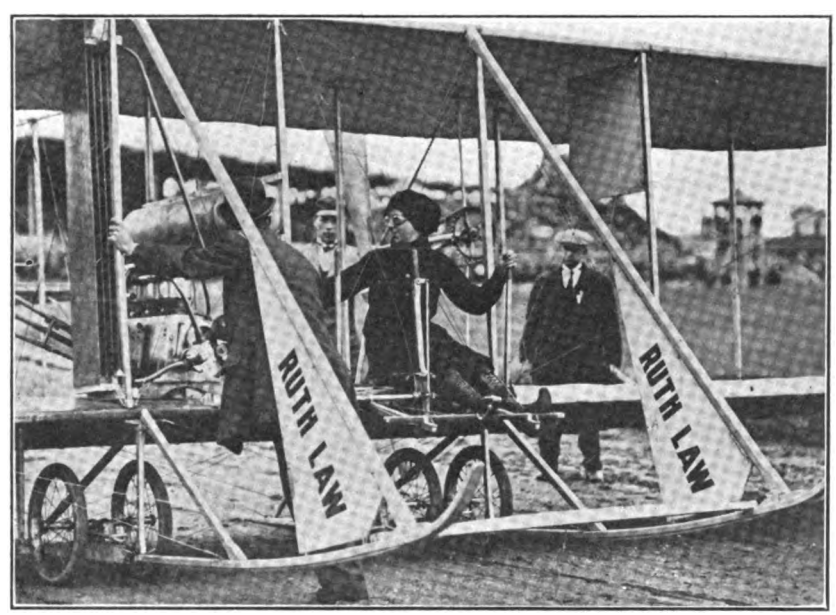
Aviator	Country	Machine
Anthony Janus	America	Benoist
Guiseppe Collucci	Italy	*Hamilton-Brooks
J. R. Montero	Peru	*Bleriot
Maurice Prevost	France	*Deperdussin
George Mestach	France	*Borel
Otto W. Brodie	America	Henri Farman
A. C. Beech	America	Beech National
Charles L. Wiggins	America	Wright
De Lloyd Thompson	America	*Nieuport
Howard Gill	America	Wright
Glenn Martin	America	Martin
Max Lillie	America	Wright
Paul Peck	America	Columbia
Katherine Stinson	America	Wright

*Monoplane.

It is interesting to note, in connection with the winning of the open competition in the recent British military trials, by S. F. Cody in a Cody biplane, that the lubricant used throughout the tests was Vacuum Mobiloil, made by the Vacuum Oil Company, Rochester, N. Y.

Lieut. Scott of the United States Army appears to have won the first annual competition for the Michelin prize of 50,000 francs for landing the greatest number of "bombs" on a target of 20 meters diameter out of 15 attempts. Flying with Gaubert of France, Lieut. Scott succeeded in placing 12 of the 15 shots, while the next best performance was that of Lieut. Varcin of the French army, with seven. The American utilized a bomb

Digitized by Google



dropping device of his own design, in which he hopes to interest the American army officials upon his return.

Miss Bernetta Adams Miller, a native of Canton, O., received her pilot's license at Hempstead Plains, Long Island, Sept. 16. She flies a 50 horsepower, Gnome engined Moisant monoplane, and made her first public flight Sept. 1.

An accompanying illustration presents Miss Ruth Bancroft Law in her Burgess-Wright biplane. She has been making a number of very creditable flights in Rhode Island, and is regarded as a worthy addition to the list of world's women aviators.

Miss Law always has been interested in athletic sports and holds the opinion that women should be allowed to compete with men in such events. When her brother, Rodman Law, began jumping from aeroplanes with his parachute, she decided that the field of aviation offered a splendid opportunity for her sex.

Her first effort was to interest Orville Wright of the Wright Company, but his advice was discouraging. In effect, he suggested that women could not be successful in aviation for the reason that they were unable to grasp the necessary mechanical details. Miss Law was not so easily discouraged, however, and straightway began to study the internal workings of the aeroplane, not forgetting the engine, and it is claimed that she has a much better knowledge of her mount than most men who are flying.

Miss Ruth Bancroft Law and Her Burgess-Wright Biplane.

Carmanti de Brembilla, an Italian, secured the 1000th pilot's license issued by the Aero Club de France, Aug. 31.

Some 40 aeroplanes have been entered for the annual German military manoeuvres, as against eight in 1911. Of course the dirigible balloon will be represented as well. The minister of war has given special orders that only the slower types of aeroplanes be used, so that the observers may have the best conditions for their work. In addition to the regulation tests for military machines, it has been decided that the mails for the troops shall be delivered by this method. This is the first attempt at aerial mail carrying in Germany.

Georges Legagneux of France created a new altitude record of 18,681 feet at Villacoublay, Sept. 17, exceeding the mark of 16,240 feet attained by Roland Garros, Sept. 6. Legagneux has been flying a Zeus monoplane, and it is presumed he secured the new record in this machine.

The new scheme for the organization of French military aviation will go into effect Oct. 1. It provides an aeronautic corps in three groups, the first of which will be stationed at Versailles and will consist of two aerostation companies and one aviation company. It will be an adjunct of the first, second, third, fourth, fifth, ninth, 10th and 11th army corps and in Morocco and Tunis. The second group, similarly composed, will be stationed at Rheims and the third at Lyons. The former will be an adjunct of the sixth, seventh and 20th army corps, and the latter of the eighth, 12th, 13th, 14th, 15th, 16th, 17th, 18th and 19th.

According to the Tagliche Rundschau of Germany, which states that the source of its information is unquestionable, a German engineer has invented an aeroplane with which it is possible to remain poised in the air for a considerable period. The machine is said to differ materially from the types now in use, but an effort will be made to interest the German government in the production before its details are made public.

HAMILTON BI-FUEL CARBURETOR.

The high price of gasoline is viewed with more apprehension abroad than it is in this country, especially in England where engineers are experimenting with various forms of devices for vaporizing heavy fuels. One of the latest types of carburetors and one which permits of the utilization of both gasoline and kerosene is the Hamilton bi-fuel vaporizer, announcement of which was made recently in the Autocar, an English motoring print.

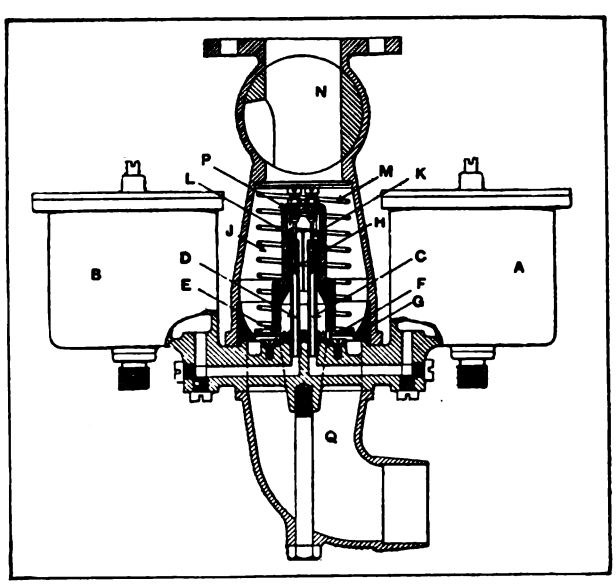

Fig. 1—The Bi-Fuel Carburetor, Employing Gasoline and Kerosene as Fuel.

As the name implies, the device combines the two fuels, which does not appear to be an easy matter, but it is stated that the Hamilton carburetor mixed the two fuels successfully and that in practise a motor car has been operated on a supply of 60 and 40 per cent. gasoline and kerosene, respectively. This has been accomplished by the utilization of the usual hot air intake pipe, while with the whole or greater part of the induction pipe heated it is stated that the above figures were reversed.

By referring to the sketch at Fig. 1 it will be noted that two float chambers are employed, A and B, for gasoline and kerosene, respectively. Two separate jets are also provided, these being outlined at C and D. At the base of the mixing chamber J is the air inlet which forms a ring around the two jets. The fixed air inlet ports E are utilized for slow speed when operating on gasoline. When the air valve F, between the air inlet and the mixing chamber, is closed, only a comparatively restricted air flow can pass to the motor. This it must do through the ports E, so that all the air used has to pass up the choke tube H.

The seating G, on which the air valve F is pressed by a helical spring M, is formed on the lower part of the chamber J. It will be noted that the seating G of the valve F is curved and shaped in such manner as to graduate the flow of air between it and the air valve, as the latter rises under the increasing engine speed, in such proportion to the travel of the valve that the negative pressure in the mixing chamber J remains practically constant.

The air valve consists of something more than a flat annulus, for it is carried upwards to form a bridge piece P above the choke tube of the jets, and in this bridge piece the needle valves K and L are held in such position as to regulate the flow of fuel through the two jets. As they screw into the bridge piece and are held by small lock nuts their position is adjustable, so that the flow of fuel in either jet can be relatively adjusted to require-

Digitized by Google

ments, such as starting, climatic changes, etc.

The operation of the carburetor is best explained by the method of adjustment. In the

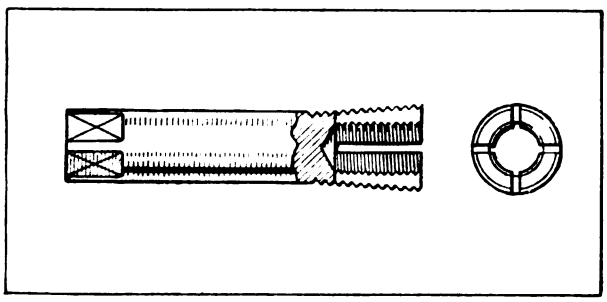

Fig. 2—A Useful Tool for Removing Broken Studs Which May Be Employed as a Die Nut.

first place the cross sectional areas of the two fuel jets are so proportioned as to give in general terms the required relative flow of the two sorts of fuel. The needle valves are fitted to the bridge and with the main air valve shut, the needle controlling the kerosene jet is screwed down until it entirely shuts off all flow of this fuel, while the needle regulating the gasoline orifice is adjusted to allow the passage of just sufficient fluid to carburet the air capable of passing up the choke tube H.

Under these conditions it is practically as though the motor were running on a pilot jet, for the supply is sufficient for slow running with no load or starting from cold. Directly the throttle is opened, however, and the engine speed increases, the additional suction raises the air valve F, which thus automatically has the effect of increasing the gasoline aperture and opening up the kerosene jet in its rise. In this way the engine, started on gasoline, is able to continue to run on the fuel mixed in proportions decided by the respective areas of the two nozzles.

BROKEN STUD REMOVING TOOL.

Broken studs are sometimes difficult to remove without injuring the threads of the part in which they are fitted. At Fig. 2 is shown a useful stud tool the designer of which was awarded first prize in the competition among mechanics by a foreign publication. The drawing shows the device of .75-inch size, although it may be constructed in any desired proportion. It should save considerable labor.

The tool is made as follows: Take a piece of 1.25-inch round steel about five inches long and turn it down on the outside to the shape shown in the sketch. A 1.25-inch hole is drilled at the tapered end and tapped out to the bottom, taking care to make a good, clean thread. The tapered end is then screwed on the outside and the stock end squared to take a tap wrench. A one-inch nut is next chased out and slightly tapered to suit the tapered end of the tool. Two saw cuts are then made across the screwed end, and these should go down to the bottom of the tapped hole. The tapered end should be hardened, but care should be taken that it is not made too hard or the jaws will break off in service.

In drawing studs the box should be screwed down onto the stud ,and the nut on the outside tightened with a wrench. The operation enables the tool to obtain a secure grip upon the stud, which can be removed with the aid of a tap wrench. When used as a stud box, the nut should be slackened back until the box is down hard on the stud, and then the nut should be tightened and the tool employed as an ordinary stud box. The tool could be used as a die nut if required. When employing it with damaged threads, it should be handled carefully and plenty of lubricant used.

FITTING WRISTPINS.

In fitting a new wristpin to a new piston in some motors and when new pins have to be made it is sometimes an open question as to whether it is best to make the pin first or bore the hole in the piston. The pin has to be hardened and in the process it is likely to become slightly warped

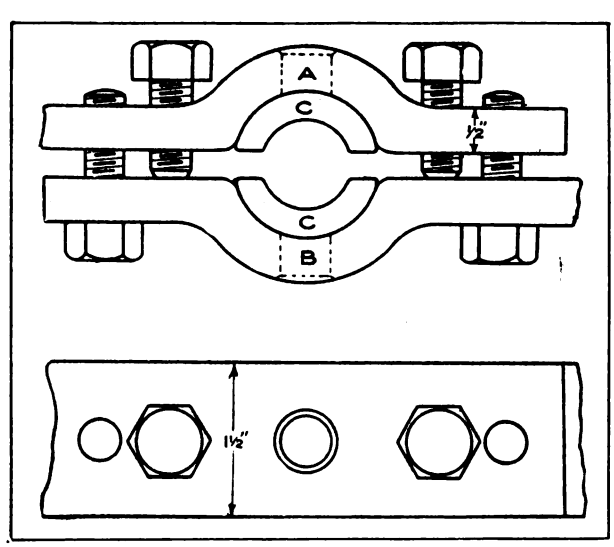

Fig. 3—Grinding Tool for Wristpins and Crankpins Where Grinder Is Not Available.

out of shape. Ordinarily a grinder would be used to correct the misalignment, but if such is not available the work may be performed by means

Digitized by Google

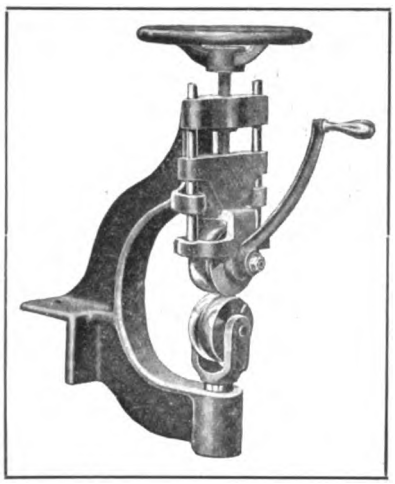

Fig. 4—The Williams Tread Rolling Machine.

of a grinding clamp, as shown at Fig. 3.

The clamp is made easily by bending two plates of iron as illustrated in the drawing. It is fitted with four screws, two of which are employed to hold it apart and the other two together, thus enabling the adjustment of the halves to the diameter of the work being ground, and yet held rigidly with regard to each other.

The two metal laps C are made as follows: The clamp is laid on its side on a flat surface on which is spread a thin layer of putty to prevent leakage of the molten metal. The spindle to be ground is held in the centre of the opening, the gaps and ends of the holes stopped with putty, and molten type metal, lead, or tin, is poured in the remaining space. The holes A and B being countersunk prevent the laps falling out of the clamps, as the metal running into these forms plugs with enlarged ends. The clamp can be used on work running in the lathe, or as in the case of crankpins, rotated by hand. Oil and emery are used as an abrasive.

QUICK OPENING TIRE KETTLE.

The tire repair shop which averages two retreaded casings a day is the exception rather than the rule. It is now unnecessary for a concern doing this amount of retreading to install a large vulcanizer and kettle which require valuable space and increase the investment. With a large kettle the repairman is apt to allow tires to accumulate until enough to fill the kettle are ready to cure. This often inconveniences the customer.

The Williams Foundry & Machine Company, Akron, O., maker of tire repair equipment, is marketing a new quick opening steel tire kettle which is shown at Fig. 5 and with it a retread can be cured with as little trouble as a sectional repair. The tires after being wrapped are placed in the kettle and the lid lowered by means of the hand wheel working the double acting screw. A bar is placed on one of the sockets on the lid and given a part turn so that the lugs on the cover extend under the projecting lugs cast on the body of the kettle. Steam is then turned on and this brings the special wedge shaped packing into play, effectually sealing the joint.

When the cure is completed the inlet valve is closed and the steam blown off. The lid is given a part turn as before so as to free its lugs from those on the body of the kettle, and raised about four inches by means of the hand wheel. The crane and lid are then swung to one side, leaving the opening of the kettle entirely unobstructed. There is no overhead rigging and no possibility of the lid catching and injuring the operator.

The member is boltless and has sufficient capacity for all except the very largest shops. It measures 43.5 inches inside diameter in the clear and the curing space is 16 inches high above the bottom grating, making a capacity for about four tires, 42 inches or smaller. The kettle and lid are constructed of open hearth steel, tested with 200 pounds steam pressure, making it perfectly safe for any condition of service. The crane head handling device and bottom grating, which keeps the tires out of the water and permits steam to circulate all around the casings, are an improvement over the vertical kettle.

The same concern is also manufacturing a tread rolling machine which is depicted at Fig. 4 and which is designed to replace the work of uniting the rubber and fabric by hand when tires are to be retreaded or new sections inserted. The

Fig. 5—The Williams Quick Opening Steel Tire Kettle.

Digitized by Google

maker also points out that the machine not only rolls the work properly, but it prevents air pockets and consequent blistering.

In operation the upper or concave roll is raised by means of a large hand wheel and the tire inserted between the rollers. The desired pressure is applied by screwing down the hand wheel. A heavy oil tempered steel spring below the lower convex roller insures even tension regardless of inequalities in the thickness of the casing. Turning the crank causes the tire to travel between the rollers which will work from one bead clear around the tread to the other. The rolling machine is constructed of high grade material.

TREATING HARD CLUTCH LININGS.

When the leather lining of the clutch becomes hard and dry through neglect and slippage, and the limit of adjustment has been reached, the usual method is to reline the clutch, as oil will not penetrate the glazed surface. A driver who takes care of his own machine makes the following suggestion for treating leathers in the above described condition:

Take an old steel table knife and grind its end to an angle of 45 degrees and turn up the outside edge about .0625 inch. The clutch is next thrown out and held, and the leather scraped with the upturned edge of the knife. This will remove the shiny surface, after which the material may be treated with oil. It is advisable to keep the clutch out over night, to allow the oil to soak in, and the surface should be cleaned before use.

HOME MADE ELECTRO-MAGNET.

While electro-magnets may be purchased for picking up nuts, cotter pins, etc., which fall in places not reached easily by the hand, one of these devices may be made easily by taking the magnets of an old bell and fitting them to a piece of .375-inch iron rod. The free ends of the wires are connected to a six-volt storage battery or a group of dry cells and when the circuit is closed the magnets will attract and hold small pieces of metal that fall into the crankcase, transmission, etc., frequently saving the work of disassembling the part to remove the piece.

PRESERVING OIL STONES.

Many repairmen have a special piece of oil stone which they have used for a number of years. If the member is placed in a cloth after use it will be found that the material will absorb the oil, preventing the lubricant from filling up the pores of the stone and reducing its efficiency because of the gum like surface.

HANDLEY REORGANIZES COMPANY.

Announcement was made at Indianapolis recently by President J. I. Handley of the Marion Motor Car Company of the completion of his new organization. Under his direction an executive staff composed of men of national prominence in the automobile industry has been secured and they have reorganized the Marion Company.

The list of men who will work with Mr. Handley in carrying out the new and extensive policies he has inaugurated, includes J. B. Myers, vice president, in charge of production; J. M. Edsall, treasurer; F. G. W. Sudrow, sales manager; M. B. Morgan, chief engineer; W. McK. White, advertising manager.

VERMONT CLUB ELECTS OFFICERS.

At the annual meeting of the Automobile Club of Vermont held recently at Montpelier, it was announced that an increase in membership from 1167 to 1275 had been recorded during the year. Two similar events are planned for next year, one in June to include women, to be held in some city other than Montpelier, with a banquet, and the regular annual meeting and banquet at Montpelier later in the year. These officers were elected for the coming year: President, E. A. Brodie, Burlington; vice president, George T. Chaffee, Rutland; secretary-treasurer, S. S. Ballard, Montpelier; director, G. H. Morrill, St. Johnsbury; director in A. A. A., E. C. Smith, New York.

MILLER'S ATLANTA STORE.

The business conducted by Chas. E. Miller, 97-103 Reade street, New York City, in Atlanta, Ga., has grown to such proportions that it has been found necessary to secure more commodious quarters. To this end a store in a new building, nearing completion, at the corner of Harris and Peachtree streets, has been acquired and the southern branch will be located at 259 Peachtree street in the near future. As is well known this pioneer accessory manufacturer, jobber, exporter and importer has 14 branches in 13 cities and in nine different states. The business conducted at each of these is growing rapidly, and the result in Atlanta is quite in keeping with the Miller policy.

NATIONAL CONTEST AND RACING NEWS.

Detailed Itinerary for Glidden Tour---Annual Desert Race Receives Sanction---Peugeot Wins Twice Abroad---Barney Oldfield in Minnesota---Programme for Rockingham Park Meet---Other Items of Interest.

While entries for the national reliability run of the American Automobile Association, generally known as the Glidden tour, do not close until Oct. 1, it is announced by the committee in charge that it may be necessary to limit the number to 100. Plans have been completed, as far as the route is concerned, and an accompanying map shows the ground that will be covered. The tourists will leave Detroit, Oct. 7, and are due to arrive in New Orleans Oct. 19, the daily itinerary being given in the following table:

Oct.	Detroit to	Miles
7	Fort Wayne, Ind	170.5
8	Indianapolis, Ind	137.6
9	Louisville, Ky	138.5
10	Mammoth Cave, Ky	116.9
11	Nashville, Tenn	107.7
12	Sheffield, Ala	125.6
13	Rogers Springs, Tenn	98.8
14	Memphis, Tenn	69.5
15	Greenwood, Miss	175.3
16	Vicksburg, Miss	170.7
17	Magnolia, Miss	155.5
18	Baton Rouge, La	87.0
19	New Orleans, La	116.7
Total miles		1670.3

Among the well known people who have expressed their intention of competing are Dr. Wallace Wood of New Orleans, Frank Hardart of Philadelphia and J. S. Kinnan of Toledo, O. Each is a long distance tourist of much experience and there is decided rivalry among them for the possession of the new A. A. A. trophy.

This cup has been on exhibition at the national headquarters of the association in New York City during the past week. It stands 25 inches high and has diameter of 24 inches. The handles are formed of two eagles, beneath which are the conventional automobile wheels. Around the top is a border depicting scenes in Yellowstone park, California, the White Mountains and the South.

In the centre of the front is a cartouche, in which appears the emblem of the A. A. A. On either side of this are figures symbolizing endurance and speed. Around the base is a border of ivy, entwined with ribbons, bearing the names of the state associations affiliated with the national body. The reverse of the trophy bears the emblem of victory, a laurel wreath, within which will appear the inscription. The trophy was made by the old established firm of Samuel Kirk & Sons Company, Baltimore.

The start of the tour from Detroit is to be made a signal event in the history of motoring. A parade will be formed, in which the entrants will be escorted by members of the Wolverine Automobile Club, and it is anticipated that every motor car, parts and accessories factory in the city will be passed. At some of the larger plants the tourists will enter the grounds at one entrance and emerge from another. This is the programme for Saturday, Oct. 5, ending with a visit to Walkerville, Ont., where they will be the guests of the Canadian Club for the night. Sunday the tourists will be taken for an all-day trip on one of the lake steamers.

The success of the Flanders electric pathfinder in covering the route has been the means of creating a mild demand for an electric division in this year's tour. Advertising Manager Pelletier of the Flanders company is championing this phase of the situation. He feels certain that the manufacturers and owners of electric cars would welcome the opportunity to demonstrate their touring possibilities under official supervision.

SANCTION FOR DESERT RACE.

William Schimpf, chairman of the contest board of the American Automobile Association, has notified G. P. Bullard, representative of the board in Phoenix, Ariz., that sanctions 500 and 501 have been granted for the annual Los Angeles-Phoenix desert race, and the track meet following its conclusion. The exact date has not been determined as yet. All arrangement of details has been placed in the hands of Mr. Bullard.

PEUGEOT TAKES SARTHE CUP.

The annual road race for the Sarthe cup over the Le Mans course in France, Sept. 9, resulted in a victory for the Peugeot car driven by Goux, who covered the 402.4 miles in 5:31:54. Only one other driver was able to finish, this being Leduc in an S. P. A., and his time was 6:55:15.

A second race for small cars was held at the

Digitized by Google

same time and for the same distance. Zuccarelli in a Peugeot was winner in this event, his time being 6:12:25. Second place went to Champoiseau with a Schneider in 6:30:36.

RESULTS IN MINNESOTA.

Barney Oldfield and Louis Disbrow were the chief winners in the race meet held in the connection with the Minnesota state fair at the Hamline track, Minneapolis, Minn., early in the month. The first race resulted in a tie for first position, as will be seen by the following summary:

Five Miles, 300 Inches.

Cino	Oldfield	5:05.0
Case	Ulbrecht	5:05.0
Case	Disbrow	.....
Mercer	Broker	.....

Five Miles, 301-450 Inches.

Benz	Oldfield	5:17.04
Case	W. Endicott	.....
Jackson	Wilson	.....

Ten Miles, 600 Inches.

Simplex	Disbrow	10:03.6
Cino	Heinemann	.....
Case	J. Nikrent	.....

Ten Miles, 600 Inches.

Simplex	Disbrow	10:15.0
Case	J. Nikrent	.....
Cino	Heinemann	.....

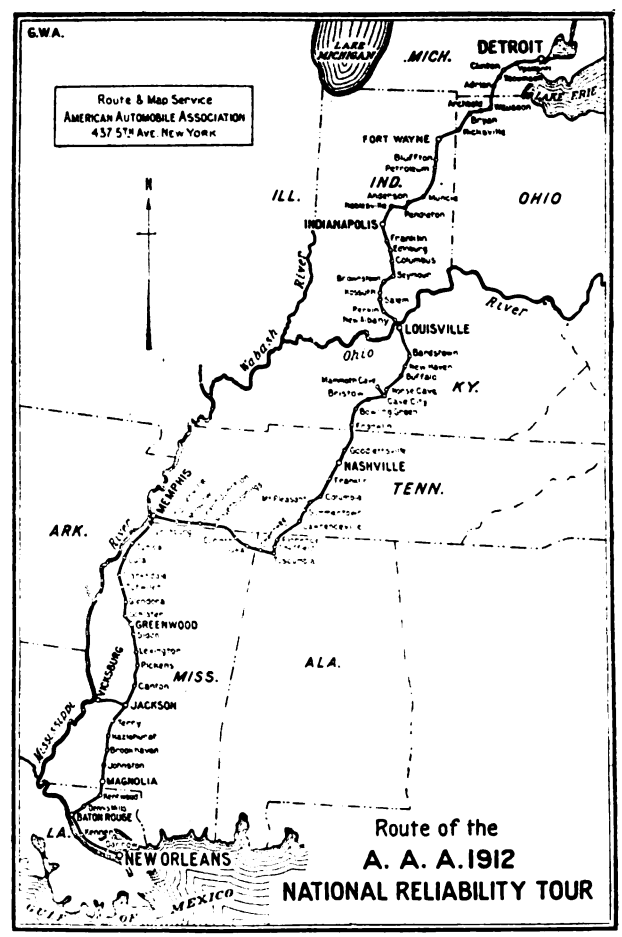
Australian Pursuit, 13 Miles.

Cino	Oldfield	13:07.4
Case	J. Nikrent	.....

Five Miles, Free-for-All.

Simplex	Disbrow	4:47.2
Case	J. Nikrent	4:48.8
Mercer	Broker	4:53.0

ST. LOUIS PLANS TOUR.



The fifth annual owners' reliability tour of the Automobile Club of St. Louis will be held Oct. 5. The route selected is through one of the most picturesque sections of the state, skirting the Ozark mountains for some little distance. The event is open to any amateur driver in the city.

ROCKINGHAM PARK MEET.

There is every indication that the coming race meet at Rockingham park, Salem, N. H., Columbus Day, Oct. 12, will be one of the most important ever held in New England. The events will be under sanction from the contest board of the American Automobile Association. A. D. Peck will be the starter and James Fortescue referee.

Manager James F. Kerr was in Milwaukee during the past week interviewing several of the well known drivers who were taking part in the big events there. Entries are expected from such men as Ralph De Palma, winner of the Elgin National and free-for-all events at Elgin; Harry F. Grant, twice a winner of the Vanderbilt cup; Hugh Hughes, winner of the Aurora trophy; Bruce-Brown, twice a winner of the international Grand Prize; Robert Burman, holder of the world's speed record; Joseph Dawson, winner of this year's 500-mile race at Indianapolis; Louis Disbrow and others.

The programme will include the following: Five miles, 161-230 inches, $75, $35 and $15, amateurs; 10 miles, 231-300 inches, $75, $35 and $15, professionals; 10 miles, free-for-all for Rockingham Park trophy (to be competed for at subsequent meets until won three times in succession by the same driver), valued at $250, and cash award of $150, professionals; five miles, 301-600 inches, $75, $35 and $15, amateurs; 25 miles, 301-600 inches, $125, $65 and $35, professionals; 20 miles, special match, $500, $200 and $100; 15 miles, motorcycles, amateurs; 25 miles, motorcycles, amateurs. Entries close Oct. 7 with James F. Kerr, 67 Milk street, Boston, the entrance fee being $5.

Plans are under way for still another meet to be held Memorial Day, 1913. It will be remem-

Digitized by Google

bered that the first meet on this track was held June 8, and the results were such as to indicate that Rockingham park is to prove one of the best motor racing courses in the country.

OLDFIELD MAKES NEW RECORD.

It seems like old times to read that Barney Oldfield has made a new record. At North Randall, near Cleveland, O., Sept. 14, he created a circular track record for one mile, covering the distance in 0:47.91, and exceeding the mark of 0:48.62 set by Robert Burman on the Brighton Beach track, Sept. 4, 1911.

NEW ELECTRICAL CONCERN.

The New York Electric Vehicle Company was formed at New York recently as the result of a meeting of the electric vehicle manufacturers. The new organization is co-operative, its object being to boom the electric vehicle industry in the New York metropolis. It is announced that it will in no way conflict with the national body, the Electric Vehicle Association of America.

The membership of the association will include corporations and firms engaged in the manufacture and sale of electric vehicles. Among the plans being considered is the establishment of a common showroom, centrally situated and equipped with model charging facilities, and the maintenance of a list of duly inspected and reliable garages about New York. Among other considerations of importance is the possibility of co-operative advertising on a large scale.

CARROLL, GOODYEAR MANAGER.

Frank E. Carroll, for many years prominent in automobile trade circles on the Pacific Coast, has been appointed manager of the new branch of the Goodyear Tire & Rubber Company at San Francisco. W. T. Powell of the Portland, Ore., branch, has been promoted to be Pacific Coast manager of the Goodyear Company.

SHOW FOR ATLANTA, GA.

Plans are being formulated for the Atlanta, Ga., automobile show, which will open in the Auditorium on Nov. 16. It is estimated that the cost of staging the event will approximate $100,000 and the decorations will cost $16,000. Automobile firms from all over the United States are to be represented and the exhibit is expected to help boom the industry in the South.

MORGAN OUT OF COMPANY.

Ralph L. Morgan, formerly with the Morgan Motor Truck Company, Worcester, which has just been incorporated for $300,000, has severed his connection with the company. He has taken a suite of offices in the People's Saving Bank building on Main street, where he will in future be at home to his friends in the automobile trade.

COMING EVENTS.

September.

Sept. 28—Track events, Dayton, O.
Sept. 28—Track events, Kalamazoo, Mich.
Sept. 28-Oct. 26—Electrical show, Boston, Mass.
Sept. 29-30—Track events, St. Louis, Mo.

October.

Oct. 4-5—Track events, Sioux City, Ia.
Oct. 7—National tour, Detroit, Mich.
Oct. 7-11—Reliability run, Chicago, Ill.
Oct. 8-14—Show, St. Louis, Mo.
Oct. 9-19—Electrical show, New York City.
Oct. 12—Track meet, Salem, N. H.
Oct. 12—Track events, Springfield, Ill.

November.

Nov. 6—Track events, Shreveport, La.
Nov. 8-16—Olympic show, London, England.
Nov. 16-23—Show, Atlanta, Ga.
Nov. 28—Track events, New Orleans, La.

December.

Dec. 7-20—Automobile Salon, Paris, France.

1913.

January.

Jan. 4-11—Show, Montreal, Can.
Jan. 11-18—Show, Madison Square Garden, New York City.
Jan. 11-18—Show, Grand Central Palace, New York City.
Jan. 20-25—Commercial car shows, New York City.
Jan. 20-25—Show, Philadelphia, Penn.
Jan. 27-Feb. 1—Show, Detroit, Mich.

February.

Feb. 1- 8—Show, Chicago, Ill.
Feb. 10-15—Show, Minneapolis, Minn.
Feb. 17-22—Show, Kansas City, Mo.

March.

March 3- 8—Show, Pittsburg, Penn.
March 8-15—Pleasure car show, Boston, Mass.
March 17-22—Show, Buffalo, N. Y.
March 19-26—Commercial show, Boston, Mass.
March 24-29—Show, Indianapolis, Ind.

Digitized by Google

During the past several months the number of automobiles in Nova Scotia has been notably increased. In September, 1911, only 537 were registered, but the number has grown to over 900, 180 of which are credited to the city of Halifax. The outlay for motor cars in the province is now said to amount to $1,000,000 and for the city of Halifax about $220,000, the average value being about $1200.

At the opening of each season many owners replace their old cars with newer makes, although the better grade cars are generally retained a few years at least by the first purchaser. The depreciation of a machine is estimated at about 10 per cent. for ordinary wear and tear and the life of a car in Nova Scotia is fixed at eight or nine years, running on an average 6000 or 7000 miles a year.

—— ★ ——

Overland cars, made by the Willys-Overland Company, Toledo, O., are being sold in all parts of the world judging from the fact that the company has been busy making shipments to distant lands during the past year. An accompanying illustration shows two of these machines being delivered to Chinese purchasers soon after their arrival at Tientsin.

Soon after the government of China was transformed into a republic the natives, particularly the more progressive, took kindly to American products. Several machines made in this country are represented by local agencies, and the outlook for the future is decidedly promising.

—— ★ ——

The municipal council of Barranquilla, Colombia, South America, has decided to place the following monthly taxes on automobiles and motor trucks: Omnibuses, first class, $6; automobiles for hire or private use, with protected riveted rubber tires, $4; with unprotected riveted rubber tires and with simple hard rubber tires, $3. There are now about 30 motor cars and trucks in Barranquilla, which were manufactured, with few exceptions, in the United States.

Two Overland Cars, Made by the Willys-Overland Company, Toledo, O., Delivered to Chinese Purchasers upon Their Arrival at Tientsin.

Digitized by Google

An American consular officer in a European city desires to receive catalogues of American manufacturers of automobiles ranging in price from $800 to $1200 to the agent. Price lists, discounts, terms and other pertinent information should be furnished. A considerable number of requests are being received by this officer from dealers and agents, and care will be taken to submit catalogues, etc., to interested inquirers. Information may be had from the bureau of foreign and domestic commerce, file number 9503.

—— ★ ——

For the first time there are favorable prospects for the sale of American automobiles in the Neth-

One of a Fleet of 12 Maxwell Cars in Constant Tourist Service in Madras, India.

erlands. The Amsterdam agent of an American make says he is very well satisfied with it and that since January he has sold 33 cars which are proving entirely satisfactory. It is said the reason why American cars could not be formerly sold in the Netherlands was that the cheapest and poorest automobiles were imported. The belief is now growing, however, that the high class American machines can overcome all European competition. Apparently, only liberal and aggressive methods are needed to establish a flourishing trade in the Amsterdam district.

—— ★ ——

More than 600 new cars are sold annually in the Milan district of Italy and there are approximately 2900 in use now, including about 100 taxicabs in the city of Milan. There are in the neighborhood of 1000 cars manufactured there annually, of which less than 50 are electrics. The most popular cost $1100 to $1250 for the chassis, or from $1700 to $2100 with body. The trade in automobiles is being pushed with considerable energy and advertising is done upon a comparatively large scale. There is no prejudice against American machines but, other things being equal, those of Italian make would naturally be preferred.

—— ★ ——

Since the holding of the imperial Durbar in India last year, automobiles have come into more general use in that country. It is maintained that they have largely superseded all other forms of transportation for tourist travel in the vicinity of Madras, and in many instances the American machines are favored.

The Madras Stable Company not only sells Maxwell cars, made by the Maxwell-Briscoe Motor Company, Tarrytown, N. Y., but operates a rental service which is liberally patronized by tourists and commercial men. The field covered by this concern embraces a large portion of the Indian peninsula. An accompanying illustration shows one of the 12 Maxwell Mascotte, 30 horsepower touring cars, which are kept in constant service in front of one of the ancient temples.

—— ★ ——

During the last four years manufacturers in Germany have greatly increased their sales and extended their market. The Daimler, Benz, Horch and other automobile factories have been enlarged and other companies, which have been manufacturing bicycles, sewing machines and other articles, have in the last few years successfully developed the automobile. The great electrical companies have also taken up the construction of motor cars.

In Germany, as a rule, only domestic machines are to be seen and there is also a considerable increase in the exports to foreign countries. Foreign motor cars for passengers are imported into Germany principally from France and Belgium and to a small degree from Italy and Switzerland. The chief countries which import German machines are Russia, Austria-Hungary, Brazil, Great Britain, Argentina, the Netherlands and Roumania. During the first six months of 1912 France imported 150 tons of automobiles from Germany and the latter imported 360 tons from France.

—— ★ ——

Although the hilly and narrow streets of the city of Bahia, Brazil, are paved with rough cob-

Digitized by Google

blestones and are unsuited to automobiles, the number of machines in use there has increased the past year from five to nearly 50 and new cars are constantly arriving. Outside of the city proper motor cars cannot be used because of poor roads. The city and state governments are planning to construct a number of paved streets which will doubtless result in a great increase in the number of cars in service.

There appears to be a good opening for a first class repair shop, which could perhaps be best maintained in connection with an agency for some good machine. Only strongly built cars are adapted for use in Brazil and manufacturers should not attempt to market any other kind. It is gratifying to note that of the machines in use in Bahia at present, fully two-thirds are of American manufacture and seem to be giving just as much satisfaction as the more expensive British, French and Italian cars.

—— ★ ——

The Duke of Westminster, a son of the late Queen Victoria of England, has become the owner of a Hudson car, made by the Hudson Motor Car Company, Detroit. Among the British nobility there are several owners of Hudson machines, including Lord Barrington, the Earl of Lanesborough, Sir D. Haig, commander-in-chief of the post at Aldershot, and Gen. Bingham.

—— ★ ——

The information is given in bulletin No. 9472 of the government bureau of foreign and domestic commerce, that a business man in a German city requested an American consul to place him in communication with American manufacturers of automobiles with a view to represent some line in that market. Correspondence in German or Italian is preferred.

—— ★ ——

Consul Albert Halstead, Birmingham, England, reports that the rapid growth of the automobile industry, the enormous development in the manufacture of motorcycles and the continued British use of the ordinary bicycle have made the United Kingdom as good a market as exists for rubber tires of all kinds, as well as other articles made of rubber. Despite the large sales of American automobiles in England, American tires have not been introduced there to the degree that might have been expected, in spite of the fact that there is more actual rubber in our product than in the British or European article.

"If tires are to be introduced by American firms," says Consul Halstead, "it will be absolutely necessary for a trained organization to be created in England and the tactics followed by English and other makers pursued, with such modifications as American sales ingenuity may deem desirable. The thorough introduction of tires by any American company will cost an immense amount of money for advertising, racing expenses, etc., and for many months there would be no return; but if the American tires are as good as they are said to be and the prices right, success, when it comes, will be great, even though delayed by the strong hold of British and foreign tires on this market."

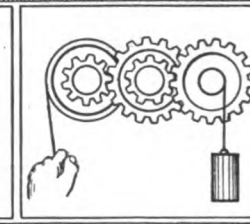
—— ★ ——

Uruguay recently acquired three automobile 'buses from Germany, England and France and so popular have they become since July that an ordinance regulating the number of passengers to be carried on one trip is being prepared by the city council of Montevideo. The government recently passed the following law: "Omnibus automobiles introduced into Uruguay with a capacity for carrying more than eight passengers and exclusively for public service, are exempted from the payment of customs duties and all additional duties with the exception of the 3 per cent. additional duty for the port works of Montevideo." The experiment has been so satisfactory that the government has decided to purchase other vehicles of a similar type. Should American manufacturers desire to supply some of these they should address El Ministro del Obras Publicas, Montevideo, Uruguay, the communication being made preferably in Spanish.

—— ★ ——

It is said that if Toronto, Can., purchases the three motor 'buses recommended by the board of control at a cost of $10,000 each and puts them into commission, the Toronto Railway Company will probably attempt to secure an injunction. The company claims a general franchise to the streets and says that the city has not the legal right to enter into competition by running a passenger service.

—— ★ ——



In South Australia, Victoria, New South Wales and Tasmania good roads far exceed the bad, while heavy and neglected ways are becoming fewer with each succeeding year. The ordinary Australian road will allow an average speed of 23 to 25 miles an hour by a car of 20 horsepower, without injury to the machine.

—— ★ ——

Ecuador has 22 motor cars, 11 of which are of one American make. There are less than 300 miles of roads in the country suitable for automobile use.

RECENT MOTOR VEHICLE PATENTS

Fuller Tire Signal.

A patent has been granted to Fred Leo Fuller, Sacramento, Cal., for a signalling device for pneumatic tires, and the invention presents novel features in that it appears to be attached easily and is designed to give the operator of the automobile warning when a shoe becomes deflated through a puncture, etc. The device includes a bell, which is clamped to the spokes of the wheel, and a projecting operating lever. Attached to this lever is a chain having a closed coil spring the tension of which is greater than the spring within the bell. The chain member is secured to the tire in such manner that when the latter becomes deflated the tension of the coil spring relaxes, releasing the lever of the bell, causing it to ring.

Rice Muffler and Exhaust Pipe.

Walter T. Rice, Chicago, has patented a combined muffler and exhaust pipe for internal combustion motors and the device is so designed that the usual exhaust manifold is dispensed with, being replaced by flaring funnels, the number of these corresponding to the number of cylinders of the motor. The ends secured to the motor have openings corresponding to the diameter of the exhaust port and the flare is increased to about three times the diameter of the port at the place of attachment to the muffler. The latter is cylindrical in form and is constructed in two sections secured by bolts. The outlet for the exhaust gases is located beneath the muffler. By this arrangement the muffler is positioned near the forward part of the chassis and the usual exhaust pipe is eliminated.

Auperl Tire Armor.

Of late several inventions are noted for providing tires with traction devices and among the more recent is that of Harry Auperl, New York City. The inventor claims that it not only prevents skidding, but it is puncture proof. It comprises rings of less diameter than the wheel, these being placed on either side. The ring on the outer side is composed of separately disconnected parts. Both are provided with detachable cross chains and turnbuckles connect these members. The tread of the tire is covered with armor plates having a number of balls which provide anti-skidding qualities. The plates are retained by chain devices which are secured to the rings.

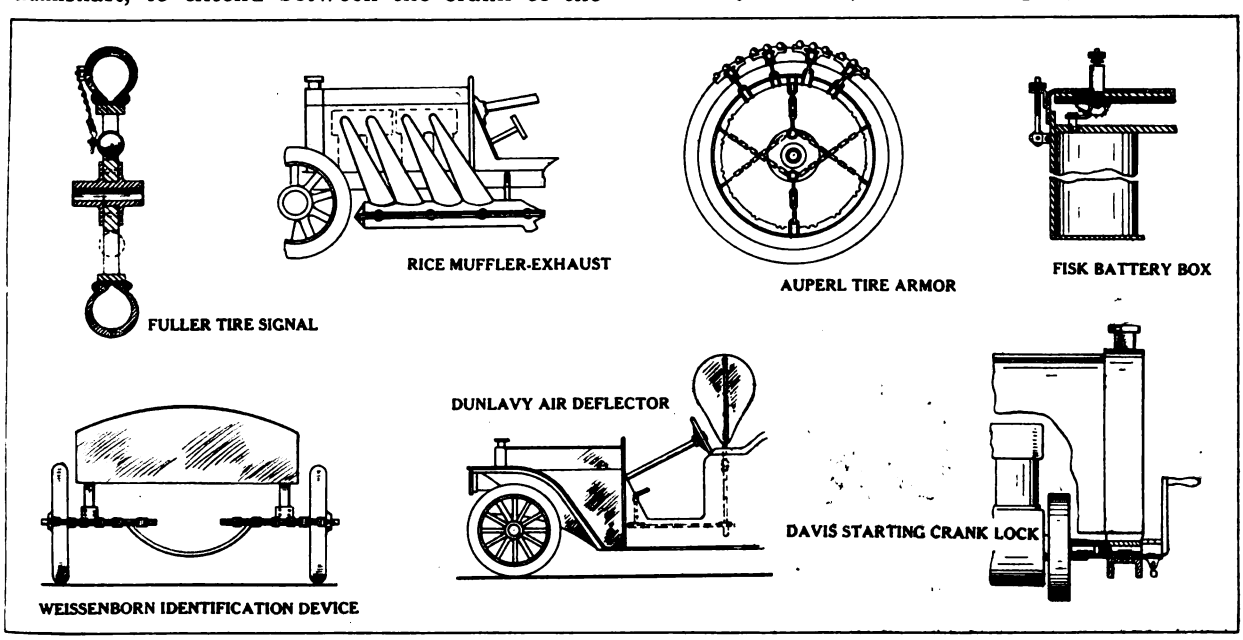
Fisk Battery Box.

In connecting dry cells in series or multiple series with ordinary wires, the connectors are liable to work loose, causing considerable annoyance when employed for ignition purposes. Henry M. Fisk, Watseka, Ill., has been granted a patent for a battery box which is claimed to eliminate wiring, as all necessary connections are contained within the device. The box or container is of sheet metal and is provided with a cover of similar material which fits over the container. The inner portion of the cover is suitably insulated and is provided with spring contactors which make the necessary connections from the positive of one cell to the negative of the next. These connectors consist of strips of metal so bent at the end as to present the two lateral edges downwardly for the purpose of causing said lateral edges to enter between the threads on the binding screws. Means are also provided for vertically adjusting the cover so as to increase or decrease the pressure of the connectors on the battery terminals.

Weissenborn Identification Device.

Oscar A. Weissenborn, Jersey City, N. J., has been granted a patent for an identification device which presents original features. It comprises a fender secured to the front of the automobile by brackets and a large number of brass discs or identification checks are contained in the fender. A thin brass wire, in two sections, is included in the device and when the wire comes in contact with any solid material it releases the discs. The object of the invention is to provide means of identifying automobiles the operators of which seek to escape after an accident.

Dunlavy Air Deflector.



Harry Craft Dunlavy, Fresno, Cal., has been granted a patent for an air deflector for attachment to motor cars or other vehicles. It comprises a vane member which is mounted at the

Digitized by Google

top of a vertical shaft. A second vertical shaft carries a sprocket at its lower end. A chain connects the sprocket to a similar member located conveniently to the operator's foot, and a lever is fitted for actuating the chain and controlling mechanism. By it the vane may be placed in any desired vertical position for deflecting air currents.

Davis Starting Crank Lock.

The increasing number of cars reported stolen has stimulated the efforts of inventors to design locking devices and among those recorded is the Davis starting crank lock, patented by William J. N. Davis, Chicago. It comprises a two-part sleeve adapted to be removably fitted upon the crankshaft, to extend between the crank of the shaft and the support through which the shaft is mounted, and to serve as an abutment for holding the shaft against longitudinal movement. Means are also incorporated for holding the parts of the sleeve assembled. The sleeve has apertured ears and a lock having a hasp engages through said apertures, providing means for locking.

Illustrating Some of the Recent Patents Applicable to the Motor Car.

OTHER PATENTS GONE TO ISSUE.

Traction Wheel, Kenneth N. Avery, Covina, Cal. A wheel comprising a drum, a rim portion outside same, a series of tangential springs carried by said drum and having ground engaging points at their free ends.

Electrolytic Cell, Frank H. Briggs, Elyria, O. The combination of an electrolyte container and electrodes, of an electrolytic cell, of a fixed support normally extending within the container, a cover and heating elements carried by said support, and means for removing the container without disturbing the support or parts carried thereby.

Governor, Norman T. Harrington, Lansing, Mich. A governor for an explosive motor. The combination comprises a periodically opening admission valve, of a continuously moving oscillating valve controlling the same conduit having an instantaneous closure at the centre of its oscillation, and means for varying the amplitude of oscillation.

Traction Wheel, Walter S. Morton, Harrisburg, Penn. The rim is composed of two angle irons each connected with the outer extremities of one series of spokes and a tread made up of a series of three-legged members having outstanding ribs along their outer faces.

Vehicle Body, Frederick A. Brand, assignor to the Broc Electric Vehicle Company, Cleveland, O. In a coupe vehicle body having a window therein, the combination of a seat disposed below said window; a fixed back for said seat, said back extending to a point below the level of window sill, and a vertically movable supplementary back adapted in its lower position to rest upon fixed back and to extend therefrom to the level of the window sill.

Headlight Controller, Wilson B. Hargreaves, Bloomingdale, N. Y. The lamp bracket is secured to a spindle having a bearing head and to the spindle is attached a rod like member leading to and connecting with the steering mechanism of a motor car.

Motorcycle Saddle, Frederick Mesigner, New York City. A saddle provided with a post clamp, a pair of arms extending laterally therefrom and having seats at their outer ends, a pair of flat cradle springs engaging said seats at their forward ends, bolts passing through said springs and arms, a saddle top and means for securing the rear ends of springs to said top.

Spring Wheel, Walter Hill, Mattoon, Ill. Between the solid shoe and rim of the wheel are fitted U shaped springs arranged transversely, and secured to a plate carrying the tire and to the rim of the wheel by a bolt and clamp device.

Cranking Device, Peter Christensen, Kingsville, Tex. A starting device comprising a clutch, a toothed sleeve slidably mounted in said clutch and adapted to be mounted upon an engine shaft, a pawl pivotally mounted upon said clutch and adapted to engage said teeth, means carried by said pawl for limiting the inward movement of said pawl, and an operating mechanism for moving said clutch to bring pawl into and out of engagement with said teeth.

Braking Means for Traction Vehicles, William E. Paine, New York City. Two independent water tight sand carrying compartments are secured to opposite sides of the chassis and directly in front of the traction wheels. Each container is provided with one or more valves for discharging the sand. The valves are operated by a pedal.

ACTIVITIES OF MOTORCYCLISTS, THE RIDER, THE MANUFACTURER, AND THE DEALER

President Coffman Resigns.

A. B. Coffman, for the past 12 years one of the most potent factors in building up the Yale business, has resigned as vice president and sales manager of the Consolidated Manufacturing Company, Toledo, O., and has connected himself with the American Wood Rim Company of that city and the Eclipse Machine Company, Elmira, N. Y. In the latter position he will handle the exclusive sales of Morrow coaster brakes and hubs. He has also resigned as president of the Motor-

J. M. Pancoast, Philadelphia, Penn., and Emblem on Point Breeze Track.

cycle Manufacturers' Association, because he will no longer be connected directly with the production of motorcycles.

The Dayton Twin.

At the recent display at the Made-in-Dayton exposition, Dayton, O., the Davis Sewing Machine Company of that city put on exhibition its first motorcycle, a twin-cylinder model. The company, which enjoys an international reputation for its sewing machines and bicycles, has had its mechanics at work perfecting a motorcycle for some time and the product obtained is said to be of high grade. About 40 of the concern's employees who made possible the completion of the machine in time for the Dayton exposition were given a banquet by the company.

Crawford a New Mount.

The Crawford motorcycle is a new machine which has just appeared on the market from Saginaw, Mich. Robert S. Crawford, a veteran of the bicycle trade, is head of the company. The machine is equipped with a nine horsepower, Spacke De Luxe motor, Schebler carburetor, Bosch magneto, free engine clutch and Eclipse coaster brake.

Motorcycle Prints Paper.

When a heavy storm recently played havoc with the electric service at Phoenix, Ariz., it is said that newspapermen operated linotype machines by connecting a motorcycle with the main drive shaft of the typesetting system and got the paper out on time.

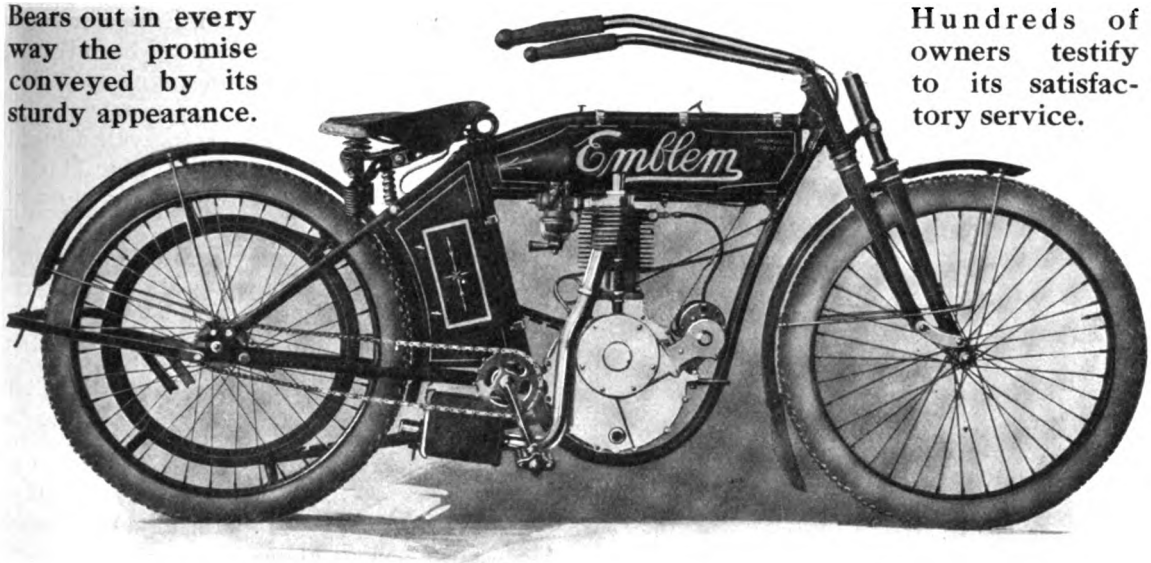
Race Meet in Alabama.

A fine programme of motorcycle racing will be held in connection with the Alabama state fair, Oct. 3-12, at Birmingham, Ala. The races will include amateur opens, amateur trophy, professional open and match races. The cash prizes will aggregate $1300.

New Henderson Agencies.

The Henderson Motorcycle Company, Detroit, has closed agencies in the South as follows: Dallas, Waco and Sherman, Tex.; Atlanta and Savannah, Ga.; Montgomery, Ala.; Richmond, Va. Substantial export orders have been filled by the company from Mexico, Rio Janeiro and Singapore.

Indian Pow Wow in Springfield.



George M. Hendee of the Hendee Manufacturing Company, Springfield, Mass., maker of the Indian motorcycle, has practically engaged the entire park at Riverside in that city for a huge outing and clambake for all the employees of the company on Sept. 21. It is expected that between

1200 and 1500 men will enjoy the hospitality of the Hendee company.

Takes Emblem Agency.

The Emblem Manufacturing Company, Angola, N. Y., maker of Emblem mounts, has closed a contract with Keith McKee, Macomb, Ill., for the representation of its product in that territory.

Return from Foreign Tour.

B. F. Crowley of Danvers, Mass., with three fellow students at Yale University, arrived at Boston recently on the steamship Cambrian from London. The young men had been on a motorcycle tour of Europe, lasting two months, during which they visited parts of England, France and other countries.

Long Distance Club Run.

The Angel City Motorcycle Club, Los Angeles, Cal., has completed its first endurance run, which covered a distance of 1124 miles, probably the longest ever held. Eleven machines started the run and five finished with perfect scores, a good record considering the long distance. Those who finished perfect were C. L. Armstrong, five horsepower Minneapolis, two-speed; R. E. Bissett, four horsepower Indian, two-speed; Clarence Biggs, six Excelsior, belt; Erwin Knappe, seven Indian, two-speed; W. O. Borden, seven Indian, two-speed. It will be noted that the machines which finished perfect were two-speed, except that rode by Biggs, who made the run by sheer good riding ability.

Changes in Yale Force.

Following the resignation of A. B. Coffman as vice president and manager of the Consolidated Manufacturing Company, Toledo, two important changes in the company's sales staff are announced and in future there will be two sales managers, both located at Toledo in close touch

JOIN THE F. A. M.

which is the National Organization fostering the interests of motorcyclists along legislative and other lines. Cut this out, mail it, and you will get the reasons.

with General Manager D. J. Welsh. Robert L. Hinds will be in charge of Yale motorcycle sales and F. C. Cornish, heretofore eastern representative of the company, goes to Toledo to become sales manager of the bicycle department.

J. H. Lord, Silver Spring, R. I., and His Excelsior.

Jackson Becomes Indian Chief.

E. M. Jackson, for five years secretary and sales manager of the Miami Cycle & Manufacturing Company, Middletown, O., and connected with the Elyea-Austell Company, Indian motorcycle distributor at Atlanta, Ga., since February, has joined the Indian sales staff of the Hendee Manufacturing Company, Springfield, Mass., and will start his work at the factory Oct. 1.

Club Notes, Here and There.

The following clubs have affiliated with the F. A. M. recently: York F. A. M. Motorcycle Club, York, Penn., H. S. Bortner, secretary, 15 members; District Mikes Motorcycle Club, Cripple Creek, Col., H. R. Kuni, Jr., secretary, 22 members; Ravenna Motorcycle Club, Ravenna, O., W. N. Reach, secretary, 15 members; Middletown Motorcycle Club, Middletown, O., W. M. Mapes, secretary; Sunshine State Motorcycle Club, Albuquerque, N. M., H. A. Douglass, secretary, 19 members.

The Trinidad Motorcycle Club has been formed at Trinidad, Col., and as soon as the charter list is closed affiliation with the F. A. M. will be considered.

Members of the Capital City Motorcycle Club, Little Rock, Ark., recently made a run of 100 miles to Mount Nebo, Ark.

Members of the Rochester Motorcycle Club, Rochester, N. Y., recently made a run to Hammondsport, where they visited the Curtiss aviation field and were entertained by Glenn H. Curtiss, the aviator.

William A. Myers, Indian, Excelsior and Thor dealer at Williamsport, Penn., recently entertained 75 Williamsport motorcyclists at his annual picnic.

The Harley-Davidson Motorcycle Club, Philadelphia, recently had a run to Stine Harbor, N. J., where the members camped over night at the shore.

In the recent three-day endurance run held by the Middletown Motorcycle Club, Middletown, O., seven riders finished with perfect scores, as follows: Morrison, Jones and Palmer, Indian; Valiant, Merkel; Squier, Campbell and Myer, Yale.

A plan is now in process of formation for a national organization of motorcyclists in Japan. Literature embodying all the principles of the Federation of American Motorcyclists has been sent on request to Tokio.

Ocean-to-Ocean Relay.

Motorcycle riders and clubs are volunteering their services in carrying the proposed coast-to-coast relay message and much interest has been aroused in the undertaking. No definite decision as to the route has been made, but every effort will be given to establish a new transcontinental record. Two itineraries have been suggested, one from New York to San Francisco, by way of Buffalo, Cleveland, Chicago and Salt Lake City, and the other from New York to Baltimore, thence by way of the national road to St. Louis

Harry Goode Utilizing His Flanders Mount on Fishing Trip in Colorado.

Digitized by Google

and through the Southwest to the coast. It has also been suggested that a message be started at the Pacific Coast at the same time as the one from New York and that there be a relay race between the riders on the two routes.

One of the first motorcyclists to offer his assistance is Charles Fuller Gates, Los Angeles, who offered to see that the message is carried the first 400 miles from the coast. Others who have volunteered are: C. C. Hopkins, San Francisco; G. F. Killinger, Cedar Rapids, Ia.; Paul Werner, Kansas Short Grass Motorcycle Club; C. L. Bunten, Hanna, Wyo.; W. D. Rishel, Salt Lake City; C. L. Woodrow, Newton, Ia.; Allen Brunck, Town Line, N. Y., and motorcycle clubs at Oakland, Cal.; Toledo, O.; Chicago, Ill.; Council Bluffs, Ia.; Kansas City, Mo.; Salina, Kan., and New York City.

Pancoast on Emblem.

J. M. Pancoast of Philadelphia sells Emblem machines, made by the Emblem Manufacturing Company, Angola, N. Y. He also rides an Emblem, and occasionally he has an opportunity to demonstrate to the people of the City of Brotherly Love that the Emblem has qualities which make it ideal for racing as well as touring purposes. An accompanying illustration shows Pancoast and his mount on the Point Breeze track, near Philadelphia, on which he had decided a number of questions as to the Emblem's supremacy.

Motorcycle on Fishing Trip.

When Harry Goode of Denver, Col., feels like catching a mess of trout he thinks nothing of utilizing his Flanders motorcycle, made by the Flanders Manufacturing Company, Pontiac, Mich., with which to reach the choicest fishing holes. An accompanying illustration shows his method of making the trip.

Cupid on a Motorcycle.

Within the past few weeks six couples in as many states have utilized the motorcycle on their honeymoon trip, and it goes without saying that the mounts were employed somewhat frequently in bringing about the marriages which resulted in the honeymoons.

The longest trip was made by Mr. and Mrs. Clinton Johnson of Topeka, Kan., who left immediately after the ceremony for El Paso, Tex., where they will make their future home. George W. Fuller and Miss Gertrude Edwards of Los Angeles, Cal., eloped on a tandem mount and spent their honeymoon at Long Beach and other Pacific Coast resorts. Carl A. Jones and Miss Edna Birdsall of Columbus, O., were introduced over the telephone, but a motorcycle trip followed their visit to the home of a minister.

The fourth motorcycle romance took place in Great Falls, Mont., when Miss Loris M. Gervais became Mrs. Edward Schmidt. The fifth was in Spokane, Wash., with Mr. and Mrs. Jay Granger as the contracting parties. The sixth had its beginning in Fulton, Mo., and its ending in Kansas City. Mr. and Mrs. Harry Becker were the participants.

Touring on Indians.

R. B. Williams, H. J. Hopstetter and B. Phillips of Zanesville, O., are enjoying a sight-seeing trip through eight states, the distance to be covered being about 2000 miles. Mr. Phillips and Mr. Williams are travelling on a T. T. tandem Indian.

Marsicano in Florida.

John Marsicano, the motorcycle policeman of Tampa, Fla., who came into prominence as a racing rider last year, was the chief winner at the recent meet of the Tampa Motorcycle Club. Three events were held with the following results:

Five miles, stock—First, Marsicano, Harley-Davidson; second, Johnson, Indian; third, Weber, Excelsior; time, 7:40.

Seven miles, stock—First, Marsicano, Harley-Davidson; second, Johnson, Indian; third, Torres, Excelsior; time, 10:31.

Ten miles, open, handicap—First, Torres,

Merkel; second, Nolan, Indian; third, Marsicano, Harley-Davidson; time, 13:40.

Results at Baltimore.

Everything was Indian at the meet held in connection with the Timonium fair, in Baltimore, Md., under the management of Howard A. French. The summary:

Two miles, novice—First, Reckford, Indian; second, Hammond, Indian; third, Mears, Indian; time, 3:16.

One mile, open—First, Tiemeyer, Indian; second, Heinz, Indian; third, Reckford, Indian; time, 1:26.

Three miles, handicap—First, Reckford, Indian; second, Tiemeyer, Indian; third, Hammand, Indian; time, 3:57.

Boston Riders Compete.

The Boston Motorcycle Club, Boston, Mass., held a race meet near that city early in the month. The track was not in particularly good condition, but the following results were obtained:

Five miles, novice—First, Horn, Indian; second, Hind, Excelsior; time, 7:15.

Fifteen miles, open—First, Crandall, Thor; second, Smith, Indian; third, Halliwell, Indian; time, 16:20.

Ten miles, private owners—First, Halliwell, Indian; second, Martin, Indian; third, Haines, Indian; time, 12:06.4.

Twenty-five miles, open—First, Crandall, Thor; second, Halliwell, Indian; third, Smith, Indian; time, 26:39.

Ten miles, open—First, Gove, Indian; second, Smith, Indian; third, Broadley, Thor; time, 12:31.4.

New Twin-Cylinder Pope.

Following closely its announcement of its single-cylinder mounts for 1913, the Pope Manufacturing Company, Hartford, Conn., has brought out a twin, although it is understood that it is not quite ready for the market. Those who have seen it speak highly of its lines and mechanical details.

The Newark Accident.

While the exact cause of the accident on the motordrome at Newark, N. J., Sept. 8, probably never will be known, it was an extremely unfortunate blow to the sport of motorcycle racing. Two of the best known riders in this country, Edward Hasha and John Albright, and six spectators lost their lives. It is safe to predict that all those interested in the future of motorcycling will make a thorough investigation of the matter, with a view to preventing absolutely any repetition of the occurrence.

It was during the last event of the meet, just after Ray Seymour had passed Hasha, that the latter, in trying to regain his lost position, swerved his machine up the track. After plowing along the rail, cutting down several boys, who had posted themselves at this point, it struck a large stanchion, throwing Hasha against a post, and rolling down the track directly in front of Albright.

Hasha was well known largely because of the many records he held. He was the first man to ride a motorcycle a mile in less than 0:40. Albright had been racing longer than Hasha, but had not achieved the same prominence. Both were Texas boys and were recently married.

Edward Hasha and Indian with Which He Created Many Records.

PROTECTION FOR GARAGE AND OWNER.

TWO or three problems stand out pre-eminently in the successful conduct of a public garage and service station. The proprietor who gives careful attention to business details realizes that there are many places in which leaks are liable to occur. It is not always so easy to determine just what is causing the leaks or to suggest a remedy, although it generally follows that the remedy is much more readily discovered than the leak.

The garage which is just starting in business in a small city or town is prone to count the cost, which sometimes means that conditions are overlooked in which it is possible to waste many times the money that would be expended in guarding against such situations. It is well enough to cut down expenses, but the successful business man is aware that there are ways of saving money by making wise expenditures.

Few garage proprietors will be disposed to criticise the statement that there is grave danger of losses which materially affect the profits of the business. It is only necessary to cite the instance of the customer who habitually "borrows" a little gasoline to clean his hands, or the man who persists in using the firm's tools to make minor adjustments on his car. Such small items, in the aggregate, make up a substantial total during the week, month or year.

But these are minor problems. Most garagemen find ways to overcome these difficulties, despite the fact that it may cost a trifle to secure locking devices which protect the gasoline tank and the tool box. They represent minor leaks, and while it is important to guard against them, it should not be forgotten that still other problems can be solved as easily.

Some garage proprietors lose sight of the fact that it is as important to retain customers as to secure them in the first place. Satisfactory workmanship is not the sole requisite. The job may be performed in the most careful manner, but if the owner once gains the impression that he is being overcharged, it is a difficult matter indeed to disabuse his mind. A better way is to convince him from the outset that he cannot be overcharged.

The desirability of adopting some method of recording the time at which work on a given job was begun and ended, has been commented upon freely in these columns. Without doubt the best scheme is that known as a time recording clock, and the truth of this assertion is borne out by the fact that the utility of the device does not end with its use in checking up given pieces of work.

The time-recording clock is familiar enough to those who have had occasion to watch its operation in factory and department store service. By its use it is possible to record the time of arrival and departure of the employees, thereby simplifying the matter of bookkeeping in connection with the payroll. And it is only necessary to take a step further in its utilization in order to realize its full benefits to the garage business.

The cost is not excessive. Several makes are available. Herewith is presented the product of the Cincinnati Time Recorder Company, Cincinnati, O. It is known as the standard cost keeping machine, style 14, and has been designed especially for automobile garage use.

Fig. 1—The Cincinnati Time Clock Recorder.

Contained within a polished solid oak case, the mechanism is operated by an eight-day Seth Thomas clock movement. It is constructed to last an ordinary business lifetime, and is built with a one-piece frame with well baked Japan finish, the small parts being with gun metal finish and polished nickel. The length is 34.75 inches, width 15.75, and depth eight. It is claimed to be entirely automatic in action, with no shifting device of any kind. It prints the day, A. M. or P. M., hour and minutes, and a decimal wheel can be furnished in place of the minute wheel, if desired. In short, it is a machine particularly

Digitized by Google

adapted for accuracy in figuring cost.

Several blanks also are presented, indicating some of the uses to which the machine may be put in garage work. That at Fig. 3 A represents the employee's record card. On the obverse side

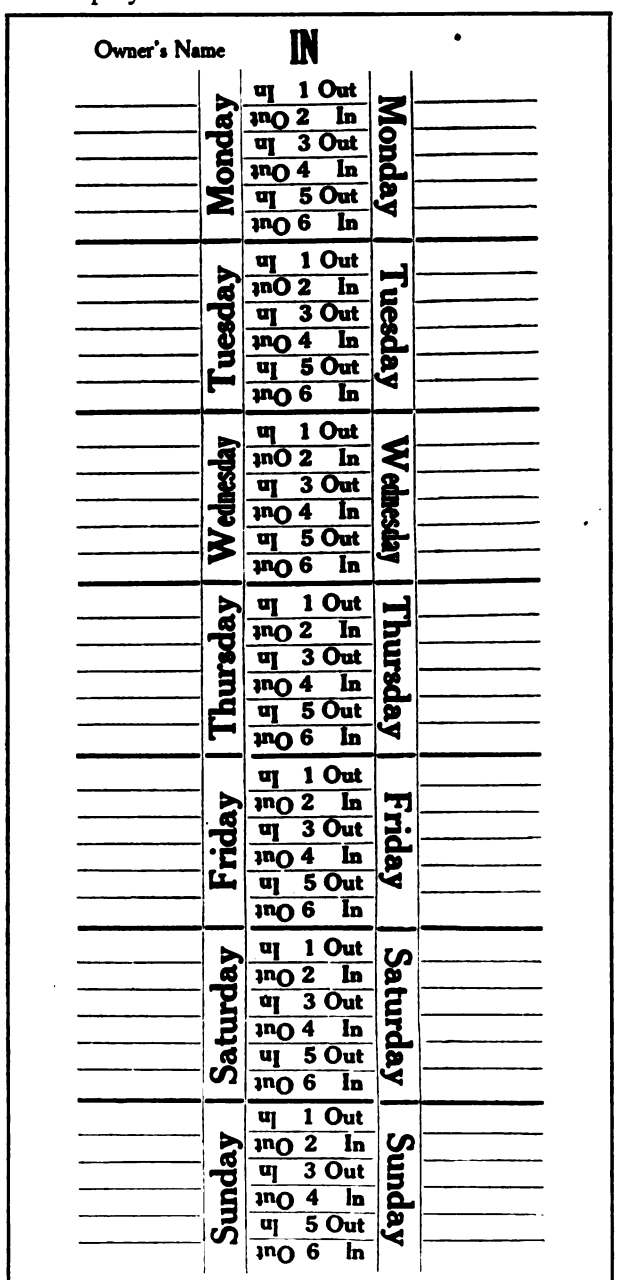

Fig. 2—Showing Card Used to Check the Arrival and Departure of Each Machine—Copy of Record Is Sent to Owner.

it will be noted that provision is made for recording the time of arrival and departure of the workman for seven days. The "in" and "out" spaces on this side make it possible for the proprietor to know exactly at what hour the workman reported for work in the morning, went to lunch at noon, returned from lunch, and quit at night. On the reverse side are similar spaces, one portion of the card being reserved for overtime only, and the other for time out or lost time.

By means of this card it always is possible for the proprietor to tell at a glance whether or not his workmen are prompt and efficient. It will be noted that the machine is adapted to print upon any portion of the card, 8.25 by 3.375 inches.

Fig. 3 B presents the card utilized in keeping track of the work. As soon as the repairman begins work he runs the card through the clock, thereby securing an impression of the exact minute at which work was begun. If he is called off for any purpose, he first runs the card through the clock, then puts it in a case provided for that purpose, where it is readily accessible when he resumes work on this job, after again securing an impression of the time on the card.

At the bottom of the card will be noted a space for the noon hour registration. It will be seen that it would be possible to utilize this card for one job or any number of jobs, keeping an accurate account of the time expended on each. It might also be used in lieu of that at A, as a record of the workman, although in such cases it would necessitate rather more figuring to obtain the desired information. The best arrangement would be to utilize one card for each job.

On the reverse, provision is made for keeping track of the total time expended upon a given job or jobs, and where it is found desirable to utilize this card for an employee's record as well, sufficient information is available to assist the bookkeeper in making up the payroll. The size is the same as that at Fig. 3 A.

Probably no problem has caused the garage proprietor more concern than that of keeping watch of the cars in his care, so that none but those entitled to use them shall do so. Of course, it has been demonstrated that no owner can hold the garage liable for damages sustained in the so-called joy ride. No concern could remain long in business if such view of the matter were generally taken.

When the garage proprietor has taken every precaution to deliver the machine to none but the authorized agent of the owner, his responsibility ends. Still, when it is considered that it is desirable to give a service which shall attract and retain custom, any proposition which will aid in solving this problem will be appreciated. And it is in this respect that the Cincinnati Time Recorder Company claims for its product a distinct advantage.

Digitized by Google

Without in any manner assuming the responsibility for the machine, the garage equipped with one of these clocks is in a position to render a valuable service to its customers. It may be added that several of these clocks are being utilized in this manner in the large garages of New York City, and that the results have been decidedly successful.

The card at Fig. 2 suggests the method. It will be noted that the card is divided into daily spaces, providing for the seven days of the week. Experience has indicated that six trips a day is about the largest number required for the ordinary garage. Each time the car is driven out of the garage the card is slipped into the clock, and a record is secured. As soon as it returns another record is obtained in the same manner.

Of course, it is necessary to assign some one to the duty of inserting the cards. It would not do to allow this duty to devolve upon the owner or chauffeur, so it must be an employee of the garage. In most cases some one in the establishment is assigned to look after cars when they go out or come in, but in the New York City garages mentioned the matter of securing the records is left to the young woman who cares for the telephone exchange, or to the bookkeeper.

This card is intended as a report. It may either be shown to the car owner at the end of each day or week, as desired, or it may be printed in copying ink, and after a press copy has been made for filing, the card itself is sent to the owner. The reverse side provides for the owner's name, make of car, storage report, garage advertisement and such remarks as may be necessary. The size is 9.125 inches long by 3.5 wide.

Let it be assumed that the owner has reason to suspect that his car is being used by the chauffeur without his consent. The garage equipped with one of these clocks and a set of cards is in a position to report to the owner at all times, just when his car left the garage, how long it was gone, and how many times a day it was being used. It is seldom indeed that the chauffeur ventures upon an extended joy ride at the first opportunity offered. If the report indicates that he is in the habit of taking more time to deliver the car to the garage than seems necessary, or any other lapse of duty, the owner is notified at once, and the possibility of a damaged machine is reduced thereby.

If the garage proprietor cannot afford to assume the responsibility for the improper use of a machine on storage, neither can he afford to relax his watchfulness over the cars in his charge. The possession of the clock does not eliminate the necessity for the other little means of checking against failure in this regard. But where it is possible to afford a service of this nature, in conjunction with the utilization of the clock as a time check on the employees and on the work of customers, it is easy to be seen that the recording device will pay for itself in a reasonably short time.

The loss of time on the part of employees is of moment. The possibility of losing a customer through inability to convince him that the entire time for which he has been charged was expended in work upon his car is decidedly important. The

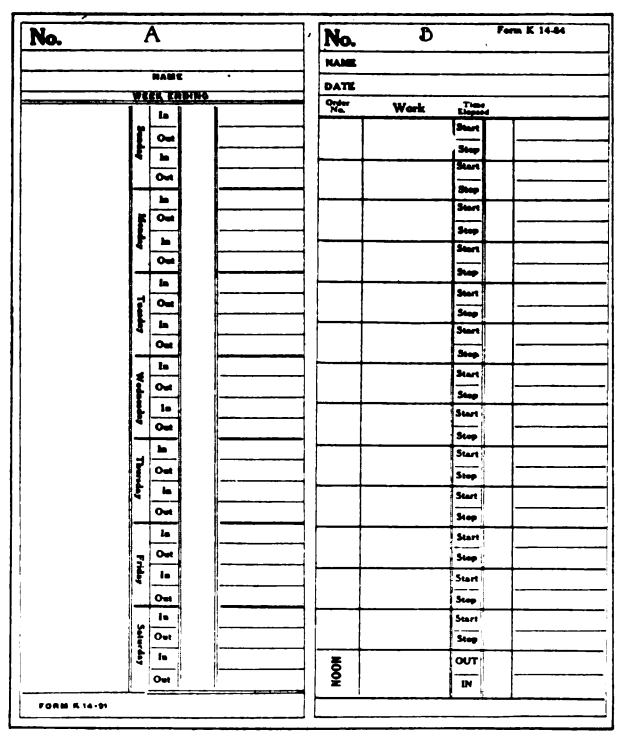

Fig. 3—Cards Used in Cincinnati System: A, Employee's Blank Stamped by Recording Device; B, Card Used for Keeping Track of the Work.

additional feature of providing a daily report of the car's movements, insofar as the garage itself is concerned, has a distinct value. Little attempt has been made herein to do more than suggest the possibilities. Numerous other ways of saving money can be cited by the garage owner himself. The need for system is imperative in the successful conduct of any business, and it is even more than ordinarily important in the garage and service station. Other things being equal, the owner is better satisfied when he realizes he is doing business with a man who keeps careful account of every item entering into the transaction.

The following concerns have been incorporated recently to manufacture or deal in automobiles, accessories, etc.:

Koogle Automobile Company, Indianapolis, Ind.; $10,000; to deal in automobiles, wagons, etc.; incorporators, J. G. Koogle, C. P. Cline, E. S. Buenting.

Guarantee Motor Car Company, San Antonio, Tex.; $10,000; incorporators, J. F. Hagan, H. J. Smith, C. W. Voss.

Ardery Holliday Motor Car Company, St. Joseph, Mo.; $10,000; to manufacture, sell and repair automobiles; incorporators, J. W. Ardery, J. W. Holliday, Jr., W. S. Thompson, Charles Ardery, W. H. Watson.

Harley Company, Springfield, Mass.; $50,000; garage and engineers; incorporators, Leon J. Harley, Leon J. Harley, Jr., Thomas B. Purves, Jr.

Tredvent Tire Company, New York City; $100,000; to manufacture automobile tires; incorporators, Morris Rachmil, Nathan A. Sterling, Samuel Ring.

New York Electric Vehicle Association, Inc., New York City; $50,000; to deal in motor vehicles; incorporators, George Tiernan, Frank H. Parcello, Robert G. Redlefsen.

Greenpoint Tire Repair Company, Brooklyn, N. Y.; $10,000; incorporators, Charles E. Keller, Anna Kovacs, John Kovacs, Jr.

Walter Williamson Automobile Company, Highland Park, N. J.; $10,000; to deal in automobiles and accessories; incorporators, W. M. Williamson, W. Whittlesey, V. J. Miller.

Auto Service & Supply Company; Wilmington, Del.; $15,000; incorporators, F. A. Webb, B. I. Bothe, Alfred Hindle.

A. W. Halle Motor Company, Buffalo, N. Y.; $300,000; incorporators, Arthur W. Halle, Bradley H. Phillips, E. C. Schlenker.

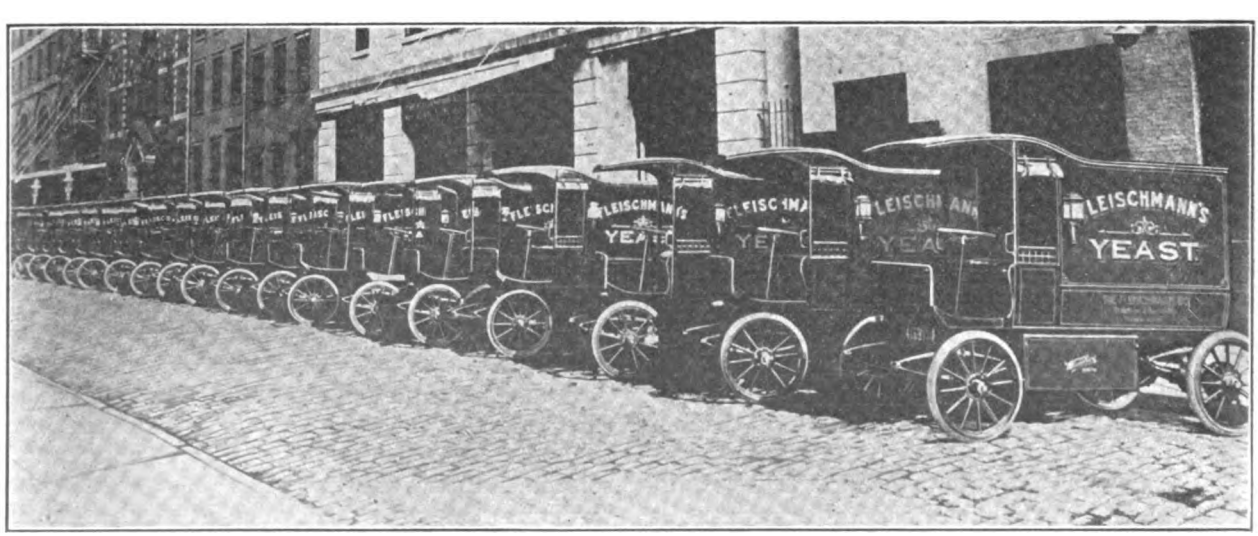
Park City Auto Company, Ashland, Ky.; $1000; incorporators, Howard Elhoff, B. E. Tate, J. Varnell Tate.

Viking Manufacturing Company, New York City; to deal in automobiles; $25,000; incorporators, A. R. Bangs, R. Condon, A. O. Briggs.

L-A-W Motor Truck Company, Wilmington, Del.; $200,000; incorporators, G. G. Rheubym, C. V. Mannering, C. R. Mudge.

Taxi Service Company, Waterbury, Conn.; $10,000; incorporators, Michael W. Norton, C. B. Schoenmehl, Arthur A. Page.

Cameron Manufacturing Company, Beverly, Mass.; $300,000; motor vehicles and boats; incorporators, Everett S. Cameron, Helen P. Cameron, Albion B. Emerson.



Harmon-Yount Company, New York City; $10,000; automobile business; incorporators, Daniel H. Hanckel, Frederick B. Hunt and others.

Brockway Motor Truck Company, Cortland, N. Y.; $100,000; to manufacture motor vehicles; incorporators, George A. Brockway, Charles B. Pomeroy and others.

Troy Motor Company, Troy, N. Y.; $10,000; incorporators, Richard G. Thornmeyer, H. P. Schoonmacker and others.

WITH THE MANUFACTURERS.

The Waverley Company, Indianapolis, Ind., has supplied the Fleischmann Yeast Company, New York City, with a large number of commercial vehicles, made by it, a photograph of 20 Waverley light delivery wagons being shown herewith. This is only a portion of the entire fleet operated by this concern, inasmuch as it has 12 others, ranging in capacity from one to three tons, on order or in use in Baltimore and other eastern cities. The majority of these cars have been in service for the past eight months and are said to be doing their work consistently and with a good degree of economy.

Fleet of 20 Silent Waverley Electric Delivery Wagons in Service with the Fleischmann Yeast Company, New York City.

C. L. Morgan, sales manager of the electric division of the General Motors Truck Company, Pontiac, Mich., has resigned to become associated with the Moon-Hopkins Billing Machine Company, St. Louis, Mo., as eastern sales agent. His new headquarters will be at 350 Broadway, New York City.

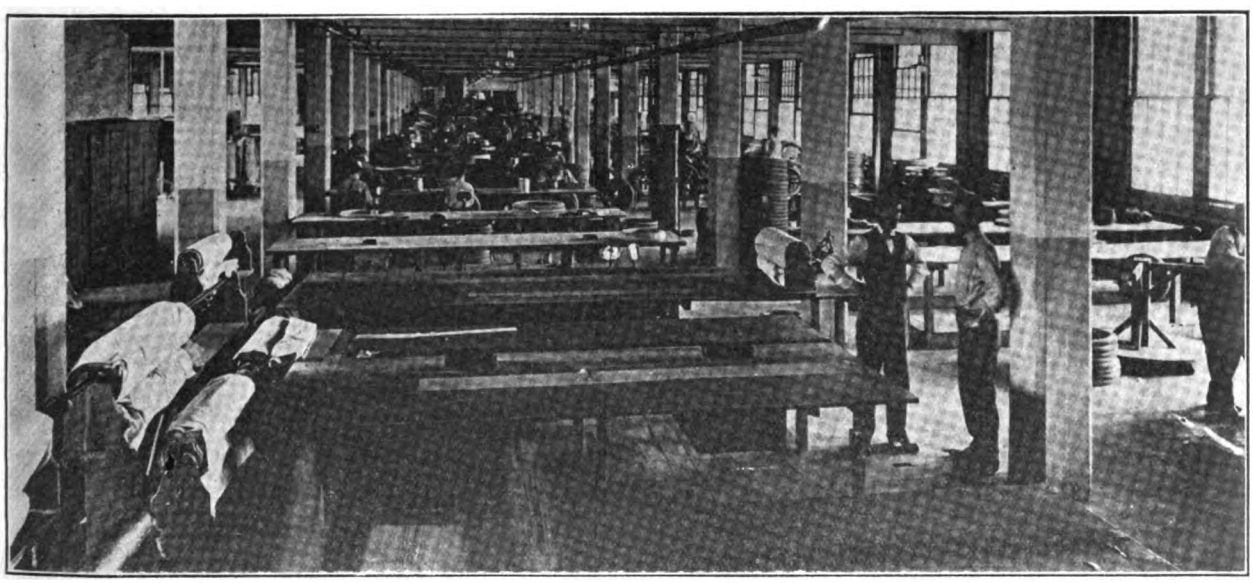
Elwood Haynes, president of the Haynes Automobile Company, Kokomo, Ind., maker of Haynes cars, recently completed an overland trip throughout the East, visiting New York, Boston, and several of the more important centres in that district.

The Hupp Motor Car Company, Detroit, maker of the Hupmobile, has increased its capital stock from $500,000 to $750,000. The additional $250,000 will cover expansion, equipment and facilities to care for the production of some 15,000 cars during the coming season.

C. S. Henshaw, for a number of years connected with the E. R. Thomas Motor Car Company, Buffalo, N. Y., as branch manager, and a pioneer salesman in the industry, has resigned as manager of the New York branch, to take effect in the near future.

George E. Daniels, vice president and general manager of the Oakland Motor Car Company, Pontiac, Mich., maker of Oakland cars, has announced a number of factory additions, which will add about 300,000 square feet of floor space.

The B. F. Goodrich Company, Akron, O., maker of Goodrich tires, is undergoing an era of factory expansion, because of the rapid increase of its output. A new building, six stories high, is nearing completion, and work already has begun on a six-story office building, which with a two-story addition to the present quarters, will furnish much desired room.



The Dahl Punctureless Tire Company of America has been organized in Minneapolis, Minn., to take over the business of the Dahl Punctureless Tire Company of Minnesota in the manufacture of automobile tires, etc. The home office will be located at 246-248 West 59th street, New York City, and Chicago will be made the distributing point for the Middle West.

John N. Stockfisch, formerly with the Havoline Oil Company, New York City, as division manager, has resigned to take a positon in like capacity with the Texas Oil Company of the same city, manufacturer of Texaco oils.

The Fisk Rubber Company, Chicopee Falls, Mass., maker of Fisk tires, recently entertained about 90 sales managers and salesmen connected with its 35 branch offices throughout the country, at the factory. Following the convention a clambake was held at Hampton ponds, Westfield, Mass., which was attended by some 150 representatives of the automobile trade.

The Goodyear Tire & Rubber Company, Akron, O., devotes a separate department in its factory to repair work, as may be indicated by the accompanying illustration. The department is in charge of competent workmen, all experts in the manufacture and care of Goodyear tires.

The Cole Motor Car Company, Indianapolis, Ind., manufacturer of the Cole cars, has appointed the following agents: Abberville Motor Car Company, Abberville, S. C.; Wolverine Auto Company, Bay City, Mich.; Model Auto Company, Clinton, Ia.; Johnson Motor Company, Duluth, Minn.; Potter Burgess Motor Company, Erie, Penn.; Fred H. McCullough, Fort Wayne, Ind.; Galesburg Machine Works, Galesburg, Ill.; John Christensen & Co., Galveston, Tex.; Cowdin & Woodland, Grand Rapids, Mich.; F. H. Graf Motor Car Company, Hamilton, O.; Thomas Motor Car Company, Lima, O.; Banta Bros., Low Point, Ill.; National Garage & Sales Company, Manistee, Mich.; Jerome P. Parker-Harris Company, Memphis, Tenn.; Myersdale-Overland Company, Myersdale, Penn.; J. C. Lewis Motor Company, Oakland, Cal.; H. W. Bowen, Pawtucket, R. I.; Ottawa Garage Company, Ottawa, Ill.; Neate & McCarthy, Portland, Ore.; B. & C. Auto Company, St. Johnsville, N. Y.; Guarantee Motor Car Company, San Antonio, Tex.; J. C. Lewis Motor Company, Savannah, Ga.; Bunnell Auto Sales Company, Toledo, O.; Prince Motor Car Company, Urbana, O.; B. C. Automobile Company, Ltd., Vancouver, B. C.; Burd Auto & Supply Company, Waterloo, Ia.

Interior of the Room in the Goodyear Tire & Rubber Company's Factory at Akron, O., Reserved for the Repair Department.

The R-C-H Corporation, Detroit, maker of the R-C-H cars, has closed 1913 contracts with the following dealers: Piedmont Motor Car Company, Charlotte, N. C.; Lincoln Garage & Repair Company, Kankakee, Ill.; Henley Oversole, Newman, Ill.; F. W. Koenig, LaSalle, Ill.; Thompson & Walther, Marshall, Ind.; Menomonie Auto Company, Menomonie, Wis.; Commercial Garage, Lebanon, Penn.; Leon Morris, Demopolis, Ala.; A. Y. Harvey, Meridian, Miss.; S. G. Brannon, Columbus, Ga.; George Grow Auto Company, Boston; Remington Motor Car Company, Remington, Va.; H. M. Vondersmith, Lancaster, Penn.; George F. Gulde, St. Cloud, Minn.; The Larimore Auto Company, Larimore, N. D.; Lewis Bros. & Johnson Mercantile Company, Rocky Ford, Col.; H. C. Shaw, Galeton, Penn.; A. E. Smith, Avondale, Col.; Montana Auto Service Company, Butte, Mont.; A. F. Anderson, Lynn Center, Ill.; P. F. Sondergroth, Mendota, Ill.; Standard Garage, Ottawa, Ill.; Indiana Auto & Supply Company, LaPorte, Ind.; James L. Robertson, Visalia, Cal.; Oslerberg & Colmark, Kensington, Minn.; Henry Cain, Monticello, Minn.; Claude O. Hallenbeck, Canandaigua, N. Y.; C. H. Beck, Webb City, Mo.; H. L. Triplett, Whittier, Cal.; M. F. Morris, Avondale, Penn.; W. E. Layman, Coshocton, O.; Timmons Auto Company, Longmont, Col.; Mogul Auto Company, Newburg, N. Y.; R. C. Jones, St. Louis, Mo.

GARAGE AND DEALER.

W. Downs and S. Fales, Boston, Mass., have opened a vulcanizing shop at Waltham, Mass., and are doing business under the firm name of the Waltham Vulcanizing Company.

Walter E. Blake has made necessary changes to the Palace stables at Ansonia, Conn., and has opened a garage for storage and repair purposes.

The Oldsmobile, made by the Olds Motor Works, Lansing, Mich., is now located in its new building, 626-630 Commonwealth avenue, Boston, with salesrooms, executive offices and service station. The building is four stories high, of reinforced concrete construction.

The Buick Boston Company will soon occupy its new salesroom, completed at Massachusetts avenue and Newbury street, Boston.

The Derry Auto & Carriage Company will remove from its present quarters on West 12th street, Los Angeles, Cal., to its new and larger home on South Los Angeles street.

Peter Albers and Henry Hagedorn have rented the Manitou livery, in which to locate a garage at Luverne, Minn. The firm will be known as Albers & Hagedorn and will deal in automobile supplies and accessories, besides having the agency for the Overland cars, made by the Willys-Overland Company, Toledo, O.

Frederick Worsley has opened a garage at Perry, Kan., fitted with a complete line of automobile supplies and accessories.

The Pioneer Automobile Company has opened a branch in the new building recently erected on 24th street and Broadway, San Francisco, for the sales and service departments of its business.

The Howard Automobile Company, San Francisco, has taken the three floors and basement of a warehouse on Sutter street for a repair shop.

The Overland Automobile Company, Rockford, Ill., has been incorporated for the exclusive sale of the Overland cars, made by the Willys-Overland Company, Toledo, O. A distributing branch sales department has been opened.

The Stanley Auto Company and Frank Stanley, New Castle, Ind., individually, have made a 10-year lease of the building on Broad street, from which Edward Peed recently sold out his livery stock. The company plans to conduct an increased business in its new home.

Fred Durnwald has assumed charge of the Palace garage, which he recently purchased at Freemont, O.

The Sweeney Automobile Company was recently incorporated in New Jersey. The concern will have its principal office at 208 North Broad street, Philadelphia.

The Wallace Automobile Company was recently incorporated at Wilmington, Del., and will have its principal offices at 206-210 North 21st street, Philadelphia.

John W. Hubbard has retired from the City garage, Port Chester, N. Y., and Clifford Flint has purchased his interests. Arthur B. Lowden remains in the firm as partner and with Mr. Flint hopes to carry on an excellent business.

The Knipper Kipp Company, which recently purchased the Kondolf garage at Monroe bridge, Rochester, N. Y., has moved into new quarters and is now ready for business.

Frank Brown, Chickasha, Okla., has purchased of A. L. Eagles, the garage on South Union avenue, Los Angeles, Cal. The purchase price is said to have been $25,000.

Fred H. McCulloch of the Minuet electric garage, Fort Wayne, Ind., has taken the agency in that city for the Cole Motor Company, Indianapolis, Ind., maker of the Cole car.

Charles Noel of the firm of Noel Bros., Goshen, Ind., has sold his interests therein to James Waltz, who will soon open a new garage to be conducted under the same firm name as the old establishment.

The East End Auto Company, Grand Rapids, Mich., has received a permit to erect a one-story addition to its garage in that city.

John J. Sullivan & Co., Cincinnati, O., has let the contract for a concrete and brick public garage on Michigan avenue. The garage will represent an investment of about $7000.

Edward Junck of Dallas, Tex., has rented the Cravens building at Fort Smith, Ark., and he will soon open a garage, repair and machine shop.

The Potomac Motor Car Company has taken quarters on H street, Washington, D. C., until the completion of its new salesroom and service department on Connecticut avenue.

W. B. Herbst, one of the pioneer automobile dealers of Indianapolis, Ind., has found it necessary, because of increasing business, to secure more commodious quarters on West Michigan street.

William G. Faatz has taken possession of the building known as Brown's garage, Binghamton, N. Y., and is conducting the automobile business formerly operated by Howard Brown.

H. F. Sundin, formerly with the National Motor Vehicle Company, Indianapolis, Ind., has opened an agency and service station for the National at Kansas City, Mo.

Samuel H. Rosenthal has purchased of Harvey T. Weeks, a two-story garage on Wabash avenue, Chicago, for $60,000, giving to the Chicago Title & Trust Company a trust deed to secure $25,000 for six months.

The Rainier & Lineberger Company, general eastern distributor of the Garford Company, Elyria, O., maker of Garford trucks and pleasure vehicles, has taken a lease of the Thomas building on Boylston street, Boston. P. C. Chrysler, a motor truck man of wide experience, will be in charge. His son, G. R. Chrysler, will direct the pleasure car end of the business.

The South Brooklyn Auto Livery & Sales Company, Brooklyn, N. Y., has just opened its large garage, which has 25,000 square feet of floor space. The establishment is not only for storage purposes for commercial and pleasure cars, but for repairs, painting, upholstering and supplies, with a rental department of taxicabs, touring cars and limousines. The company is agent for the R-C-H cars, made by the R-C-H Corporation, Detroit.

William R. Baker, Milford, Mass., has leased the salesroom formerly occupied by Leroy Leighton and will act as distributor for Oakland cars, made by the Oakland Motor Car Company, Pontiac, Mich., for Worcester county, Mass.

L. B. Clark has opened a first class repair shop at Hartford, Conn., and expects later to establish a garage in connection with it.

The Essenkay Company, Chicago, has purchased the City garage, Hagerstown, Md., of W. Kieffer Hull. J. B. Neville is manager and R. L. Mowen has charge of the mechanical department.

Charles Jacobson and Thomas B. Finlay, inventors and machinists, Hartford, Conn., have leased a large building on Main street, that city, and have opened an automobile repair shop. Their equipment includes all the latest appliances, making their establishment one of the best in the city.

The Poertner Automobile Company, New York, has opened fine new quarters at 1384 Bedford avenue, Brooklyn The concern is the eastern representative of the National and Herreshoff cars.

The Stafford Illuminated Auto Lamp & Number Company, Dallas, Tex., has filed an amendment increasing its capital stock from $25,000 to $50,000.

J. F. Wallace of Chicago has secured plans for a one-story brick garage to cost $17,000. The building will be located on South State street, Chicago.

The Motor Car & Supply Company, recently organized at Savannah, Ga., will do a general repair business and will carry a full line of automobile supplies.

Kirk's Garage has opened for business on Crown street, New Haven, Conn. The establishment has a capacity of 250 cars and is fitted with the latest improvements and conveniences.

J. A. Bagwell and Cline Bagwell, formerly located at Macon, Ga., have transferred their business to Savannah, Ga., where they have secured headquarters with Broughton & Lamb, garage owners. They have the agency for the Overland and Little Four cars.

The Warren Motor Car Company, Detroit, maker of the Warren pleasure cars, has made the Warren agency house at San Francisco a distribution point of parts of the Warren machines, to the entire Pacific Coast trade. The agency, in charge of Edward Knauss, will have the handling of an immense stock of Warren parts, giving it the same advantages to take care of its owners as a branch house.

John S. Waterland and Charles Andrews, Chico, Cal., are erecting a large automobile garage in that city, to cost $10,000. The structure is to be in the mission style of architecture and will be one of the most modern automobile establishments north of Sacramento.

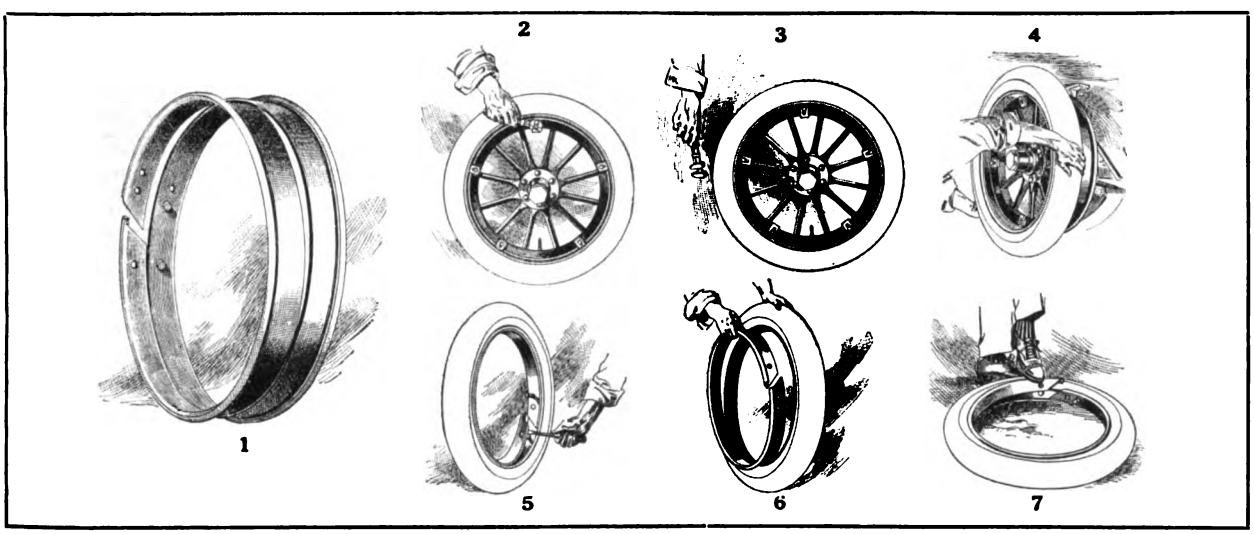
FEATURES OF NEW J-M DEMOUNTABLE RIM.

SIMPLICITY and ease of operation are among the qualities of the new demountable rim which has been brought out by the H. W. Johns-Manville Company, New York City. It is styled the J-M demountable rim, and as the accompanying illustrations show, comprises two main parts or band members, each of which carries one of the raised beads which hold the tire in place. As will be noted at Fig. 1 one rim is a continuous ring while the other is split diagonally and slips inside the solid member, where it is retained by dowels projecting from the under side of the main ring and engaging with depressions formed in the split ring.



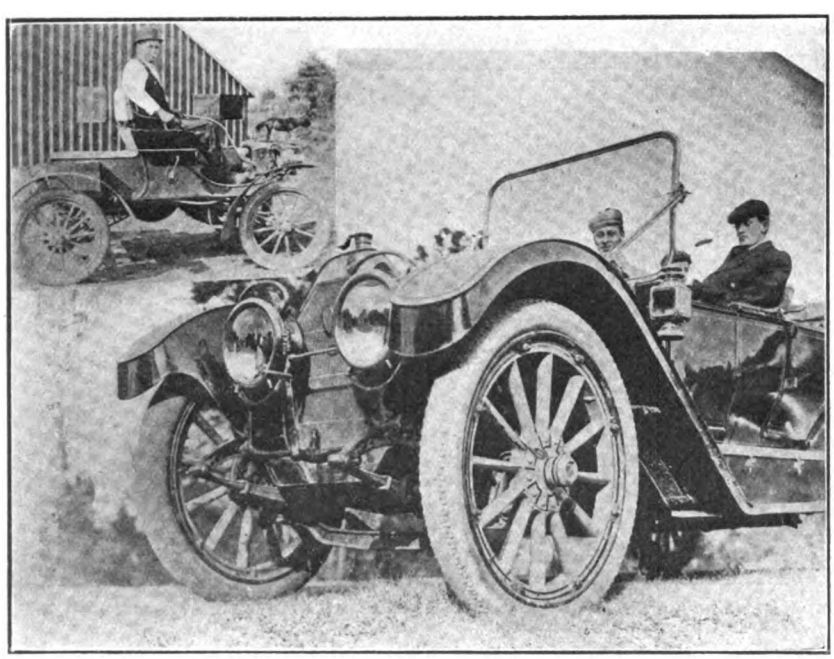
The construction is best explained by the operation of removing and replacing a rim, also the tire. After jacking up wheel, the top one of five simple but efficient clamps is loosened one full turn when the clamp will automatically drop down out of contact with the rim. The nut is then turned to retain the clamp, an operation performed easily with the fingers. The remaining clamps are similarly treated. The rim and tire are then removed as shown at Fig. 4. To remove the casing from the rim is a simple matter. A screw driver or J-M combination tool may be employed, and the end of either of these is inserted in the slot on the under surface of the demounted rim and pried out slightly, just enough to disengage the dowel pin and slip the two rim members apart as indicated at Figs. 5 and 6.

As the continuous ring has a perfectly smooth, flat surface, it is an easy matter to remove the shoe or the inner tube. After replacing the casing, which may be done easily, and without danger of pinching the inner tube, and before inflating the tube, the two rim members are assembled. This is accomplished by laying the main rim member with shoe flat upon the ground. After setting the tongue member into the groove of the other, the dowels are matched up with the dowel holes. The split rim is then pressed down with the foot as shown at Fig. 7, and the dowels and tongue snap into place when the rim is ready for mounting upon the wheel.

In replacing the rim and shoe the process is reversed. The lowest clamp nut is loosened enough to allow it to drop down over the rim and then tightened slightly. The wheel is rotated until the next clamp is at the bottom, when the operation of loosening and tightening is repeated, and so on until all five members have been secured. The nuts are then tightened with the offset wrench provided for that purpose, although an ordinary member may be utilized. The operation draws the rim into position and locks it securely.

As the two rings overlap for their entire width, water, dust or foreign elements cannot enter the shoe or inner tube and the tongue and groove form a block against the passage of dirt.

The J-M rim can be employed with any standard make of clincher tire, both quick detachable and regular. All parts are interchangeable and are Sherardized so that they are rust proof.



Illustrating the J-M Demountable Rim, Its Components and Method of Removing and Replacing Tires—The Design Is Noticeable for Simplicity and Few Parts.

EVOLUTION OF THE OLDSMOBILE.

An accompanying illustration shows the evolution of the Oldsmobile, made by the Olds Motor Works, Lansing, Mich., and indicates that in America it is possible to find cars which have been doing good work for a series of years and are still able to give satisfactory service. The insert presents the first car purchased by Willis A. Evans of Ewan, Wash., this summer, concerning which he writes:

"My Oldsmobile was first sold to a doctor near Colfax, Wash., about 10 years ago and it was used and run all over this section by him until I bought it this summer, at which time he purchased the big Oldsmobile Limited (shown in the larger view). I had never driven a car in my life until the doctor took me out about three miles from Colfax and showed me how to handle it, and I came on home with it to Ewan, a distance of 28 miles. The two pictures show the evolution of the Oldsmobile. The doctor thinks his car is great, but I've no fault to find with mine."

Upper View, Oldsmobile of 10 Years Ago, Recently Purchased by Willis A. Evans, Colfax, Wash.; Lower View, Oldsmobile Limited Which Replaced It with Original Owner.

WOLVERINE CLUB'S NEW HOME.

The cornerstone of the new $500,000 club house of the Wolverine Automobile Club, Detroit, will be laid late in December, according to information given by a prominent official of the club. It is stated that but $25,000 is now needed to finance the proposition. It is believed the moment actual building starts the membership limit of 1500 will be reached.

LATEST BUFFALO ELECTRIC.

Miss Virginia E. Aiken of Boston, who has been handling the Babcock electric in that city for the past year and who is believed to be one of the most successful women agents in the country, has returned from Buffalo, N. Y., where she has been inspecting the new models of the Buffalo electric, the product of the Buffalo Electric Vehicle Company, which is the successor of the old Babcock Electric Carriage Company. The primary object of her visit was to select the models which she will exhibit at the 1912 electric show in Mechanics' building, Boston, Sept. 28-Oct. 26.

Miss Aiken says that the general public never has had the opportunity of owning and driving such beautiful and correctly designed electric automobiles as those which she will display at this exhibit. They have long wheelbase, large wheels, roomy bodies, exquisite appointments and equipment, and what is more, speed, distance and great hill climbing ability.

Her exhibit will consist of two sizes of coupes, one wheel steer and the other lever steer, both of the direct shaft design, upholstered in delicate shades which will harmonize with the costume. For the men there will be a long distance roadster, which has covered 150 miles on one charge of the battery and at a speed of 20 miles an hour. In addition to the cars on the main floor there will be a direct shaft driven coupe in the model electric garage, as well as Miss Aiken's own roadster, for demonstration purposes.

While Miss Aiken will retain an interest in the Buffalo electric, it is her intention, after the electric show, to devote the most of her time to studies and music, believing that the proportions to which she has brought the business warrant placing it in the hands of a large automobile sales establishment. Full details of this move will be announced later.

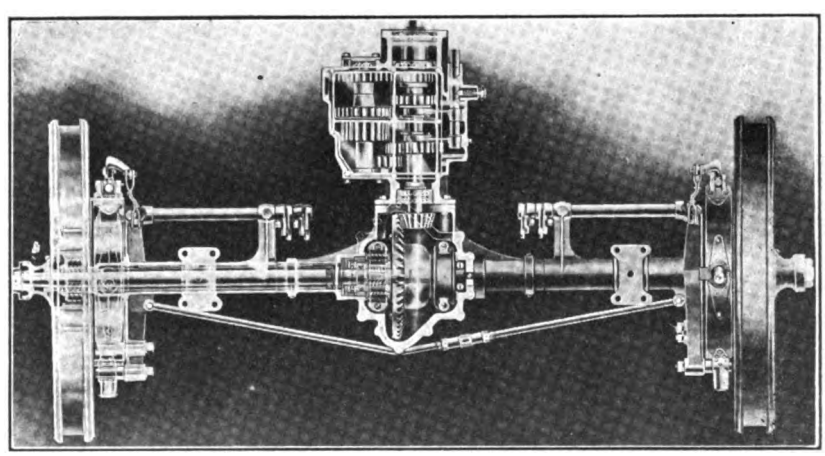
NEW TYPE OF OVERLAND AXLE.

In keeping with its policy of improving its models and adding such refinements as are made possible by modern machinery and production in large quantities, the Willys-Overland Company, Toledo, O., is equipping its model 69 car with a new design of rear axle of the three-quarter floating type.

Its difference from that of the semi-floating is best explained by a brief description of the latter, the two axle shafts of which carry half the car load and the housing the other half. In addition to sustaining this weight the axles also impart energy to the road wheels.



In the Overland three-quarter floating type the load is carried on the axle housing, which is reinforced by an inner steel tube, riveted and keyed to the housing proper. The rear wheel roller bearings rotate on the hardened seamless steel tube which projects from the axle housing on either side. As a consequence the differential and wheel bearings do not come in contact with the axle drive shafts. The latter are of special heat treated chrome nickel steel and simply turn the rear wheels.

The differential bearings are subject only to their own stresses and the Hyatt roller bearings of the rear wheels sustain the rear load of the machine. These bearings are in the vertical plane of the spokes and receiving the load straight from above, require no adjustment. Side thrust is cared for by an adjustable ball thrust bearing on either side of the differential.

The difference between the full floating rear axle employed on the Overland model 71 and the new design on the model 69 is that in the former the rear wheel is secured to the axle housing, while in the three-quarter floating type the wheel is fastened to the axle shaft. In the matter of caring for the load, the designs are similar. Leakage of lubricant is prevented by using heavy and well designed felt washers, pressed against the axle tube by a spiral spring.

The brakes are of new design and very large, the diameter of the drums being 13.375 inches, width 2.875, and a brake band 2.25 inches wide. Gradual but powerful application is assured and two methods of adjustment are provided, one at a sector and the other by the band levers.

All components of the axle are reached and adjusted easily. The transmission and rear axle are a unit, as will be noted by the accompanying illustration, which gives in detail the components. A feature upon which the company lays stress is that the main shaft is not open, but operates in an encased steel torsion tube which serves a double purpose by taking up twisting stresses as well as maintaining perfect alignment at all times.

Illustrating the Construction of the Three-Quarter Floating Axle Employed with Model 69 Overland Cars.

ST. LOUIS DEALERS' SHOW.

The sixth annual automobile show at Forest Park Highlands, St. Louis, to open Monday night, Oct. 7, will have many innovations this year, chief among which will be a bail on the dance floor for exhibitors and their friends. St. Louis has 6562 licensed cars, and 83 dealers handle 90 makes of automobiles for pleasure purposes propelled by gasoline and eight by electricity. They also represent 36 different makes of trucks and light delivery wagons. In addition there are two manufacturers of fire apparatus and three of pleasure cars. At least 95 per cent. of these makes will be exhibited. H. B. Krenning of the Dorris Motor Car Company is chairman of the show committee, the other members being: W. C. Anderson, Ford Motor Company; Samuel Breadon, Western Automobile Company; Frank R. Tate, United Motor St. Louis Company; John H. Phillips, Hudson-Phillips Automobile Company, and T. L. Hausman, Overland Automobile Company. Robert E. Lee is show manager, and as he has acted in a similar capacity in connection with several other displays, the success of the venture seems to be assured in every way.

NEWTONE

The Mile Away Electric
MOTOR HORN

Torpedo Type

PRICE

$20.00

Including Button and Cable

Patented Sept. 5, 1911

The Most Perfect Warning Device on the Market

The increased demand for the Newtone Motor Horn is due to its absolute efficiency in warning and economy in operation.

The motor with Hess-Bright Ball Bearings and imported Self-lubricating brushes, eliminate all oiling and cleaning.

The chief engineers of three leading American automobile manufacturers, after a "Break-Down" test, state that, in their opinion, the Newtone Horn is the BEST warning signal made.

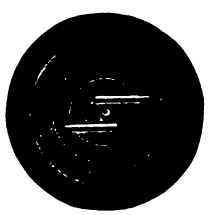
A NEW VALUE

TO THE PURCHASING POWER OF FIFTY CENTS—A

"BLACK EAGLE" SPARK PLUG.

EFFICIENCY AND QUALITY WITHOUT EXTRAVAGANCE.



From all viewpoints the "**BLACK EAGLE**" Spark Plug represents the greatest advance in spark plug design and construction in recent years, and has given a new value to the purchasing power of fifty cents.

The base of the "**BLACK EAGLE**" Spark Plug provides double electrodes so positioned that they present a round surface to the action of the spark, absolutely eliminating pitting of the electrodes which indefinitely prolongs their life, and produces a uniform spark at all times.

When you have discovered that the price you pay for a spark plug has little to do with its service value, you will save 100% to 400% on this item of expense. Try a genuine

"BLACK EAGLE"

The 50c Spark Plug Without an Apology. **TRY THEM NOW.**

Don't wait until you are 10 miles from a Garage and find you need them.

Most jobbers and dealers sell "**BLACK EAGLE**" Spark Plugs. All can secure them; if you are unable to have your wants supplied we will forward them free of transportation expense upon receipt of price.

"INVADER" GEAR OIL

"Puts Noisy Gears to Sleep"

INVADER GEAR OIL is a heavy, dark fluid lubricant, designed for the lubrication of sliding gear transmissions and differential gears. It can also be used for front gears where a heavy lubricant is required, if the case is tight and separate from the crank case.

This oil possesses peculiar properties which make it invaluable as a lubricant for gears. It contains no foreign matters, such as ground cork, sawdust, etc., but is 100% oil. It is stronger and more serviceable than any other lubricant made. Being free from water and chemicals, it will not foam in the gear case when running or allow the bearings to rust when idle.

Invader Gear Oil being a fluid lubricant it is only necessary to fill the case sufficiently to allow the gears to dip. It is not necessary to pack the case full, as is customary when grease is used. It faces the gears with a coating which is practically indestructible, thereby preventing wear and reducing *noise* and friction to a minimum. A trial will convince the most skeptical that "**Invader**" Gear Oil is the only practical and economical gear lubricant.

Sold in 10 lb. square cans, lithographed; 25 and 50 lb. wooden jacketed cans, special top; barrels and half-barrels

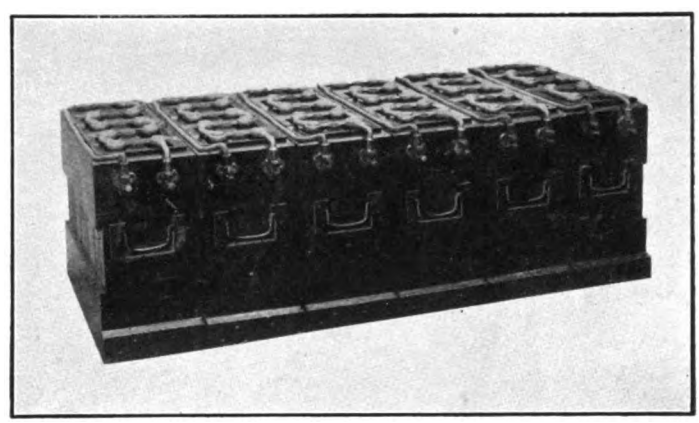
This Is The Car

That made the wonderful Path Finding trip for the 1912 Glidden, or National Reliability Tour

1721.7 MILES



FROM DETROIT TO NEW ORLEANS

arriving at latter city on exact schedule time.

This Is The

LBA

Willard
Electric Vehicle Battery

that contributed to the success of this wonderful performance, an achievement never before attempted or considered within the range of possibility for an electric.

It was, by no means, a boulevard trip. Over roads of every description, in drenching storms, through mud and mire, up hill and down, successfully overcoming difficulties calculated to daunt the most powerful gasoline car—the LBA battery propelled the Flanders Path Finder and demonstrated the thorough reliability of the Electric under every condition of service.

Great credit is due to the manufacturers, whose faith in their car was proven well founded, but the supreme confidence which prompted them to embark upon this stupendous undertaking was inspired by their intimate knowledge of the absolute dependability of LBA batteries.

A Plan to Prevent Wear in the Places Where Friction Stress is Greatest

USE "K-OOO" NON-FLUID OIL for Axles, Steering Knuckles, Differential, Fan (grease cup) Universal joints and all grease cups.

USE "A-5" Pump Lubricant for Circulating Pump.

USE "K-00 SPECIAL" NON-FLUID OIL for Transmissions and Differentials (designed for oil).

USE "K-FORTY" NON-FLUID OIL for Timing Gears.

LET THIS CHART BE YOUR GUIDE. Always use these grades of NON-FLUID OIL and you will escape the penalties of friction.

One hundred thousand miles of service will leave no mark of destruction upon the bearings and gears of your car if you consistently and insistently lubricate with **NON-FLUID OIL.**

Only when the bearings are dry or when the lubricant you use fails to do its work does friction damage metal. Once let abrasion start and the rate of wear increases. Keep every bearing generously supplied with **NON-FLUID OIL** and wear is next to impossible.

Thousands of miles of driving will not remove the original tool marks on gears lubricated with **NON-FLUID OIL.**

Not only does NON-FLUID OIL prevent wear by separating opposed bearing surfaces, but it reduces friction to such an extent that practically all the power of your engine is delivered to the driving wheels. No other lubricant is so absolutely wasteless. Every particle you apply is utilized for lubrication. Grease smeared gear cases, wheels and rear axles tell the story of waste when other lubricants are used. Ask your dealer for NON-FLUID OIL.

Be sure you get the genuine bearing this trade mark.

Choose Hoffecker Speedometers As Country's Best

After a thorough and exhaustive examination of all the speedometers made in America, the builders of the LENOX cars, made in Boston, emphatically endorse the

HOFFECKER

as being the finest instrument of its kind produced and have adopted them as part of their equipment for the coming year.

Wide-awake manufacturers are rapidly learning that printer's ink does not in itself mean good instruments—a speedometer must stand up under any and all conditions. The HOFFECKER has proven itself---Mr. Owner when buying your new car, specify

To win the fiercest war even known to motordom, the MICHIGAN "40" enters the field with every big selling feature---electric lights, four forward speeds, extra size tires, complete equipment---at a price no other maker will meet---

$1,585

The Fight of the Forties

There are 72 makers in a fight for supremacy, with cars around 40 horsepower.

Most of the ablest engineers now give their whole thought to "40's." And some of the finest, most luxurious cars ever built are now in this class.

Yet the prices on Forties, since this war began, have practically been cut in two.

Into this fight comes the Michigan after four years' preparation.

And the offer we make outbids every rival, and every man who knows will concede it.

300 New Features

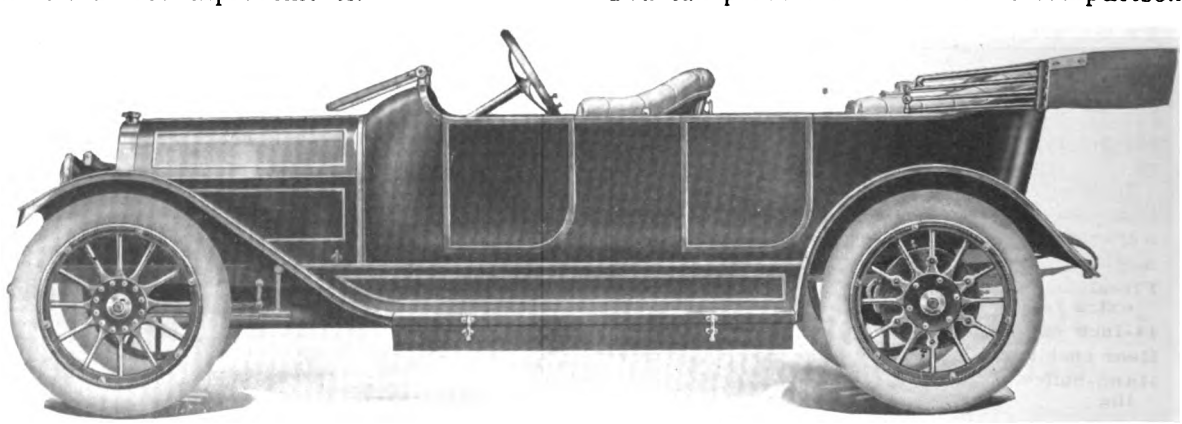
We have built 5,000 cars and have carefully watched their performance.

We have worked out in the past four years more than 300 improvements.

We have brought to bear on this car some of the best brains in the industry.

Every engineering advancement has been noted and adopted. All the comforts and luxuries have been sought out and included.

Now, in this day of luxurious Forties, we believe that the Michigan outrivals them all.



A Wonderful Price

The Michigan factory now has enormous capacity. Every detail of the car is built by modern machinery.

Through wondrous efficiency the cost of this car has been cut 30 per cent. in four years.

Part of this saving has gone into extras. Part has been taken from the price. Now we offer this car with complete equipment at $1,585. And no other maker will meet it.

With this car at this price, the Michigan is bound to take first place among Forties. You can prove that in an hour's comparison.

Michigan "40"

Cameron's Greatest Car

To W. H. Cameron, our designer-in-chief, is due the main credit for the Michigan "40." Cameron has built 100,000 successful cars, and all he has learned makes possible this wonderful machine.

To John A. Campbell this car owes its matchless body, its graceful lines, its finish, its upholstering. Campbell has designed equipages for kings, but this is his greatest achievement.

To an army of experts, selected by Cameron, we owe the strength, the simplicity, the over-capacity of every important part.

These men have combined to produce a wonderful car. And you'll find no car that excels it.

Remember these men when some maker tells you that his higher price buys something better. This is Cameron's best, and Campbell's best. No designers have ever excelled them.

Get All You Can

It is up to you this year, if you are buying a "40," to get all that you can, and pay the least that you need to.

Make careful comparisons. Watch the points that count.

Require big tires—as wide as the Michigan's—for that is the secret of small upkeep. Get four forward speeds, for the world's best cars now have them.

Get electric lights with dynamo. To add them afterward would cost $125.

Get a roomy car. Compare width of seats, size of tonneau, length of wheel base. Get a comfortable car. Note that Michigan cushions are 14 inches deep. Michigan springs are wide and long.

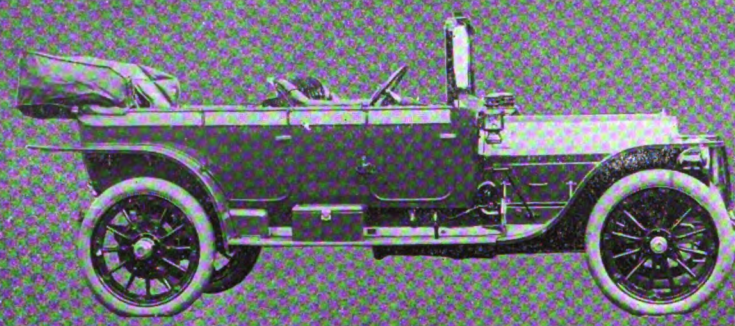
Compare the brakes, the axles, and every vital part. Here you should have big margins of safety—ample for 60 horsepower.

Compare all these things which mean care and cost, and you'll find no car in the Michigan class that comes anywhere near the Michigan price.

Send for our catalog, giving all the details, and showing the various bodies. Then we'll tell you where to see the car.

MICHIGAN MOTOR CAR COMPANY, Kalamazoo, Michigan

Owned by the owners of the Michigan Buggy Company



Some of the Michigan Features

- Four-forward-speed transmission
- Oversize tires—35x4½ inches
- Electric lights and dynamo
- Center control—left-side drive
- Motor, 4¼x5¼
- Extra effective brakes—16x2¼ inches
- Big, comfortable springs
- Adjustable steering post
- Adjustable pedals
- Firestone demountable rims—extra rim
- 14-inch cushions
- Rear cushion 50 inches long
- Hand-buffed leather upholstering
- Best curled-hair filling
- Wheel base 118 inches
- Nickel mountings
- Large over-capacity, giving big factors of safety
- Pressed steel, full floating rear axle
- Axles sufficient for an 80-horsepower car
- Genuine cellular-type radiator
- Best mohair top, side curtains and envelope
- Windshield built in as part of body
- Electric horn
- $50 speedometer, 4-inch dial
- Special foot rail
- Swing robe rail
- Rear tire irons
- Complete tool equipment
- Tool chests under running boards

There is such a difference of opinion about the various types of self-starters that we have not adopted any one type as regular equipment. We prefer to leave this selection to the buyer. We equip with either the gas or a positively efficient electric starter at a moderate extra price.

REXO

A high grade electric horn operating on any 6 volt battery, taking only 1.8 amperes, built for hard service and plenty of it, instantly and always responding to pressure on the button, sold at a price within the reach of every car owner--**this is the Rexo.**

$8

No person who has really driven a car questions the superiority of the electric horn and when a Rexo can be purchased for $8.00 a horn of any other type is expensive at any price.

Automobile manufacturers have put their O. K. on the electric horn for 1913 models. We sold fifty thousand Rexo horns during August. We met all competitors and sold the Rexo on Dean quality and actual performance of the horn in tests for efficiency, reliability and all round service in the hands of the man who drives the car.

The REXO is made by the people who also make the Tuto and Tutoette horns. It employs the same electrical principle as the Tuto and Tutoette but is different in that it has but one tone. The Dean standard of quality is fully maintained in the REXO and every horn is sold under the Dean liberal long time guarantee.

THE DEAN ELECTRIC COMPANY

366 Taylor Ave. **ELYRIA, OHIO**

MERCER

"As to the Mercer, it can be said that considering its size it made the most wonderful showing ever displayed in a Vanderbilt Cup Race."—*The Automobile*, Oct. 3, 1912.

A 301 cubic inch Mercer car finished second in Vanderbilt Cup Race—229.5 miles—at Milwaukee, Wis., October 2, 1912, only 40 seconds behind winning Mercedes—a 600 cubic inch speed creation, conceded to be Europe's best.

An average speed of 69 miles an hour was maintained, over one of the roughest courses ever used for racing. The quotation from ***The Automobile*** is but one of the many tributes to the remarkable power, speed and consistency shown by the Mercer.

OTHER IMPORTANT 1912 MERCER WINNINGS INCLUDE

May 4—First in 151.5 mile Jepsen Trophy Race, Santa Monica, Cal.

May 30—Third in 500 mile International Sweepstakes, Indianapolis, Ind. Average speed, 76.3 miles per hour.

July 5—First in 150 mile medium car race, at Tacoma, Wash.

August 25—Won 200 mile track race, Columbus, O. Broke all mile track records from 75 to 200 miles.

August 30—First and second in 152 mile Aurora Trophy Contest at Elgin, Ill.

Warner AUTO-METER

WHEN the matter of Speedometer equipment came up for 1913, the leading automobile manufacturers instructed their engineers to pick the BEST speed and mileage indicator made.

They chose the Warner Auto-Meter. The makers thereupon selected this instrument *despite its highest price.*

This designates the Warner Auto-Meter the OFFICIAL and standard instrument of the motor car world. It has always graced the high priced cars. It is now "regular equipment" on all leading cars. This is official recognition by the entire automobile industry.

This coming season more than 100,000 new cars will be equipped with Warner Auto-Meters. All 1912 contracts have been renewed. It is an unparalleled recognition of merit.

You can rest satisfied if your car bears a Warner. Only cars of known quality pick the HIGH PRICED Warner.

Priced from $50 to $145. For sale at our own branches and leading dealers the world over.

Handsome catalogue on request.

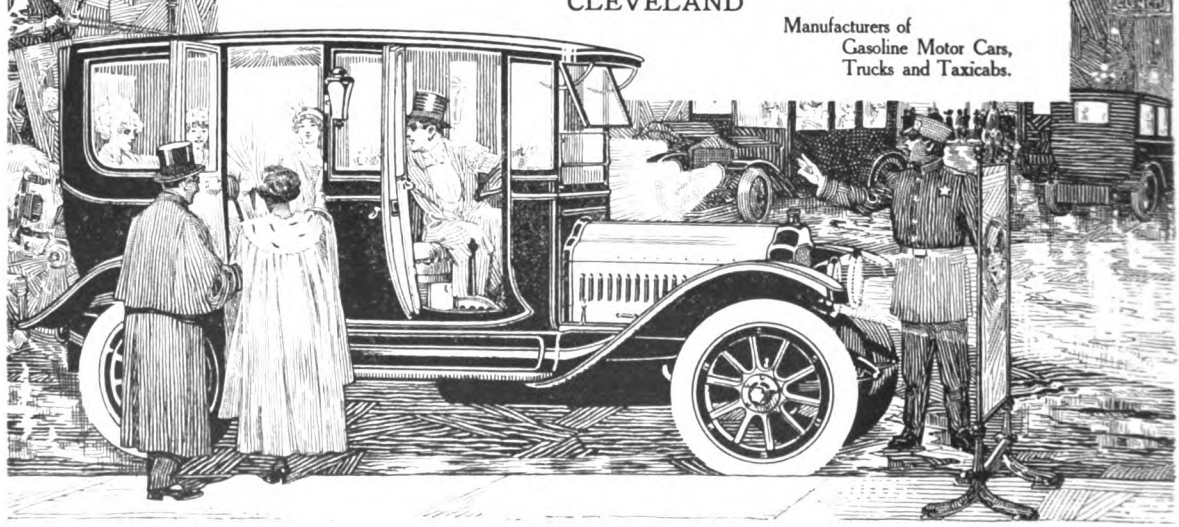
The White Berline Limousine

The Latest Production of the Most Progressive Motor Car Company of America



THE White Berline marks the highest development of the modern motor car, both in beauty of body design, and merit of chassis construction. Every small detail which adds to comfort, convenience, and safety of operation has been carefully and successfully executed.

The logical combination of left-side drive with right-hand control, places the driver in the proper position to handle the car with the greatest amount of safety in traffic, a very important factor in closed cars. The left-side position of the steering wheel, together with the White Electrical Starting and Lighting System, makes it possible to reach the driving seat, start, and light the car without the necessity of stepping into the street. When the services of the chauffeur are not required, the glass partition back of the driving seat can be instantly dropped out of sight, throwing the entire interior into one compartment.

White Berline Limousines are built in Forty and Sixty horse-power models.

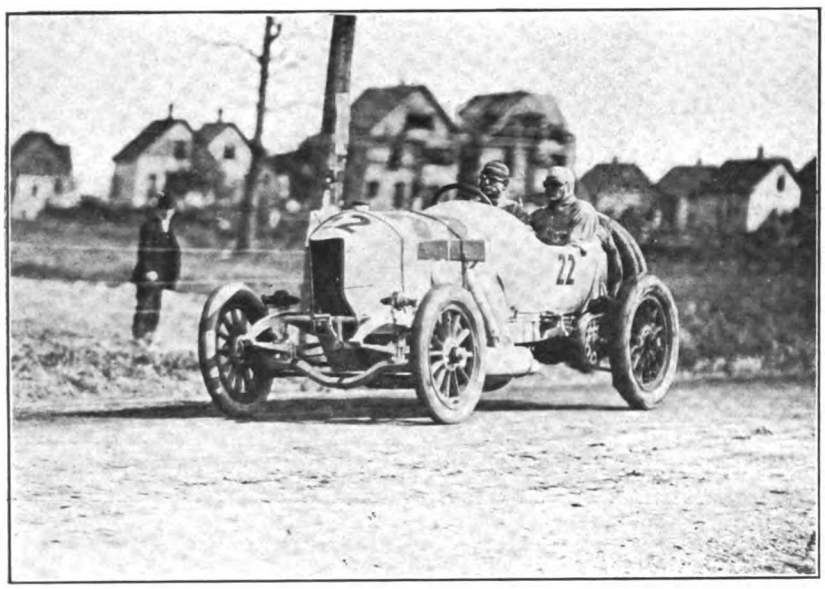
THE AUTOMOBILE JOURNAL

VOL. XXXIV, No. 5 OCTOBER 10, 1912 Price, $1.00 the Year

BRAGG TAKES GRAND PRIZE WITH FIAT.

De Palma and Mercedes Victorious for Vanderbilt Cup---Mortimer Roberts and Harry Endicott Successful in Mason Cars in Pabst and Wisconsin Trophy Events---Splendid Performance by Stutz and Mercer.

AFTER winning the eighth race for the Vanderbilt cup and maintaining a consistent pace in the fourth contest for the Grand Prize, Ralph De Palma in his big Mercedes car experienced the same ill luck which lost him the 500-mile race on the Indianapolis motor speedway, Memorial Day. The accident occurred on the last lap of the 409.8 - mile contest at Milwaukee, Oct. 5, just as De Palma and Caleb Bragg, the latter in a Fiat, were turning into the final stretch of the course.



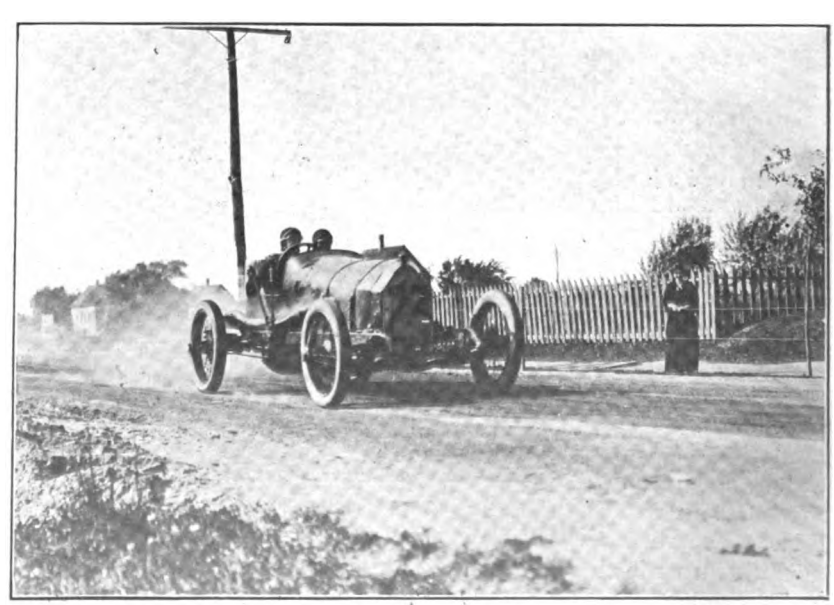
Caleb Bragg in Fiat 41, Winner of the Fourth Race for the Grand Prize, Rounding One of the Curves on the Milwaukee Course.

Bragg was leading and De Palma was making one last effort to overtake him. In some manner the Mercedes struck the rear of the Fiat. De Palma and his mechanician, Thomas Alley, were thrown clear of the track with the wrecked machine. Bragg's Fiat swerved a trifle and crossed the line a winner. His time was 5:59:27 and his average speed 68.4 miles an hour. Erwin Bergdoll in the Fairmount Park Benz was second in 6:14:51.28, while Gilbert Anderson in a Stutz took third place in 6:15:22.47. Barney Oldfield's Fiat was the only other machine to finish before the race was called, although two others were still running.

The Vanderbilt Cup event was held over the same course, Oct. 2, the winner being Ralph De Palma in a Mercedes. His time was 4:20:31.64

Digitized by Google

Ralph De Palma and Mercedes 22 with Which He Took the Eighth Vanderbilt Cup Race.



and his average speed for the 298.5 miles, 68.82 miles an hour. Second place was taken by Hugh Hughes in a Mercer, his time being 4:21:14.29. Spencer E. Wishart in a Mercedes was third, with time of 4:36:35.75. Gilbert Anderson in a Stutz was fourth and George Clarke in a Mercedes fifth. One other machine was running when the race was called, but it was too far behind to be considered in the final score.

Oct. 3, two smaller car events were decided simultaneously. One was for the Wisconsin challenge trophy, covering a distance of 173.4 miles. Only three cars competed, all Masons. Harry Endicott was first in 3:06:44.79 and George Mason second in 3:42:50.35. Endicott's average speed was 55.75 miles an hour.

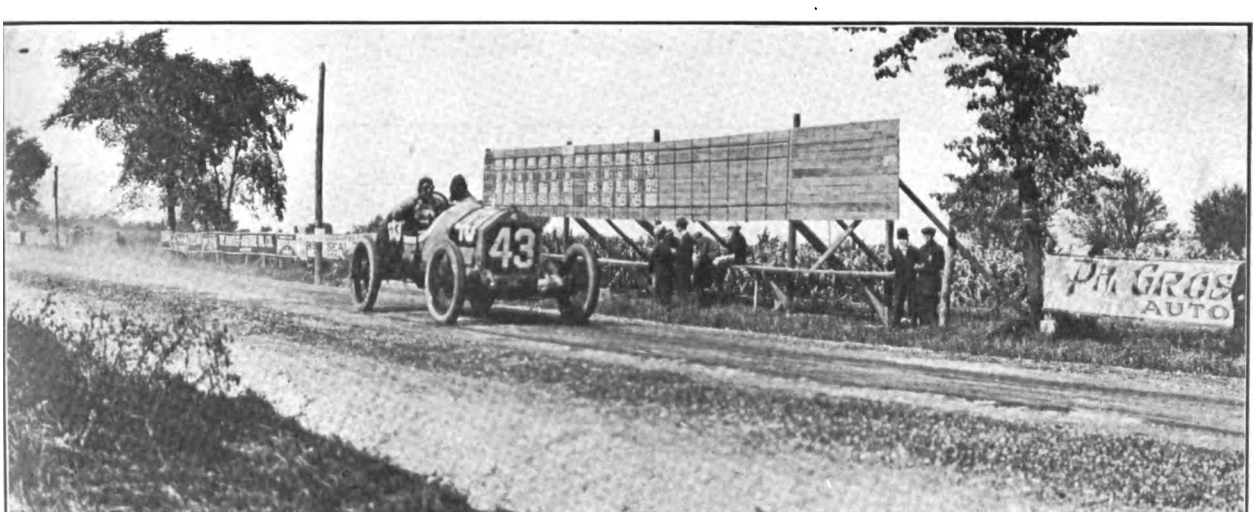
The fourth race of the series was for the Pabst Blue Ribbon trophy, the distance being 220.6 miles. Mortimer Roberts in a Mason finished in first place in 3:25:08.71, his average speed being 64.54 miles an hour. H. L. Hastings in a Fal-Car was second in 4:15:05. William Chandler in a second Fal-Car was still running when the race was called, and was awarded third position.

The running of the eighth race for the Vanderbilt cup is of particular interest because of the showing made by Hugh Hughes in his Mercer, one of the smallest cars in the contest. Compared with the two Mercedes machines, which finished in first and third places, the Mercer had piston displacement about half that of the foreign cars. That De Palma should be able to win by only 0:42.75, is something which must forever redound to the credit of the product of the Mercer Automobile Company, Trenton, N. J. A glance at the accompanying score sheet shows how consistently Hughes drove throughout the entire race.

Tetzlaff and his winning Fiat were well in the lead from the start and until his enforced retirement on the 26th lap. He made the fastest round of the course on the second lap, completing the seven miles and a fraction in 6:15. When he was compelled to withdraw he was running almost seven minutes ahead of the field and it appeared to be a foregone conclusion that the holder of the world's road racing record was to have his name inscribed alongside of those of Heath, Hemery, Wagner, Robertson, Grant and Mulford in America's most historic motoring classic.

Hugh Hughes at the Wheel of the Mercer 22, Second Place Winner in Vanderbilt Cup Event.

Digitized by Google



Mortimer Roberts and Mason 16, Winner of the First Race for the Pabst Blue Ribbon Trophy.

De Palma, who alternated with Wishart, also in a Mercedes, for second place during the early portion of the race, went into first position with Tetzlaff's retirement. Hughes had run into third place at the end of the 20th lap, and Wishart was directly behind him. With the exception of the 22nd round, when Wishart was 22 seconds ahead of Hughes, this same relative position was continued throughout the remainder of the contest.

When De Palma took the lead, Hughes quickly observed his opportunity, although he was 3:13 behind. From this point the contest for supremacy lay between the German and American cars, and it may be added that it was a decided test for the wearing qualities of the tires used on each. Both men realized they were in need of new shoes, those upon the respective machines being worn almost through, but neither dared to stop for an instant.

But while De Palma and Hughes were engaged in a persistent duel, Wishart was experiencing more or less difficulty with his Mercedes and it may almost be said that a second race lay between him and Anderson in the Stutz. Here again it was the case of a small car of American manufacture, competing against a higher powered machine of foreign production. At one time Wishart was fully six minutes ahead of the Stutz, but with two exceptions, in the 23rd and 30th laps, the product of the Ideal Motor Car Company, Indianapolis, Ind., maintained a most consistent average of slightly over seven minutes to the lap. At the conclusion hardly three minutes

Gilbert Anderson in Stutz 43, Third Place Car in Grand Prize Event, and the Smallest Machine to Finish with Place in Any Race for This Award.

separated Anderson from third place.

Clarke and his Mercedes finished in fifth position, slightly over 31 minutes behind the winner. Nelson's Lozier was still running when De Palma crossed the finish line, but no attempt was made to complete the race.

Three Mercer cars, driven by Hugh Hughes, Edward Pullen and Spencer E. Wishart, competed in the race for the Pabst Blue Ribbon trophy, but all three were withdrawn before the conclusion of the contest. It was particularly exasperating to the Mercer team, inasmuch as two of the cars, those driven by Hughes and Pullen, were well in the lead when they met with trouble.

Eight machines started in this event, but J. Nikrent in a Case and Rooney in a Bergdoll were forced to withdraw in the sixth round. Roberts finished the first lap in the lead, and maintained this position for 10 rounds, at which point Pullen went into first place, closely followed by Hughes. On the next round the three Mercers were running one, two, three, but Wishart was forced to retire on the 15th. Hughes and Pullen exchanged places in the lead until the 22nd, when Hughes went out, and Pullen regained the lead for the one additional lap he was to remain in the race.

This left but three cars in the running—Rob-

erts, in a Mason and Hastings and Chandler in Fal-Cars. Chandler was so far behind the others that there was but little hope of his reaching the goal in time, providing no more cars were withdrawn. At this point the race lost its interest as a spirited contest. Roberts was more than 20 minutes ahead of Hastings, and Chandler was nowhere in sight. They finished in that order, Roberts having almost 30 minutes to spare. Chandler was still trying to reach the goal and was accorded third position without finishing.

In the race for the Wisconsin challenge trophy, which was run at the same time as that for the Pabst award, but three cars started, all Masons. It hardly could be called a race in any strict sense of the word. Snyder was forced to retire in the fourth round, and there never was any doubt as to the order in which the other two would finish.

The performance of the Stutz in the fourth contest for the Grand Prize undoubtedly was the most interesting event of the week. It was the second time an American made machine had finished with place in this international classic, Robert Burman in a Marquette-Buick completing the second race in 1909 in third place. It should be remembered in this connection that the Stutz is a much smaller car, one of the smallest entered in this year's race, and that it was able to compete so favorably with the high powered foreign machines speaks volumes for its construction. It also will be noted that the Stutz finished in fourth place in this year's Vanderbilt Cup event.

Twelve cars started in the Grand Prize, these being: Robert Burman, Benz; Joseph Fountaine, Lozier; Teddy Tetzlaff, Fiat; Hugh Hughes, Mercer; Ralph De Palma, Mercedes; Spencer E. Wishart, Mercedes; George Clarke, Mercedes; Erwin Bergdoll, Benz; Caleb Bragg, Fiat; Joseph Horan, Benz; Gilbert Anderson, Stutz, and Barney Oldfield, Fiat.

Tetzlaff immediately began the same fast driving which marked his performance during the early portions of the Vanderbilt Cup race three days before. For 10 laps he was in the

Digitized by Google

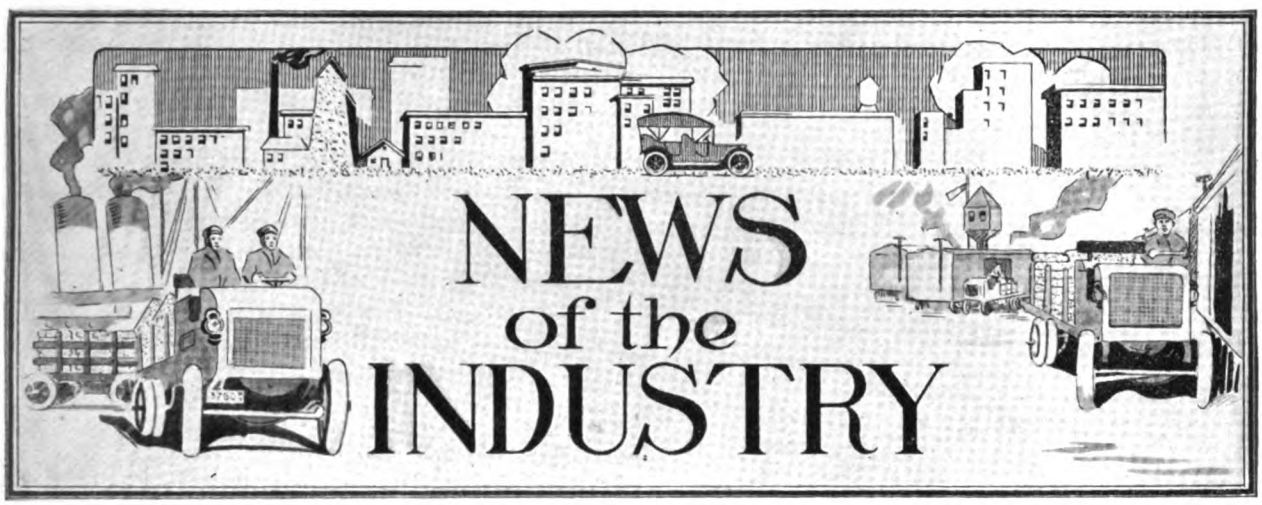
lead, but there were frequent changes in the order of the leaders from this point until Tetzlaff withdrew in the 31st. As far as the first position was concerned, the result did not again appear in doubt, as De Palma was 6:40 behind Bragg at the end of the 44th lap, and barring unforeseen delays, there seemed little possibility that the Mercedes would overcome this lead. At the finish Bragg was practically five minutes ahead of De Palma when the accident occurred.

In the matter of accessories: Splitdorf magnetos, made by the Splitdorf Electrical Company, Newark, N. J., appear to have been most successful, being fitted to the cars finishing first, second and third for the Pabst trophy, first and second for the Wisconsin award, and third for the Grand Prize. Bosch magnetos, made by the Bosch Magneto Company, New York City, were used by the machines finishing first, second and third for the Vanderbilt cup, and first and second for the Grand Prize.

Rayfield carburetors, made by the Findeisen & Kropf Manufacturing Company, Chicago, were victorious on the cars finishing first, second and third for the Vanderbilt cup, and first for the Grand Prize. Schebler instruments, made by Wheeler & Schebler, Indianapolis, Ind., were employed on all the place cars in the Pabst and Wisconsin events, and on that finishing in third place for the Grand Prize.

At least four makes of tires appear to have been represented on the place cars. Firestones, made by the Firestone Tire & Rubber Company, Akron, O., finished in second place for the Vanderbilt cup. Goodyears, made by the Goodyear Tire & Rubber Company, also of Akron, were on the car finishing in third place for the Grand Prize. Fisk tires, the product of the Fisk Rubber Company, Chicopee Falls, Mass., were on the machine finishing second in the Grand Prize. Michelin tires, made by the Michelin Tire Company, Milltown, N. J., took the other honors.

Texaco oils, the product of the Texas Company, New York City, were employed by the first and second place cars in the Vanderbilt Cup race, by both place cars in the Wisconsin and by the machines finishing first and second in the Pabst event.



The equipment of all the machines taking part in the four events, so far as it is possible to verify it by the manufacturers of the cars or the equipment, is presented in accompanying table.

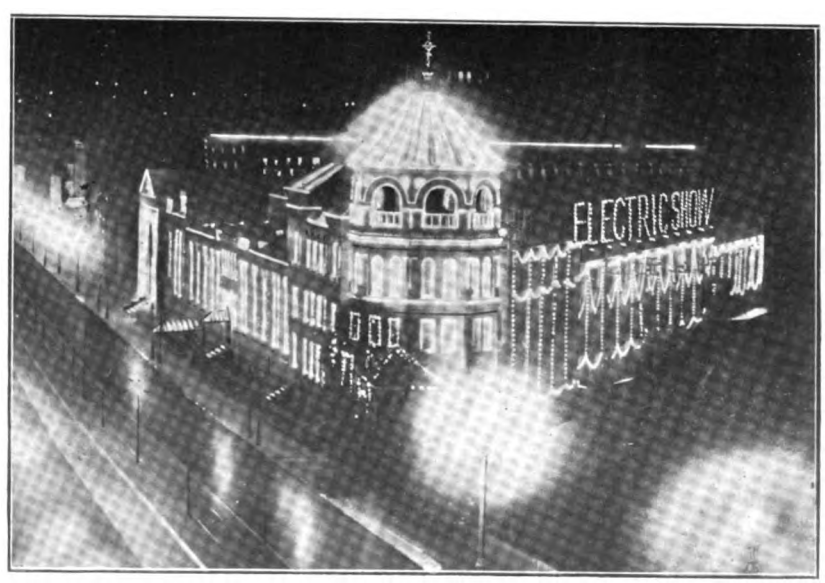
DISPLAYING ELECTRIC VEHICLES.



An Interesting Feature of the Electrical Shows in Boston and New York City.

While the 1912 Boston electric show, which opened in Mechanics' building, Boston, Sept. 28, and will be concluded Oct. 26, is devoted to the demonstration of every method of utilizing electrical energy, by no means the least important is the display of electric vehicles. There is little doubt that it is the most representative exhibit of such cars ever seen in America. In all automobile shows electrics have been displayed, but rarely have they been departmentalized. In fact, no such concerted effort has been made previously by manufacturers to bring to the attention of the people the qualities of their machines for pleasure and commercial uses.

The Edison Electric Illuminating Company of Boston made possible the Boston show, assuming the financial responsibilities of its management and the establishment of its policies, as well as giving direct supervision. Because of the active co-operation of the company with the electric vehicle dealers in the city and vicinity in general promotion, the opportunity for display and demonstration afforded by the show was developed to fullest extent.

The show as a spectacle is magnificent. Within the building, from which all daylight has been excluded, the effect is constant, but at night the exterior is a blaze of light from thousands of incandescent lamps, which are so arranged as to outline the structure, and the effect is accentuated by intermittent lighting. The transformation inside is equally as surprising.

The decorations are especially interesting and are unlike anything ever seen before in Boston. The departments have been individualized by differing treatment, the purpose being to have each section appropriate to its setting. The south section of Machinery hall is the "Automobile Park," in which are shown the electric vehicles, this having decorations to represent cement walls with brick posts. The aisles are indicated by arches and by large bronzed griffins supporting

Exterior of Mechanics' Building and Huntington Avenue as Illuminated for Boston Electrical Show.

Digitized by Google

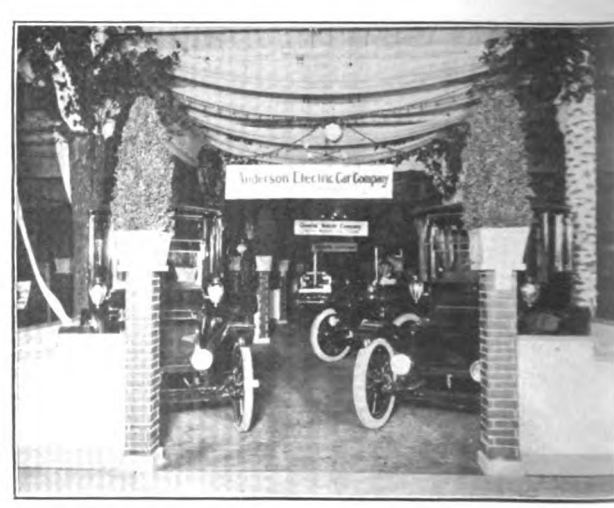
flambeau torches. On the brick posts at the entrances to the spaces are tubs of trimmed boxwood. The ceiling appears as an azure sky and

Display of Lansden Vehicles at Boston Show, Indicating Treatment of Individual Booths.

the columns are enclosed to represent tree trunks. The rail of the light well is covered to appear as a stone wall, entwined with flowering vines, and from the roof is suspended a circle, from which drop long festoons of colored lamps.

In this space are to be seen the exhibits of 17 different manufacturers of electric machines, some of these building pleasure cars exclusively, some service wagons and some both types. Besides these there are several exhibitors of vehicle, lighting and ignition storage batteries, and the department is not sufficient to accommodate all, so that a few of the exhibitors have been forced to the basement to make a satisfactory display. The list of exhibitors in these two divisions is as follows:

Cars—Anderson Electric Car Company, Detroit; Atlantic Vehicle Company, New York City; S. R. Bailey & Co., Inc., Amesbury, Mass.; Baker Motor Vehicle Company, Cleveland, O.; Buffalo Electric Vehicle Company, Buffalo, N. Y.; Century Electric Car Company, Detroit; Flanders Manufacturing Company, Pontiac, Mich.; General Motors Company, Pontiac, Mich.; General Vehicle Company, Long Island City, N. Y.; Lansden Electric Vehicle Company, Boston; Ohio Electric Car Company, Toledo, O.; Rauch & Lang Carriage Company, Cleveland, O.; Studebaker Automobile Company, South Bend, Ind.; Tyler Bros. Corporation, Brookline, Mass.; Underhill Company, Boston; Walker Vehicle Company, Chicago; Waverley Company, Indianapolis, Ind.



Accessories—American Storage Battery Company, Boston; Edison Storage Battery Company, Orange, N. J.; Electric Storage Battery Company, Philadelphia, Penn.; Gould Storage Battery Company, New York City; General Electric Company, Schenectady, N. Y.; Holtzer-Cabot Electric Company, Brookline, Mass.; Philadelphia Storage Battery Company, Philadelphia, Penn.; Wagner Electric Manufacturing Company, St. Louis, Mo.; Western Electric Company, Boston; Westinghouse Electric & Manufacturing Company, Boston.

In the basement, under the vehicle section, is an ideal garage, which is conducted under the management of E. S. Mansfield, manager of the Atlantic avenue electric garage in Boston, in which many of the wagons and trucks in daily service in the city are garaged during the show. The purpose is to afford to visitors opportunity to observe and investigate the methods and system by which electric machines are given attention and maintained.

In connection with this display it should be added that the sixth annual New York electrical exposition and automobile show was opened in the new Grand Central Palace, New York City, Oct. 9, and will continue until Oct. 19. Opportunity also has been afforded the manufacturers of electric vehicles to make display of their product at this show. The idea is the same as at Boston, although the plans have not been carried out in quite the same manner. The Grand Central Palace does not permit of the same decorative scheme, but the display booths have been arranged in the most attractive manner. Among the exhibitors at New York are the following:

Cars—Atlantic Vehicle Company, New York City; Anderson Electric Car Company, Detroit; Baker Motor Vehicle Company, Cleveland, O.; S. R. Bailey & Co., Inc., Amesbury, Mass.; Buffalo Electric Vehicle Company, Buffalo, N. Y.; Champion Electric Vehicle Company, Oswego, N. Y.; Cleveland-Galion Company; General Motors Truck Company, Pontiac, Mich.; General Vehicle Company, Long Island City, N. Y.; Lansden Company, Newark, N. J.; Studebaker Automobile Company, South Bend, Ind.; Ward Motor Vehicle Company, New York City.

Accessories—Edison Storage Battery Company,

Where Detroit Electric Pleasure and Commercial Lines Were Shown at Boston Display.

Orange, N. J.; Electric Storage Battery Company, Philadelphia, Penn.; Gould Storage Battery Company, New York City; Philadelphia Storage Battery Company, Philadelphia, Penn.

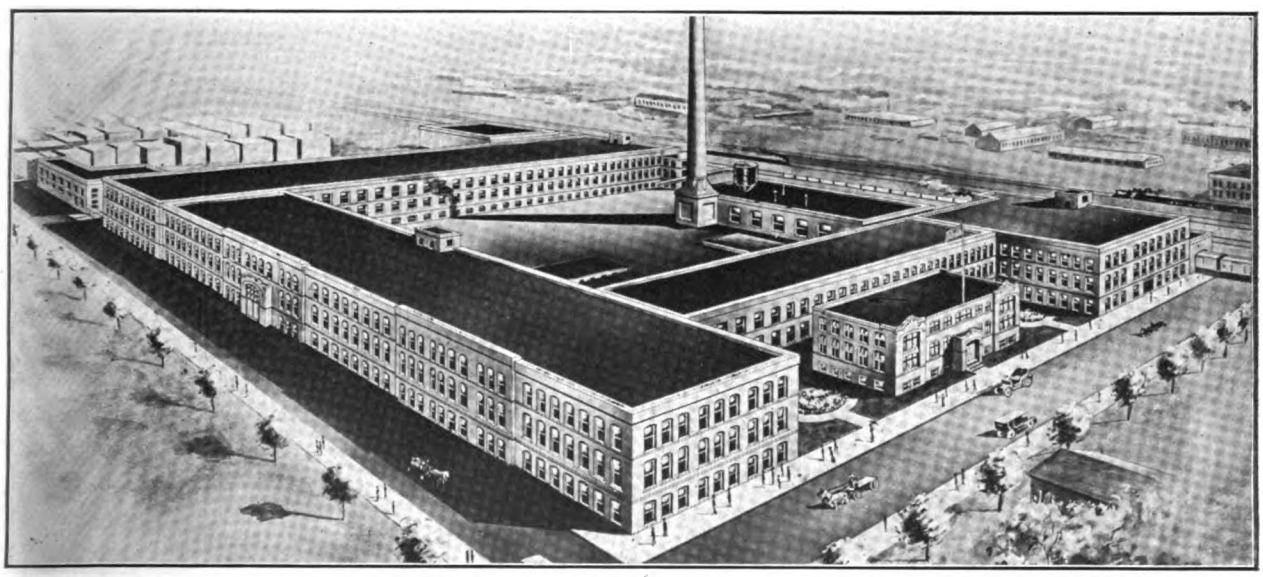
UNITED STATES MOTOR COMPANY.

Details of the Reorganization Plan Call for New Concern Capitalized for $28,000,000.



The committee on reorganization of the United States Motor Company, which went into the hands of receivers Sept. 12, has presented to all the interests involved a plan which appears to meet with their approval. It is understood that Hallgarten & Co., of New York City, will act as underwriter of the new securities, and that a new company will be formed with capitalization of $28,000,000 to take over the business of the old concern, which had capital of $42,500,000. Briefly stated the tentative plan is as follows:

The present company will be sold to a new company, which will have a capitalization of about $28,000,000 par value, divided into three classes of stock—$10,000,000 first preferred, seven per cent., cumulative; $8,000,000 second preferred, six per cent., non-cumulative, and $10,000,000 common. There will be no bonds or debentures, and no fixed charges of any kind.

The present obligations of the company, amounting to about $12,000,000, will be taken care of as follows: The $6,000,000 outstanding debentures will be exchanged for new stock; the $4,000,000 in notes held by banks also will be exchanged for new stock, and merchandise bills amounting to about $2,000,000, will be paid in cash. Present stockholders will be permitted to exchange their holdings for stock in the new company upon the payment of $22.50 a share on their old stock. These subscriptions will amount to approximately $5,575,000, and as the company now has about $1,500,000 in the treasury, the new company will have some $5,000,000 in working capital after the merchandise bills are paid.

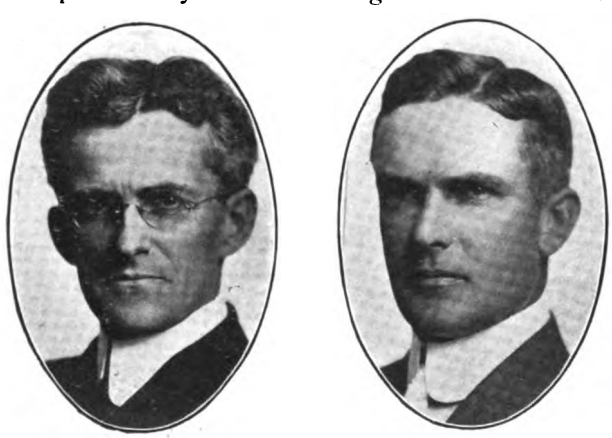
It is estimated that the present assets of the company have a conservative book value of at least $18,000,000 to an operating company, and probably are worth considerably more to a new, well organized concern. With the $5,000,000 in working capital, added to these book values, the new company expects to have at least $23,000,000 in good assets back of the total issue of $28,000,000 in stock.

The apportionment of the new stock is understood to be as follows: Bondholders to receive $30 of each of the three classes for each $100 now held in bonds. Note holders will receive $10 first preferred, $25 second preferred and $25 for each $100. Preferred stock holders will receive for each $22.50 subscription, $30 first preferred, $20 second preferred and $30 common. Common stock holders are to receive for each $22.50 subscription, $22.50 first preferred, $17.50 or $20 second preferred and $20 or $25 common.

Plant of the Romadka Trunk Company, Milwaukee, Wis., Recently Purchased by Kissel Motor Car Company.

KISSEL COMPANY EXPANDS.

Purchases Factory of Romadka Trunk Company in Milwaukee for Assembling Purposes.



One of the most important announcements of the year is that of the Kissel Motor Car Company, Hartford, Wis., maker of KisselKars,

Digitized by Google

which has purchased the plant of the Romadka Trunk Company in Milwaukee. This news follows closely that of the completion of factory additions in Hartford, giving an increase of 40,000 square feet of floor space. The Milwaukee plant is modern, completely equipped and contains some 200,000 square feet of working floor space.

The Kissel company states that the new factory is ideally designed for its needs and that it will afford opportunity to produce 10,000 Kissel-Kars, pleasure and commercial, each year. The general offices of the concern will be removed to Milwaukee, and it is anticipated that the plant, which is shown in an accompanying illustration, will be in operation early in November. At present it will be used exclusively for assembling purposes, the production of parts being continued at Hartford.

The rapid expansion of this company within the past few years has brought it into unusual

The Henderson Brothers of Indianapolis: C. P. at the Left and R. P. at the Right.

prominence. Inside of six years it has grown from a $50,000 corporation to a concern capitalized for $1,000,000 and with a surplus of $500,000. The entire stock is owned by the Kissel family, George A. Kissel being president and general manager and William L. Kissel secretary and treasurer.

HENDERSON SUCCEEDS CARTER.

Head of Cole Sales Force Retires to Become President of Henderson Company.

When it became known last May that the Henderson Motor Sales Company, which had been in charge of the distribution of the product of the Cole Motor Car Company, Indianapolis, since the organization of that concern, was to be absorbed by the Cole company and that the men connected with the old sales organization were to form the new Henderson Motor Car Company, R. P. Henderson became sales manager of the Cole Motor Car Company. At the same time he was financially interested in the production of the new Henderson car, and it does not come as a complete surprise to the industry that he has now resigned from the Cole company to become president of the new Henderson concern.

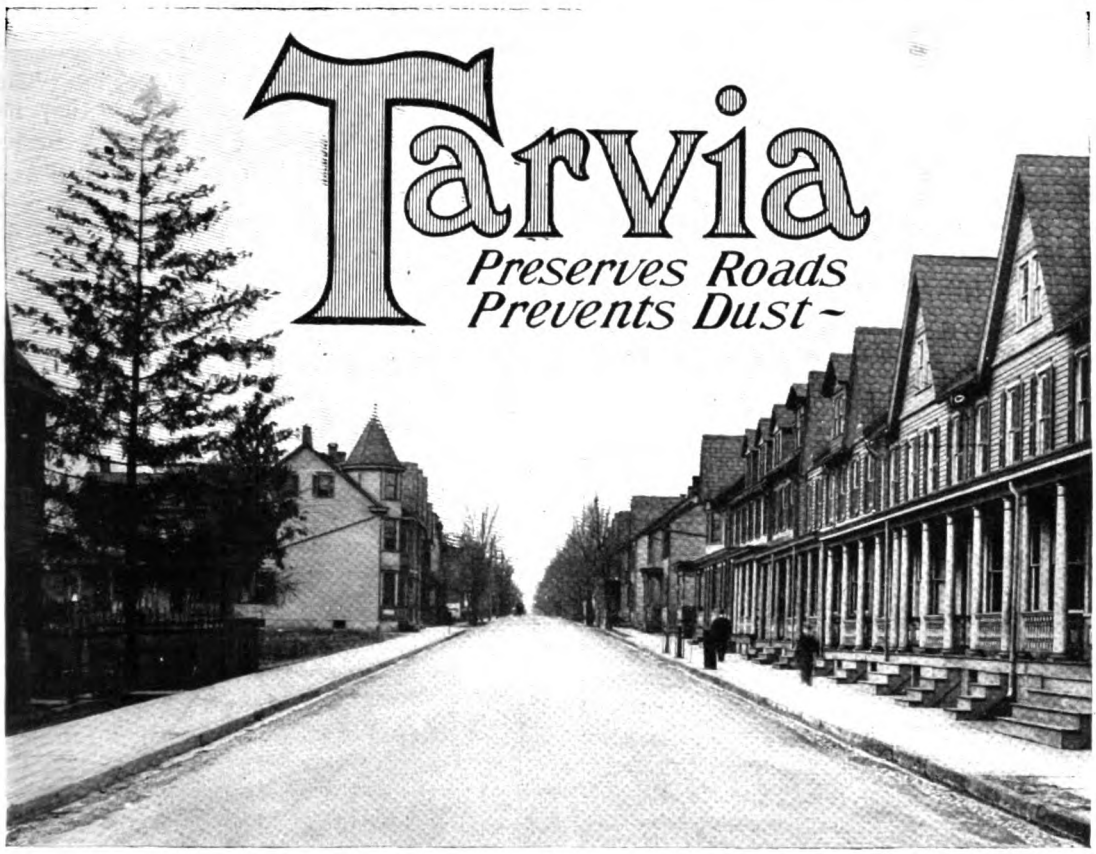
Mr. Henderson succeeds L. Carter, a Georgian banker, who always has been closely associated with the Hendersons, of whom there are two brothers, R. P. and C. P., and who now becomes chairman of the board of directors. In addition to being interested in the Henderson company, Mr. Carter also is one of the largest stockholders in the Cole company.

Under the new arrangement every share of stock in the Henderson Motor Car Company is owned by those actively directing its progress. R. P. Henderson continues as vice president and general manager, and L. S. French is secretary. The Henderson brothers are known in the trade as the Hendersons of Indianapolis, and R. P. will devote his time exclusively to directing the manufacturing end, while C. P. will supervise the sales and control the administration of the company's affairs.

EXHIBITORS AT CHICAGO.

Space Allotted to Eighty-Two Concerns for February Display, with Electrics Unplaced.

Manufacturers who will exhibit at the Chicago show of pleasure and commercial vehicles in February have drawn positions. Eighty-two motor car concerns have received allotments and three-quarters of the centre space of the First Regiment Armory has been reserved for electric vehicles, which have not drawn. As usual, the show will be held in the Coliseum, Coliseum annex, and the First Regiment Armory. On the main floor of the Coliseum are to be 39 exhibitors; Coliseum annex, 8; Coliseum annex basement, 17; Armory, 18. The following makes will be represented:



PLEASURE CARS.

Coliseum Centre—Peerless, Flanders, Pierce-Arrow, Haynes, Glide, Buick, Cadillac, Maxwell, Stevens-Duryea, Stearns, Winton, Stoddard-Dayton, National, Hudson, Packard, Premier, Reo, Franklin, Locomobile, Studebaker, Oldsmobile, Pope-Hartford, Chalmers, Overland.

Coliseum, Along the Walls—Selden, Columbia, Auburn, Rambler, Fiat, Marmon, Alco, White, Cole, Case, Imperial, Mitchell, Moon, Oakland, Lozier.

Coliseum Annex—American, KisselKar, Carter-car, Knox, Velie, Inter-State, Hupmobile, Garford.

Mercer Street, Phillipsburg, N. J., Road treated with Tarvia B.

Phillipsburg's Experience with Tarvia

THE towns and cities which have settled down to the regular and persistent use of Tarvia on their roads as a matter of fixed policy are endless in number.

Here's another—Phillipsburg, N. J., Mr. Edward Brill, Chairman of the Street Committee, writes as follows:

Phillipsburg, N. J.

The following data may be of interest to you in view of the fact that for the past two years we have treated our streets, under various circumstances, with "Tarvia B" and "Tarvia X."

The streets which were originally built of the common system of waterbound macadam, we have treated with "Tarvia B" at an average cost of three and six-tenths cents (3 6-10c) per square yard, according to our City Engineer's figures. The streets so treated are to-day in a better condition than they were at any time in their history. We take pleasure in recommending this system of treating such streets, as we find it the most permanent and economical method of treatment that we have so far discovered.

In our city we have many streets that average from eight to fifteen per cent grade. On these streets we have successfully used "Tarvia X" on the steepest grades, and have top-dressed the lower grades with the "Tarvia B." In no circumstances has this method of treatment failed to give us entire satisfaction, and we can frankly state that our experiences have proved that your method of treatment has served us, as a community, to our entire satisfaction. We take pleasure in submitting this testimonial as a tribute to the efficiency of this method of maintenance and construction.

(Signed) EDWARD BRILL,
Chairman of Street Committee.

There are three kinds of Tarvia: "Tarvia X" used in road and pavement construction, "Tarvia A" for surface work and "Tarvia B" for dust suppression.

Illustrated booklet regarding the treatments mailed on request.

REMOVES TO DETROIT.

Well Known Manufacturer's Agent Transfers Boston Headquarters to Industry's Centre.

Smalley Daniels, operating as manufacturer's sales representative with headquarters in Boston for several years, has removed his main office to Detroit. He already has branch offices in five principal centres throughout the country, and the former Boston quarters will become a branch.

The operations conducted by Mr. Daniels outside of the state of Michigan are entirely distinct from the Smalley Daniels Company of Michigan, which has just succeeded the Snyder & Harbridge Selling Company of Detroit. Associated with him in Michigan is J. C. Schmadebeck, who has been connected with H. M. Snyder in the above company for a number of years.

MACK IN LANSDEN COMPANY.

Heads Executive Board, Confirming Rumor of His Connection with That Concern.

J. M. Mack of Allentown, Penn., has been elected chairman of the executive board of the Lansden Company, Newark, N. J., maker of electric trucks. At the time of the reorganization of the company about a year ago it was reported that Mr. Mack, who was then vice president of the International Motors Company, New York City, maker of Mack, Saurer and Hewitt trucks, had acquired an interest, but the report could not be confirmed.

Mr. Mack has since retired from the International corporation and now is devoting himself chiefly to the new Webb company, which will manufacture motor fire apparatus at Allentown. His election as chairman of the Lansden executive board is said to relieve R. S. Hotz, president of the company, who resides in Chicago.

TWO BUILDINGS FOR MONTREAL.

Demand for Exhibition Space Much Larger Than for Any Previous Canadian Show.

There has been such an unprecedented demand for space at the Montreal motor show, the representative automobile exhibition of eastern Canada, that the management has been obliged to secure a second building for overflow exhibitors. The 65th Armouries has been engaged in addition to the large Drill Hall on Craig street. The show will be held Jan. 4-11, under the direction of the Automobile Club of Canada.

The exhibition will be devoted to pleasure cars and motor trucks exclusively and American vehicles will probably comprise 50 per cent. of the exhibits, the balance being made up by cars of Canadian and European manufacture.

WARD BUYS KING BUSINESS.

Bid of $40,000 Accepted and He Will Continue Manufacturing Plant in Detroit.

The assets of the King Motor Car Company, Detroit, have been purchased by Artemas Ward of the advertising firm of Ward & Gow, New York City, who intends to continue the factory indefinitely. Mr. Ward's bid of $40,000 was accepted by the United States district court receiver, the Union Trust Company of Detroit.

Mr. Ward was the heaviest creditor of the company, having loaned it $100,000 in cash and also having an unsettled advertising claim against the concern amounting to about $29,000. It was found that in order to continue the manufacturing as he contemplated, material, parts and money to a large amount would be needed. The accessory men who had appealed to the courts did not care to follow this plan and left the field clear for Mr. Ward to acquire the plant.

HALL WINS PROMOTION.

Work in Illinois Leads to Appointment as Sales Manager of Olds Motor Works.

J. V. Hall, formerly manager of the Oldsmobile Company of Illinois, has been appointed general sales manager of the Olds Motor Works

Digitized by Google

Lansing, Mich., maker of the Oldsmobile, by General Manager O. C. Hutchinson. Mr. Hall's ability in his Illinois territory was marked and was responsible for his selection by Mr. Hutchinson to succeed Rupert E. Paris, resigned.

The success of Mr. Hall in his new position is assured, as the qualifications displayed by him in bringing about the efficient organization of the company in Illinois are such as indicate that he is capable of extending Oldsmobile sales in a satisfactory manner.

SHOW SPACE ALLOTTED.

Eighty-Seven Manufacturers Will Exhibit Products in Two Buildings at New York City.

Allotment of floor space for the annual pleasure car show which is to be held Jan. 11-18 in the Grand Central Palace and Madison Square Garden, New York City, running simultaneously for two weeks, has been made at the headquarters of the Automobile Board of Trade. It was evident that the interest of the manufacturers has not abated as the applications for space greatly exceeded all expectations, there being 87 requests from car makers and more than 400 from accessory producers. The figures indicate that the double show will surpass any previous exhibition ever held.

When the drawings for space were held at the quarterly meeting of the Automobile Board of Trade, a representative of each of the 61 members in the organization was present. Pleasure cars are to be shown during the first week of the exhibition and commercial vehicles will be on display in both buildings during the second week. The plan is to charge one admission, which will provide admittance to both buildings. The exhibitors of pleasure cars to make display in the Palace and Garden include the following:

Willys-Overland Company, Toledo, O., Overland.
Pierce-Arrow Motor Car Company, Buffalo, N. Y., Pierce-Arrow.
Garford Company, Elyria, O., Garford.
Knox Automobile Company, Springfield, Mass., Knox.
Moon Motor Car Company, St. Louis, Mo., Moon.
Matheson Automobile Company, Wilkesbarre, Penn., Matheson.

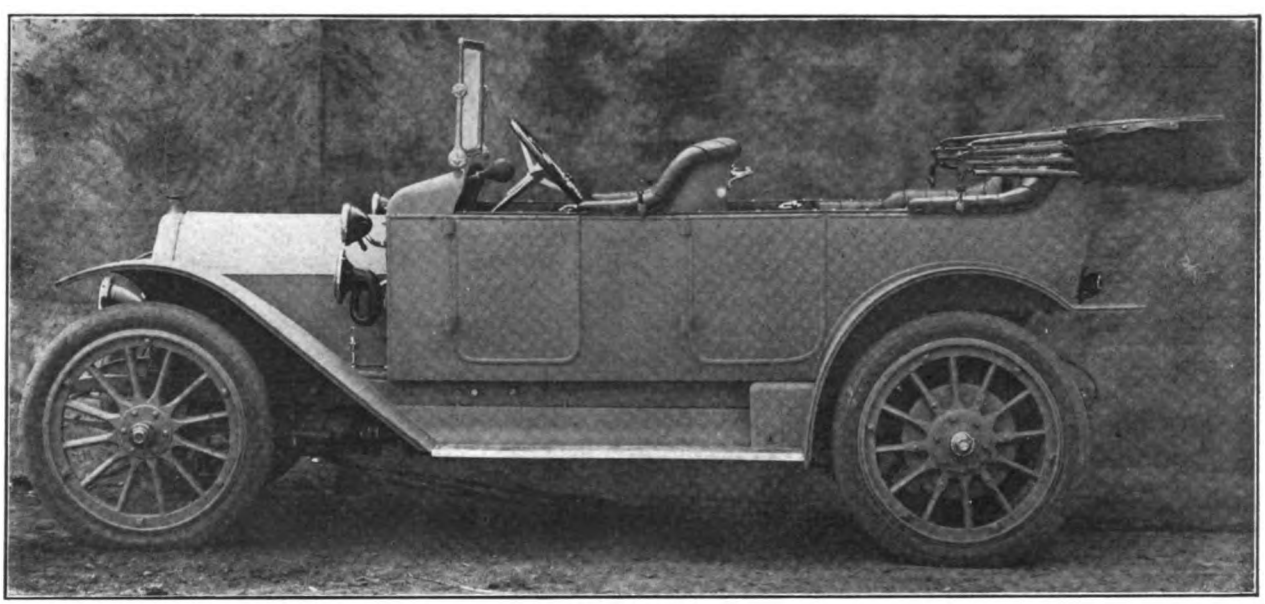
LENOX LINE INCLUDES NEW "SIX."

THE Lenox Motor Car Company, with main salesrooms at 16 Columbus avenue, Boston, Mass., and factory at Jamaica Plain, in that city, which concern was organized three years since to build the Lenox car, will for the coming manufacturing season produce two distinct types of machine, the one being a four-cylinder and the other a six-cylinder chassis. The former type will have a wheelbase length of 118 inches, and the latter 130 inches. Aside from the motors there will be practically no difference in the construction, save that the six-cylinder will be somewhat heavier and the parts of greater length wherever the requirements necessitate. There has been a number of refinements and perfections made throughout the four-cylinder chassis, these having been dictated by experience, but none of these is radical and the purpose is generally to simplify the construction and secure greater accessibility, to insure economy of time and attention in maintenance, and to minimize upkeep expense. To a large degree the six-cylinder is a replica of the smaller machine, and for this reason it can be regarded as being quite up to the Lenox standard in every respect, and that the construction has been amply tested and found to be satisfactory from every point of view.

The Lenox cars will be placed in the market with equipment complete in every sense of the word. Everything that will make for comfort, convenience and the pleasure of the driver and passengers has been provided. The engine is started by an electric motor and the lamps are lighted by electricity. Besides all this the bodies are of handsome design and are luxuriantly upholstered, so that no matter how long the journey or how rough the road, the motorists will not realize fatigue. So far as the construction is concerned high class material is used and the workmanship is such that unusual service is assured and the machines ought to endure under the severest conditions of use.

For the purpose of description the four-cylinder chassis will be taken, and following this will be specified the features of the six-cylinder motor, while the references to bodies will appear in their general application to both types.

The Six-Cylinder, Five-Passenger Lenox Car for the 1913 Season, Offers Every Refinement Making for Comfort and Convenience.



En Bloc Motor.

The motor is a vertical water-cooled type L head with the cylinders cast en bloc, the valves being at the right side. The bore is 4.25 inches and the stroke 5.5 inches, the bore to stroke ratio being 1 to 1.294. The rating by the S. A. E. formula is 29.8 horsepower, but it is claimed by the maker that the engine will develop 45 horsepower, so that it will be understood that the car has power in excess of all requirements, and sufficient for all demands that may be made upon it. The cylinder block is cast of a fine quality of gray iron of 20 per cent. steel with the water jackets integral, the water spaces being of generous size and so designed that the water circulates entirely around

Digitized by Google

each cylinder making for efficient cooling.

The block is open above the combustion chamber heads, making possible the complete cleaning of the water jackets and insuring perfect flow of the cooling fluid. The flange base is wide and beneath the valve pockets side webs and the flange form recesses, which are covered for the protection of the valve mechanism. The cylinder block is machined, rough bored, reamed, aged and finished by grinding, this process eliminating all casting strains. The pistons are of similar material and are carefully turned and ground. The pistons are fitted above the wristpins for four compression rings of the diagonal split eccentric type, that are ground to accurate size on the edges and peripheries. The pistons each have two oil grooves at the bottom to insure the perfect distribution of the lubricating oil.

The Four-Cylinder Lenox Model Presents Many New Features Over Last Season's Design.

The engine base is an aluminum alloy that is cast in two sections, the upper half carrying the main and camshaft bearings. The lower section is divided by a horizontal web, which contains the oil pools for the splash lubrication, and below which is the oil reservoir, which contains 10 quarts. In the upper half is a central transverse web in which is carried the centre main bearings. The crankshaft is a nickel steel drop forging with the crankpins two inches diameter, and the main bearings are two inches diameter forward and 2.125 inches diameter at the centre and rear, these being respectively three, 3.625 and 4.5 inches length, this giving a total of 11.125 inches total bearing length. The bearings are of nickel babbitt in bronze journals. The camshaft is a nickel steel drop forging 1.125 inches diameter with the cams integral. The shaft has three bearings two inches diameter and two inches length. The camshaft bearings are phosphor bronze. The shafts are hardened, heat treated and accurately ground to size. The camshaft is forged with a forward flange to which the timing gear is bolted, and the shaft may be easily removed from the front of the case. The connecting rods are I section drop forged steel, heat treated, that carry bronze journals lined with nickel babbitt, caps being secured by four nickel steel bolts. The wristpins are of hardened steel and are secured in the piston bosses by set screws, the large size bearings being of phosphor bronze. At the lower ends of the connecting rods are scoops that sweep into the oil pool at every revolution of the shaft.

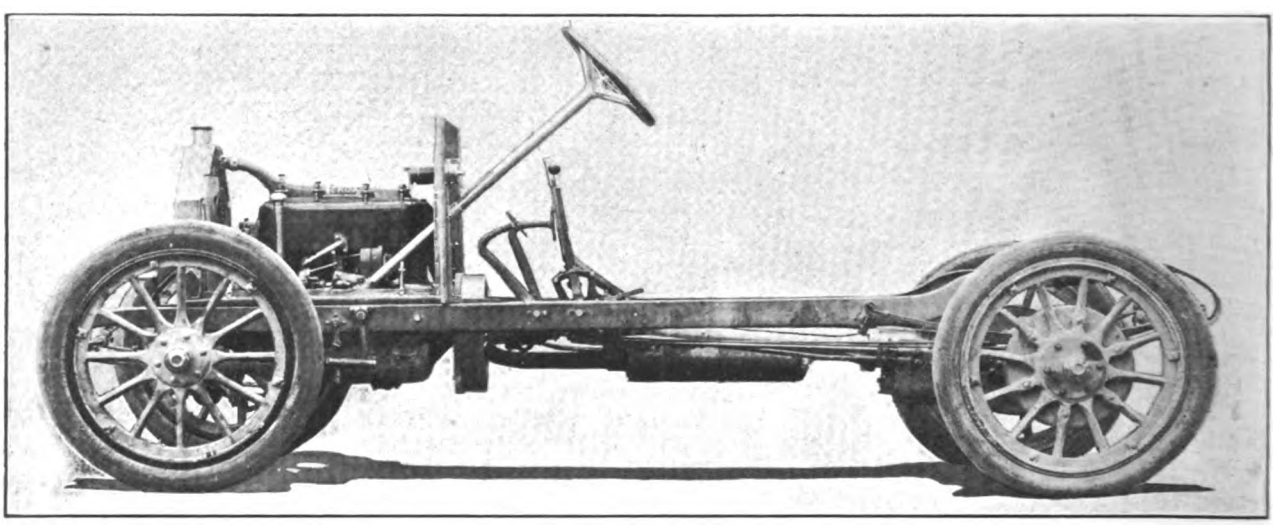
The timing gears are four in number, those for the crankshaft and the magneto shaft being steel and the idler and the camshaft gears being cast iron, spiral cut to minimize noise and 1.25 inches face to insure wear. The camshaft is driven off the crankshaft, and the idler gear operates the outside shaft.

The valve ports are 2.25 inches diameter and the valves have such clearance as will insure complete diameter charges of fresh fuel and the certain scavenging of the cylinders after firing. The valves are nickel heads and carbon steel stems, electrically welded, carefully ground to size, with the stems hardened. The valve stem guides are cast iron bushings pressed into the cylinder block. The tappet guides are set into the cylinder block flange. The valve tappets are of the mushroom

Digitized by Google

type, hardened and ground, with set screws and lock nuts for adjusting for wear. The valve springs are oil tempered and are retained by collars and keys. The valve tappets, stems and springs are enclosed by two plates and are protected against all abrasive substances.

Lubrication and Cooling.



The lubrication is by a spring returned plunger pump that is driven by an eccentric off the camshaft. This pump forces the oil by a system of tubes to each of the main bearings, thence through channels drilled in the crankshaft to the crankpin bearings, and to the timing gear chamber, and the drainage from the bearings and the timing gears is to the oil pool below. Splash lubrication is afforded the camshaft, crankpins, wristpins, valve tappets and the piston and cylinder walls. The excess oil from the pool is drained into the reservoir, where it is filtered before it is drawn into the pump. The oil reservoir may be drained and cleaned conveniently.

The water for cooling the engine is forced through the water jackets and the large extended front cellular radiator by a centrifugal pump at the left side of the motor, that is driven by an outside shaft, and it enters the cylinder block at the base of the explosion chamber. After circulating about the cylinders it is forced to the radiator, the large water jacket cover plate being channelled to the outlet to direct the flow. This plate is secured to the cylinder block by a series of cap screws. The radiation is assisted by a large fan mounted on a ball bearing adjustable bracket installed on the front of the cylinder block, which is driven by a pulley carried on the extension of the water pump shaft. This cooling system is said to be especially effective. It has a capacity of 4.5 gallons.

Ignition and Carburetion.

The ignition is by a high-tension magneto driven by a flexible coupling to the water pump shaft, the magneto being mounted on a bracket on the side of the engine case. The wiring leads are to a single set of spark plugs, are well protected and are exceedingly simple and accessible.

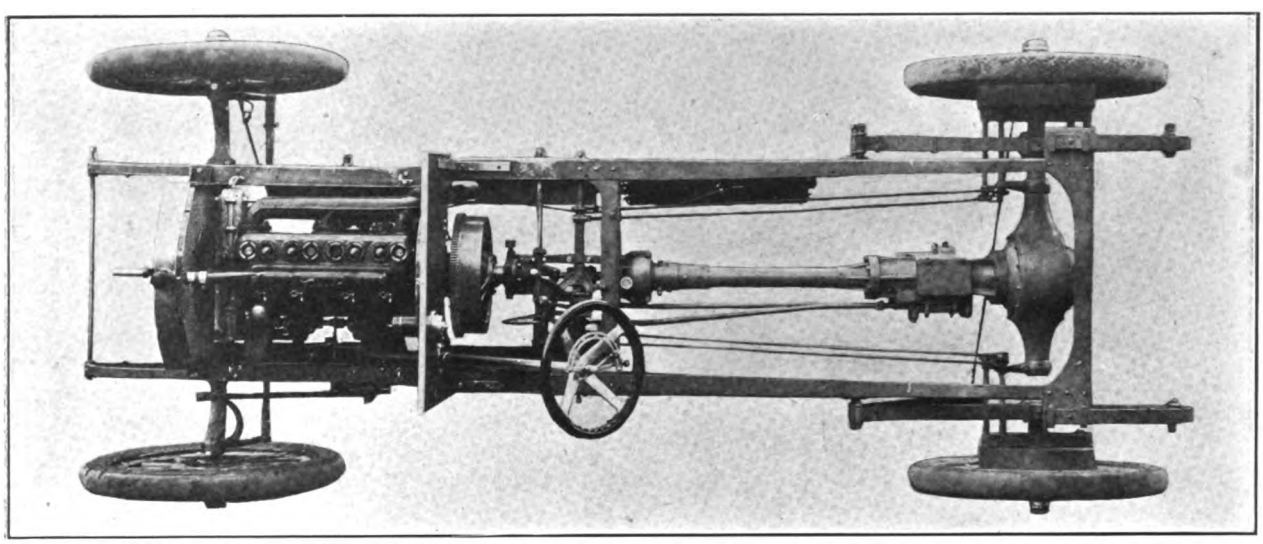
The carburetor is an automatic float feed two-jet type, with a long water jacket and an auxiliary valve that controls the high speed intake. This has a feature in a strangling tube, that by the velocity of the air flow, prevents any accumulation of gasoline at the seat of the auxiliary valve and insures against "choking" of the motor when accelerated after it has been running slow.

Side View of the Four-Cylinder Lenox Chassis for 1913, Showing Block Motor and Other Features of Construction.

Electric Starting and Lighting.

The engine is fitted with an electric starter, consisting of a motor and a battery. A steel ring gear is shrunk on the flywheel rim and there is a miniature sliding gear of chrome nickel steel that can be engaged with this by pressing a toe pedal. The system is the Gray & Davis, with a six-volt 90 ampere-hour storage battery. Pressing the toe pedal engages the gears and causes the battery to energize the motor, which will turn the engine at 150 revolutions a minute for 20 minutes or more before exhaustion. With the release of the toe pedal the electric motor automatically ceases to operate, its work having been accomplished.

The current for starting is obtained from the



Digitized by Google

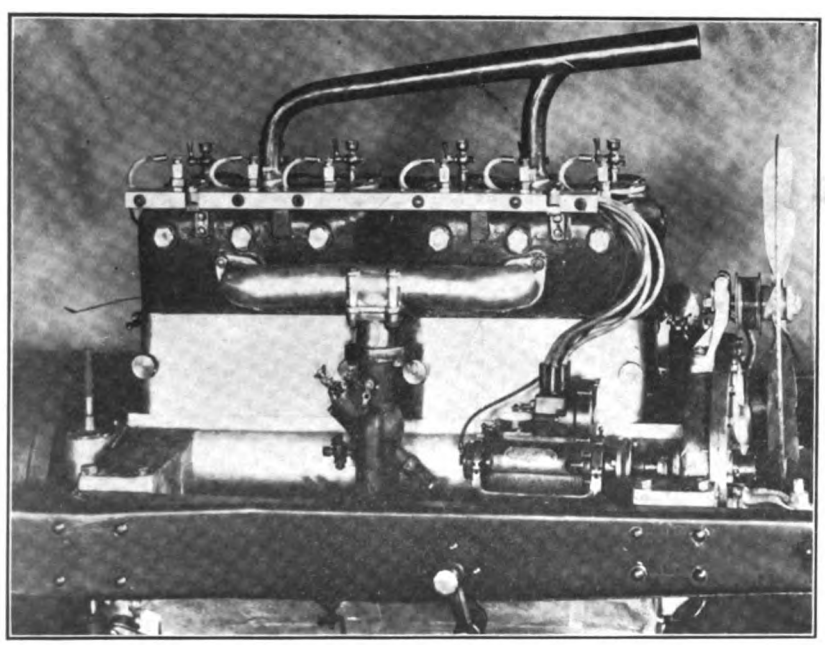
storage battery, which is charged by the regulation Gray & Davis dynamo, driven by a silent chain. This same dynamo also furnishes lighting current. The charging is cut out at capacity, or may be continued during the time the battery is drawn upon for lighting the head, dash and tail lamps. The lighting is controlled by a series of dash switches, so that they may be lighted in combination or individually, as desired.

Clutch and Transmission.

The clutch is a cone that engages with the recessed flywheel, the cone being faced with leather, beneath which five helical springs are installed in bosses, with means of adjusting the tension so as to insure easy and positive engagement and prevent jar and jolts in starting. There is a Hartford joint behind the clutch, and the shaft is coupled to the rear section of the shaft by a squared sleeve. The rear end of the rear section is connected with the universal joint contained in the large globe end of the torsion tube that contains propeller shaft. A leather boot packed with grease protects the clutch shaft forward of the torsion tube. The torsion tube globe end is 5.375 inches diameter, of steel, riveted to tube, and this is mounted in a large globe socket that is bolted to a heavy cross member of the frame. This socket is lined with nickel babbitt that is scraped to a perfect fit. In the forward end of the torsion tube is a large imported annular ball bearing that is retained by a collar and will sustain both radial and thrust load. The driving shaft is carried in this bearing. The rear end of the shaft is squared and this squared end floats in the squared hole in the driving pinion of the gearset, through which it may move forward and back, eliminating end thrust.

The gearset is a selective sliding gear type with three forward speeds and reverse, with the driving pinion on the transmission shaft. There is an interlock between the shafts so that only one of them may be operated at a time. A bronze cage in which are fitted annular ball bearings carries the differential gear mounting, and the bearings may be adjusted at either side to the pinion gear. The rear axle housing is pressed steel and the axle construction is three-quarters floating, it being of the single bearing type, with the wheels mounted on annular ball bearings. The driving shafts are 1.5 inches diameter and the wheel flanges are secured on tapered ends with nuts and keys. The gearset case may be opened at the top or left side for examination or work upon the shafts and gears, and the differential may be reached by removing a cover plate at the rear of the axle housing.

Looking Down upon the Four-Cylinder Lenox Chassis, Indicating Simplicity and Accessibility of Transmission, Etc.



Axles and Springs.

The front axle is an I section drop steel forging 1.75 inches width and 2.625 inches depth, dropped in the centre. The bearings for the pivots are in the yoke instead of in the pivots and the pivot pins are carried in hardened steel bushings. The pivots carry ball thrust bearings at the top and the wheel spindles are fitted with annular ball bearings. The springs are of Krupp silico-manganese steel, semi-elliptic forward, 36.5 inches length and 1.75 inches width, and three-quarters elliptic rear, 46.75 inches length and two inches width. The wheels are artillery type, second growth hickory, 36 inches diameter, 12 spokes, the

Digitized by Google

spokes being 1.75 inches width, and they are fitted with 36 by four-inch tires on the four-cylinder model and 36 by 4.5 on the six.

The left pedal actuates the clutch and the right pedal the service brake. The steering column is at the left side and has an irreversible gear of the worm and sector type, being operated with an 18-inch corrugated wheel. The spark and throttle levers are of the Isotta design and are carried above the wheel on quadrants having friction contact. The gear shifting lever and the emergency brake levers are located at the centre and a locking device locks both shifting rods in neutral and locks shifting lever in high speed. The brakes are of the internal expanding form and operate on a double

Intake Side of Six-Cylinder Lenox Motor, Illustrating Accessible Position of Magneto and Carburetor.

rim drum 2.25 inches width. The brake shoes are faced with an asbestos fabric, the service set being 16 inches diameter and the emergency set 12 inches diameter, when expanded. The brakes are exceedingly powerful.

Frame and Bodies.

The frame is a pressed steel channel section three inches wide and four inches depth of channel, of .1875 inch metal, dropped 3.5 inches forward of the upper half of the rear springs. The rear cross frame member is very heavy and it is carried beyond the side members, where the ends, supported by heavy brackets, form the upper supports for the springs. There is a heavy steel rod, enclosed in a steel tube, that stays the ends of the forward spring horns. The frame is also stiffened by the clutch rocker shaft and the shaft that carries the control levers. The motor, which is supported by aluminum arms, is bolted to the side frame members, and these also carry the flanges on which the dust pan is mounted.

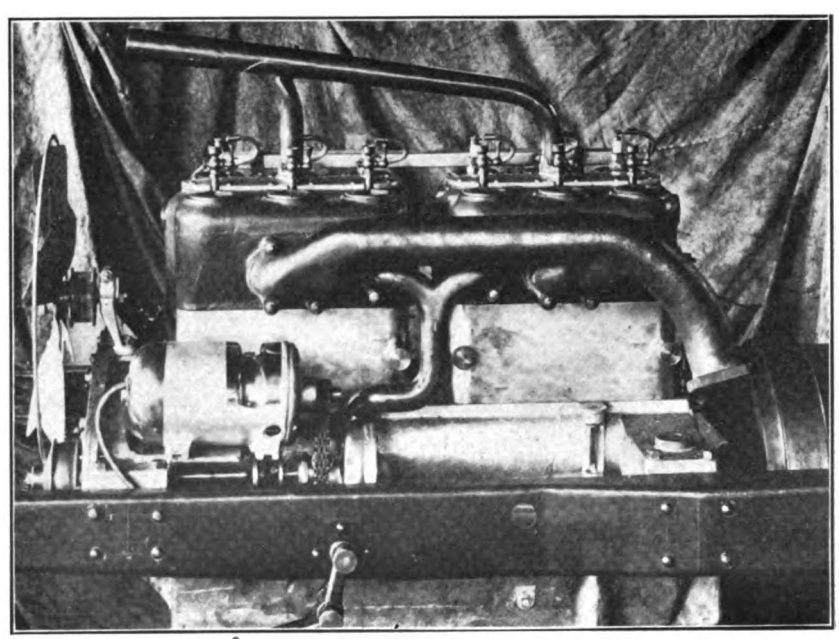
Especial care has been taken to insure lubrication of all wearing parts and wherever possible large grease cups have been fitted. The mudguards are long and graceful and the running board at the left side carries the battery. The copper gasoline tank, of 17 gallons capacity, is installed beneath the front seat. The bodies fitted are large four and five-passenger type, and roadsters with two, three or four-passenger capacity. These have unusually luxuriant upholstering and are very comfortable. The car is guaranteed to make 55 miles an hour. All types have a cast aluminum cowl of handsome design.

These cars are very fully equipped. Besides what has been specified they have fine mohair tops, lamps finished in black enamel and nickel, Firestone quick detachable demountable rims, bulb horn and speedometer. There is abundant storage space under the rear seats of the touring cars and the rear decks of the roadsters. All cars are equipped with a single piece Whirlwind windshield adjustable to any position.

The Six-Cylinder Chassis.

In the six-cylinder chassis the rear axle is heavier and the driving gear ratio is 3.5 to one. It is a large powerful car and has a rating of 38.4 by the S. A. E. formula, while it is stated it has developed 61.5 horsepower on block tests of the engine.

The principal difference is in the engine, which is a T type and has a bore of four inches and stroke of five inches, the cylinders being cast of a superior quality of gray iron, with the exhaust valves at the left and the intake valves at the right. The water jackets are cast integral with the cylinders and they have outlets at the centre of the units. The jackets are large and a very free circulation of water is insured. The base flanges are of unusual size and the cylinder units are very securely seated. The units are machined, bored, reamed, aged and ground to exact



Digitized by Google

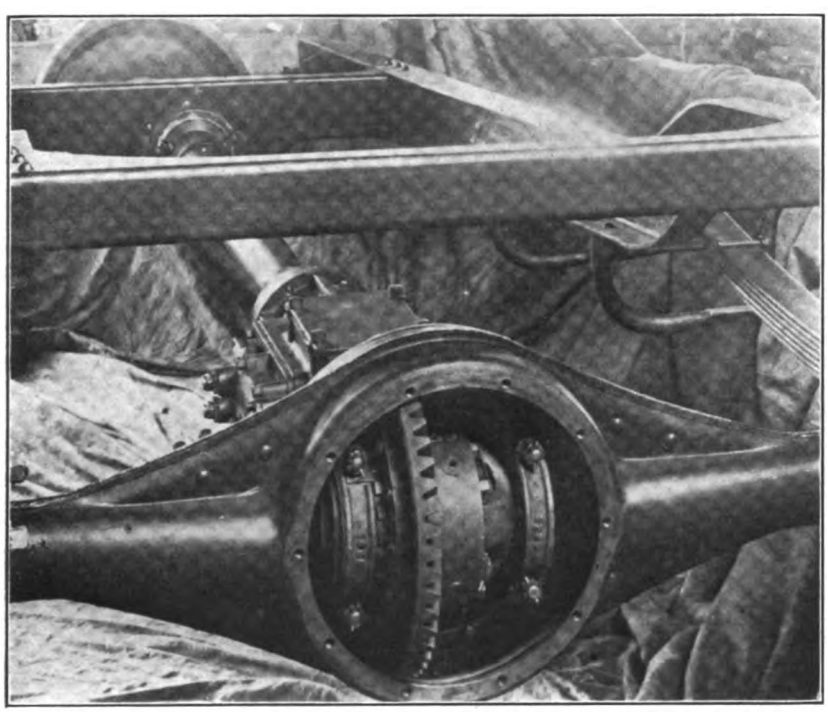
size. The crankcase is of aluminum and it is of the same character of construction as that of the four-cylinder motor, having three main bearings. It has large supporting arms at the front and rear ends and it has the 10-quart oil reservoir below the horizontal web that forms the bottom of the oil pool. The timing gears are enclosed in an extension of the forward web of the sections and by a cover plate. The pistons are of the same material as the cylinder units and are finished as are those for the smaller engine.

The crankshaft is a drop forging of nickel steel and it is carefully ground to two inches diameter at the main bearings and the crankpins, and these bearings are respectively three, 2.1875 and 3.6875 for the front, centre and rear. The main bearings have a total length of 8.875 inches. The bearings are of nickel babbitt carried in bronze journals. The camshafts are 1.125 inches diameter, of drop forged heat treated steel; with forward flanges integral to which the timing gears are bolted. These are carried on three bearings each and these bearings are 1.75 inches diameter for the front, centre and rear, and the lengths of the bearings in the same order are 2.75, 2.25 and 2.25 inches. The camshaft bearings are of phosphor bronze. They may be removed easily from the front of the case. The connecting rods are I section drop forged steel, of liberal size, and they are fitted with lower end bearings two inches diameter and 2.1875 inches length, these being of nickel babbitt and bronze journals, each retained by four bolts, securely locked. The small ends have bearings of phosphor bronze and the wristpins of hardened steel are secured in the piston bosses by set screws and lock nuts. The timing gears are of cast iron and steel and they are spiral cut with 1.125 inches face to insure noiseless operation, and long endurance. There are means for adjusting end play in all the timing gear shafts. The valve ports are two inches diameter and the valves are of the same material and the same construction as in the "four." The valve stem guides are cast iron bushings and the springs of oil tempered steel are retained by collars and keys. The valve tappets are of hardened steel with forked lower ends in which are steel rolls on hardened steel pins, which contact with the faces of the cams. The upper ends of the tappets are fitted with hardened screws and lock nuts to compensate for wear.

Lubrication and Cooling.

The lubrication is by a plunger pump driven from the intake camshaft by an eccentric, the oil being drawn through a screen filter to the pump and forced through a system of tubes to the main bearings and thence through channels drilled in the crankshaft to the crankpins, and to the timing gearcase. The oil drains from the bearings to the pool in the base of the engine case and then is distributed by splash by scoops at the large ends of the connecting rods to the camshaft bearings, the cams, valve tappets, the wristpin bearings and the cylinder and piston walls.

Exhaust Side of Six-Cylinder Lenox Motor, Presenting Location of Lighting Generator, Etc.



The motor is cooled by the water circulating through the cylinder units by pressure from a centrifugal pump driven by the left outside shaft. This water enters the cylinders at the base of the explosion chambers and circulating about the valve pockets is carried out through manifold outlets that are in the cover plates, the tubing being of copper, with easy curves, 1.75 inches diameter, there being a rapid flow of the water. The radiator is two inches higher than in the smaller chassis. Radiation is insured by a six-bladed fan, mounted on an adjustable bracket, with ball bearings, located on the front of the forward unit and driven by a belt from a pulley on the extension of the right outside shaft. This belt is an inch

Digitized by Google

width and it is adjustable for tension. The radiator and water system capacity is five gallons.

Carburetor and Magneto.

The carburetion is by a carburetor of the same type as that used on the "four" but larger, supplying a uniform mixture for all conditions of engine operation and affords abundant power and endurance under load. The ignition is by a Mea high-tension magneto, and the wiring leads are carried through a large copper tube above the cylinder units and to the spark plugs in the tops of the valve pockets. The magneto is located at the right side. The left outside shaft, by a silent chain, drives the water pump and also the motor generator by which the battery is supplied with current for starting the engine and for illuminating the lamps.

Rear Axle of 1913 Lenox Car, Showing Well Designed Differential and Gears, Accessibility, Easy Method of Adjustment and Transmission as a Unit with Rear System.

The chassis throughout is as has been described for the smaller machine, save for the increased size of the parts. Practically all of the components are drop forged and the springs and wheels are the same as has been described. The steering column is at the left side, of the worm and sector type, with ball thrust bearings and with adjustments for end play. The gear is entirely housed aside from the spark and throttle connections, and is irreversible. The gear shifting and emergency brake levers are located in the centre.

Body Equipment.

The six-cylinder chassis is fitted with a five-passenger touring body of the Benz type. The design is graceful and pleasing and the bodies are upholstered with hand buffed leather and first quality hair, and with the best of coiled springs, to a depth of 10 inches. The equipment is the same as has been described, with the top, windshield, nickel and black enamel finished lamps, and the usual foot rail, robe rail, tool boxes, tools, jack, pump, tire tools, tire repair outfit, quick detachable demountable rims, and tire holders.

The motor of this chassis has exceptional power production, and the following statement specifies the horsepower at the number of revolutions stated: 6.5 at 200, 10 at 300, 14 at 400, 18 at 500, 22.5 at 600, 26.5 at 700, 31 at 800, 34.5 at 900, 39 at 1000, 43.5 at 1100, 47.5 at 1200, 51 at 1300, 53.5 at 1400, 56 at 1500, 58 at 1600, 60 at 1700, 61.5 at 1800. The motor has been driven to 2275 revolutions a minute under test.

The chassis are both up to the Lenox quality, and the finish is equal to the material and the workmanship. The company has become recognized for the character of its production, and it is stated that these machines are the best that it has yet placed in the market.

As will be noted, the equipment is in every way complete and thoroughly in keeping with the high grade product of the Lenox company, the accessories and fittings being produced by well known and representative makers. This applies particularly to the type of electric lighting and starting system employed. It has proved its efficiency and practicability in service and has been adopted as standard equipment on several leading cars.

DEATH OF W. H. CORBIN.

The Joseph Dixon Crucible Company, Jersey City, N. J., announces the death of its honored vice president, William Horace Corbin, in that city, Sept. 25. Mr. Corbin was well known in the industry and the announcement comes as a distinct personal loss to his many friends.

NATIONAL CONTEST AND RACING NEWS.

Next Year's 500-Mile Race---Bruce-Brown Dies at Milwaukee---Glidden Tour Postponed Until 1913---Savannah Seeking Race Sanctions---Buffalo's Annual Endurance Trials---Results in Recent Meets.

Announcement is made by Charles W. Sedwick, director of events at the Indianapolis motor speedway, that the third international sweepstakes race for a distance of 500 miles will be held over that course, Memorial Day, May 30, 1913. In addition, there will be a second day's programme, at which it is expected that other events will be run for the Wheeler-Schebler trophy, Prest-O-Lite trophy and Remy grand brassard. Definite plans respecting this last feature will be made public later.

Some changes in the rules regarding entrants for the 500-mile race are noted, chief among which is that reducing the minimum piston displacement from 600 cubic inches to 450, and the minimum weight to 1600 pounds. Entries will be opened Jan. 1 and closed May 1. The field is restricted to 30 cars, and the entrance fee is $500 a machine. To qualify a machine must be able to cover one lap of the course, 2.5 miles, at a speed not less than 75 miles an hour.

The order of starting will be determined under rule 122 of the contest board of the American Automobile Association, which provides that it shall be determined by lot, and that drawings shall take place in the order of entry. When two or more cars of the same make fall together in the drawing, one or more of them shall be moved down one place, until separated by another make of machine.

Director Sedwick is planning a trip abroad on which he will attempt to interest foreign drivers in the events. It is anticipated that with two days given over to racing it will be possible to secure a number of well known men.

DEATH OF BRUCE-BROWN.

Few American automobile racing drivers were better known the world over than David L. Bruce-Brown, and his death, coming as it did immediately before the running of this year's Vanderbilt Cup race, was a decided shock to the industry and cast a cloud over the events for the week. With his mechanician, Tony Scudari, Bruce-Brown was trying out the Milwaukee course in his high powered Fiat car, Oct. 1, when the heavy machine swerved into a ditch and the two occupants were thrown into a field. The noted driver died three hours later in the Trinity hospital at Milwaukee.

David L. Bruce-Brown was born in New York City in 1887. He was rated as one of the wealthiest men in the racing end of the industry and began his racing career while in school at the age of 20, when he acted as mechanician for Emanuel Cedrino at Ormand Beach, Fla., in 1908. Later in that meet he drove in the one-mile amateur event, securing the amateur world's record for the distance, previously held by W. K. Vanderbilt, Jr., his time being 0:33.6.

The same year he won the Shingle Hill climb in New Haven, Conn. In 1909 he lowered his own record to 0:33 at Ormand Beach, and also won the Sir Thomas Dewar trophy, the world's 10-mile straightaway record and the Giant's Despair hill climb the same season. In 1910 he took the second Grand Prize in a Benz, and last year he won this event for the second time in a Fiat. He also finished third in the first 500-mile race on the Indianapolis motor speedway, Memorial Day, 1911.

The Late David L. Bruce-Brown.

In the Santa Monica road race of May 4, 1912, he was again at the wheel of a Benz, in which he finished in third place, exceeding the previous world's road racing record. His last big race was at the wheel of a Fiat in the French Grand Prix in June.

GLIDDEN AND THE GLIDDEN TOUR.

Oct. 2 the national tour committee of the American Automobile Association decided to postpone the annual reliability event, which has come to be known as the Glidden tour, until next year. Presidential campaign activities are held

Digitized by Google

to be responsible for a depleted entry list and suspended interest in long distance touring competition, according to the official announcement of the committee. Many cities are said to have guaranteed teams for 1913, and several sections of the Detroit-New Orleans route, now under process of improvement, are expected to be finished early in the year, so that the tour may be held at that time.

While it may be impossible to determine what effect, if any, the replacement of the Glidden trophy as chief award by a new A. A. A. trophy, may have had upon the present situation, it would appear that Charles J. Glidden, donor of the cup bearing his name, was not anxious that the season should pass without a tour of national proportions. Immediately following the announcement of the national tour committee, it became known that Mr. Glidden was to lead a caravan of tourists over the route selected for this year's contest.

It is stated that this tour will be conducted under the auspices of the 50,000-Mile Maxwell Club, an organization fostered by the United States Motor Company, which it will be remembered, won the Glidden trophy in 1911 with a trio of Maxwell cars, made by the Maxwell-Briscoe Motor Company, Tarrytown, N. Y. It is scheduled to start from Detroit, Oct. 14, and to end in New Orleans, Sept. 27, over the identical route selected by the national tour committee of the American Automobile Association, and the same daily schedule will be maintained throughout.

The run will be open to all who wish to take part. Mr. Glidden, who will drive a 40 horsepower Maxwell touring car, has invited all motorists interested in good roads to accompany him. Of course neither the Glidden trophy nor the new A. A. A. cup will be awarded as a result of this tour, which is to be conducted solely in the interests of good roads and sociability.

SAVANNAH MAY WANT RACES.

It is understood that the Savannah Automobile Club, Savannah, Ga., has experienced a change of heart respecting the holding of the Vanderbilt Cup and Grand Prize events, and it would not surprise the industry at all if application should be made by this organization to take charge of them again in 1913. A. W. Solomon, secretary of the club, was in New York City recently, and suggested that something of this nature might occur. He explained there were now sufficient hotels in the southern city to accommodate all who might wish to attend the races, and that rainy weather would not be likely to interfere with holding the events on the original date selected.

This position is decidedly different from that manifested by the club last spring, before it was definitely decided to hold the events at Milwaukee. Of course, it is too early to state with any degree of certainty whether or not Savannah would be likely to secure the races in any event, but it is safe to presume that the claims of Milwaukee will be given due consideration, in case that city cares to repeat the experiment of the past month.

RESULTS AT PITTSBURG.

Robert Burman in his Benz created a new track record for a mile, which he covered in 0:51.98, as against Oldfield's mark of 0:52.8. on the Brunot's Island track, Pittsburg, Penn., Sept. 21. The summary of the meet follows:

Five Miles, 300 Inches.

Car	Driver	Time
Ohio	Raimey	5:02.82
Kline-Kar	Kerr	....
Mercer	Ringler	....

Five Miles, 231-300 Inches.

STUDEBAKER TEAM DISBANDS.

After a most successful year, particularly with reference to securing new records in the light car class, the racing team of the Studebaker Corporation, Detroit, composed of Evans and Tower, has disbanded for the season. An accompanying illustration shows the two Studebaker cars, which finished in second and third place for the Chanslor & Lyon trophy at Santa Monica, Cal., May 4, and later took first and second place in a similar race at Tacoma, Wash., July 5.

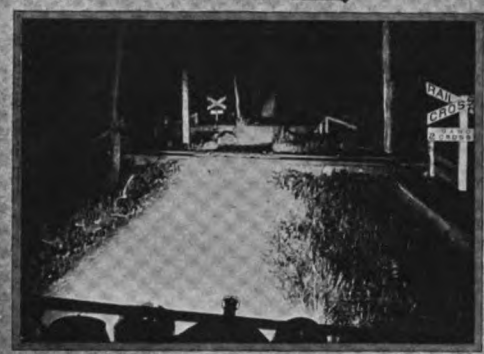
Following the Santa Monica road race, these two cars created new records for one, two, three, five, 10 and 25 miles on the Los Angeles motordrome. This proved to be but a sample of the manner in which they were to perform in nearly every event of their class in which they were entered throughout the year. The crowning achievement appears to have been the five-mile race from standing start on the Cleveland track, which Evans won in 4:59.

Two Studebaker Cars, Driven by Evans and Tower, to Create New Records During the 1912 Racing Season.

TWO PERFECT AT BUFFALO.

Only two cars, the Warren 19 and the Maxwell 25, finished the third annual tour of the Automobile Club of Buffalo, N. Y., last month with perfect scores. The first was winner in division 3 and the latter in division 2. The winner in the touring division was the Hupmobile 8 with a penalization of six points. The score follows:

No.	Car	Driver	Penalty
7	Maxwell	Wolfe	4
8	Hupmobile	Almendinger	6
9	K-R-I-T	Langham	37
10	McFarlan	Graham	176
16	Paige-Detroit	Malcolm	3
19	Warren	Holcombe	0
22	R-C-H	Schroeder	9
25	Maxwell	Schoenthal	0
31	Amplex	Barckay	withdrawn



BURMAN CREATES NEW RECORDS.

On the new track at St. Louis, Mo., Sept. 29-30, Robert Burman, in the "Blitzen" Benz created new world's records for one and two miles on a circular dirt track. The marks now stand at 0:46 and 1:32.6, respectively. The summary of the meet follows:

Car	Driver	Time
Three Miles, 450 Inches.		
Ohio	Raimey	2:05.0
Mercer	Ringler	....
Five Miles, 600 Inches.		
Cutting	Burman	4:02.0

Electric Lighting of Motor Cars

Outlining Various Systems Employed and Methods of Operation.

By C. P. Shattuck

Part XVI—Ward Leonard Automatic Dynamo.

INVENTED and perfected by H. Ward Leonard, one of the pioneers in the electrical industry, the Ward Leonard automatic dynamo lighting system, manufactured by the Ward Leonard Electric Company, Bronxville, N. Y., is the culmination of 20 years' experience in the design and manufacture of the highest class electrical control devices. From the beginning the engineering force of the company has been cognizant of the unusual requirements of a lighting dynamo for motor cars, having built gasoline automobiles from 1899 to 1903.

Six years ago a series of exhaustive experiments were begun to develop a lighting system that would be as simple to operate and maintain as the electric lights of a modern house. Four years ago such progress was made that a car equipped with the first year's model of the Ward Leonard automatic dynamo lighting system, and no other lights, made a run from New York to Lake Nipissing, Ontario, and return with perfect success. Shortly after the system was placed upon the market and the equipment described and illustrated herein includes such refinements as facilitate installation and operation.

Features of System.

Simplicity, high grade material and workmanship are noticeable qualities of the equipment which comprises a plain shunt wound dynamo of compact design, a storage battery adapted for lighting work, an automatic controller, a combination switch and distribution panel, and the necessary wiring, connectors, etc. A feature of the product of the Ward-Leonard Electric Company, and one that will appeal to the motorist as well as the manufacturer, is that each equipment is shipped complete and ready for installation.

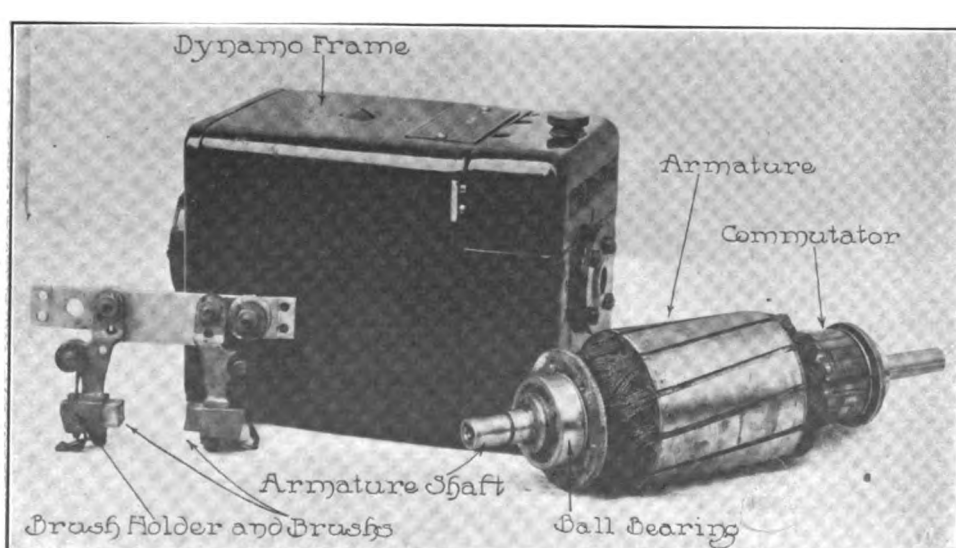

Fig. 112—The Ward Leonard Automatic Lighting Dynamo, Delivering an Output of 10 Amperes, Which Is Produced in Three Types, Having Different Driving Ratios.

By referring to Fig. 113 it will be noted that the control box has its connections made as well as the lighting switch and distribution panel. All wires are cut to the proper length and complete-

Digitized by Google

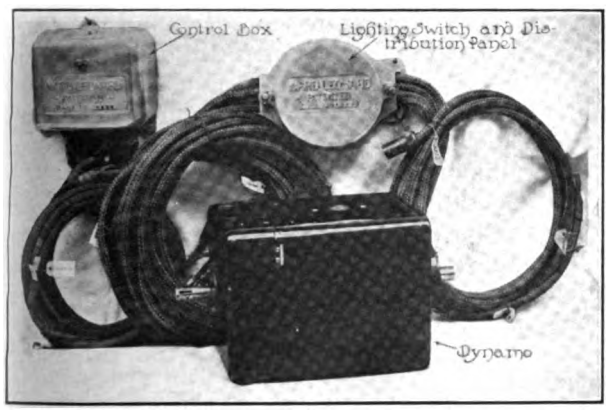

Fig. 113—The Complete Ward Leonard Lighting System Ready for Shipment.

ly equipped with connecting plugs, etc., making it an easy matter to install the system, as aside from mounting the dynamo, all that is necessary is to secure the wires by cleats. In addition to convenience, economy is effected as the services of the electrical expert are not essential.

The simplicity of the system is shown at Fig. 117, the drawing illustrating the components of the equipment, their relation to one another and the flow of the current from the time it is generated until it passes through the filaments of the lamps. It will be noted that two wires lead from the dynamo to the control relay and resistance coil, these being marked B and C, respectively. Another connection is made from the terminals A and D of the control box with the relay. Two wires, battery + and —, connect terminals A and D of the control box with the positive and negative poles of the battery. The current from the latter is led to the distribution panel, thence to the lamps, control of which is by a multiple switch combined with the panel. As the latter is assembled at the factory and the connections of the dynamo and terminals of the control box are plainly marked, it is apparent that the system is a simple one to install by those not familiar with electricity.

With a shunt wound dynamo its voltage increases with the speed, unless a method of controlling is adopted. The variable speed of the automobile not only makes it necessary to incorporate means for compensating for high ratios, but it is also imperative that the battery be prevented from discharging itself through the dynamo when the voltage developed by the latter is less than that of the battery and when the generator is inoperative. It is likewise important that the controlling device be so designed and constructed that it will operate automatically and efficiently at all times, even when the gasoline motor is raced at high speeds without load.

The device employed with the Ward Leonard system is an electrically operated switch located in the automatic controller. When the speed of the motor car, and consequently that of the dynamo, is such that the voltage developed is greater than that of the storage battery, the switch member closes and current flows to the battery, charging that member. Upon the voltage of the generator falling below that of the battery, the connection is broken.

Control of Excessively High Ratios.

As the dynamo charges the battery it is important that the latter should not receive other than a proper charging current; that is, it should be protected from high voltages which tend to destroy the plates. It is obvious that if a dynamo develops the maximum charging rate at moderate car speeds, excessive current is resultant at high ratios and to prevent the latter the speed or output of the dynamo must be controlled. In the Ward Leonard system an automatic electric switch in the automatic controller inserts a single step of resistance in the dynamo field, reducing its ampere output to a predetermined amount. When the speed of the motor car falls or equals this amount, the resistance is auto-

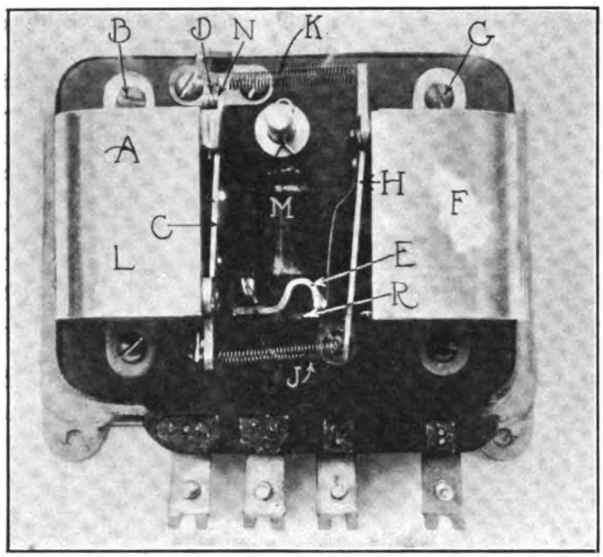

Fig. 115—The Automatic Electrical Controller with Cover Removed to Show Its Operation.

matically cut out. Thus, regardless of any high speeds the gasoline engine may attain, the amperage will remain between predetermined limits, which are proper for charging.

The generator develops a current of proper charging value at all car speeds above 10 miles an hour. When the dynamo is inoperative or its armature is driven at any speed up to that corresponding to 10 miles an hour, the current is supplied by the battery.

Construction of Dynamo.

The dynamo is illustrated at Fig. 112 and it will be noted that it is very compact. Its overall dimensions are: Length, including extension of the armature shaft, 11.1875 inches; width, five inches; height, 5.125 inches. The frame is of the best grade of electrical cast steel, carefully machined and finished. The armature shaft is of crucible steel, ground to size with a maximum variation of 5-10,000 inch. The field, commutator and armature windings are of the best quality materials, carefully impregnated to render them perfectly insulated and water proof.

The brushes and brush holders are of the radial type which the company points out has proven the most efficient and satisfactory where subjected to vibrations and shocks, as in automobile service. The commutator is ample in size and the brushes are also large in area, making for perfect commutation and eliminating arcing or sparking. The brushes are of a special composition, constructed for this particular kind of service, and the maker holds they will endure for years without attention as they are carefully fitted and tested. Imported Hess-Bright radial type of ball bearings are employed and the company emphasizes the fact that although all parts are of ample size, careful design and construction has been productive of a dynamo as compact and light as is possible with minimum heating and a minimum of speed.

Operation of Automatic Controller.

It has been explained that when the automobile attains a speed of approximately 10 miles an hour the dynamo will develop a voltage sufficient to begin charging the battery. The circuit is normally open, being controlled by the automatic electrical device illustrated at Fig. 115. When the armature of the dynamo develops a proper charging speed the coil A on the magnet core B magnetizes the latter sufficiently to attract the arm C. This arm moves toward the core B, causing contact between two spark proof points D and N, thus establishing the circuit between the dynamo and the battery and charging of the latter begins.

In a shunt wound dynamo the voltage increases with the speed of the armature and if the machine developed sufficient current for proper charging at low car speeds it would be destructive at high ratios, as previously explained. Excessive dynamo voltage would also tend to cause sparking at the brushes and commutator troubles, as well as excessive wear and heating. To prevent this the strength of the dynamo field and consequent output of the generator is dependent upon the action or contact of the two points E and R.

How Output Is Regulated.

The coil F on the magnet core G carries the armature current, and if this becomes of a certain amount (usually 10 amperes in practise) the core is sufficiently magnetized to attract the lever H. This separates the contacts E and R, and a resistance is inserted in the field circuit, weakening it. It also decreases the amperage flowing through the battery.

When the current is decreased to 9.9 amperes.

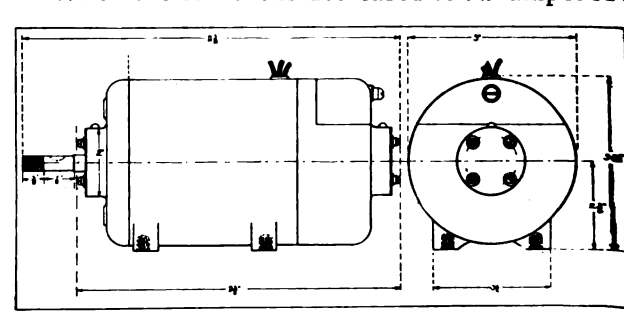

Fig. 116—The Dynamo Is Very Compact as Will Be Noted by Outline Dimension Diagram.

Digitized by Google

for example, the coil F loses its magnetism to the extent that the tension of the pull spring J is overcome and the points E and R again make contact when the full field strength is restored, and the current is augmented. It is pointed out by the maker that in practise the lever H vibrates so rapidly as to have no effect upon the lights.

The adjustment of the automatic electrical device is such that the battery will not receive a charge above the predetermined amount, 10 amperes, even when the motor car is operated at high speeds. The dynamo develops a varying charging rate having the above maximum, and a minimum of 9.9 amperes.

When the current developed by the dynamo falls below the proper charging rate, due to slow car speeds, the magnetism of the coil A is weakened so that the spring K is actuated, separating the contact points D and N. This opens the circuit between the dynamo and the battery. The auxiliary coil L is employed to insure perfect demagnetization of the core B on reversal of current.

All insulating parts of the automatic controller are constructed with special dies so as to be extremely accurate, interchangeable and heat resisting. All other components are made with special jigs and dies, and the best grade of electrical iron, brass and phosphor bronze is utilized. The device is enclosed in a compact box like member having a removable cover as will be noted at Fig. 114, which shows the cables connected to the terminals, these being lettered. The control board may be mounted in any convenient place, usually on the dash under the hood as depicted at Fig. 118, which shows the system installed upon a Locomobile.

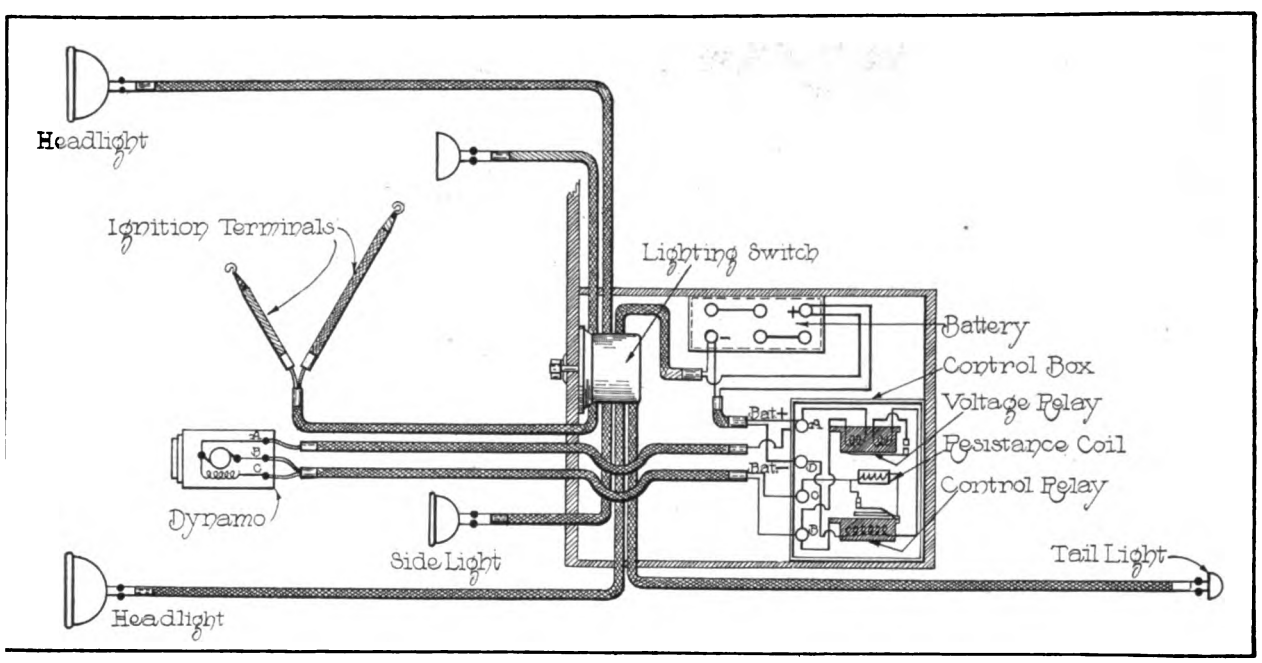

Fig. 117—Wiring Diagram of Ward Leonard System as Installed upon the Henderson Car—Note the Simplicity of Leads and Convenience of Switch Under Driver's Seat.

Wiring, Connecting Plugs, Etc.

Proper connections are an important factor in an electric lighting equipment. It is imperative that the cables should be thoroughly insulated and protected from the solvent action of oils, greases or gasoline. The material employed by the Ward Leonard Electric Company is in keeping with the high grade established by this concern, which manufactures all types of electrical motor controlling devices.

The connecting plugs are equally important, it being essential that these members be perfectly insulated, as well as of rugged construction. The company manufactures its own plugs, which are enclosed in a brass casing. Tape is not necessary, as all wires are encased in a fibre sleeve before they leave the insulation of the cable. All connections are carefully soldered, eliminating opportunities of poor contact through loose screws, etc. The brass shell of the plug is so secured to the armor of the cable that strains are reduced to a minimum. The cable connections of the battery are fitted with lead lugs, while those of the dynamo, etc., are the tubular loop type terminals. A

Digitized by Google

continuous wire is employed for each lead; that is, from the distributing board to a plug or from the dynamo to the control box, as the case may

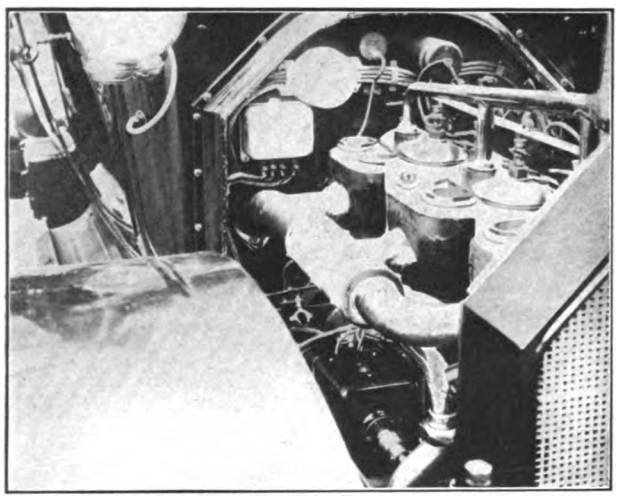

Fig. 118—Showing the Ward Leonard Dynamo Installed on a Six-Cylinder Power Plant and Driven by Magneto Shaft.

be, effectually eliminating joints and splices.

Switch and Distribution Panel.

An interesting feature of the system is the combined lighting switch and distribution panel illustrated at Fig. 114. The panel is very compact and may be mounted as convenient, and to it is led the cable from the battery. The current is distributed to the head and side lights and tail lamp by other leads, an arrangement making for simplicity. The switch is of the rotary snap type, standard electrical practise, and progressive quarter-turns of the switch key provide for any combination of lights. The key is removable, locking the system and preventing tampering with the lights. In addition to the group of five lights provision is made for a speedometer, dome, or trouble light, electric horn and ignition on the distribution panel if desired. The latter is equipped with binding posts for a separate cable for each circuit, any of which may be removed and replaced without disturbing the other members.

LBA Battery Employed.

The battery employed is a special six-volt, 80 ampere-hour capacity LBA lighting battery, manufactured by the Willard Storage Battery Company, Cleveland, O. It is maintained in a properly charged condition at all times, regardless of the fact that the automobile is operated more continuously at night than during the day. The battery is not damaged unless charged at so high a rate as to overheat, and this overheating is prevented by conditions of charge on an automobile, which prevent the formation of gas bubbles, and keep a free circulation of air around the battery.

How Equipment Is Tested.

The inspection and testing of the Ward Leonard system is very complete. All machined parts are carefully gauged by inspectors with snap gauges insuring interchangeability of all parts. The armature shafts are ground, then gauged to extreme accuracy, and all bolt holes, etc., are drilled to jigs. All cast insulation is cast in steel dies and gauged for accuracy, while every piece of cable, as well as wires in the dynamo and controller, is carefully inspected and tested for perfect insulation and mechanical strength.

Each equipment is tested before shipment, the dynamo being operated in connection with the automatic controller and storage battery at different speeds. The automatic controller is similarly tested as is each switch and distribution panel with a full group of lights to insure that all connections are secure and the system operating properly.

Care and Maintenance.

The system requires but little attention other than lubrication and replenishment of the electrolyte in the battery. The company recommends that one or two drops of oil be used about once in two weeks in the oil holes at each end of the dynamo. The battery should be inspected about every two weeks. By removing the plug member a black rubber inside cover will be revealed about an inch below the plug hole. If the electrolyte is not up to or covering the cover plate, pure or distilled water should be added until the level is reached. The connecting terminals of the battery should be examined at the same time to make sure they are tight. The positive

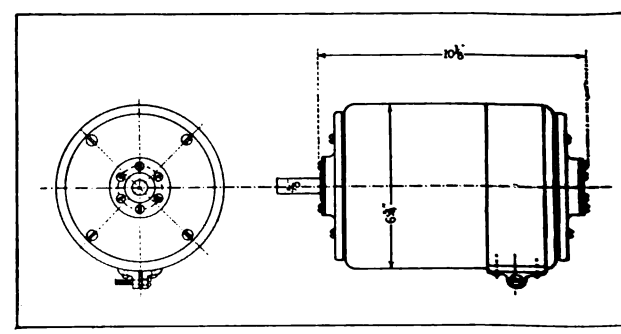

Fig. 119—Outline Dimension Diagram of Ward Leonard Series Wound Motor Starter.

member is denoted easily by the red post. The other components of the system require no attention whatsoever.

Digitized by Google

Method of Drive.

The company manufactures three standard sizes of lighting dynamos. One gives an output of 10 amperes at 500 revolutions a minute when directly connected to a four-cylinder gasoline engine. Another develops 10 amperes at 750 revolutions a minute, and is usually installed so as to be driven directly on the magneto shaft of a six-cylinder motor, as shown at Fig. 118. The third dynamo has an output of 10 amperes at 1000 revolutions a minute and is driven at a two-to-one ratio from the pump or crankshaft of the average four-cylinder motor. The company makes various modifications of the frame to meet the individual requirements of installation, but the electrical characteristics of all three dynamos are standard.

Electric Motor Starter.

The Ward Leonard Electric Company also produces an electric motor starter, which is very compact, as indicated by the dimensions given in the drawing at Fig. 119. It is of the series wound type and is usually geared to the flywheel of the gasoline motor at about a 30-to-one reduction and will rotate the crankshaft of the automobile engine at a rate of 60 turns a minute. The starting motor develops a torque of 2.2 pounds at a one-foot radius with 200 amperes of current flowing. The ordinary 4.5-inch bore and 5.5-inch stroke motor takes about one pound torque at a foot-radius to crank it at 60 revolutions a minute, and with this type of engine the Ward Leonard motor requires about 125 amperes. The motor is a six-volt, and is operated by a switch or push button as desired.

(To Be Continued.)

NEW POPE-HARTFORD MODEL.

The Pope Manufacturing Company, Hartford, Conn., has just brought out a new Pope-Hartford medium priced car of the 40 horsepower, four-cylinder type. In every detail the characteristic Pope thoroughness is in evidence. To do the new car full justice without impairing the efficiency of the old models, a new four-story factory building was added to the big Hartford plant.

The new Pope has many striking features and is a car of luxury as well as power. The Gray & Davis electric system of starting and lighting has been adopted after an exhaustive search of various electric systems. A new four speed, roller bearing transmission, designed to give the greatest possible flexibility to the speed of the car and a remarkably efficient full floating rear axle are also numbered among the specifications.

The machine has a wheelbase of 118 inches and is eminently adapted to town use. The Pope-Hartford long stroke motor is calculated to produce speed and great pulling power on the hills. Other details are: Leather cone clutch with cork inserts, semi-elliptic front and three-quarter elliptic rear springs, large brakes, double-drop frames and 36 by 4.5-inch tires with demountable rims. A liberal equipment is provided and the car is exceptionally handsome in appearance.

COLORED SPEED LIGHTS.

The proposal of the city council of Los Angeles, Cal., to act on the recommendation of the police commission of that city that all automobiles operating in Los Angeles streets be equipped with an automatic device flashing colored lights for different rates of speed, has caused considerable comment among automobile dealers generally. The practicability of the device and its benefits are questioned by the most experienced automobile men, who urge as well the tremendous burden it would impose on automobile owners and the ease with which any such device could be manipulated by unscrupulous speeders. A vigorous protest against such an ordinance has been made by the automobile dealers of Los Angeles.

DEFINING TOURING ROUTES.

Supt. Reel of the New York state highway department, acting on the suggestion of Frank L. Lyon, secretary of the New York State Automobile Association, has officially designated the main highway routes of the state by colors for the convenience of motorists. Five routes have been announced and Deputy Commissioner Foley, in charge of state improved highways, has been instructed to begin coloring the routes at once. Fences and bridge approaches, telephone and telegraph poles will be banded in colors and maps will be prepared showing the color scheme as outlined. Connecting routes will be designated by combinations of colors later.

The main routes as named follow: Blue, New York to Buffalo, by way of Poughkeepsie, Albany, Schenectady, Utica and Syracuse; red, New York to Jamestown, over the route known as the "Overland Trail;" yellow, New York to the Canadian border and return, skirting the Adirondack mountains; green, Binghamton by way of Albany and Rouses Point to Niagara Falls; brown, Oswego to Binghamton by way of Syracuse and Cortland.

THE AMERICAN INVASION.

During the past year the French motor car manufacturer has added his protest to that of the British producer against the so-called American invasion. French and British engineers have been visiting the United States in an effort to learn the manufacturing methods by means of which the low priced machines are produced in such quantities that the whole world is sought as a market for them. Now, Great Britain seeks to erect a tariff wall, and France is watching the outcome of the proposition.

Concerning the subject an English periodical recently had the following to say: "The American car manufacturer has had a public to deal with almost totally ignorant of motoring or motors. Conditions of acceptance by it have been simple enough. The car was to be cheap, to be built to traverse the bad roads found in the United States, and to require no skilled attention."

On the face of things the first count of this indictment appears the most serious. However, there is little doubt that the American motorist can plead "not guilty" without fear of being surpassed in knowledge by the rank and file of foreign owners. As to the other three counts, it would appear that if a car were constructed to withstand the poor roads in this country, where the Romans failed to bequeath good ones, there should be no trouble on this score abroad. That they require no skilled attention surely is not a serious accusation. If they are low in price it would appear that there was little to hinder foreign producers from meeting this price if they care to do so.

FIRST MOTOR DRIVEN LINER.

During the first years of Queen Victoria's reign in Great Britain, the world of science was much interested in the problem of crossing the Atlantic by depending upon steam and steam alone. The results accomplished by the Great Western and its sister ships always have been looked upon as establishing a new means of world transportation and as marking a new era in the world's history. Other vessels had made use of steam power, one having rounded Cape of Good Hope, but with these the steam boiler was not depended upon to the exclusion of the sails and the latter were expected to take up the work whenever the steam plant should fail, through lack of fuel or for any other reason.

Last month the Christian X, of the Hamburg-American line, arrived in New York harbor, being the first motor driven liner to cross the Atlantic. Other boats, of minor size, have sailed the high seas depending entirely upon the hydrocarbon motor, but this is the first time a regulation liner has ventured upon the trip with no no trace of funnel or other propelling power, the space usually given over to the steam boilers and coal bunkers being taken up by Diesel internal combustion engines. It marks the beginning of another era in the world's shipping.

AN EXCHANGE OF COURTESIES.

Occasionally one of the Massachusetts towns decides to abolish its speed traps and place the motorist on his honor not to violate the provisions of the automobile law. The plan should work well, since if a town secures unfavorable advertising among motorists because of the obnoxious speed traps it should receive the best the

Digitized by Google

motorist can give in exchange for courtesies extended. When the plan does not become a success, it is due to the thoughtlessness of certain drivers who are not only a menace to pedestrians and occupants of horse drawn vehicles, but other automobilists as well.

Another suggestion for an exchange of courtesies is made by the people of Nashville, Tenn., who believe that the motorist would win many friends by inviting pedestrians to occupy a vacant seat when overtaken on the highway. The Nashville Tennessean says, "Such slight courtesies as this make a marked impression upon the parties to whom the kindness is shown, and are helpful as well to the car driver."

Perhaps it is because motor vehicles have become employed so generally that owners no longer think of the pleasure they may give by extending little courtesies of this nature.

ALCOHOL AND ARTIFICIAL RUBBER.

The increase in the price of gasoline since the first of the year has been such as to cause those engaged in the sale and use of automobiles to inquire more definitely into the reason therefor. The producers of this fuel declare that the present situation is the result of the law of supply and demand. While the growth of the motor car industry has been increasing rapidly, the production of crude oils from which gasoline is made has been decreasing.

Much experimentation has been made with alcohol as a fuel for the hydrocarbon engine. It is stated that this costs 20 to 22 cents a gallon in Germany, while in America the price is nearer 50 cents. It is understood that an experimental station at Noroton, Conn., has been working on this problem in a quiet way for some years, but is not yet ready to make public its findings. It is held by some engineers that one gallon of alcohol will do the work of three gallons of gasoline. It is certain that the industrial world is turning its attention to this subject in a manner little realized by the majority of people.

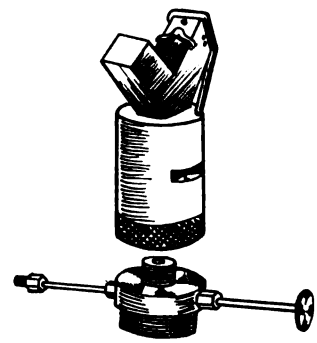
The tire problem is another which has occasioned much discussion among motorists. Among the papers read at the recent international rubber exposition in New York City, was one by A. Crosbie Roles, special commissioner from Ceylon, in which he stated that rubber, selling in New York at about $1.15 a pound, was being produced in Ceylon at a cost of 15 cents a pound. Here again the law of supply and demand appears to have entered into the situation, but it is stated that the application of this law will be modified somewhat when the rubber plantations now in process of formation shall have attained their growth.

In the meantime, the attempt to produce synthetic rubber on a commercial basis is being pushed with all possible vigor. There seems to be a wide difference of opinion regarding the ultimate success of this experimentation, however. In a recent address before the international congress of applied chemistry in New York City, Dr. Carl Duisberg, director general of the Farbenfabriken Company, Eberfeld, Germany, declared that synthetic rubber would appear upon the market in a very short time. But he gave as his opinion, and in this several other engineers present agreed, that the wonderful success expected of it in reducing the present price of rubber was still a long way in the future.

PAYING FOR GOOD ROADS.

Elsewhere in this issue, Albert S. Callan, author of the present automobile law in New York State, is quoted as saying that in his opinion the legislature would soon call upon the motorist to bear a greater proportion of the expense for maintaining improved highways. This statement was made in an address in which he cited the hope that the proposed $50,000,000 bond issue for good roads would receive the support of the people at the polls this fall.

It is sincerely to be regretted that Mr. Callan should have deemed it necessary to create this situation in the present campaign for good roads in his state. The danger that the legislature will attempt to compel the motorist to assume more than his just share of the expense in such matters is always present, but it is soon enough to combat that issue when the time comes. New York needs good roads, and the bond issue should be approved. The other proposition can be met when it comes before the legislature and it should be met with the same determination as it is presented. The $50,000,000 worth of good roads in New York State is not going to benefit the motorists alone.

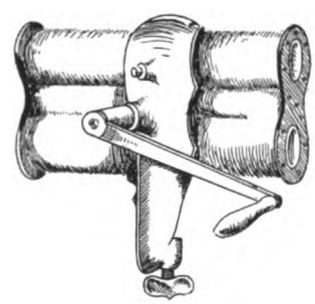


Digitized by Google

NEW AND NOVEL ACCESSORIES THAT APPEAL TO MOTORISTS.

The Advance Adapter and dashboard regulator is a new product of the Advance Motor Specialties Company, 508 South Dearborn street, Chicago. The complete outfit comprises a dashboard regulator of acetylene and adapters for the kerosene lamps. The latter screw into the oil members in place of wicks, which are carried in the tool box for emergency. The company points out that this arrangement provides for kerosene, gas and electric lights in the side and tail lamps. All lamps fitted with the acetylene adapter are lighted by a spark, and gas is conducted to the burners by small tubing with solderless joint connections. Each adapter is fitted with a needle valve for regulating the flame or shutting off the supply of gas which is lighted by pushing a button. The regulator handle of the dashboard equipment is removable, locking the device, and the sparking tips of the burners are so designed that they are not injured easily.

★



The Hawthorne Tire Pump, made by the Hawthorne Manufacturing Company, 29 Spruce street, Bridgeport, Conn., is a compact, four-cylinder unit which may be carried easily in the tool box or any other convenient place in the car. It may be attached to the running board in a few seconds by a clamp device, and the largest sized tire can be pumped up quickly. The pump is provided with four cylinders which produce a constant flow of air to the inner tube when the handle is rotated. The design of the pump is such that little exertion is required to operate it, and being constructed of high grade material it is very durable. Each equipment is provided with ample hose, enabling the inflating of all four tires without changing the position of the pump.

Advance Adapter

Coronet Recorder

Hawthorne Pump

Security Reliner

★

The Coronet Recorder, manufactured by F. Baumgaertner, 2344 East 105th street, Cleveland, O., is a recording device constructed in the form of a hub cap, which member it replaces upon the automobile. The device is self-contained, is not attached to the axle and operates on the gravity principle. The maker states that it will register the mileage covered both forward and backward up to 100,000 miles, or up to 10,000 miles, showing 10ths. It is dust and weather proof and is designed so as not to be tampered with by the operator. Its accuracy is guaranteed for two years.

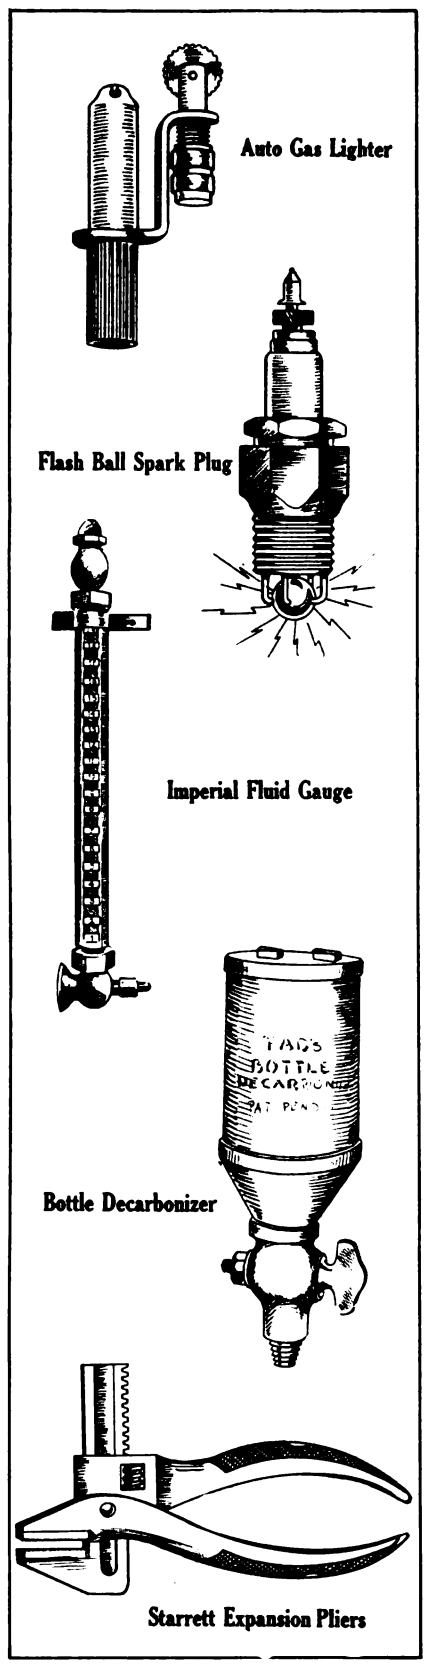
★

The Security Reliner, as the name implies, is a lining for casings which the maker, the Security Reliner Company, Inc., Montgomery, N. Y., states is two tires for one. It is constructed to conform to the shape of a casing and covers the entire inside, including the bead, preventing blow-outs when the shoe is rim-cut. That portion of the reliner that comes in contact with the tire is covered with a self-vulcanizing compound made by the company, and the device is attached by moistening the surface with a little gasoline. The Security reliner comes wrapped in air-tight wax paper, packed in a neat carton and may be carried easily in the car.

★

The Auto Gas Lighter is produced by the Auto Gas Lighting Company, Fountain

Digitized by Google



City, Ind., and is used for lighting lamps employing acetylene. It comprises the burner and lighting device as a unit and replaces the ordinary member. An arm or extension of the burner carries a small wheel, which when rotated by the thumb or finger, gives off a shower of sparks in the path of the escaping gas. The igniting member is adjustable, does not interfere with the reflected light, and may be renewed from time to time. There is but one gas outlet in the burner proper. It is made both for automobile and motorcycle lamps.

★

The Flash Ball Spark Plug, manufactured by the Toledo Auto Devices Company, Gardner building, Toledo, O., is novel in its design in that the central electrode terminates in a sphere or ball. The maker points out that this member acts as an accumulator of current and that the spark developed between it and the four contact points of the shell is of greater intensity than other forms of plugs. It is also stated that the ball deflects the sparks into the mixture, increasing the efficiency of the motor because a larger amount of the vapor is converted into useful energy. The plug is made in .5-inch standard, A. L. A. M. and metric threads and is moderately priced.

★

The Imperial Fuel Gauge, manufactured by the Imperial Fluid Gauge Company, Dayton, O., possesses among other qualities that of indicating the amount of gasoline in the tank, the registering device being so constructed that it may be attached on the dash in plain view of the operator or at any other convenient place. A substantial glass tube, graduated

to correspond to the capacity of the fuel tank, is mounted in a metal frame. The fluid is led to the bottom of the tube through a valve, which may be closed if desired, and a float in the tube rises with the gasoline, indicating the quantity on hand. The gauge is adaptable for either gravity or compression feed systems and throughout solderless connections are utilized. Among the advantages claimed for the device are: It indicates the amount of fuel in the tank, quantity consumed by the motor, detects loss of gasoline by leaks or flooding of the carburetor and indicates the amount received when purchasing. The gauge and equipment is inexpensive.

★

Bottle Decarbonizer is the product of the Toledo Auto Devices Company, Cleveland, O., and the container holds about four ounces of a special liquid decarbonizer which is utilized when the motor is running warm. The bottle is provided with a gas tight valve, at the end of which is an adapter for screwing into the spark plug opening. The decarbonizing material is inexpensive and the maker claims that by using it regularly about every 500 miles the disassembling of the motor will not be necessary. The device is of brass, highly polished and compact.

★

Starrett's Expansion Pliers, manufactured by the L. S. Starrett Company, Athol, Mass., will appeal to motorists who desire a tool that will perform the function of a monkey wrench and pliers when either of these tools is not practical for the work to be performed. The Starrett device may be employed to start and loosen rusted nuts or

Digitized by Google

bolts, and the jaws may be expanded to fit large sized parts. The pliers are constructed of the same high grade material for which the maker is noted.

★

The Egyptian Mixer, is manufactured by the R. D. Loose Mixing Chamber Company, 110 North Fifth street, Springfield, Ill., and is a patented device for completing the vaporization of fuel after leaving the carburetor. It is inserted in the intake pipe between the vaporizer and the cylinders and any particles of gasoline not aerated are broken up and converted into useful vapor by the mixer. The maker claims that greater mileage is obtained upon a gallon of fuel and that the design is such that it may be attached easily to any type of induction pipe, etc.

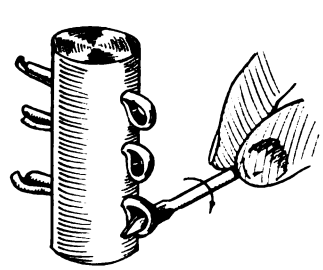
★

The Bray Roni Burner, imported by the William M. Crane Company, 20 West 32nd street, New York City, differs from those of usual construction in that it is fitted with but one aperture through which the air passes, and the maker claims that the atmosphere destroys all carbon, obviating clogging of the gas way. It is also claimed that should the opening become clogged the flaring flame will shoot sideways instead of up, and that danger of broken mirrors through excessive heat is eliminated. The Roni burner is designed to withstand a pressure of 4.5 inches.

★

Ford Injector Bolts, produced by the Home Light Manufacturing Company, 2108 Dayton street, Chicago, is a specially drilled bolt for the Model T Ford motor. They replace the four bolts which retain the cylinder head and permit the utilization of priming cups without alteration of the water jacket. They also may be employed for equipping the motor with an acetylene starting system. To install the bolts it is only necessary to drill four .375-inch holes through the inner wall of the cylinder head. The bolts are so marked that the installation is an easy matter. Lock nuts having concave washers and asbestos packings are employed, making the device gas tight. The bolts and priming cups are moderately priced.

Egyptian Mixer



Bray's Roni Burner

Ford Injector Bolts

Hi-Po Dry Cell

Campbell Cotter Pin

★

The Hi-Po Dry Cell, manufactured by the Lincoln Electric Company, 1007 Atlantic avenue, Brooklyn, N. Y., is an improvement over ordinary batteries in that it is water proof. This quality is obtained through a patented process of manufacture and one it is said that absolutely protects the cell against all outside influences, such as moisture, heat, etc. Each unit is sealed in an insulated case and the maker points out that it may be left standing in water without danger of short circuiting. Because of its construction greater efficiency and longer life is assured.

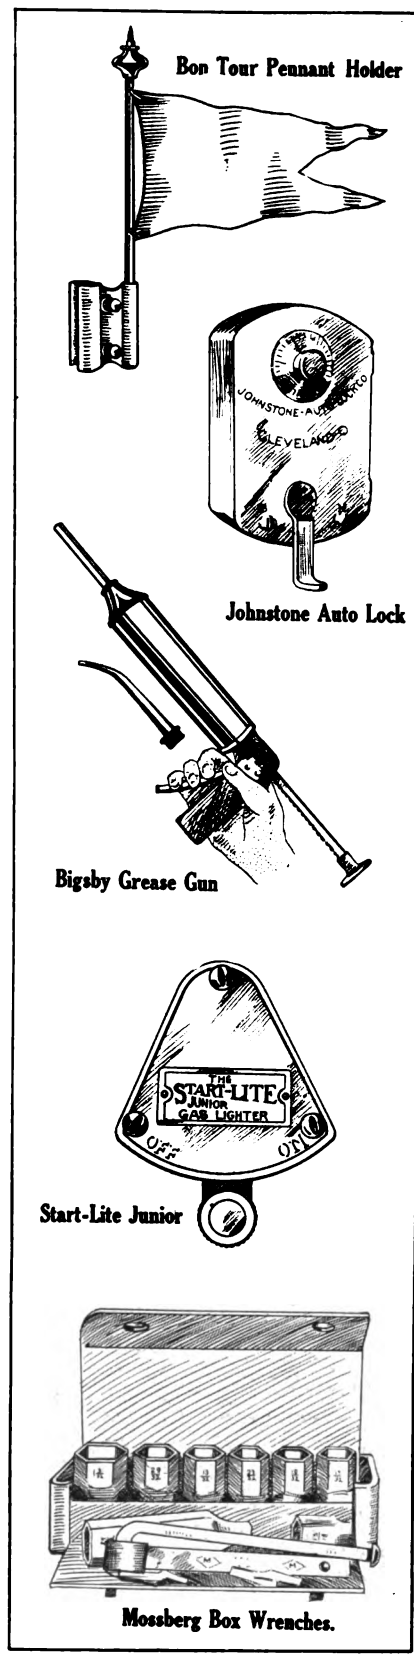
★

The Campbell Cotter Pin, which is being manufactured by the inventor, A. C. Campbell, Waterbury, Conn., possesses features which will appeal to the motorist and repairman as it is easily fitted and removed and may be used over again as many times as desired. It is constructed of half-round wire, but is bent in a different manner than the ordinary pins. The Campbell pin is constructed with two limbs of unequal length and has an offset eye. The tip of the long portion is bent at an

Digitized by Google

angle across that of the short member so that when the pin is inserted and the eye given a blow with a hammer the tips will engage as shown in the illustration, causing them to separate. The pin may be removed easily with a screw driver as twisting the eye section returns the pin to its original shape. The Campbell pins come in a nickel screw top box containing 125 assorted sizes.

★



The Bon Tour Pennant Holder is produced by the Bon Tour Manufacturing Company, Cobleskill, N. Y., and is designed for attachment to the frame of the windshield. The retaining member is a two-part clamp adjusted by means of locking screws, a design facilitating attachment and removal. It is provided with an 18-inch rod having two rings, to which is secured the pennant, etc. The holders come in pairs and are finished in brass, nickel or oxidized.

★

The Start-Lite Junior is a new lighting device brought out by the Start-Lite Company, 1502 Michigan avenue, Chicago, maker of the Start-Lite lighter. The new device operates on the same principle as the original lighter, controlling the flow of acetylene from the tank to the headlights, and enables the lighting of these members without the driver leaving the seat. It operates on the same principle as a switch and is easily installed.

★

The Bigsby Grease Gun, marketed by the Bigsby Manufacturing Company, Cleveland, O., differs from the usual member in that its operation is automatic and only one hand is essential in its employment. The plunger or rod is provided with teeth which register with similar members of the actuating mechanism enclosed in a handle having a lever. Compressing this lever operates the rod, which forces the grease to the parts to be lubricated. The design of the gun is such that gasoline, oil or grease may be used. The usual washer is replaced by a metal piston ring. When desired the gun may be employed as a syringe by giving a half-turn to the rod.

★

The Johnstone Auto Lock, manufactured by the Johnstone Auto Lock Company, 874 Rockefeller building, Cleveland, O., is a device for locking the ignition system, preventing thereby the operation of the car or its loss by theft. It comprises a pressed steel box which is secured over the coil on the dash, by screws inside. It is fitted with a combination lock to open which a dial is rotated to certain numbers. The combination may be changed from time to time as desired. The lock is neat and compact and can be attached in a few minutes.

★

The Mossberg Wrench outfit, manufactured by the Frank Mossberg Company, Attleboro, Mass., is a valuable addition to the tool equipment of the cars as well as the garage. It comprises a number of socket members, varying in sizes adapted to the components of the motor car, and a folding operating member adapted to fit the sockets. An extra long socket member is provided, also screw driver attachments. The construction of the socket holders is such that considerable leverage may be exerted upon frozen or rusted nuts. The material and workmanship are of the best and the tools come in a neat, folding case. It is moderate in price.

Baron Freederichsz, general aide-de-camp of the Czar of Russia and president of the Imperial Automobile Club of Russia, has written a letter of invitation to American Ambassador Curtis Guild to attend a great international automobile exhibition at St. Petersburg in the spring of 1913. The Russian club is now organizing for 1913 and plans for the show are being made. In his letter the aide-de-camp shows the attitude of the Czar towards the motor car, as follows:

"His Majesty, the Emperor, in view of the increasing interest in automobiling in our country and on account of the important role which the automobile is called upon to play from the industrial, agricultural and public service points of view, has deigned to grant to this exhibition his high patronage. The necessary steps to attract exhibitors from different countries have already been taken by the Imperial Automobile Club of Russia. On my side I take the liberty of addressing these lines to your excellency, begging you to lend us your valuable assistance and to inform the ministry of commerce and industry of your country of our plans, explaining to it the special importance of this exposition, of which His Majesty, the Emperor, is patron and which is being organized with the assistance of the government and under the honorary presidency of the president of the council of ministers."

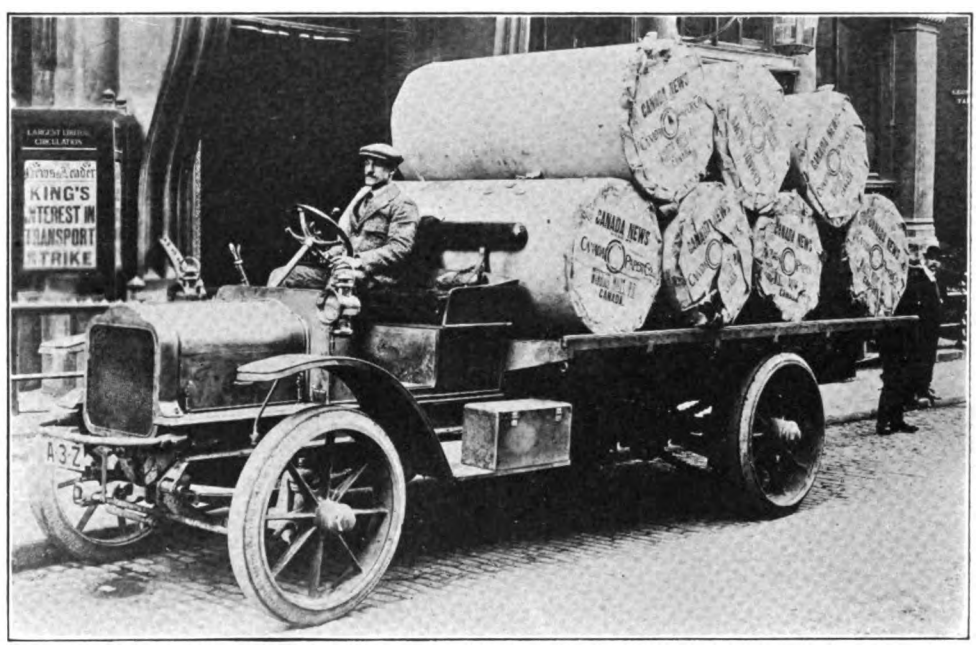
In view of the fact that Russia has but few automobiles within its borders and is just awakening to their importance from a commercial point of view, American manufacturers, by exhibing at the coming show, can succeed in opening up a most lucrative field for future trade.

—— * ——

An accompanying illustration presents the new Camion travelling workshop, which was purchased recently by the French government, for use by the army while in the field. As outlined the equipment is adapted particularly for use by the aviation corps, although its nature is such that it may be utilized quite as advantageously in connection with the motor vehicles in the army, or for other repair work which may appear necessary.

New Camion Travelling Repair Shop, Recently Purchased by French Army.

The illustration shows the vehicle ready to take the field. When a stop is made, both sides are let down upon specially construct-



Digitized by Google

ed standards. The interior equipment includes a lathe, grindstone, carpenter's shop, vises, etc., all operated by electric energy, supplied by the vehicle motor. It is maintained that with this machine it is possible to undertake all manner of repairs.

—— ★ ——

Until recently the business men of Great Britain were little impressed by the possibilities for competing with railroads in making deliveries of merchandise over restricted areas within easy access of the larger centres. Undoubtedly, it was the action of the London Daily News, and other concerns, in utilizing trucks during a recent strike, which brought this situation most forcibly to their attention. The News began its trials with a three-ton White, made by the White Company, Cleveland, O., and the results were so satisfactory that it not only purchased this vehicle, but has ordered others.

Now comes the information that the Inter-Transport Company has been organized in London for the purpose of maintaining a daily specified schedule of motor truck deliveries over a certain radius from such cities as London, Manchester, Glasgow, Birmingham and Dublin. Eight five-ton Berna trucks have been put in service, and the experience thus far obtained would seem to indicate that the equipment would be doubled within a very short time.

Three-Ton White Truck in Service with London Daily News for Hauling Paper Stock.

—— ★ ——

It is announced that thus far this year American automobiles have been sold in Victoria, Australia, to the value of $443,992 and the large share of this trade was secured through the enterprise of American manufacturers and exporters. Automobiles of all sorts were purchased, but their commercial value is now becoming recognized, a fact which bids fair to greatly increase the future trade. According to a Victoria newspaper economy has resulted in the rapid increase of automobiles. It says:

"One hundred cars a week. This is the roll of Victoria's purchases. The man in the street might be inclined to say that the great prosperity of the country has urged the people to extravagance. A careful consideration of the subject, however, would prove that in the majority of cases economy was the real reason. It is not so much a matter of pleasure, but of service that brings the people in to get a car, in fact a saving in every way. The farmer without a car can no longer compete with the farmer with one. With good roads and a good car, important business journeys can be accomplished and work resumed again on the farm while the horses would still be plodding on the way. The business people of the cities are awakening to the fact, too, that they must employ the motor. Thus it will be easily seen that the growth of the car and the extension of its field of operations are evidences of economy rather than extravagance and as time goes on the numbers now sold must soon be doubled."

—— ★ ——

England promises to have, in the near future, a universal automobile lighting law, as several of the shires are following the lead of Warwickshire in enacting bylaws which require all vehicles to carry red rear lights. Flintshire has just enacted such a bylaw and Cheshire and Leicestershire have similar ones in course of passage. With the enactment of these bylaws it is proposed to have the government secure a statutory enactment making rear lights compusory on all vehicles, motor and horse drawn alike.

Digitized by Google

S. O. Ochs of the Russian-American Mercantile Company, St. Petersburg, is much amused at the protest of the British automobile manufacturers against the so-called invasion of English territory by low priced American machines. He expressed himself on that point at London when he said:

"I am selling machines made by the Hupp Motor Car Company, Detroit, maker of Hupmobiles, and the only difficulty is in the matter of slow deliveries. With quicker delivery I could sell 10 machines where I can now sell only one. The same is true of the Cadillac, the Ford and other low priced machines.

"This means that the American automobile has invaded not only England, but the Continent as well, and its superiority is recognized. Automobiles are not made for automobile builders. They are built for automobile users. Therefore, I would rather have the opinion of the automobile user, for he is the man who pays the bill."

—— ★ ——

In the Federated Malay states, British India, the railway administration which has been making extensive progress with its railway lines, now operates a motor car service for passengers, mail and parcels between Klang and Kuala Selangor, 28 miles, and between Kuala Kuba and Kuala Lipis, a distance of 80 miles. While this service, considered alone, has never paid its way, the loss in 1911 being $30,605, it has undoubtedly had the effect of increasing the earnings of the rail lines considerably and has contributed much toward opening up sections remote from the railway. In this, as in some other respects, the benefits of a state-owned line are obvious. In 1910 45 cars were operated, including six motor trucks, the total number of miles covered being 311,254 and the total number of passengers carried being 249,894.

—— ★ ——

The entries for the O'Gorman trophy in England this year have been very encouraging and a spirited contest is assured. The last time the race was run was in August, 1910, when three Vauxhall cars led in the procession. This year two Vauxhalls are entered, one to be driven by A. J. Hancock and the other by Percy Lambert. R. S. Witchell will drive a Straker-Squire, C. L. E. Geach a Singer, G. Tysoe, Singer; C. Bianchi, Crossley; H. C. Lambert, Crossley. Other machines entered are: Two F. A. B. cars and one Vivinus.

Interest in motoring in Scotland has steadily increased and there has been a decided addition to the number of people who have taken an active part in the work during the past season, as is shown by the fact that the Scottish Automobile Club has increased its membership, which now exceeds 2000.

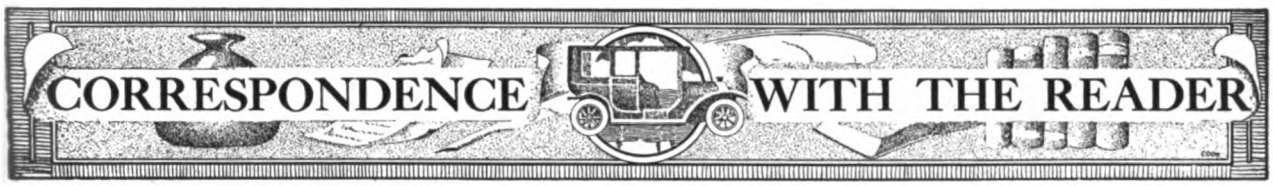
—— ★ ——

A "No Mud" association has been formed at Paris, France, and as a result of its activities the municipal council has decided to hold a competition for splash guards. The examinations are for motor 'buses only and if a successful device appears its use will be required by ordinance.

—— ★ ——

That the manufacturers of automobiles in this country are more than holding their own against foreign competitors is shown by the report of the imports and exports of automobiles during the month of July, as compiled by the bureau of foreign and domestic commerce. While the exports of American machines showed a decided increase over the corresponding month a year ago, the imports showed a decrease, the only foreign country showing an increase over its last year's record being France, which outstripped all its competitors in the number of automobiles shipped into this country.

The total amount of the imports during July was $155,251, of which three machines, valued at $7000 were exported back to their respective countries, leaving the total net imports for the month at $148,251, as against a total export record for the same period by the United States of 1635 cars, valued at $1,702,637, or a balance of $1,554,386 exports in excess of the amount of imports. Following are the export and import records for the month:



Exports.

	1911		1912	
Country	No.	Value	No.	Value

Lighting by Magneto.

(1437)—I have a Wizard magneto which develops eight volts and 22 amperes at 2400 revolutions a minute. I would like to inquire if I could use it to charge a storage battery, for ignition work on the car and for lighting the lamps. Will you please send me a wiring diagram? K. J. WALLACE.

Brockton, Mass., Sept. 25.

The magneto referred to generates a direct current which is necessary to charge a storage battery. A rectifier is employed, when an alternating current is utilized.

The magneto could be used for charging purposes, but owing to the fact that it would be necessary to employ some form of a regulator to control its output, as well as to prevent the discharge of the battery through the magneto, the cost of the equipment would not warrant the expense involved.

It may be explained that with the lighting dynamos or generators utilized in connection with some electric lighting systems for motor cars, the speed of the machine is controlled or regulated by mechanical or electro-mechanical devices. These are essential, as at excessive high ratios the current developed would be stronger than the lamps could withstand and the filaments would be destroyed. Similarly, when the generator operates at low speeds the current would not be sufficient to heat the filaments to an incandescent state. The constant variations would produce flickering of the lights, an undesirable factor in car lighting.

In systems where the battery is floated upon the line, and the current is drawn from it for lighting and ignition, the generator is provided with some means of cutting it out from the battery when its voltage falls below that of the battery. It is also important that the speed of the generator be so controlled that it will not develop other than proper charging current, as excessive voltages would ruin the battery.

The magneto referred to could be employed for lighting, provided lamps were fitted which are equal to the highest voltage developed by the machine. Of course, at low speeds the bulbs would not be productive of a brilliant light. The subject of lighting motor cars by electricity is being discussed in serial form in The Automobile Journal, and wiring diagrams of lighting magnetos were presented in the issue for June 25.

Loss of Power.

(1438)—I have a 1911 model E-M-F and am experiencing trouble in climbing hills. Is there any way I can remedy this? I will be very thankful for any information. A SUBSCRIBER.

Milwaukee, Wis., Sept. 23.

The motor probably needs overhauling and a general tuning up. If it has been operated for some time and carbon has accumulated, it is a good plan to remove the cylinders and scrape out all deposit. The valves may not seat properly and may require regrinding or refacing. The timing of the valves should also be tested as the intake members may open too late, preventing the cylinder from receiving the proper charge of mixture. The valves should be adjusted by the flywheel timing method, checking up each member carefully.

In the overhaul the cylinders should be inspected as well as the piston rings, especially if the compression is poor. Ignition and carburetion are important in the development of maximum efficiency of the power plant and both these systems should not be overlooked in the work. If not familiar with the operation of overhauling the motor it is advisable to consult the expert repairman.

Lining up Pistons.

(1439)—In replacing pistons in cylinders when assembling a motor after the overhaul, which is the best method of obtaining the correct adjustment on the connecting rod bearing: First, place the piston in the cylinder, then make connections to crankshaft; second, connect connecting rod with piston to crankshaft and then replace cylinders? DOUBTFUL.

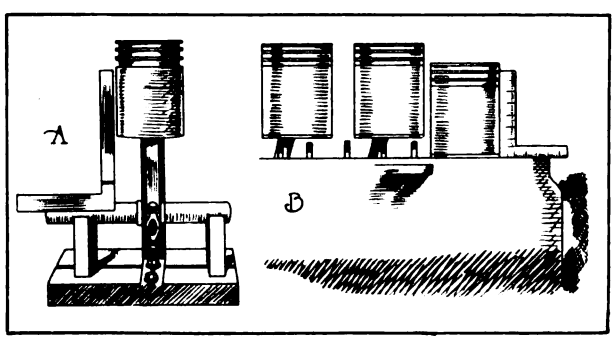
Danbury, Conn., Oct. 2.

It is presumed from the question that the bearings have been scraped in and that the reader is doubtful as to the alignment of the piston. There are two methods of testing the position of the piston and these are presented in an accompanying illustration. That at A is performed after the bearings have been scraped in and consists of slipping the large end of the connecting rod on a mandrel or bar which itself rests upon a couple of V blocks, the latter having a base consisting of the usual surface plate.

The piston is supported by a bar at the rear which keeps it upright. A square having a V shaped base, which fits on the mandrel, is held against the piston, behind which is placed a sheet of white paper. The white line between the edge

Digitized by Google

of the set square and the piston enables the operator to note whether the width varies. If the piston prove to be out of line it is best to set the connecting rod slightly in the vise than attempt to rectify the error in the bearing surfaces at either end.



At B is presented a method of testing the alignment with the try-square when the piston and connecting rod have been replaced and tightened. The tool is placed upon the crankcase as illustrated in the drawing and any misalignment will be noted readily.

Irreversible Steering Gear.

(1440)—Is the Ross steering gear for trucks of the reversible or irreversible type and how is the latter obtained? A. J. WHITMAN.

White Plains, N. Y., Oct. 4.

The Ross Gear & Tool Company, Lafayette, Ind., manufactures two models of steering gears for commercial vehicles and both are of the irreversible type. The steering wheel is tapered

Illustrating Methods of Testing Alignment of Pistons: A, Employing a Square with Connecting Rod Attached to a Mandrel; B, Showing Operation When Connecting Rod Is on Crankshaft.

and keyed to a tube, the lower end of which carries a steel screw, which when turned by the wheel gives a phosphor bronze sleeve longitudinal motion. The bronze sleeve, which is threaded to receive the screw, has spirals on its external face. These spirals have a very long lead in comparison to the threads on the steel screw. The malleable iron housing has spirals on its interior which engage the spirals on the bronze sleeve.

When the sleeve is given longitudinal motion by the steel screw, it also is given a rotative motion by the spirals on its exterior. The bronze sleeve, in addition to being interiorly threaded, contains a number of straight internal keyways. The lower steering arm, which projects half way up into the gear, has keys milled on its surface which fit keyways within the phosphor bronze sleeve so that when the sleeve is given rotative and longitudinal motion it operates the steering arm. The difference in pitch of the steel screw and the bronze sleeve causes the gears to be irreversible in their action.

T Head and L Head Motors.

(1441)—What is the advantage, if any, of the T head type of motor over the L head design? Is either type more efficient than the other or more accessible for adjustment, repairing, etc.? INTERESTED READER.

Oswego, N. Y., Oct. 4.

Among the advantages claimed for the T head type of motor is that its external components are accessible, such as the magneto, carburetor, water pump, etc. There are, however, many L type motors which are equally accessible as the T type and some are more easy to work upon. With the T type the valves are divided, the intake being on one side and the exhaust on the other. With the L type, the valves are all located on one side. With some designs of the latter type the valves are even more accessible than with some of the other design. Regarding efficiency as well as accessibility, it would depend upon their respective design and construction.

Linoleum or Rubber.

(1442)—The rubber mats on my car having become badly worn and discolored, I am contemplating renewing same. Which is the better material to use, rubber or linoleum? A. J. L.

Wichita, Kan., Sept. 30.

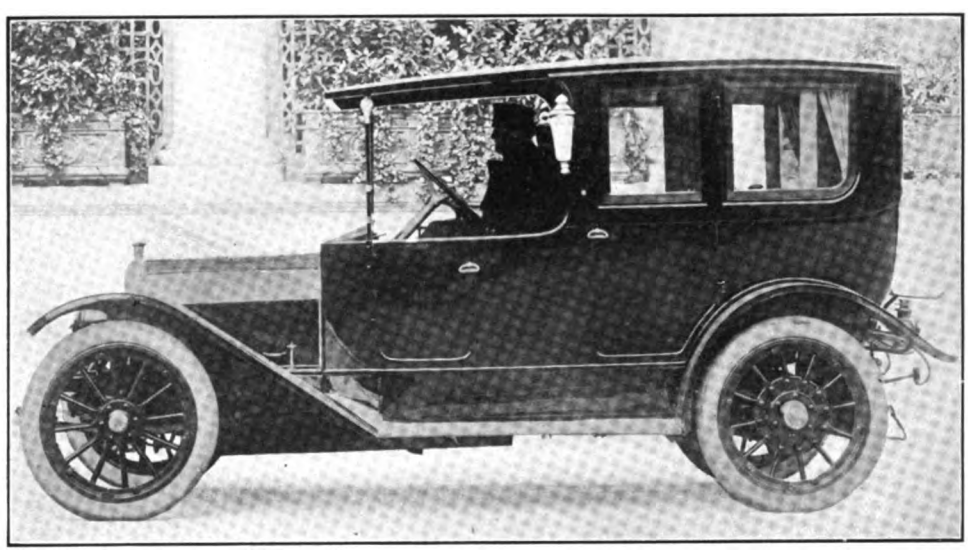
It is largely a matter of taste. Rubber has the disadvantage of wearing, being difficult to clean and becoming soiled easily by lubricants, which soften the material. Linoleum is cleaned easily and if a good grade is employed, the pattern will not disappear with wear. It also has the advantage of being maintained easily in a presentable condition.

Timing Battery Ignition.

(1443)—Some time ago I had my four-cylinder car overhauled at a repair shop and since then have been unable to start the motor on the spark even when the engine is hot. When the spark lever is fully retarded and the switch on, the coil does not buzz as it did formerly. If I advance the lever until the coil buzzes, it does not start. What is the cause and how may the trouble be corrected? IGNITION.

Norwalk, Conn., Oct. 7.

If the motor formerly started on the spark it should continue to do so. It is very probable that in the overhaul the repairman timed the distributor or timer earlier than formerly with the result that when the motor comes to a stop, the contact member of either of these devices is not in a position to close the primary circuit and cause a spark to appear in the cylinder charged with gas. If the lever be advanced until the next contact is made a back fire is likely to ensue and



Digitized by Google

the motor may become damaged in consequence.

The trouble may be remedied by retarding the timer or distributor by unloosening the retaining screw or nut and moving the roller or distributor arm slightly, and in the same direction as it rotates. This will cause the contact to be made later. The buzz of the coil will denote the contact and it should be made with the lever in a fully retarded position. By gradually moving the roller or arm the desired position may be secured and the motor should start upon the spark, provided, however, other components of the engine are in proper condition.

NEW MERCER LIMOUSINE.

Anticipating a brisk demand for closed cars during the coming fall and winter, the Mercer Automobile Company, Trenton, N. J., maker of Mercer cars, has brought out a new limousine, which is expected to make an instant appeal and which will be known as the type 35E. As shown in an accompanying illustration this body is fitted to the regular Mercer 35 AB chassis, and it will be noted that it presents a decidedly low and attractive appearance. An idea of its height may be judged from the fact that a man a little taller than the average can stand on the curb and look over the top.

New Limousine Body Fitted to 35 Horsepower Chassis by Mercer Automobile Company.

The interior is trimmed in Weis & Co.'s broadcloth, and all of the appointments are in the best of taste. Following the usual Mercer practise, the spare tires are carried in the rear, leaving both sides clear. Four people can be seated in comfort in the rear compartment, two collapsible seats being built into the upholstery facing the rear. When not in use these are so arranged that they may be closed down and form a part of the upholstery. The chassis has a wheelbase of 118 inches and the entire assembly is expected to make an ideal winter car for city and suburban use. The entire design is with a view to comfort and attractive appearance.

GOODYEAR SUCCESS RAPID.

C. W. Seiberling, vice president of the Goodyear Tire & Rubber Company, states that it will be necessary to keep the Goodyear factory in operation 24 hours a day the entire year, except for two weeks in October to overhaul machinery and make repairs. This activity is necessary to meet demand for Goodyear no-rim-cut tires. The growth of the company's business the past 12 months has been phenomenal. "In all," says Mr. Seiberling, "the company has now 67 branches, 11 of which are in Canada, 55 in the United States and one in Mexico, with a new field being opened in England, Australia, South Africa and European countries.

Commenting upon the increased business of the Goodyear company, he intimates that during the past year it has been found necessary to extend its distribution system, and from September, 1911, to September, 1912, direct factory branches have been opened at Albany, N. Y.; Dayton, O.; Kansas City, Mo.; Denver, Col.; Newark, N. J.; Oakland, Cal.; Omaha, Neb.; Portland, Me.; Rochester, N. Y.; St. Paul, Minn.; Spokane, Wash.; Salt Lake City, Utah; Syracuse, N. Y.; Worcester, Mass., and Mexico City, making a total of 16 new branches in the past 12 months. New Goodyear buildings have been erected the past year at Grand Rapids, Wis.; New York City; Baltimore, Md.; Buffalo, N. Y.; Columbus, O.; Birmingham, Ala.; Kansas City, Mo.; Louisville, Ky.; Minneapolis, Minn.; Memphis, Tenn.; Newark, N. J., and Philadelphia.

THE MODEL B SPLITDORF MAGNETO.

The Model B Splitdorf magneto, manufactured by the Splitdorf Electrical Company, Newark, N. J., is standard equipment on several makes of cars, and the instrument generates a low-tension current which is built up or converted into a high-tension by a transformer coil having a low and high-tension winding somewhat similar in construction to the coil employed with the battery and coil system of ignition.

A cross section of the magneto is shown at Fig. 2, the illustration depicting the general con-

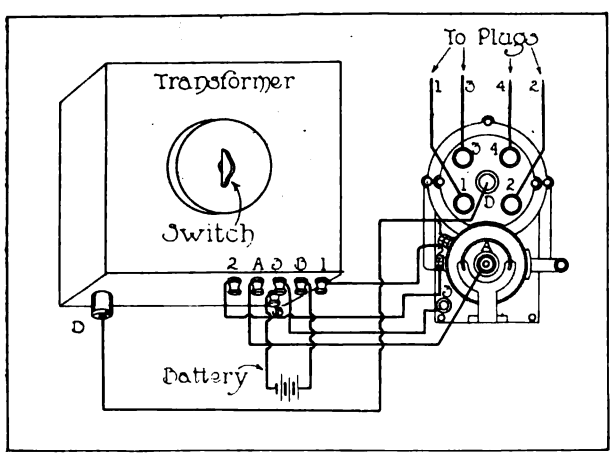

Fig. 1—Illustrating Wiring Plan of Model B Splitdorf Magneto.

struction of the machine, and it will be noted that the armature is of the shuttle type and is mounted upon two annular ball bearings. One end of the shaft is the driving end while the other is equipped with the breaker cam and insulation plug, which delivers the current generated in the armature to the collector brushes, whence it goes to the transformer connection.

The breaker box is an important factor in magneto operation as it not only times the spark in the cylinder, but interrupts the primary current generated by the magneto. The operation of breaking or interrupting is performed by cams on the shaft, these members lifting a breaker bar which is equipped with a roller. The end of the breaker bar is provided with a platinum point which normally is in contact with a similar member. The latter is adjustable by means of a screw and lock nut, and by changing the position of the screw the points are made to separate early or late as is necessary for proper timing. In operation the spark may be advanced or retarded by moving the breaker box assembly by means of a timing lever connected to the spark control lever on the steering wheel.

Operation of Magneto.

The low-tension current generated by the magneto is collected by brushes and led through the primary wire A of Fig. 1 to the transformer coil, and the circuit being broken at the proper moment a high voltage current is induced in the secondary winding of the coil. This high-tension current is conducted from the coil by the cable D to the central brush D of the distributor whence it is delivered to the different cylinders in correct sequence. This distributor operates on the same principle as a distributor of the coil and battery system of ignition.

A dual system is provided by utilizing dry cells or a storage battery. The transformer is employed as a spark coil by utilizing the mechanism of the circuit breaker to interrupt the current from the battery, permitting the one set of spark plugs to be employed. The distributor is utilized to deliver the current to the plugs as with the magneto system.

In the event the wiring becomes broken or disarranged through accident or in the overhaul of the power plant, the wiring diagram presented at Fig. 1 will be of value. It will be noted that both poles or leads from the battery are connected to posts properly marked for identification on the transformer and the battery must not be grounded.

Digitized by Google

Timing Magneto.

Assuming that the magneto has been removed from its base and the coupling was not marked for resetting, the instrument must be retimed. First bolt or attach the magneto to its base on the motor and rotate the flywheel of the engine until the first cylinder—usually that nearest the radiator—is on the firing stroke; that is, the piston is at the top of the compression stroke. Next connect the rods actuating the timing lever of the magneto to the lever on the steering wheel and retard the hand lever to its limit. If the magneto shaft rotates in a clockwise direction looking at its driving end, the breaker box lever should be at its topmost position. If the armature revolves anti-clockwise or left handed, the lever should be at the bottom and will be advanced upward. At Fig. 2 C is illustrated the circuit breaker arrangement with the left hand magneto, looking at it from the driving end.

Adjusting Contact Points.

Next, revolve the armature shaft by hand in the direction of its rotation until the oval cam breaker comes in contact with the roller on the breaker bar and just begins to separate the platinum points. The points should begin to separate when the armature core leaves the pole piece as shown at Fig. 2 C. It is important that the position of the bronze sector of the distributor be ascertained and this may be observed as indicated at C. It must be remembered that the direction of rotation of the distributor is opposite to that of the armature shaft as the distributor is mounted upon a gear driven from another gear on the armature shaft.

Connecting Cables.

The direction of rotation of the distributor is necessary when connecting the high-tension cables from the cups to the spark plugs. The firing order of the motor must be known and as all four-cylinder, four-cycle engines fire either 1, 2, 4, 3 or 1, 3, 4, 2, it is an easy matter to watch the intake valves to determine the order of firing.

Assume that the distributor sector is in contact with the No. 1 cable as indicated in the wiring diagram at Fig. 1, and the motor fires 1, 3, 4, 2: Here the distributor is rotating clockwise and as the next cylinder to explode is the No. 3, the cup above the first member in the drawing is connected by cable with the third cylinder of the motor. The next contact to be made in rotation is the cup marked 4 as the fourth cylinder fires next. The second cylinder is the last to explode and to this is secured the wire leading from the cup marked 2. It should be borne in mind by the novice making connections that while the distributor sector completes a circle the cylinders do not explode in 1, 2, 3, 4 order, but 1, 3, 4, 2. By following the wiring diagram the amateur should experience no difficulty in correctly installing the cables.

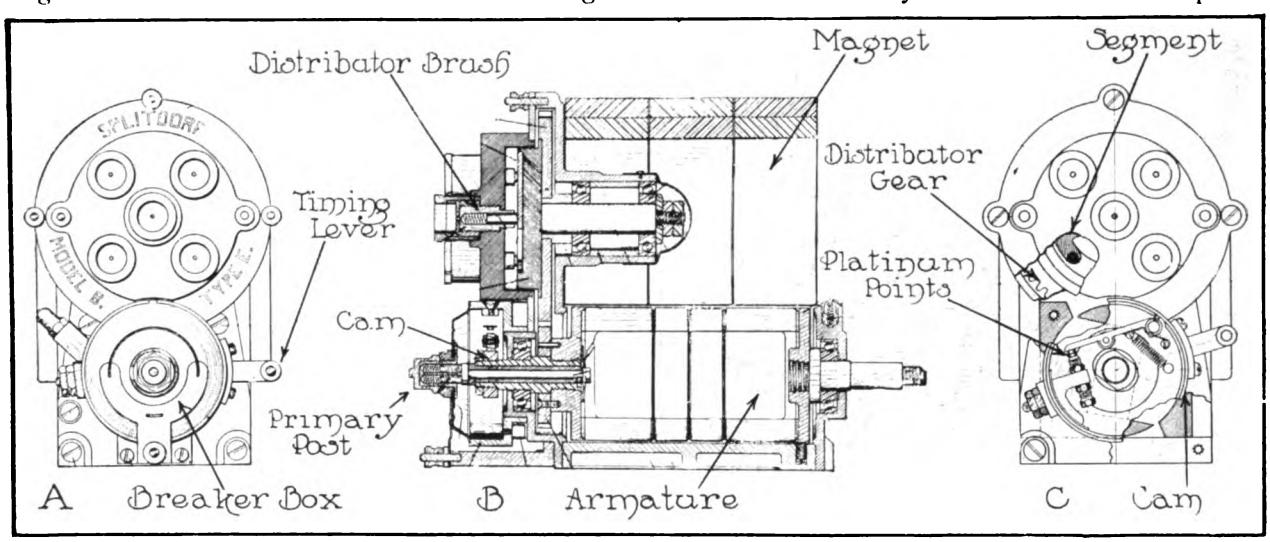

Fig. 2—The Model B Splitdorf Magneto: A, Showing Breaker Box End; B, Cross Sectional View Depicting Construction and Components of Instrument; C, Illustrating Breaker Box, Cam and Contact Points and Arrangement of Distributor.

Although the magneto is so designed that it may be changed to operate from clockwise to anti-clockwise, or vice versa, it should not be attempted by the novice, although the operation may be performed easily by those familiar with the construction of magnetos.

The magneto requires little if any attention other than lubricating the little roller on the breaker bar. This should be oiled about once a

Digitized by Google

month by applying a little lubricant with a toothpick. It should be just lubricated, not flooded. The annular ball bearings are packed in grease, but the company recommends a drop of oil in the oiler at each end of the armature shaft about once in 30 days, depending upon the mileage of the car.

Care of Platinum Points.

If the platinum contact points become pitted after considerable service, they may be smoothed by utilizing a jeweller's fine file, taking care not to remove too much of the metal. In resetting the adjusting screw the break should not be more than .03125 inch to obtain maximum efficiency and a cool motor. In replacing points it is advisable to use the best grade of platinum, and as all parts are interchangeable it is recommended that new points be secured from the factory.

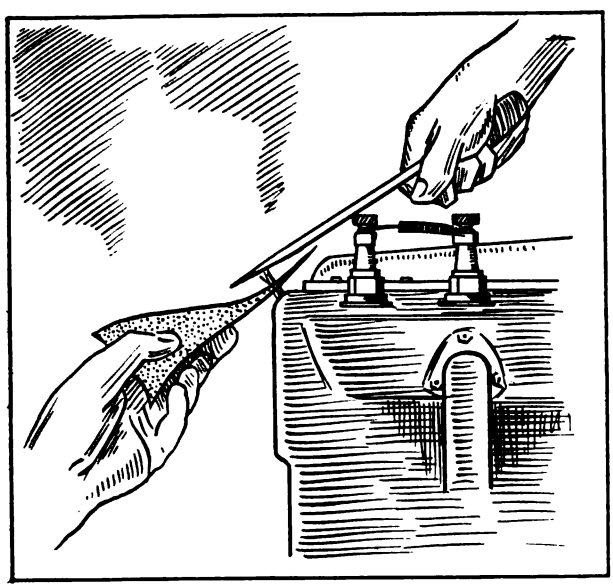

Fig. 3—Showing How a High-Tension Current May Be Employed to Ignite Paper When Matches Are Not Available.

Aside from lubricating, cleaning and adjusting the contact points, the novice will do well not to try to improve the operation of the magneto, and it may be stated that the majority of trouble experienced with these members is occasioned by the driver tampering with the instrument.

THE MATCHLESS LIGHTER.

The average motorist has experienced the annoyance of endeavoring to light the lamps upon the road with a gale of wind blowing. Invariably the supply of matches becomes exhausted before the lamps are lighted and if it occurs upon a country road the driver is obliged to wait until some passing machine, team or pedestrian makes it possible to secure means for lighting the lamps.

A simple method of securing a flame is illustrated at Fig. 3. It is a well known fact that the spark produced by the high-tension current will ignite thin paper if the current is passed through the material. It is not necessary to remove the plug from the motor or to stop the engine.

Take a screw driver with a wooden handle and with the motor running, touch the metal blade of the tool to the terminal of a spark plug as shown in the drawing. The end of the blade should be held within .25 inch of the cylinder and a piece of paper inserted in the gap across which the current will jump and ignite it. If the material does not ignite easily by this method it may be rendered combustible by wetting the end to be lighted slightly with kerosene or gasoline.

If the motor is equipped with a battery and coil system, one cylinder may be turned up on compression until the vibrator buzzes and the screw driver employed as indicated in the drawing. This will give a continuous stream of sparks until the connection is broken. In grasping the screw driver care should be taken not to touch the metal of the tool else one is likely to experience a shock. One end of the paper should be twisted to prevent its being consumed too quickly by the flame.

PROTECTING GAS TUBING.

Acetylene, whether derived from the generator or supplied by a tank, is too expensive to be wasted, yet it is surprising to note the number of motorists who are careless regarding the installation of the tubing conducting the gas to the lamps. Aside from the waste there is an element of danger from fire to say nothing of the disagreeable odor of the escaping acetylene.

Where rubber tubing is employed it should not be passed through metal, such as the splash aprons, without being covered by some sturdy insulating material, especially if the rubber is subject to vibration. A few cents will purchase at any electrical supply house enough protective tubing to cover all exposed sections. There is also marketed a flexible metal tubing designed for carrying piping, wires, etc.

Few drivers make it a practise to inspect the condition of the tubing connecting the main line to the lamps, etc. Usually the operator delays the work until the smell of escaping gas denotes

Digitized by Google

that the rubber is cracked. Deterioration of the tubing is caused by the exposure to the air which dries and hardens the rubber and the vibration of the car assists in the cracking process. Several manufacturers of cars now equip the acetylene lighting system with tubing covered by braided linen. This prevents the air from reaching the rubber and not only prolongs the life of the tubing, but also adds to the appearance of the machine.

ATTENTION TO STEERING GEAR.

The importance of going over the steering mechanism and its connections has been pointed out in these columns and too much emphasis cannot be laid upon the necessity of periodical inspections. In some types the steering column is supported by an adjustable bushing or bearing secured to the dash and retained by screws. Where the floor boards are of aluminum and the retaining members threaded into the material, any play of the plate will tend to destroy the threads of the floor member. Invariably it means reboring the metal and tapping out new threads as well as fitting new screws. By going over these members from time to time and testing for play, the motorist will save repair bills.

CONVERTING TERMINALS.

Some makes of cars are equipped with high-tension cables having terminals with closed ends. This compels the motorist to employ a spark plug having a screw terminal or nut, or else fit the clip terminal. The ordinary members may be converted easily by taking a pair of cutting pliers and cutting out a slightly V shaped piece, which will permit of sliding the jaws over plugs fitted with solid connecting posts. The converted terminals may also be used with screw top plugs.

TIRE PUMP HINTS.

Many times the tire pump is condemned as faulty and thrown away when a little work would place the member in good operating condition. It should be borne in mind that the pump has to overcome the pressure of the inner tube valve and as the tube becomes inflated the pressure is increased.

When the pump packing or washer on the plunger becomes dry, air will escape past these members, a condition usually denoted by a hissing sound. The remedy is to unscrew the cap on the pump cylinder, pull out the plunger and soften the packing with a little hard grease. It is advisable to allow the grease to soak in thoroughly over night before reassembling the parts. If a leather washer is fitted, and it has become compressed, open the material as an umbrella.

If caught upon the road with a pump that cannot apparently overcome the pressure in the tube, loosen the valve by unscrewing and it is surprising how easily the tire may be inflated. The valve should be readjusted after the work and tested for leaks.

COMING EVENTS.

October.

Oct. 9-19—Electrical show, New York City.
Oct. 12—Track meet, Salem, N. H.
Oct. 12—Track events, Springfield, Ill.
Oct. 26—Desert race, Los Angeles-Phoenix.

November.

Nov. 6—Track events, Shreveport, La.
Nov. 8-16—Olympic show, London, England.
Nov. 16-23—Show, Atlanta, Ga.
Nov. 28—Track events, New Orleans, La.

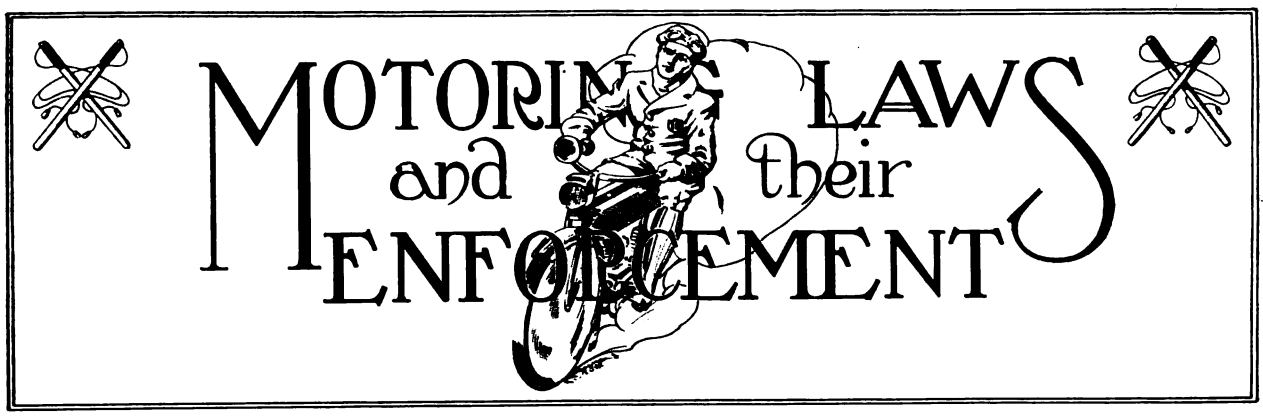
December.

Dec. 7-20—Automobile Salon, Paris, France.

1913.

January.

Jan. 4-11—Show, Montreal, Can.
Jan. 6-11—Show, Cleveland, O.
Jan. 11-18—Show, Madison Square Garden, New York City.
Jan. 11-18—Show, Grand Central Palace, New York City.
Jan. 20-25—Commercial car shows, New York City.
Jan. 20-25—Show, Philadelphia, Penn.
Jan. 27-Feb. 1—Show, Detroit, Mich.



February.

Feb. 1- 8—Show, Chicago, Ill.
Feb. 1-March 1—Show, Cincinnati, O.
Feb. 10-15—Show, Minneapolis, Minn.
Feb. 15—Show, Richmond, Va.
Feb. 17-22—Show, Kansas City, Mo.
Feb. 24-March 1—Show, Omaha, Neb.

March.

March 3- 8—Show, Pittsburg, Penn.
March 8-15—Pleasure car show, Boston, Mass.
March 17-22—Show, Buffalo, N. Y.
March 19-26—Commercial show, Boston, Mass.
March 24-29—Show, Indianapolis, Ind.

REGISTRATION AND RECIPROCITY.

Fifteen out of 35 states which have passed motoring laws covering the subject, permit full reciprocity to non-residents. Some of the commonwealths, the residents of which strongly advised New Jersey to repeal its obnoxious clause against visiting motorists, while nominally in the reciprocity column, really grant no reciprocity, insofar as residents on border states are concerned.

Special reference may be had to Massachusetts, which grants an exemption for 10 days in one calendar year. The same thing may be held to apply to New Hampshire and Pennsylvania, and in a similar measure to Rhode Island. This exemption is of benefit to the tourist, but even North Carolina, which requires all non-residents to register, makes an exception of those who are crossing the state.

The original idea appears to have been that of compelling residents of border states to contribute their proportionate share for the maintenance of roads which they helped to destroy. It may be remembered that this was the argument advanced by New Jersey for not granting reciprocity in any form. The special reference to Massachusetts is made because merchants in Springfield, Pittsfield, North Adams, Fitchburg, Haverhill, Newburyport and other cities near the border have found that residents of Connecticut, Rhode Island, New Hampshire, Vermont and New York fail to visit their stores as regularly as they might be expected, for fear of being arrested or compelled to take out a special automobile license. Naturally, a movement is on foot looking toward an amendment in the law, permitting full reciprocity, such as is granted by Connecticut, Vermont and New York.

An accompanying table sets forth the exemption granted to non-resident motorists in the several states, and it also presents the registration provisions. For instance, the registration in Alabama expires annually on Oct. 1, and the fee is $7.50 to $20, according to the horsepower. This table, as well as others which have appeared in these columns from time to time, shows the desirability of uniform laws covering these matters.

	Expires	Fee	Exemption
Alabama	Oct. 1	$7.50-20	reciprocity
Arkansas	Dec. 31	$5	reciprocity
California	perpetual	$2	temporarily
Connecticut	Dec. 31	50c hp.	reciprocity
Delaware	Dec. 31	$5	reciprocity
Florida	perpetual	$2	30 days
Georgia	perpetual	$2	30 days
Illinois	Dec. 31	$4-10	60 days
Indiana	perpetual	$1	reciprocity
Iowa	Jan. 1	*40c hp.	reciprocity
Kentucky	annually	$5-20	reciprocity
Maine	Dec. 31	$5-15	30 days
Maryland	Jan. 1	$5-25	†$14 days
Massachusetts	Dec. 31	$5-25	10 days
Michigan	Dec. 31	$3	reciprocity
Minnesota	triennially	$1.50	30 days
Mississippi	annually	$5-25	30 days
Missouri	Jan. 31	$2-10	20 days
New Hampshire	Dec. 31	$10-40	10 days
New Jersey	Dec. 31	$3-10	15 days
New Mexico	Sept. 30	$11	60 days
New York	Jan. 31	$5-25	reciprocity
North Carolina	July 1	$5	‡
North Dakota	Jan. 1	$2	temporarily
Ohio	Jan. 1	$5	reciprocity
Oregon	Dec. 31	$5-10	30 days
Pennsylania	Dec. 31	$5-15	10 days
Rhode Island	annually	$5-25	20 days
South Dakota	perpetual	$1	reciprocity
Utah	perpetual	$2	temporarily
Vermont	Dec. 31	$1 hp.	reciprocity
Virginia	Jan. 1	$5-20	†14 days
Washington	June 1	$2	reciprocity
West Virginia	perpetual	$1	reciprocity
Wisconsin	Dec. 31	$5	reciprocity

*Less than 20 horsepower, $8; †two periods of seven days each; $reciprocity with certain states by governor's proclamation; ‡only cars passing through the state are exempt.

UNIFORM TRAFFIC LAWS NEEDED.

With the increasing use of motor cars, not alone for touring, but for interstate and interurban business purposes, the necessity for uniform

Digitized by Google

traffic regulations in America is becoming more and more apparent. And it may be cited that other vehicles using the highways need these uniform regulations quite as much as the automobiles.

There are some 200 cities in the United States which come within the classification where traffic regulations are needed or are in force. In one, slow moving vehicles are required to keep near the curb, while in the next they are not so required. In some, all vehicles must stop with the right side to the curb, while in another exactly the opposite is true. One city makes it imperative that drivers shall look to the rear before turning to the left across traffic, or signal with the hand, while in another these precautions are not required or heeded when given. The list might be continued almost indefinitely.

LARGER FEES IN NEW YORK STATE.

In an address before the automobile school of the West Side Y. M. C. A. in New York City, Albert S. Callan, author of the present automobile law in that state, declared that the legislature would be compelled to increase the license fees for motorists in the near future. He said in part:

I declare myself unalterably in favor of a state constabulary; one whose actions can be controlled by the governor of New York and whose make up will be similar to that of the army. Punishment for the crime must be commensurate with its gravity, so we could honestly construe that a mere violation of a speed ordinance was not a prison offense, but rather one upon which a fine should be placed. But I believe that in our present law we took the strongest grounds possible against the drunkard and he who would strike and leave a helpless victim by the side of the road or street. This latter clause unfortunately has been declared unconstitutional, although a similar law has been held legal by the supreme court of Missouri.

The present law is not perfect. It does not meet all requirements, but I believe it has gone a long way toward remedying conditions which we are trying to bring about, and I sincerely trust that those who may handle further legislation along these lines will remember that far greater good will be accomplished if they bear in mind that construction is better than destruction.

This fall there will be placed before the people a proposition to issue $50,000,000 worth of bonds for the building, or rather completion of the present highway system. I sincerely hope it will pass, for we in the country need these roads as well as the people in the cities. But their maintenance, it has been estimated, will cost in the neighborhood of $6,000,000 a year, and I am seriously impressed with the belief that the legislature not far in the future will ask the automobilist to contribute a greater license fee to maintain these roads as they should be.

CHICAGO'S ORDINANCE INVALID.

The ordinance passed by the city council in Chicago some time ago, forbidding the making of smoke by motor car and motorcycles, has been declared invalid by Judge Freeman Blake in the municipal court. Steps already have been taken to carry the matter to the supreme court, Judge Blake having signed a certificate of importance in order to secure an early adjudication. One hundred and fifty-six cases were thrown out of court by the decision.

In another Chicago court Judge Robinson fined the owner and occupant of a car $50 and costs for exceeding the speed limit, although the chauffeur was arrested. "The game of putting the blame on the chauffeur will not be tolerated by me," declared the court in discharging the original defendant.

ONLY BULB HORNS AT NIGHT.

The Automobile Club of Maryland, Baltimore, Md., has found it necessary to call the attention of non-resident motorists to the fact that the state law respecting the use of mechanical or electric warning signals, as well as that concerning muffler cut-outs, is being rigidly enforced. The law reads as follows:

Within the limits of cities, towns or villages in this state, only horns blown by means of a hand pressure on a rubber bulb, or small electric bells of moderate sound shall be used during the period of one hour after sunset to one hour before sunrise. It shall be unlawful for any operator of a motor vehicle to operate such motor vehicle without an adequate muffler or to cut out the muffler at any hour of the day or night within the limits of any city, town or village of this state.

WILL TEST NEBRASKA LAW.

Levi L. Curyell of Nemaha county, Nebraska, maintains that the provision of the state motoring law, which denies any person under 16 years the right to operate an automobile is unconstitutional. He feels so sure of his ground that he has appealed to the supreme court a case in which he was fined $5 on each of three counts, one for allowing his son under 16 to drive an automobile, the second for driving in a careless manner, and the third for turning back into the road within less than 30 feet of a team.

HINGHAM ABOLISHES SPEED TRAPS.

As a result of a campaign conducted by the Hingham Motor Club, Hingham, Mass., the board of selectmen has voted unanimously to abolish the speed traps heretofore conducted in that city, and instructed the chief of police to post men in uniform to direct automobile traffic. Chief James is in full accord with this action and has instructed his men to use the utmost courtesy with motorists, placing them upon their honor not to violate the laws.

Progress of Aerial Navigation.

Mechanical Details and Features of Construction.

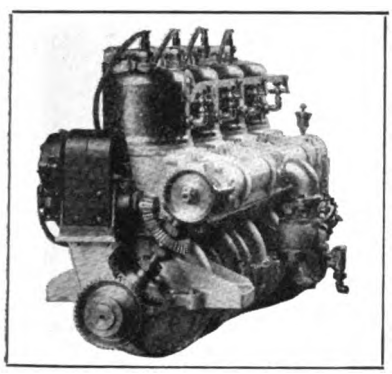
FOX DELUXE AERO MOTOR.

The Dean Manufacturing Company, Newport, Ky., makes the Fox DeLuxe aero motors in five models. Three of these are of the vertical type, with three, four and six cylinders, and of 45, 60 and 90 horsepower respectively, and the other two are of the opposed, with four and six cylinders and 60 and 90 horsepower. The bore and stroke with each is 4.75 by 4.75 inches. That illustrated is the four-cylinder, 60 horsepower unit. All are of the two-cycle, water-cooled type.

Intake Side of Four-Cylinder Fox DeLuxe Motor, Presenting Rotary Valve Housing.

The company has been engaged in the manufacture of motors for the past nine years and every engine is built completely, from pig iron to the finished product, tested and shipped from its own factory.

The crankcase and water jackets are made of special aluminum castings and the cylinders and pistons of a special composition of gray iron, all of which are cast in the company's own foundry. The water jackets are of spun aluminum and of such design that it is claimed for them that they are entirely impervious to heat and extremely light in weight. At the same time they are easily removable. The crankshaft is of a special analysis chrome nickel steel, and the main crankshaft bearings are held to be unusually long, a feature which makes for long life in a high speed motor.



Although the two-port, two-cycle type is utilized on the ordinary Fox motors, those designed for aerial use are constructed on the three-port principle, and the chief characteristic of the Fox DeLuxe is the patented fourth port, which admits air and air only. The air enters through the lowest opening in the cylinder. Thence it passes through a bypass on the side of the cylinder, where the fourth port is uncovered by the upward stroke of the piston immediately after the uncovering of the third port.

The incoming fuel charge through the third port is deflected toward the bottom of the crankcase, while the air through the fourth port is deflected toward the top, where it is pocketed inside the piston until the intake port is uncovered, when it rushes through it into the explosion chamber in advance of the fuel charge. By this means it is held that the exhaust or burned gas of the previous charge is expelled by air, and whatever part of the incoming charge is wasted by going out with the exhaust is air and not gasoline vapor.

Among the advantages claimed in this arrangement are the following: The burned gases are expelled without waste of fuel. It leaves the fresh charge, mostly air, in the cylinder instead of burned gas, and helps to cool the piston and cylinder before the fuel enters. The exact amount of air is mixed with the incoming gas to secure the best possible mixture and the maximum efficiency from every charge, since the fourth port admits additional air at high speed

Digitized by Google

when a weaker mixture is more efficient and economical. It increases the speed of the engine 12.5 per cent. with the same setting of the carburetor, because by increasing the port area at high speed a full charge of fuel is drawn into the crankcase and later compressed in the cylinder. It increases the intake port area at high speed, avoiding the undesirable use of check valves, but when closed gives much greater ease of starting, greater velocity to the incoming fuel charge, and a better mixture at slow speeds.

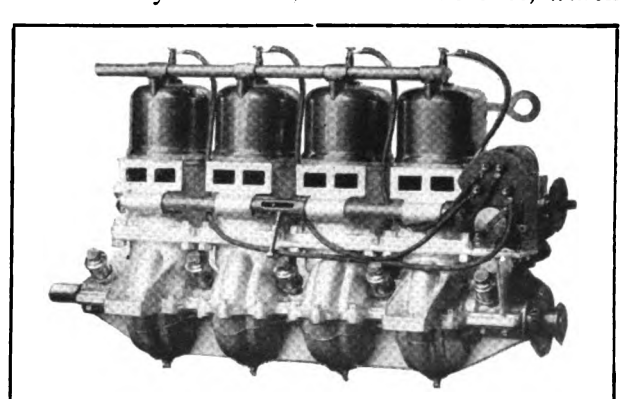
End View of Fox DeLuxe Model, Indicating Magneto Mounting, and Other Features.

In the DeLuxe models this fourth port is located directly on each cylinder and has one control and only one opening for air between the second and third cylinders on the right hand side of the motor. The exhausts open directly to the air without a manifold, except when ordered specially with the manifold, this arrangement having been made to save weight.

Opposite the exhausts is located the rotary valve manifold, a new feature with these models. Fuel is taken into this manifold, either through the carburetor or by direct injection, and is distributed by the rotary valve to the different crankcases, entering each through a screen. As it passes from the crankcase into the cylinder after compression it again passes through a screen, this being held to eliminate all danger of backfiring into the crankcase.

The rotary valve is closed just before the end of the upward stroke of the piston and the fourth port remains open until the piston returns to cover it. Two carburetors, either of the Schebler or Kingston make, are a part of the equipment for general use. In addition there is a small rotary hand gasoline pump for the direct injection of fuel to the rotary valve. It is maintained that the inclination of the aeroplane or the motor does not affect the gasoline supply, no matter what the position of the tank, as no float is utilized.

Cooling water is circulated by means of a rotary pump located at the forward end of the motor and driven directly by the rotary valve shaft. The water from the radiator passes through the pump, thence along the underside of the rotary valve and is distributed to each cylinder, circulating around the exhausts until it reaches the top of the cylinders, where it is drawn off through a manifold running across the cylinders to the radiator.



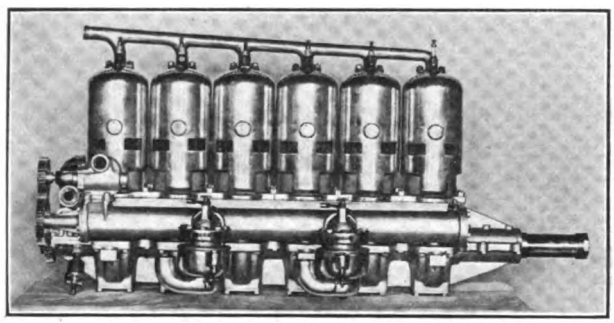
Ignition is by means of a Bosch high-tension magneto, type DU4. The weight of the several models follows: Three-cylinder, 160 pounds; four-cylinder, vertical, 200; six-cylinder, vertical, 280; four-cylinder, opposed, 180; six-cylinder, opposed, 250.

ROBERTS AVIATION MOTOR.

Undoubtedly, one of the best known American aviation motors is the Roberts, made by the Roberts Motor Company, Sandusky, O. This is not strange, considering that its designer, E. W. Roberts, M. E., has long been recognized as an authority on gasoline motors and is a pioneer student of aeronautics. Not only has he been the designer of several engines which are sold under familiar trade names, but in 1894 and 1895 he was chief engineer associated with Sir Hiram Maxim, in the construction of what has been considered the first power driven aeroplane.

The Roberts motor is a two-cycle, water-cooled unit, and is made in three models, one of four cylinders and the others of six, with horsepower ratings of 50, 75 and 125, respectively. That illustrated herewith is the six-cylinder 75 horsepower model. It is but natural that the company should claim that the signal successes of its product are due to the design, construction and materials employed.

The cylinders are constructed of a combination or alloy of metals, known as aerolite, which



Exhaust Side of Four-Cylinder Fox DeLuxe Model, Showing Fourth Port Control.

is claimed to be no heavier than aluminum, and to be superior to steel or cast iron for this purpose. It is said to have a specific gravity of 2.73

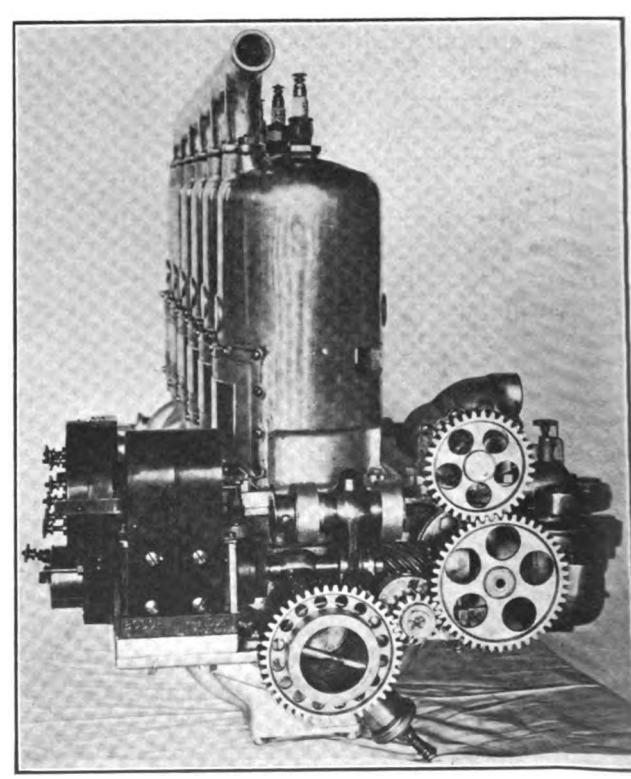
Digitized by Google

and a tensile strength of 38,000 pounds to the square inch. It is held to be exceedingly tough and not to be subject to crystallization. By its

Six-Cylinder Roberts Motor, Intake Side.

use the jackets may be made in one piece with the cylinders, thus avoiding all joints, and an additional feature mentioned is that of carrying the jackets to a point further down on the cylinders than is practical when these members are attached.

It is maintained by the company that it has overcome the possibility of firing the charge in the base and before it enters the cylinder, by the use of a bypass, consisting of a series of alternate flat and corrugated plates about three inches long, which entirely fill the passage from the base to the cylinder and divide the transfer port into a large number of small passages or cells. It is claimed that these cells have such a large surface compared to the area of the passage that should a flame start downward through them it is cooled and extinguished, the temperature of ignition of the mixture being about 600 degrees, Fahrenheit, and that of the bypass 150.



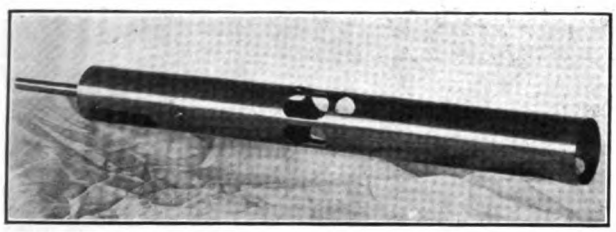
This is one of the chief features of the motor, an advantage claimed for it being that in altitude flying, for instance, no adjustment of the carburetor is necessary, as the motor will run as smoothly a mile or more above the earth as it will at its surface. Exhaustive tests are said to have demonstrated that a Roberts motor without these plates would vary so much as 100 revolutions, while the same motor with bypass in place ran steadily at one speed.

The crankcase is made of magnalium, an alloy of aluminum and magnesium, having a specific gravity of 2.4 and greater strength than aluminum. It is by the use of these special alloys, aerolite and magnalium, together with special steels, that a motor of extremely light weight is obtained without sacrifice of strength or durability.

The crankshaft is a drop forging of special alloy steel, double heat treated and bored hollow in both the shaft proper and in the crankpins. The forging from which the four-cylinder shaft is made weighs 82 pounds, and when completed its weight is 17.5 pounds. The figures for the six-cylinder shaft are 104 and 21.5, respectively.

The large bearings on these shafts prevent the oil from being squeezed out under the pressure of load, and special attention is drawn to the very long bearings at the end nearest the propeller. These are six inches long on the 50 and 75 horsepower units and 12 on the largest. The connecting rods are I beam section and are drop forged from crucible vanadium steel. The bearings in the lower end of the connecting rod are babbitt faced bronze, and in the piston they are phosphor bronze running on a hardened steel pin. The lower half of the rod bearing at the crankpin consists of a bronze strap covering but one-third the surface of the pin, and as a result 70 per cent. of the surface is left bare to the oil and good lubrication is claimed.

Water circulation is by a gear pump of ample capacity that keeps the fluid flowing



End View of Roberts Six-Cylinder Model, Showing Magneto Location and Driving Means.

through the jackets and radiator. The water enters a channel in the base and thence is forced upward, passing directly to the jacket surround-

Digitized by Google

ing the exhaust port, and after passing around the cylinders reaches the top of the radiator by means of an outlet manifold at the top.

Rotary Distributor for Roberts Four-Cylinder Motor.

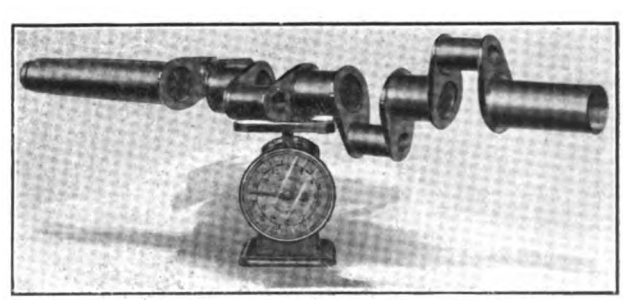
Ignition is by means of a Bosch magneto so arranged as to secure the maximum spark at any point of advance. This is accomplished by rotating the armature of the magneto and thus changing its setting with relation to the position of the piston instead of rotating the circuit breaker. The advance is brought about by sliding one helical gear over another. On the magneto the position of the break is locked so that it will always occur at the point where the current is strongest and thus the hottest possible spark is obtained, no matter what the position of the advance, it is claimed.

The fork which pushes the magneto gear from one side to the other is operated by means of a worm, in order that the pressure of the drive on the helical gear will not of itself retard the spark. The advance is operated by turning the drum on the end of the worm shaft. It is connected to the pedal in reach of the aviator by means of aviator cable wrapped twice around this drum. The pressure or drag on the worm is said to be so slight that the drum may be turned by the pressure of the little finger.

The carburetor is a Kingston, and the mixture of gas and air passing from it to the base of the motor is controlled by means of a rotating tubular distributor, which revolves in a bronze bushed housing at the same speed as the motor. This distributor regulates the admission of the mixture to the base by opening and closing ports cut in the wall of the crankcase. From the carburetor the gas enters the revolving tube at the centre and thence passes to each one of the base compartments in turn, through openings in the wall of the tube.

The company claims that this distributor is equally as important as the bypass previously mentioned. By its use the admission of the mixture is held to be timed as accurately as with a valve in the four-cycle motor, as the admission of gas is independent of the position of the piston. It is said to have been found in practise that this arrangement has given a remarkably even distribution of gas, and that all of the cylinders get the same volume of charge and explode evenly.

The four-cylinder model weighs, complete, without propeller, 170 pounds. It has a bore of 4.5 inches and stroke of five. The 75 horsepower unit weighs 240 pounds and is of the same bore and stroke, while the 125 horsepower weighs 390 pounds, having bore of 5.5 inches and stroke of six.



NEW CUSTOMS REGULATIONS.

The Treasury department has formulated new regulations governing the importation and exportation of automobiles and motorcycles. When an owner desires to take his machine abroad for a temporary stay it is now necessary for him to make that fact known to the collector of the port from which he departs and he must sign a certificate to that effect. When this certificate is presented on returning from abroad the automobile will be admitted free of duty.

When machines of American manufacture are taken abroad without securing the export certificate they may be returned here duty free on compliance with the provisions of the customs regulations for the entry of American products exported and returned. If repairs or improvements have been made, except those incidental to the running of the machine, duty will be assessed at 45 per cent. of the cost.

LOW MAINTENANCE FOR MARMON.

Two Marmon touring cars, owned by the Horace F. Wood Livery Company, Indianapolis, Ind., in service since November, 1909, have completed more than 100,000 miles after continuous service night and day in all kinds of weather

Illustrating Light Weight of Roberts Four-Cylinder Crankshaft.

conditions. During all their service they have had an operating cost for tires and repairs of less than one-half cent a mile.

In The Aviation Field

With the Manufacturer and Operator in America and Abroad

An accompanying illustration presents the new Mars biplane, the product of the Deutsche Flugzeug Werke, of Germany, which was among the machines competing with honor in the recent British military trials. The Mars monoplane has been in the market for some time and the biplane does not differ from it in the construction of the fuselage, landing chassis, control arrangements, elevator and rudder, and location and mounting of the engine. In fact, it almost may be stated that the biplane is simply the addition of the upper pair of wings to the regular monoplane formation.

As will be noted, one of the most distinctive features of the assembly is the absence of struts between the upper and lower main planes, the only vertical supports being the four at the fuselage. This construction has been adopted with the idea of permitting rapid dismounting of the machine for military purposes. It is maintained that the folding in of the wings can be accomplished in a few minutes by merely loosening two bolts. A mast holds the stay wires of the upper plane, and the bracing consists of wire cables, each of which will withstand a strain of more than 1000 pounds. All the metal parts are covered with a special coating as a protection against rust.

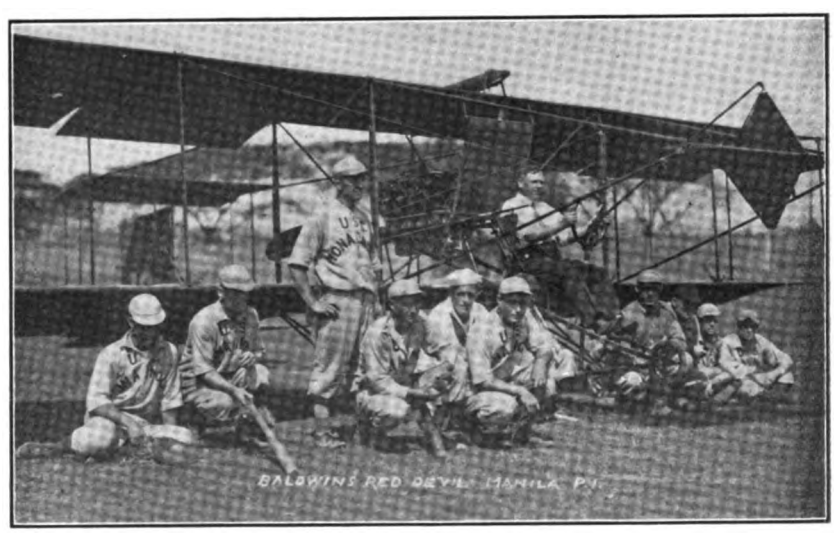
The first formal review of an aeroplane armada took place at Villacoublay, near Paris, France, Sept. 27, when no less than 72 French army flying machines, with their full complement of pilots and observers, and their attached park of motor trucks bearing supplies, passed in review before Alexander Millerand, minister of war. At the close of the review M. Millerand addressed the officers and men, urging them to refrain from

Mars Biplane of German Construction, a Machine Which Presents Some Novel Features, Particularly with Reference to Absence of Vertical Struts.

Digitized by Google

seeking publicity, which he said could only result in harm to the service. He also announced the nation's determination to keep France in the very forefront of aviation. At the conclusion of the speech, 20 aeroplanes arose in a "flock," and after encircling the parade ground for a few moments sped away to the eastward to resume their stations on the German frontier. The remainder of the armada scattered during the afternoon to their various military posts.

That air pockets are the greatest danger to be feared at present is pretty generally conceded among students of aerial navigation. It would seem that the attention of designers must be concentrated upon this one point, at least for a time. The situation is brought out in an interesting manner by H. H. Windsor, writing in Popular Mechanics, as follows:



"The mysterious and ever-to-be-feared air pocket constantly lurks as an unseen foe. The navigator in water has something substantial to aid him in avoiding danger; shoals, reefs, currents, even the wind can be detected and judged by signs which are both visible and known. The uncharted ether, changing in density from moment to moment, affords no such reliable record, and its danger spots shift from hour to hour. Safety and danger zones change places without warning, nor can any effort of man insure the one or remove the other. It is a condition which every one who mounts into the air must expect, even though he have no fear."

That this is a true picture of the conditions as they exist today cannot be denied, and it explains many of the accidents which have been the subject of much unfavorable comment. A few years ago the air not only was uncharted but unnavigable. Much has been learned during the past decade, and it is difficult to determine what shall be the record of the next 10 years.

Capt. Thomas S. Baldwin is said to have purchased a large plot of ground on Staten Island, N. Y., where he will establish the largest private flying school in the world. He is at present engaged in supplying aviators in charge of his Red Devil biplanes for exhibition flying throughout the country. An accompanying illustration shows him in one of his Red Devil machines, equipped with a Roberts motor, during his recent visit to the Philippine Islands, where he was the first aviator to appear in that section.

Germany continues to experiment with dirigible balloons as a means of quick communication in times of war, and recently startled the sailors at Malmo, a Swedish naval port, by flying the Zeppelin Hansa over the Baltic sea to Denmark and Sweden in a 13-hour flight. This included a landing at Copenhagen for lunch. The fastest train service between Hamburg, from which point the dirigible was launched, to Copenhagen, is nine hours.

Glenn L. Martin is America's first brevetted master pilot of aeroplanes, having successfully completed the tests required by the new rules of the Aero Club of America at Chicago, Sept. 14. He passed with high honors and received expert aviation license No. 1. Max Lillie and DeLloyd Thompson also competed for licenses, but failed to comply with all the requirements.

Capt. Thomas S. Baldwin and His "Red Devil" Biplane on Its Recent Visit to the Philippine Islands.

Announcement is made from England that plans are under way for a cross country flight from London to India. The Royal Geographical Society has assisted in laying out the route, which covers approximately 4800 miles and visits the following cities: Calais, Brussels, Cologne, Frankfort, Ratiabon, Constantinople, Konieh, Clincia, Adana, Alexandria, Meskene, Bagdad, Basra, Bushire and Karachi. It is estimated that the machines will be able to average 400

Digitized by Google

miles a day and that the trip will be completed in 12 days.

Additional information concerning the altitude record made by Georges Legagneux at Villacoublay, France, Sept. 15, makes necessary a correction with respect to the machine he flew. He had been using a Zeus monoplane of late, and it was presumed that his world's mark was created with a machine of that make, but it transpires that he utilized a Morane monoplane.

Legagneux reached an altitude of 18,681 feet, or a little more than 3.5 miles. He climbed the first 1000 meters, or 3280 feet, in 2.5 minutes, and this same speed was maintained for the next two 1000-meter mounts. The 4000-meter mark was reached 7.5 minutes later. Just before he reached the 5000-meter point he brought his tube of oxygen, which he carried with him, into play and this 1000 meters was made in 15 minutes. The total of 5720 meters was reached at the end of 45 minutes from the ground. It took him exactly 10 minutes to return to earth.

The history of the world's altitude record now reads as follows:

Date	Aviator	Machine	Feet
Dec. 18, 1908	W. Wright	Wright	328
July 1, 1909	Latham	Antoinette	1,560
Jan. 12, 1910	Paulhan	H. Farman	4,165
June 17, 1910	Brookins	Wright	4,939
Aug. 5, 1910	Chavez	Bleriot	5,756
Aug. 11, 1910	Drexel	Bleriot	6,750
Aug. 29, 1910	Morane	Bleriot	7,054
Sept. 3, 1910	Morane	Bleriot	8,468
Sept. 8, 1910	Chavez	Bleriot	8,792
Oct. 1, 1910	Wynmalen	H. Farman	9,186
Oct. 31, 1910	Johnstone	Wright	9,714
Dec. 9, 1910	Legagneux	Bleriot	10,430
*Dec. 30, 1910	Hoxsey	Wright	10,575
*Dec. 31, 1910	Hoxsey	Wright	11,474
July 8, 1911	Loridan	H. Farman	10,758
Aug. 5, 1911	Felix	Bleriot	10,990
Aug. 20, 1911	Beachey	Curtiss	11,542
Sept. 4, 1911	Garros	Bleriot	13,943
‡June 30, 1912	Blaschke	Etrich	14,305
Sept. 6, 1912	Garros	Bleriot	16,405
Sept. 15, 1912	Legagneux	Morane	18,681

*Hoxsey's death made it impossible to verify the barograph reading; ‡made with a passenger.

The Solane Aeroplane Company has imported a large passenger carrying military Deperdussin monoplane, equipped with a 60 horsepower Anzani motor, being a duplicate of the machine used by Maurice Prevost in the nonstop flight from Paris to London. It will be utilized by the company at its flying school at Hempstead Plains, Long Island. In some respects its equipment is somewhat novel to the American, as it includes every comfort for pilot and passenger, chief among which may be mentioned the two lockers for carrying food, etc.

Another machine which is causing considerable interest in the Hempstead Plains aviation colony is a 45 horsepower Caudron, the first of this make to be brought to this country. It is considered one of the smallest monoplanes produced abroad, being not more than 25 feet over all and with spread of 25.5 feet. This also will be utilized by the Sloane company at its school.

J. Bellaner has been trying out a new small biplane, which he has termed the Humming Bird, at Mineola, L. I. The machine is said to have performed very creditably in the hands of its designer.

Guy Kilpatrick of New York City, who has just passed his 16th birthday, has been granted a pilot's license at Hempstead Plains, Long Island. Kilpatrick thus succeeds Marcel Hanroit of France as the youngest licensed aviator in the world.

During the recent national aviation exhibition at Hendon, England, several aviators flew at night, sending messages to distant points by means of the Morse ship signal code. This is taken as an additional demonstration of the value of the aeroplane in sending messages in times of war.

Inasmuch as the first practical use of aeroplanes and dirigibles in time of war was made during the conflict between Italy and Turkey in Tripoli, the following report from H. Seppings Wright, representing the British Central News with the Turkish army, will prove of decided interest:

This war has clearly shown the terrible possibilities of aviation, especially against a defenseless people. The dirigible is virtually an aerial battleship to which the aeroplane stands in the relation of scout, and employed together the two must necessarily revolutionize warfare.

The atmospherical conditions in Tripoli are not abnormally favorable to aviation; indeed, high winds are frequently experienced, but the Italian dirigibles and aeroplanes, manned by clever and plucky men, have carried on their operations without meeting with a single serious mishap. The aeroplane scouts ran pretty high risks when they ventured inland over the Turkish camp, because if their engines had failed they would have been bound to come down in the desert. Tripoli was too far away to be reached by a volplane.

The bombs dropped from the aeroplanes were small ones, about the size of a teacup, but those which came down from the dirigibles must have weighed about 30 pounds. At my suggestion the Turkish troops were drilled to adopt a special formation when the dirigibles were about, and by spreading themselves out fanwise and throwing themselves flat when the bombs came down, escaped with little hurt. But the bigger bombs could do terrible execution when they fell among a crowd, as for instance, in a market place. Under such circumstances I have seen as many as eight or 10 persons killed and 30 or 40 injured at a time, women and children being among the number.

Digitized by Google

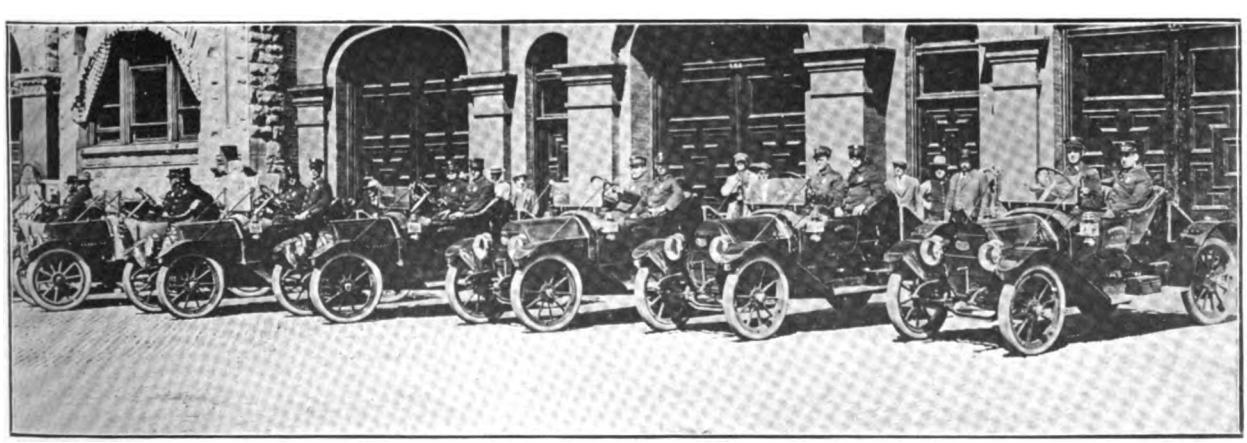
IN THE Commercial Vehicle Field

New Trucks and Applications, Time and Money Saved, and Other Items of Interest.

NEW TRUCK FIRM.

A new truck concern, of which Adam Trabold is president, has begun the manufacture of commercial automobiles at Johnstown, Penn. The Germania Brewing Company of Johnstown purchased the company's first truck and it is reported to be giving excellent satisfaction. Six more will be produced in the near future. Mr. Trabold's intention is to build vehicles of one to five tons capacity, suited to any purpose or business. The one-ton trucks will have a motor of 35-40 horsepower and wheelbase of 116 inches.

CARTERCARS IN MILWAUKEE.



The success which has attended the use of the friction driven Cartercar when employed as a municipal service wagon, has been very gratifying to the maker, the Cartercar Company, Pontiac, Mich. Several of the cities of the Middle West, included among which may be mentioned Detroit, where such a large proportion of the cars produced in this country are manufactured, have been experimenting with these machines for police and fire work, with the result that they have been found to answer every requirement and to give excellent satisfaction under all conditions of service.

An accompanying illustration presents six of the seven Cartercars recently installed with the fire department in Milwaukee, Wis. It will be noted that they have been designed especially as so-called chief's wagons and are to be utilized as a rapid means of getting the proper officials to the scene of the blaze. The picture was taken in front of the department headquarters, and Milwaukee's famous jail is shown at the left.

CHICAGO FIRM'S EXPERIENCE.

Alexander H. Revell & Co., Chicago, now have five KisselKar trucks, made by the Kissel Motor Car Company, Hartford, Wis., in its service. A. E. Holmes, superintendent of the company, is enthusiastic over the service the trucks have been giving his concern. They have replaced 50 horses and careful records show a splendid economy in their use.

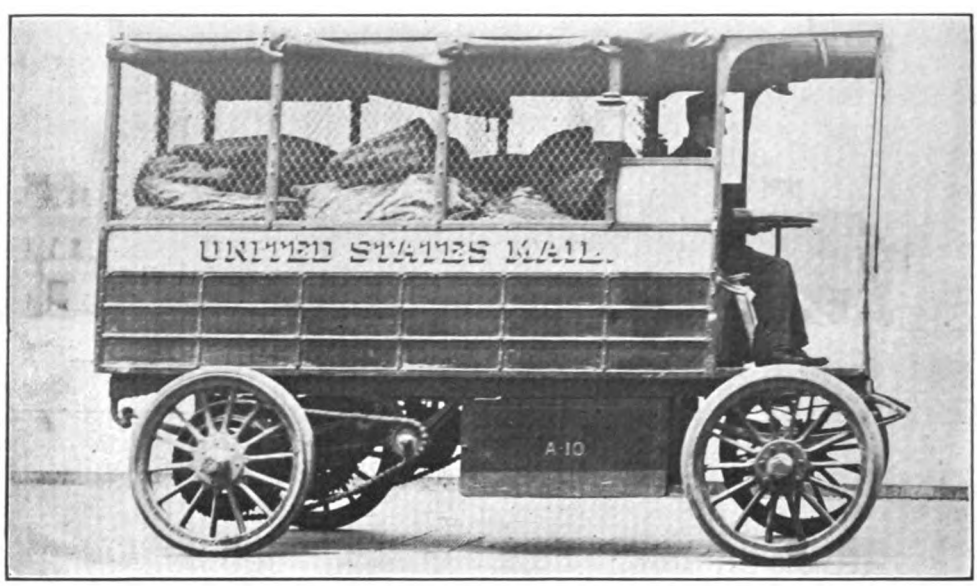
Speaking of the work of the trucks Mr.

Part of the Fleet of Cartercars Recently Placed in Service with the Fire Department in Milwaukee, Wis.

Digitized by Google

Holmes is decidedly enthusiastic. "In our business," he says, "we must be up-to-date. Our customers demand the best we can give them in service. Even if motor trucks were more expensive—which they are not—we would never go back to horses."

FEDERALS IN MANY LANDS.



That the Federal truck, made by the Federal Motor Truck Company, Detroit, exclusively in the one-ton model, is enjoying a large measure of popularity in all parts of the world is shown by the orders which have recently been filled for patrons in widely scattered sections. The Consolidated Development Company of Nome, Alaska, said to be the largest ore mining concern in that territory, recently sent two representatives to this country to investigate the various makes of trucks. An order was placed with the Standard Motor Car Company, San Francisco, agent for the Federal, for three Federals for hauling ore from among the mountains to the export stations along the coast. A representative of Futubaya & Co., Tokio, Japan, made a similar investigation of American one-ton trucks and placed an order with the Federal company. Three agents of the American Motor Truck & Auto Company, Melbourne, Australia, also visited this country in search of a truck of the one-ton type with a view to establishing an agency in Melbourne. The Federal was chosen and the contract was speedily signed.

MOON COMPANY'S SUCCESS.

The Moon Motor Car Company, St. Louis, Mo., maker of Moon pleasure and commercial vehicles, recently received an order from the city of Boston for a Moon motor patrol, which contract was secured in competition with 32 other manufacturers of automobile patrol wagons. The company also has received a contract to supply St. Louis with three machines, an ambulance and two touring cars, in competition with 29 other manufacturers.

ELECTRICS IN MAIL DELIVERY.

Herewith is presented one of the two-ton General Vehicle electric wagons, made by the General Vehicle Company, Long Island City, N. Y., in service with the Motor Delivery Company of New York City in the transportation of mails between the sub-stations of the postoffice in that city. Twenty-eight cars of this make ranging in capacity from 1000 pounds to 3.5 tons, are utilized in this work.

Two-Ton General Vehicle Electric Wagon, Used for Mail Transfer in New York City.

It will be understood that the requirements of the postal service are such that it becomes necessary to have an equipment concerning the efficiency of which there shall be no doubt. It is stated that the total mileage is about 336,000 annually, and that this works out, allowing for lessened mileages on Sundays and holidays, to approximately 40 miles a day for each vehicle. A certain definite schedule is allowed for each trip and this must be maintained as closely as possible.

These cars have been utilized for sufficient time to demonstrate their value, and the concern maintains its own garage and service station, in which all items of care are looked after by its own men. At the end of the second year the cost figures for the two-ton wagons were tabulated as follows: Tires, 1.95 cents a mile; batteries, 2.17; repairs, .94; motor, 1.01. For the 1000-pound wagons the costs were: Tires, .95 cent a mile;

Digitized by Google

batteries, 1.72; repairs, 1.47; motor, .86. The one-ton wagons figured out as follows: Tires, 1.72; batteries, 3.28; repairs, 1.30; motor, .89.

PEERLESS IN MOVING WORK.

The M. Sweeney Company, Fall River, Mass., has found the Peerless trucks, made by the Peerless Motor Car Company, Cleveland, O., of such value in handling moving jobs, that after it had operated one of these three-ton vehicles in this work for one year in April, the second was placed in service. The people of Fall River and vicinity have come to rely upon this method of moving household goods to such an extent that both trucks are employed almost constantly in this field.

The plan adopted by the concern is that of looking over the goods and giving a flat price for the job. It often has been found possible to make one trip lead to another, as for instance, taking a load of goods to Lynn, there to pick up a load for Worcester, and in Worcester taking on another cargo for Fall River. If it were possible to make such connections all of the time, the conditions would prove ideal, but it is most generally the case that the return trip must be made empty. Experience has indicated that the greater economy to the householder is effected on the long hauls, say within radius of 50 miles.

Three-Ton Peerless Truck in Service with M. Sweeney Company, Fall River, Mass., in Moving Household Goods.

An accompanying illustration shows one of the cars, and special attention should be called to the body equipment. This is the work of Robert W. Powers of Fall River, who is agent for Peerless trucks and has been engaged in the body building business for years, having started such work long before the advent of the self-propelled vehicle.

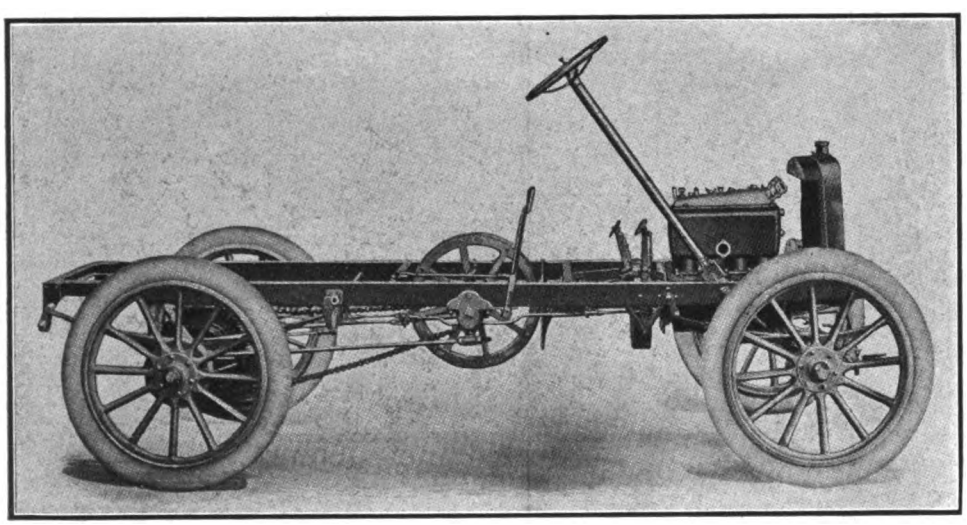
Provision is made for extending the top upward some 18 inches, so as to gain as much room as possible under the cover. This telescopic feature is worked out very neatly, six of the uprights being bored to receive stay bolts, which are fitted with wing nuts. Two men can hoist the top into its extended position. The dimensions of the body are such as to accommodate every class of household furniture, this being packed in the most advantageous manner.

WOULD BOND DRIVERS.

It was stated at a recent meeting of the Motor Truck Club, New York, that about 75 per cent. of the successes or failures accompanying the use of motor trucks depends upon the driver and the question of bonding drivers was taken up, the idea evidently being that a man who could secure bonds would most likely be a better type of operator. It was shown that in one installation of 40 trucks a saving of 41 per cent. had been effected in operating and maintenance by arranging three classes for the drivers, each differing by $2 a week in salary and graded according to a set maximum limit for each class on the cost of running and keeping up their vehicles.

BUFFALO CONCERN SPECIALIZES.

The Buffalo Electric Vehicle Company, Buffalo, N. Y., which was formed by the consolidation of the Babcock Electric Carriage Company



Digitized by Google

and the Van Wagoner Electric Vehicle Company, will specialize in the production of delivery wagons and service vehicles. The entire Babcock plant in West Utica street will be utilized exclusively in the construction of these types of machines.

FRICTION DRIVEN POSS.

The Poss delivery wagon of 1000 pounds capacity is made by the Poss Motor Company, Detroit. It is a friction driven machine, and simplicity and accessibility are features which are claimed for it by the maker. The motor is a four-cylinder unit with bore of 3.5 inches and stroke of 4.75, rated at 25 horsepower. The cylinders are cast en bloc, with water jackets and exhaust manifold integral.

Lubrication is by splash from a constant level in the base of the engine case. Cooling is by the thermo-syphon system. Ignition is by high-tension magneto with fixed spark, the magneto being carried on an extension of the crankshaft. The carburetor is of the automatic float feed type.

Friction Driven Poss Delivery Wagon of 25 Horsepower and Load Capacity of 1000 Pounds.

On the crankshaft is installed the flywheel and bolted to the latter is a heavy steel arm, behind which is a large clutch spring. This spring contacts with a flange fixed to the forward end of the driving shaft, on the rear end of which is the driving disc. The cross member of the frame is heavily braced and behind this, and ahead of a second cross member is the jackshaft, carried in heavy bearings. On this jackshaft is the driven disc with a fibre face, which is moved transversely to any position, affording the variation in speeds peculiar to this type of transmission. Final drive is by single chain. The springs are semi-elliptic front and rear. The frame is of pressed steel channel section, and with the two cast motor supports there are seven cross members, with triangular gussets at the rear end. An option in tires is permitted, either pneumatics 34 by 3.5 inches or solids 36 by 2.5. The wheelbase is 96 inches and the tread 56.

MORELAND TRUCK POPULAR.

The Moreland Motor Truck Company, Los Angeles, Cal., maker of Moreland distillate motor trucks, which have steadily gained in favor in California, has begun an addition to its factory in order to meet the increasing demand for the vehicles. The addition will permit of the construction of 500 trucks during the next 12 months. Besides enlarging the present factory facilities, the addition will also provide an up-to-date service station, which will give night and day service to Moreland owners. Moreland trucks are being manufactured in sizes from one to five tons and 26 were recently delivered. Everything in connection with the machines, except the engine, will be made in the Moreland plant after the addition is completed, which, it is expected, will be in the very near future.

WILL WORK SUMMER SCHEDULE.

During the coming winter all the factories of the United States Tire Company will be operated on the regular summer schedule, three shifts of workmen being employed night and day. This decision was reached at a conference between General Manager J. M. Gilbert and the company's factory managers, W. McMahon, Detroit; J. M. Patterson, Providence, R. I.; Harlow W. Waite, Indianapolis, and C. B. Whittelsey, Hartford, Conn. The output of the four factories during the year is more than 1,250,000 tires and this number will be far exceeded by the 1913 output.

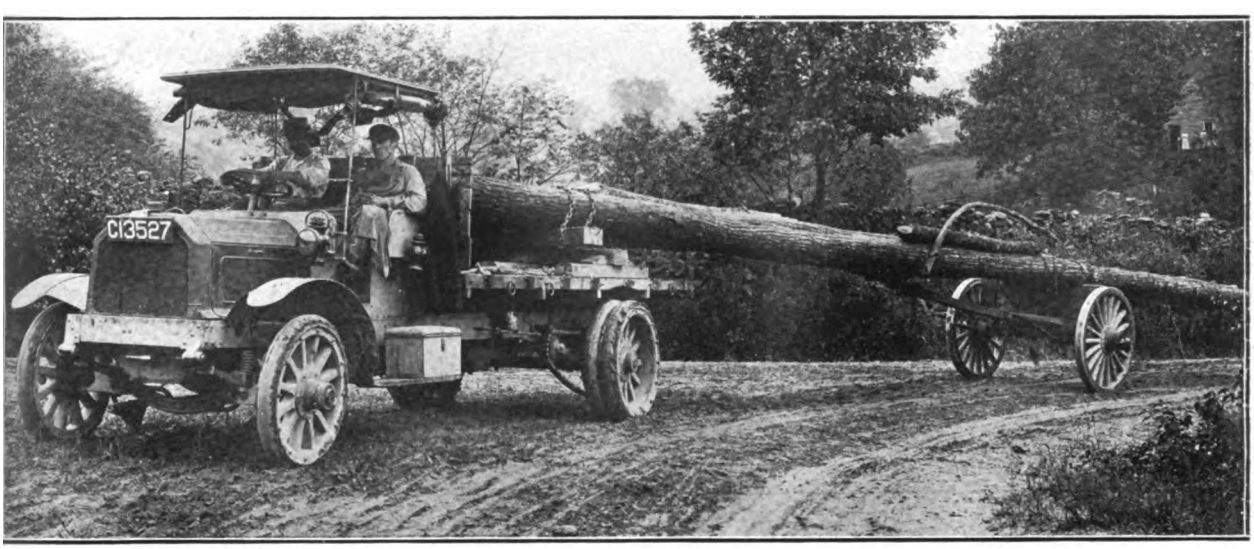
PROMPT DELIVERIES COUNT.

A western merchant who recently replaced his horses with KisselKar motor trucks has realized the advantage of being enabled to deliver orders the same day they are received and one of the weakest points in his business has thus been solved. Sales that were formerly lost by inability to deliver have been taken care of under the new system, the advertising campaign of the merchant in the local papers being centred around the slogan, "We'll deliver it today."

TRAFFIC DEPARTMENTS MERGED.



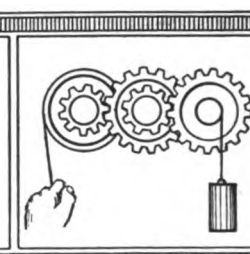
President John N. Willys of the Willys-Overland Company, Toledo, O., maker of Overland cars, has brought the traffic departments of most of his properties, including the truck concerns, under one head with headquarters at Toledo. C. W. Eggers, who has been traffic manager of the Overland company the past two years, has been made general traffic manager of the Willys-Overland Company; Garford Company, Elyria, O., maker of Garford trucks; Gramm Motor Truck Company, Lima, O., maker of Gramm trucks; Federal Motor Company, Indianapolis, Ind., and Morrow Manufacturing Company, Elmira, N. Y.

PEERLESS IN LUMBER WORK.

Two Peerless motor trucks, made by the Peerless Motor Car Company, Cleveland, O., have invaded a field which might be supposed to offer an excellent position for the horse drawn vehicles and are now doing service in the lumber woods of Connecticut, where they carry a portable saw mill from place to place in the timber, haul logs to the mill and lumber to the railroad. The trucks are owned by Charles H. Phillips of Plainfield, Conn.

He purchased the first one in October, 1911. It covered 50 miles a day over the comparatively unimproved forest roads and did the work of from eight to 10 horses. Mr. Phillips found himself saving money on the change so ordered another truck. Several very steep grades with soft surfaces are surmounted regularly without difficulty. There have been practically no repairs.

Instead of cutting tree trunks into the usual log lengths they are left intact and two or three whole trees with branches trimmed off are carried by the trucks in one load. One end of the tree is placed on the truck body and the other carried on a pair of trailing wheels, as shown in the accompanying illustration.



Peerless Truck in Lumber Service with Charles H. Phillips, Plainfield, Conn., Showing Method of Hauling Logs.

TRUCKS SUPPLANTING TRAINS.

The ability of motor trucks to compete with railroads under certain conditions was shown recently when the three-ton White truck, made by the White Company, Cleveland, O., and owned by Fred W. Wolven, New Haven, Conn., engaged in the general moving and furniture business, carried a heavy load of furniture for Thomas O'Conner of Westville, Conn., to his new home at Arlington, N. J. The truck made the trip in one day and returned to its home garage the following morning with no mishaps.

RECENT MOTOR VEHICLE PATENTS

Blair Valve Stem Housing.

William E. Blair, Buffalo, N. Y., assignor to the Buffalo Gasoline Motor Company of the same city, has been granted a patent for a valve stem housing. It comprises a tubular housing surrounding the valve spring and stem, also the tappet members. The housing is divided longitudinally in sections and the latter engage at their upper ends with recesses in the valve guide and at the lower ends with a shoulder on the outer side of the lower guide or pushrod bushing. A spring is employed to retain the housing in position and the sections are provided with locking sleeves.

Miller Tire Puncture Finder.

The customary method of locating small leaks caused by punctures to an inner tube is by immersing the inflated member in a tank of water when the puncture is noted by the air bubbles. Francis Miller, Bellevue, Ky., has invented a tire puncture finder which eliminates the water tank, as the device is so designed that it is clamped about the tube and over the suspected punctured wall. It comprises a ring adapted to completely encircle the tire and is provided with an annular air chamber communicating with a bubble blower detachably secured to the ring. The bubble detector device is fitted with a nipple screw threaded into the ring, the nipple threads being adapted to engage into the air valve of the tube. Leaks from punctures are denoted by the bubbles given off, these being created by the escaping air.

Kells Automobile Jack.

Charles Edmund Kells, Jr., New Orleans, La., has been granted a patent for an automobile jack that presents interesting features in that it may be employed to raise a wheel by placing it under the hub as well as in the usual manner, under the axle or axle housing. The head of the lifting portion of the jack is Y shaped and at each extremity of the upper part is mounted a roller. An endless belt is fitted to these rollers and supports the wheel hub. By the arrangement the wheel may be rotated if desired. Qualities claimed in the device are that the jack may be utilized without the operator stooping under the car and that the rollers permit of rotating the wheel without relieving the latter of weight.

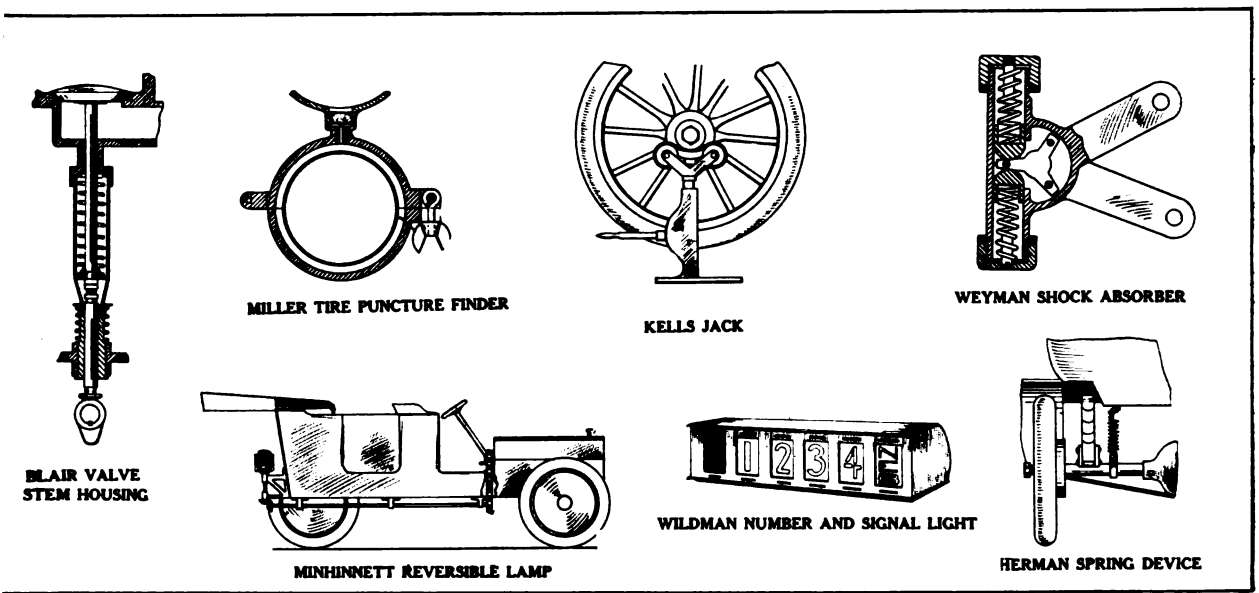
Weyman Shock Absorber.

Frederick W. Weyman, Hartford, Conn., has been granted a patent for a shock absorber having an annular housing with two opposed cylinders extending tangentially from the edge of the housing back of the centre and an integral arm projecting from the housing in front of the centre. The outer edges of two circular hubs fit the interior wall of the housing and the hubs have internal arms projecting from their edges in front of the centre of the housing. A block is interposed between the hubs and means are incorporated for securing the block and the hubs together as one piece. Movable plungers are fitted to the cylinders and bear against oppositely disposed surfaces of the block back of the axis of the hubs. The cylinders carry springs, thrust in straight lines against the plungers and caps are employed to close the ends of the cylinders and retain the springs in position.

Minhinnett Reversible Lamp.

George F. Minhinnett, Blooming Grove, Tex., has patented a reversible tail light for motor cars. The lamp is fitted with four lenses and is centrally mounted upon a vertical spindle retained upon a bracket secured to the rear end of the car body. The end of the spindle carries a bevel gear which meshes with a similar member upon a shaft mounted longitudinally beneath the body. The other end of the shaft is provided with a sprocket wheel. The shaft is supported by bearing hanger members. Another sprocket is mounted upon the dash and connection with the shaft sprocket is through a chain which is actuated by a crank, movement of which enables the light to be rotated as desired.

Wildman Number and Signal Light.



Among the more recent patents for illuminated license numbers and signalling devices is that granted to Holland R. Wildman, York, Neb. It is similar to other devices of this nature and is box shaped. The top and bottom edges of the

Digitized by Google

front of the box are provided with longitudinal channels for the purpose of slidingly fitting a frame plate. The latter carries the glasses upon which are inscribed the characters and numerals, and provision is also made for a colored glass danger signal. Means are incorporated for attaching the device, which is presumably lighted by electricity.

Herman Spring Device.

The recoil of vehicle springs after compression exerts severe stresses upon the members and to restrict this movement, as well as that of contraction, Charles H. Herman, Medford, Ore., has patented a spring device which is located between the rear axle and frame or body of the car. It comprises a pair of members slidably engaged with one another. One is mounted or secured to the axle housing and the other attached to the frame or body. Means are incorporated to limit the respective movements of the members which are enclosed by a coil spring, the ends of which are secured to the moving parts.

Illustrating Some of the More Recent Ideas of Inventors of Devices Applicable to the Motor Car, Including a Valve Stem Housing, Jack, Illuminated Number and Signal Box, Etc.

OTHER PATENTS GONE TO ISSUE.

Support for Motor Cars, Charles W. Schubert, Cottonwood, Ia. A frame floor member is provided with inclined planes spaced to engage with the wheels of the motor car, which when run upon the device is raised off the ground. A ratchet and pawl device checks the movement of the vehicle in either direction after the machine is elevated.

Shaft Straightening Machine, Timothy J. Paine, deceased, Watertown, Mass., by Julia A. Paine, administratrix. A shaft straightening device having a combination of supporting blocks with V shaped grooves and retaining means. The straightening head has a number of radially disposed pressure blocks and actuating screws, with a bed adapted to support the blocks.

Muffler Cut-Out, George C. Ward, St. Louis, Mo. A rotating sleeve is fitted to the exhaust pipe, which is slotted or cut to register with a similar opening of the cut-out sleeve. Means are provided for rotating the sleeve member and for holding it normally in a closed position.

Shock Absorber, Arsene Zeppelin, Brookline, Mass. Clips are secured to the axles and levers mounted therein. Springs are employed to regulate the movement of the levers in either direction.

Tire Fastening Device, William Leopold Bauer, Covington, Ky. A tire fastening device comprising a flat band to encircle the base portion of a tire, and having an inwardly projecting lug adjacent to each end. A lock plate is fitted, having apertures to take said lugs, and means are incorporated for tightening and securing same.

Internal Combustion Engine, Aurin M. Chase, Syracuse, N. Y. The motor is of the two-cycle type and the compression chamber is fitted with a diaphragm extending part way across the chamber. The head of the piston forms a baffle plate and one side is slightly recessed above the piston rings.

Shock Absorber, Joseph Benny, Newark, N. J. The device comprises a pair of levers, having the same fulcrum mountings and each provided with a flanged head, a pair of coil springs, a casing, a pair of hubs and means for pivotally connecting the heads and casing.

Tire Armor, John Robert Smith, Flagstaff, Ariz. A tire armor comprising a pair of detachable, semi-circular, transversely shaped curved armor sections for covering the tread of a shoe and means for securing and retaining same.

Tire, Thomas Toomey, Scranton, Penn. Two sets of wooden blocks are fitted to the channel section. One set forms portions of the tread and the outer ends of the other set. The latter is provided with dovetail heads and metal shoes, and includes means for securing the wooden members.

Exhaust for Gas Engines, Albert T. and Albert R. Titus, Robbinsdale, Minn. A vacuum relieving device operating under the influence of suction within the exhaust pipe of a gas engine and having means for varying its responsiveness to suction. The valve utilized is adapted to close by gravity and is provided with a spring to assist in its opening.

Tap Wrench, Whitman Russell, Greenfield, Mass. Within the stock member is fitted two jaws, one fixed and another movable. The latter is provided with a screw shank and adjusting nut.

Digitized by Google

GAS TANK RACKS.

The price of gas tanks is such that they should not be left lying loose around the garage or service station. The majority of larger garages keep a supply of these members for the benefit of their customers and tourists, exchanging filled tanks for empty ones.

An easily made and inexpensive rack for storing tanks is depicted at Fig. 1 and it may be located at any convenient place in the store room or in the garage proper. It is constructed

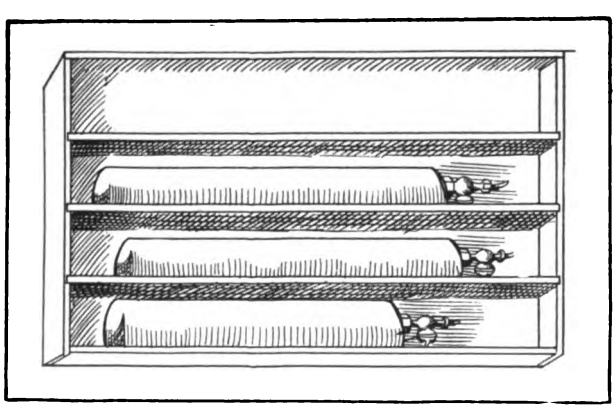


Fig. 1—Easily Made and Inexpensive Rack for Storing Gas Tanks.

of wood and the inside dimensions of the shelves are two feet, six inches long, nine inches high and eight wide. These dimensions will accommodate the largest sized tank. The number of shelves will depend upon the tanks to be stored.

The shelves should be given a slight pitch, about .5 inch higher in front than at the rear, to retain the tanks, and when the rack is built against the wall the rear partition may be eliminated. If desired a door can be fitted and provided with a lock. The shelves will also be of service for storing other accessories which require being kept under a lock and key.

HINTS ON BRAZING.

Brazing or hard soldering should be understood before attempting the work as a knowledge of the operation is valuable in the repair of motor cars. While the acetylene process is used largely there are numerous little jobs which may be handled by brazing, such as rods which have been pinned into tubing, etc.

The beginner is apt to make the error of thinking that the process of brazing is similar to soft soldering, where the heat is applied to the solder itself. In brazing the heat should be run from the work to the solder.

The material required comprises "spelter." and it resembles coarse brass filings. It consists of equal parts of copper and zinc and for different work a harder or softer alloy is employed. Generally speaking, two grades of spelter are used, the harder for iron and steel and the softer for brass and copper. For iron or steel, ordinary brass wire or strips of brass may be used in an emergency. Borax is mostly used as a flux. and it is essential that it should be pure. It should be procured at a chemist's as the domestic quality sold is useless for brazing purposes.

Preparing Materials.

The borax should be pounded up small, and some workers calcine it before using, as it prevents its swelling and frothing up, as well as carrying away the spelter when the heat is first applied. Calcining may be done by playing a flame from a blow pipe upon the borax, when it will swell up, and can be rubbed down after it has cooled. Borax treated in this manner is much easier to use.

Digitized by Google

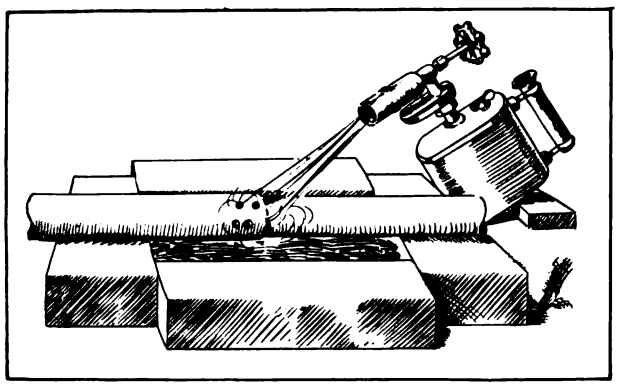

Fig. 2—Illustrating a Method of Brazing with Gasoline Torch.

The borax is then placed in a shallow pan with just enough water to make it adhere together. Some mix the spelter with it, while others have two separate pans, one containing the borax and the other the spelter with a small proportion of borax moistened with water. The latter method is recommended. A spatula is also required, and the tool may be made from a piece of iron wire flattened at the end for applying the spelter and borax to the work.

Insufficient Heat.

Insufficient heat is one of the chief causes of a beginner's troubles, for what is required is a surplus of heat, so that the work does not only get hot enough, but heats up quickly, and as little time as possible is allowed for oxide to form. When a blowpipe is employed, a small pointed flame should not be played upon the spelter, with the idea it is going to melt and unite with the work, as this will cause the spelter to oxidize before the body of the work has become red hot, and a sound joint will not be secured under these conditions.

It will be easier for those not having had experience in brazing to use a forge, as with the blowpipe it is somewhat difficult to get the work hot enough before the spelter begins to oxidize. While it is true the spelter is protected to a certain extent by the borax or other brazing compound, if it is made red hot before the rest of the work, it will be difficult to obtain a sound joint. Sometimes it is advantageous to use the blowpipe with the forge, but if the former is utilized alone it should be of large size, so that it will heat the work rapidly. If the forge is employed the fire should be clean; that is, free from smoke and flame. Coke in small pieces is the best fuel for this purpose.

If the work to be brazed be small, the method shown at Fig. 2 may be employed. It consists of building an oven with bricks as illustrated and filling the recess with charcoal which may be heated to an incandescent state by the flame of a torch. As it is important to retain the heat the oven could be covered with a strip of sheet iron or built over with bricks. The flame is directed onto the work as previously explained.

The most important factor in brazing is a sound joint. Many times joints will appear to be sound, but when the superfluous spelter is removed it will be discovered that this is what held the pieces together, and when the extra material is cleaned off, play can be detected as the spelter has not entered the joint. In some work, such as brazing a fitting onto a spindle, it is somewhat difficult to ascertain whether or not a sound joint has been obtained. One part should be held in the vise and the other moved about, and although no play is detected, yet the joint may come apart when subjected to stresses in work. When such work separates it will be found that between the fitting and the spindle there is some spelter which has melted, but not united to the surfaces of the metal, thus forming a kind of packing.

Simple Tests of Work.

The behavior of the spelter is a good guide as to whether or not the joint is sound. If under

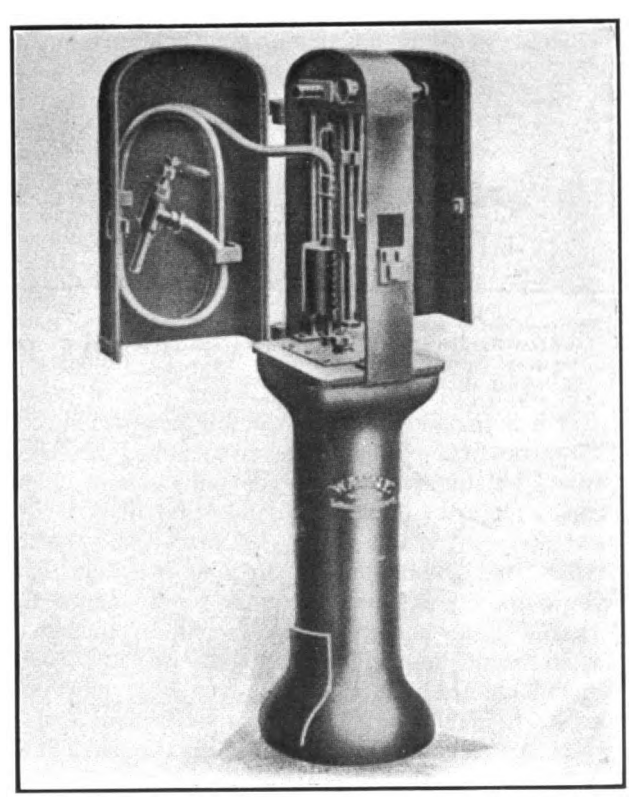

Fig. 3—The Wayne Sidewalk Gasoline Pump, an Equipment Making for Convenience.

Digitized by Google

the heat, the spelter forms into balls, it is sufficient indication that the work itself is not hot enough. If the spelter when melted, seems only to run over the surface of the work without entering the joint, it is also a sign that something is wrong.
